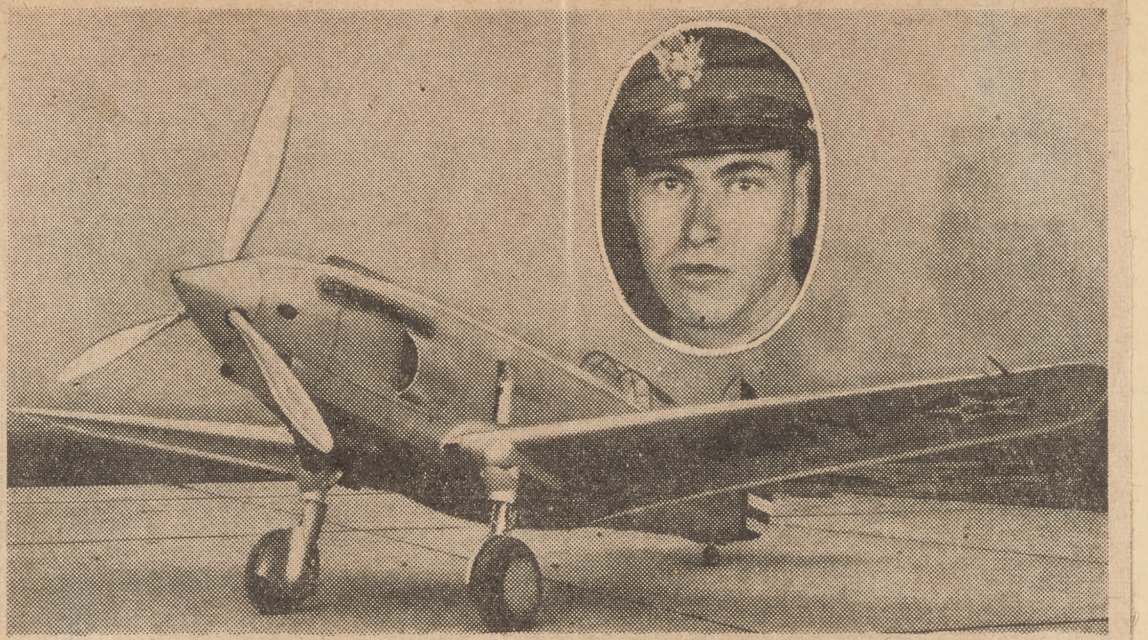
THE WASHINGTON POST: SA

6-Mile-a-Minute Flight by New Army Plane Hailed as Answer to Foreign Air Challenge



Lieut. Benjamin S. Kelsey (inset) flew a P-37-type plane shown here from Dayton, Ohio, to Buffalo—360 miles in 61 minutes—for an unofficial Army plane speed record

Navy's 'Fortress' Here Makes Dash From Coast President Will See It

America's answer to the challenge for air supremacy was revealed yesterday when the Army disclosed details of the flight of a pursuit plane which traveled 360 miles in 61 minutes.

Military authorities were particularly gratified by the fact that the 6-mile-a-minute flight, which took place Wednesday, was made in a pursuit plane carrying full military equipment, because bombers recently have been developing speeds outstripping the small fighting craft intended to intercept bombardment planes.

Foreign speed claims also will be answered by the new fighter. The German Messerchmitt is believed to have traveled at 380 miles per hour, but reports received here state that it was stripped for racing. Britain's Spitfire exceeded 400 miles per hour, but was aided by a 75-mile-an-hour tail wind, officials declared.

As the Army was checking on the new record, the Navy's $1,000,000 Flying Dreadnaught arrived at Anacostia Naval Air Station yesterday after a 13-hour and 55 minute dash from San Diego, Calif.

Neither flight was made as a stunt, officials stressing the fact they were routine performances.

Lieut. Benjamin Kelsey made his 360-mile trip from Dayton, Ohio, to Buffalo, N. Y., to inspect another new Army plane while the Navy flying boat, commanded by Lieut. Comdr. Andrew Crinkley, came here on one day's notice for inspection by President Roosevelt.

The plane flown by Lieut. Kelsey already has passed the experimental stage and a squadron of 13 of them have been ordered for the Air Corps, officials said.

Although pleased by the success of the plane, known as the P-37, the Army intends to announce completion in a few days of another and even faster model, designated the P-40. An experimental craft, details of its design will not be made public for some time.

An all-metal, single-seater monoplane powered by a liquid-cooled Allison motor, the P-37 is a considerable departure from the earlier P-36, of which 210 have been ordered by the Army.

Most notable change is the use of a liquid-cooled engine rather than an air-cooled power plant. Army officials describe the older engine as "a big job which is like pushing a barn door through the atmosphere" and point to the superior streamlining and maneuverability which can be attained by use of the liquid-cooled type of motor.

To incorporate recent improvements, however, it has been necessary to turn out the new fleet with little regard for the possibility of mass production. Standardization and mass production are being carefully studied as part of the Administration's re-examination of defense needs.

President Roosevelt, who has frequently hinted that an increase in the Nation's air power may be necessary, will drive to Bolling Field and the Naval Air Station today to inspect first-line Army and Navy planes.

Oct '38

Russian Plane Plants Praised By Van Dusen

America is at least five years ahead of any other nation in the development of air maneuvers in conjunction with fleet exercises, C. A. Van Dusen, vice president of Consolidated Aircraft Corp., said yesterday.

Recently returned from Europe, Van Dusen said he was greatly impressed by the size of military aircraft production programs. He visited England, France, Russia, Germany and several smaller nations.

BUILD CONSAIR MODELS

"While I didn't get to see all of the plants in Russia, due to government restrictions and to lack of time," he said, "I saw a very efficient plant in Moscow and also the plant at Taganrog, where work is starting on the Consolidated Model 28 flying boat.

"A large force at the Moscow plant is turning out an efficient-looking twin-engine bombardment plane, which, from my observations, is considerably more difficult to build than many other designs I am familiar with. They have good production methods and a very large production, and the planes are comparable in size to the United States army YB-10 bombers."

FACTORIES HUGE

The Moscow plant, Van Dusen said, is three times as large as Consolidated's plant here, and the Taganrog plant is twice as large. He reported that he was shown every consideration by the Russian officials. The new subway in Moscow, he said, is better than any he has seen, and while the people lack some of the conveniences and luxuries found here, they "seem to be well fed, comfortably clothed and reasonably well housed."

In Germany, Van Dusen was escorted officially to various aircraft factories, and attended a luncheon at the German air force club with Gen. Ernst Udet, World war ace.

Navy's New Bomber Flies Here From West Coast in 13 Hours

WASHINGTON D.C. Oct. 28-38.

The Navy's new $1,000,000 experimental long-range bomber landed at the Naval Air Station, in Anacostia, at 2:05 a.m. today, completing a non-stop flight from San Diego, Calif., in an elapsed time of 13 hours and 55 minutes.

Carrying a crew of seven, the huge craft actually made the approximately 2,300-mile flight in about 13 hours. The ship arrived here about 1 a.m., but, because of a number of unlighted buoys in the Anacostia River, the commander circled the area for about three-quarters of an hour to make sure of his bearings, naval officials said.

Meanwhile, a 6-mile-a-minute war plane was viewed as the Army's immediate answer to European rivalry for speed supremacy in the air following a 360-mile flight in 61 minutes from Dayton, Ohio, to Buffalo, N. Y., yesterday by Lt. Benjamin S. Kelsey. This flight lifted the wraps from a pursuit ship about which the Air Corps previously had little to say.

The Navy's huge airboat had slipped off secretly at San Diego at 12:10 p.m. (Eastern standard time) yesterday. At the controls of the 25-ton craft was Lt. Comdr. Andrew Crinkley, pioneer naval aviator, who has been conducting final acceptance tests since the ship was turned over to the Navy Trial Board by Consolidated Aircraft Corp.

With a crew of 15, the craft is said to be capable of flying 4,000 miles without refueling. It was the first big flying boat to make a transcontinental flight without landing gear equipment.

The ship is equipped with four 14-cylinder Pratt-Whitney motors, each of which has a Navy Department rating of 900 horsepower. Its wing span is 115 feet and it measures 23 feet 3 inches in height.

Naval officials would not disclose any details of the craft's armament, speed or altitude.

The Army's new pursuit plane, the Curtis P-37, already had passed the experimental stage before yesterday's 360-mile flight. An initial squadron of 13 ordered last December soon will be delivered, officials said.

Without halting to gloat over the P-37, the Army intends to announce in a few days another and presumably even faster plane. Designated the P-40, it is an experimental job, and most details will not be disclosed for the present.

Both Germany and Great Britain have combat planes for which they have boasted even greater speed than that attained by the P-37. But the Air Corps has a ready answer.

Lt. Kelsey's flight and earlier trials, which were kept secret, were made with full military equipment. Germany claimed some 380 miles an hour for its Messerschmitt, but reports here are that it was stripped for racing. Although Britain's Spitfire exceeded 400 miles an hour, it was aided by a 75-mile tailwind, American officials contended.

Officials took particular satisfaction in the performance of the American plane because high-powered bombers, both here and abroad, have been threatening to outspeed pursuit ships, whose primary function is to intercept the bombers.

After months of testing a single experimental model, the Army gave a $531,305 order to the Curtiss plant at Buffalo for the first P-37 squadron.

In order to incorporate improvements, it has been necessary to turn out the new fleet with little regard for the possibility of mass production. That possibility is involved in the administration's restudy of defense needs.

The new pursuit plane is an all-metal, low-winged monoplane, with single engine and single seat. It is similar to the Curtiss P-36 pursuit, 210 of which are being delivered to the Army. Officials credit the new plane with a high rate of climb and great maneuverability.

The Army also has ordered a squadron of fighting planes of another type, the Bell "Airacuda," which has two motors, propellers in the rear, six guns, including two aircraft cannon, and a crew of five.

Its speed has not been announced, but the War Department said it was believed sufficient to overhaul and vanquish any modern bomber now in production.

Consolidated Could Carry 100

Aviation 2/1938

FURTHER FIGURES on the new Consolidated commercial trans-oceanic flying boat (announced exclusively in the January issue of AVIATION) show that this craft can be supplied with interior arrangements to accommodate 100 passengers and baggage on eastbound trans-Atlantic flights, and 75 passengers and baggage on westbound flights. These payload increases entail a corresponding decrease in the ship's super-luxury recreational facilities, as illustrated in our January issue, but no change in stateroom size or luxury, and the same performance is maintained.

- **That "routine transfer of equipment"** label the Navy puts on its mass flights from San Diego to Honolulu (or to the Canal Zone) used to sound a little phony to us, for after all they have been astounding aeronautical feats. In the European League they would have won their crews whole chests full of medals. But last month the Navy casually sent another eighteen patrol bombers across to Hawaii; and announced it would send a dozen more in July or August; enough more in November to make the year's total 42. We give up. That's not a routine. That's a habit.

- **What a fleet of patrol bombers** the Navy is going to have pretty soon! Month ago a $4,500,000 contract for 33 more twin-engined Consolidateds brought the number of that type on-hand or on-order up to 255. Now comes a $5,299,538 contract to Glenn L. Martin for 21 patrol bombers of a new twin-engined gull-winged design that is expected to beat everything in its class.

IN THE VAN OF PROGRESS

In any history of Air Progress, tribute must be paid to these aircraft manufacturers. Their leadership in engineering design, their wisdom in the choice of materials, and their skill in construction have set new standards of speed, safety, and efficiency.

It is significant that every one of these firms uses PLEXIGLAS*—often exclusively—wherever sections of colorless transparency, light weight, and resistance to weathering are required. And, in every instance, PLEXIGLAS has met their exacting specifications.

The Röhm & Haas Company of Philadelphia, manufacturers of PLEXIGLAS, is proud of its association with these firms and proud of the part this acrylic resin has played in the advance of aviation.

CUB TRAINER
A popular model at all thirteen colleges giving civilian flying training under the CAA program

"*Hats Off*" to CAA, Instructors and Students on the Success of the Civilian Air Training Program!

Free Flying Course

The authorized Cub Dealer from whom you buy your new Piper Cub will arrange for you to receive a course of dual flight instruction in your own new plane by a government licensed instructor. Ask your Cub dealer about this free flying course and for a free flight demonstration. There are Cub representatives at all leading airports.

Free Catalog

Send today for Cub catalog, details of the free flying course and name of your Cub Dealer. Piper Aircraft Corporation, 89 A Street, Lock Haven, Pa., U. S. A. . . . Cub Aircraft Co., Ltd., Copenhagen, Denmark.

Visit Us at the New York and San Francisco Fairs and at the Cub Factory

The progress of the civilian air program made in the thirteen colleges selected for test purposes is indeed noteworthy. The figures published in the current issues of the aviation magazines are most encouraging. And we are more than happy that the Piper Aircraft Corporation, in building the Cub Trainers which comprise more than 70% of all the planes used at these colleges, has had the privilege of contributing to the success of this commendable program to date.

GET YOUR OWN CUB

and enjoy the superior advantages of this easiest-to-fly and easiest-to-buy airplane. In a Piper Cub you get the leader in economy, safety and value. The fact that nearly 1,000 Cubs have been purchased so far this year—*more than all the other makes of civilian planes combined*—should be a definite guide for you when you buy *your* new airplane.

ONLY $366 DOWN

gives you a new $1098 Piper Cub 40 h.p. Trainer on the easy pay-as-you-fly plan. Other models include 50 h.p. Trainers from $1298, 50 h.p. Sports from $1348, 60 and 65 h.p. Coupes from $1910, and Seaplanes from $1793. All prices F.A.F. Lock Haven, Pa., and subject to increase without notice. Fly the economical, safe way—the Cub way!

COUNT THE CUBS THE WORLD'S FASTEST SELLING AIRPLANE

Published monthly, price 35c a copy. Subscription rates—United States, Canada, Mexico and Central American Countries, $2.00 a year. All other countries, $5.00 a year or 20 shillings. THE WASHINGTON POST: SA

6-Mile-a-Minute Flight by New Army Plane Hailed as Answer to Foreign Air Challenge

Lieut. Benjamin S. Kelsey (inset) flew a P-37-type plane shown here from Dayton, Ohio, to Buffalo—360 miles in 61 minutes—for an unofficial Army plane speed record

Navy's 'Fortress' Here Makes Dash From Coast President Will See It

America's answer to the challenge for air supremacy was revealed yesterday when the Army disclosed details of the flight of a pursuit plane which traveled 360 miles in 61 minutes.

Military authorities were particularly gratified by the fact that the 6-mile-a-minute flight, which took place Wednesday, was made in a pursuit plane carrying full military equipment, because bombers recently have been developing speeds outstripping the small fighting craft intended to intercept bombardment planes.

Foreign speed claims also will be answered by the new fighter. The German Messerchmitt is believed to have traveled at 380 miles per hour, but reports received here state that it was stripped for racing. Britain's Spitfire exceeded 400 miles per hour, but was aided by a 75-mile-an-hour tail wind, officials declared.

As the Army was checking on the new record, the Navy's $1,000,000 Flying Dreadnaught arrived at Anacostia Naval Air Station yesterday after a 13-hour and 55 minute dash from San Diego, Calif.

Neither flight was made as a stunt, officials stressing the fact they were routine performances.

Lieut. Benjamin Kelsey made his 360-mile trip from Dayton, Ohio, to Buffalo, N. Y., to inspect another new Army plane while the Navy flying boat, commanded by Lieut. Comdr. Andrew Crinkley, came here on one day's notice for inspection by President Roosevelt.

The plane flown by Lieut. Kelsey already has passed the experimental stage and a squadron of 13 of them have been ordered for the Air Corps, officials said.

Although pleased by the success of the plane, known as the P-37, the Army intends to announce completion in a few days of another and even faster model, designated the P-40. An experimental craft, details of its design will not be made public for some time.

An all-metal, single-seater monoplane powered by a liquid-cooled Allison motor, the P-37 is a considerable departure from the earlier P-36, of which 210 have been ordered by the Army.

Most notable change is the use of a liquid-cooled engine rather than an air-cooled power plant. Army officials describe the older engine as "a big job which is like pushing a barn door through the atmosphere" and point to the superior streamlining and maneuverability which can be attained by use of the liquid-cooled type of motor.

To incorporate recent improvements, however, it has been necessary to turn out the new fleet with little regard for the possibility of mass production. Standardization and mass production are being carefully studied as part of the Administration's re-examination of defense needs.

President Roosevelt, who has frequently hinted that an increase in the Nation's air power may be necessary, will drive to Bolling Field and the Naval Air Station today to inspect first-line Army and Navy planes.

Oct '38

Russian Plane Plants Praised By Van Dusen

America is at least five years ahead of any other nation in the development of air maneuvers in conjunction with fleet exercises, C. A. Van Dusen, vice president of Consolidated Aircraft Corp., said yesterday.

Recently returned from Europe, Van Dusen said he was greatly impressed by the size of military aircraft production programs. He visited England, France, Russia, Germany and several smaller nations.

BUILD CONSAIR MODELS

"While I didn't get to see all of the plants in Russia, due to government restrictions and to lack of time," he said, "I saw a very efficient plant in Moscow and also the plant at Taganrog, where work is starting on the Consolidated Model 28 flying boat.

"A large force at the Moscow plant is turning out an efficient-looking twin-engine bombardment plane, which, from my observations, is considerably more difficult to build than many other designs I am familiar with. They have good production methods and a very large production, and the planes are comparable in size to the United States army YB-10 bombers."

FACTORIES HUGE

The Moscow plant, Van Dusen said, is three times as large as Consolidated's plant here, and the Taganrog plant is twice as large. He reported that he was shown every consideration by the Russian officials. The new subway in Moscow, he said, is better than any he has seen, and while the people lack some of the conveniences and luxuries found here, they "seem to be well fed, comfortably clothed and reasonably well housed."

In Germany, Van Dusen was escorted officially to various aircraft factories, and attended a luncheon at the German air force club with Gen. Ernst Udet, World war ace.

Navy's New Bomber Flies Here From West Coast in 13 Hours

Washington D.C. Oct. 28-38.

The Navy's new $1,000,000 experimental long-range bomber landed at the Naval Air Station, in Anacostia, at 2:05 a.m. today, completing a non-stop flight from San Diego, Calif., in an elapsed time of 13 hours and 55 minutes.

Carrying a crew of seven, the huge craft actually made the approximately 2,300-mile flight in about 13 hours. The ship arrived here about 1 a.m., but, because of a number of unlighted buoys in the Anacostia River, the commander circled the area for about three-quarters of an hour to make sure of his bearings, naval officials said.

Meanwhile, a 6-mile-a-minute war plane was viewed as the Army's immediate answer to European rivalry for speed supremacy in the air following a 360-mile flight in 61 minutes from Dayton, Ohio, to Buffalo, N. Y., yesterday by Lt. Benjamin S. Kelsey. This flight lifted the wraps from a pursuit ship about which the Air Corps previously had little to say.

The Navy's huge airboat had slipped off secretly at San Diego at 12:10 p.m. (Eastern standard time) yesterday. At the controls of the 25-ton craft was Lt. Comdr. Andrew Crinkley, pioneer naval aviator, who has been conducting final acceptance tests since the ship was turned over to the Navy Trial Board by Consolidated Aircraft Corp.

With a crew of 15, the craft is said to be capable of flying 4,000 miles without refueling. It was the first big flying boat to make a transcontinental flight without landing gear equipment.

The ship is equipped with four 14-cylinder Pratt-Whitney motors, each of which has a Navy Department rating of 900 horsepower. Its wing span is 115 feet and it measures 23 feet 3 inches in height.

Naval officials would not disclose any details of the craft's armament, speed or altitude.

The Army's new pursuit plane, the Curtis P-37, already had passed the experimental stage before yesterday's 360-mile flight. An initial squadron of 13 ordered last December soon will be delivered, officials said.

Without halting to gloat over the P-37, the Army intends to announce in a few days another and presumably even faster plane. Designated the P-40, it is an experimental job, and most details will not be disclosed for the present.

Both Germany and Great Britain have combat planes for which they have boasted even greater speed than that attained by the P-37. But the Air Corps has a ready answer.

Lt. Kelsey's flight and earlier trials, which were kept secret, were made with full military equipment. Germany claimed some 380 miles an hour for its Messerschmitt, but reports here are that it was stripped for racing. Although Britain's Spitfire exceeded 400 miles an hour, it was aided by a 75-mile tailwind, American officials contended.

Officials took particular satisfaction in the performance of the American plane because high-powered bombers, both here and abroad, have been threatening to outspeed pursuit ships, whose primary function is to intercept the bombers.

After months of testing a single experimental model, the Army gave a $531,305 order to the Curtiss plant at Buffalo for the first P-37 squadron.

In order to incorporate improvements, it has been necessary to turn out the new fleet with little regard for the possibility of mass production. That possibility is involved in the administration's restudy of defense needs.

The new pursuit plane is an all-metal, low-winged monoplane, with single engine and single seat. It is similar to the Curtiss P-36 pursuit, 210 of which are being delivered to the Army. Officials credit the new plane with a high rate of climb and great maneuverability.

The Army also has ordered a squadron of fighting planes of another type, the Bell "Airacuda," which has two motors, propellers in the rear, six guns, including two aircraft cannon, and a crew of five.

Its speed has not been announced, but the War Department said it was believed sufficient to overhaul and vanquish any modern bomber now in production.

Consolidated Could Carry 100

Aviation 2/1938

FURTHER FIGURES on the new Consolidated commercial trans-oceanic flying boat (announced exclusively in the January issue of AVIATION) show that this craft can be supplied with interior arrangements to accommodate 100 passengers and baggage on eastbound trans-Atlantic flights, and 75 passengers and baggage on westbound flights. These payload increases entail a corresponding decrease in the ship's super-luxury recreational facilities, as illustrated in our January issue, but no change in stateroom size or luxury, and the same performance is maintained.

● **That "routine transfer of equipment"** label the Navy puts on its mass flights from San Diego to Honolulu (or to the Canal Zone) used to sound a little phony to us, for after all they have been astounding aeronautical feats. In the European League they would have won their crews whole chests full of medals. But last month the Navy casually sent another eighteen patrol bombers across to Hawaii; and announced it would send a dozen more in July or August; enough more in November to make the year's total 42. We give up. That's not a routine. That's a habit.

● **What a fleet of patrol bombers** the Navy is going to have pretty soon! Month ago a $4,500,000 contract for 33 more twin-engined Consolidateds brought the number of that type on-hand or on-order up to 255. Now comes a $5,299,538 contract to Glenn L. Martin for 21 patrol bombers of a new twin-engined gull-winged design that is expected to beat everything in its class.

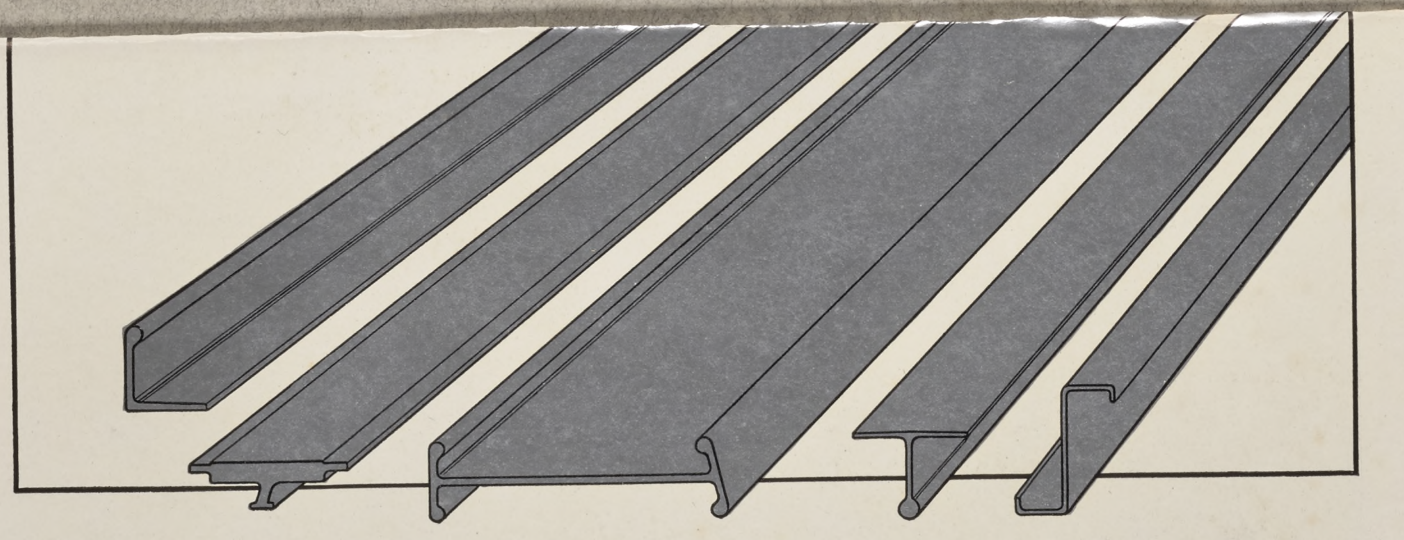
HANCOCK

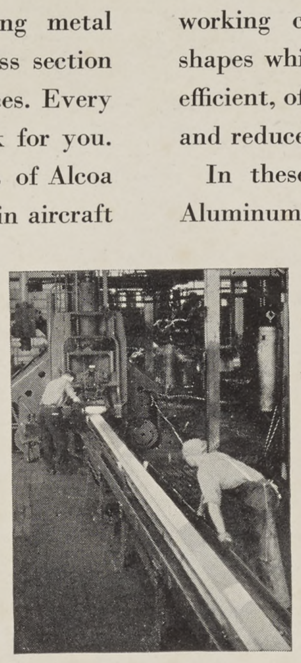


THIS IS *Aluminum* READY

TO GIVE ITS LAST OUNCE OF STRENGTH FOR YOU

These are extrusions made by forcing metal through a die, to give exactly the cross section needed. There are no unnecessary ounces. Every ounce is used so its strength can work for you.

So it is only natural that extrusions of Alcoa Aluminum Alloys are used extensively in aircraft structures. They give the most strength for the weight. They can be made to interlock, too, and thus simplify the requirements of assembly. You have seen them applied for parts ranging from wing spars to the decorative moulding inside the cabin.



Development of the technique of making extrusions of Alcoa Aluminum Alloys for aircraft has been forwarded by the experience of working closely with aircraft engineers. The shapes which are now being produced are highly efficient, often result in significant weight savings, and reduce costs.

In these respects extruded shapes of Alcoa Aluminum Alloys are characteristic of the production of Alcoa Aluminum for aircraft use. Close cooperation with aircraft builders has made it possible to provide not only the natural advantages of Aluminum, but also the "last ounces" of usefulness which come from gearing production methods to the requirements of the user. 66 San Diego Sky Cruisers Hop Today for West Indies

Amphibians, Patrol Bombers In Air Armada

San Diego skies will throb this morning with the roar of America's air might as two great flights of sky cruisers—66 ships in all—will take off, one bound for Guantanamo, Cuba, and the other for Aruba, West Indies.

The double-barreled show will start before sunrise because the Guantanamo flight, which began yesterday, was forced back by stormy weather over the mountains.

Starting at 5:30 a.m. the 18 amphibians comprising Utility Squadron VJ-1, Comdr. Allen I. Price commanding, will prepare to take the air. It was estimated they all would be aloft and headed eastward within 45 minutes after the first ship hops.

START AT 8:30 A.M.

At 8 the first of 48 mighty patrol bombers of Fleet Patrol Wing 1, Capt. Marc A. Mitscher commanding, will move down the runway and taxi to its starting position. The first of the giant airboats is expected by Capt. Mitscher to leap into the air at 8:30. In all, the departure of the 48 great sky cruisers is estimated to require two hours.

As the big ships leave the water they will rendezvous two miles high over the Coronado islands and when all have taken off the flight will start southward to Coco Solo, Canal Zone. Surface guard ships to be stationed along the route include the aircraft carrier Saratoga, cruiser Milwaukee, destroyer Cummings and the aircraft tenders Wright and Gannett.

From San Diego the utility squadron will fly the regular "ferry" route to Florida, thence to Guantanamo for use in a utility capacity with the fleet during its Caribbean exercises. Several stops on the way east are planned. The Sikorsky unit of 10 amphibians is scheduled for stops at El Paso, San Antonio, Pensacola and Miami. The Grumman unit, eight ships, is listed for stops at Tucson, El Paso, Midland, San Antonio, New Orleans, Pensacola, Tampa and Miami. On the way to Guantanamo from Miami the Grummans are to pause at Camaguey, Cuba.

REACH PENSACOLA TODAY

Tentative schedules call for arrival of the utility squadron at Pensacola tomorrow, Miami Thursday and Guantanamo Friday. The ships are expected to return here ~~in April.~~

Route of the 48 ships of Patrol Wing 1 will be along the Mexican coast to the Gulf of Fonseca, thence eastward over the Nicaraguan jungles to Chiriqui lagoon in the Caribbean and then to the eastern entrance of the Panama canal.

At Coco Solo the wing will be joined by 50 more sky cruisers from Patrol Wing 3, Capt. Frederick C. Sherman commanding, and the reinforced armada is scheduled tentatively to take off for Aruba, West Indies, Jan. 19.

The patrol bombers are expected to take part in flights from the equator to the Virgin islands during the fleet operations and after the fleet review at New York April 26 are to return to San Diego, with the exception of one squadron, VP-12, which has been assigned to Hampton Roads. This squadron is to be replaced by Squadron 16, whose officers and men are now here awaiting delivery of new planes from Consolidated aircraft.

S.D. ~~UNION~~ TRIBUNE 1/10/39

Fast Pace Set On 3087-Mile Flight

Nearing the group rendezvous area over the carrier Saratoga at the tip of Lower California, 800 miles below Pt. Loma, 48 navy patrol bombers set a fast pace on their 3087-mile flight from San Diego to the Canal Zone today.

Will Unite Over Saratoga

The planes, which took off from the bay between 8:20 and 11:12 a.m., are to assemble in a giant formation over the Saratoga at 5 p.m., naval aviation authorities reported.

Meanwhile, a second group of 18 planes, all amphibians, which departed from North Island at 6:30 a.m. for Guantanamo, Cuba, via Pensacola and Miami, Fla., was flying over Texas this afternoon. Ten of the 18 Sikorsky amphibians refueled at El Paso and began leaving at 1:30 p.m. (MST) for Abilene, The Associated Press reported. Flight Comdr. Allen I. Price said they would spend the night in Abilene, instead of continuing to San Antonio, as planned. Eight Grumman amphibians will spend tonight in Midland, Tex., said Price.

The 48 planes en route from here to Coco Solo, C. Z., flew in four groups of 12 planes each along the Lower California coast. The first squadron, VP-9, was 450 miles south of Pt. Loma at 1 p.m., four hours and 15 minutes after it left San Diego. Trailing it were squadrons VP-7, VP-12 and VP-11, in the order named, with squadron VP-11, which left here at 11:12 a.m., 120 miles in the rear.

S. D. Planes to Hop From Texas Today

S.D. UNION 1/13/39

Eighteen amphibian planes which left here Tuesday for Cuba were widely separated in Texas last night, The Associated Press reported.

Eight Grumman planes, Lt. Albert Dupuy commanding, reached Dallas after a flight from Midland, Tex. and are expected to continue eastward today.

Nine Sikorsky amphibians spent the day in Abilene, Tex., because of bad weather. The 10th Sikorsky with Lt. F. L. Ashworth and a crew of seven joined the others at Abilene after repairing motor trouble which delayed it at El Paso.

The 48 patrol bombers, which left here Tuesday after the amphibians, are at Coco Solo naval base, Panama Canal zone.

Special Consair Dividend

Consolidated Aircraft Corp, has declared a special dividend of $1 on the common stock, payable Dec. 19. On Dec. 27, 1937, a 50c declaration was made on this class. American Aviation 12/1/38

48 NAVY BOMBERS SAFE AT PANAMA; 18 OTHER SHIPS GROUNDED IN TEXAS

S.D. UNION 1/12/39

San Diego-based navy bombers yesterday safely completed the greatest mass non-stop flight in U. S. naval history—a 3000-mile trip to the Panama Canal Zone in one day.

Eighteen other navy planes en route from San Diego to Cuba were grounded in central Texas by bad weather.

THREE PLANES REFUEL

Three of the 48 planes descended en route for refueling alongside the aircraft tender Wright in the Gulf of Fonseca, off the coast of Honduras.

Officers belittled the feat, saying it was "routine and uneventful, and that the refueling simply was a "precautionary measure."

Leading the fleet in the mass formation flight, planes of VP-9 squadron began settling gracefully at Coco Solo air base at 10:07 a.m. yesterday. The squadron took off from San Diego bay at 8:47 the previous morning. Last of the 48 planes, including the three which stopped for refueling, had landed in the Canal Zone at 12:10 p.m.

Flight officers reported weather conditions were excellent, but poor radio reception made difficult direct contact between North Island and the Canal. Efforts were being made to establish a relay through the U. S. S. Milwaukee, stationed off Manzanillo, Mex. Isolated squalls and headwinds slowed speeds on the last leg of the trip. The Consolidated-built planes weathered the flight without mishap.

AVERAGE SPEED 121 M. P. H.

Average speed for the lead squadron was said to have been 121 land miles an hour. Squadrons VP-7, 12 and 11, tail-enders on the flight, maintained an estimated average speed of 140 miles an hour to close the gap between them and the leaders. The flight was commanded by Capt. Marc Mitscher, Patrol Wing 1 commander.

From Coco Solo the squadron will join the fleet for the Caribbean war games. Wing 1 will remain in the Canal Zone for two weeks for a check-up, The Associated Press reported from Cristobal. Three squadrons of Patrol Wing 3, based at Coco Solo, will take off next month for a secret destination, also to engage in fleet maneuvers.

Nineteen merchant vessels, southbound, were rushed through the Panama canal yesterday, and eight merchantmen and eight units of the U. S. Base force fleet passed through, northbound, in last-minute clearance to prepare for Saturday, when the United States fleet will pass northbound through the locks, proceeding to the Atlantic for war games.

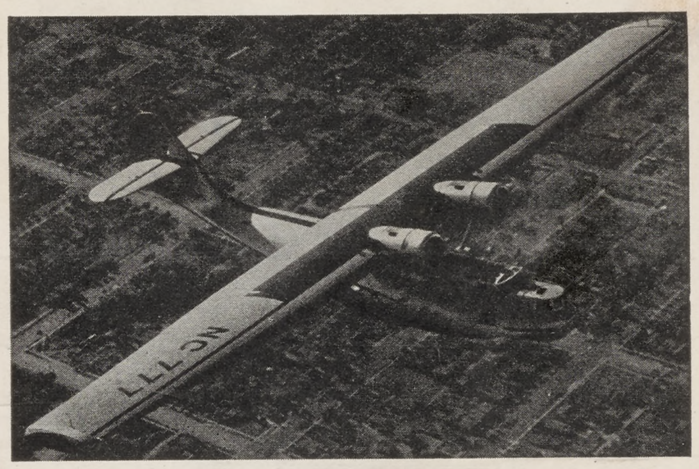
The 18 planes of VJ-1 squadron, en route from San Diego to Florida and Cuba to participate in the Caribbean maneuvers, were held in Texas by the weather, the Associated Press reported from Abilene.

Eight Grumman amphibians awaited improved take-off conditions at Midland, Tex., and nine Sikorsky planes were at Abilene. One Sikorsky was forced down at El Paso for repairs.

Flight - 3/30/39

Top left is the Consolidated model 28, generally similar to the PBY series of the American Navy.

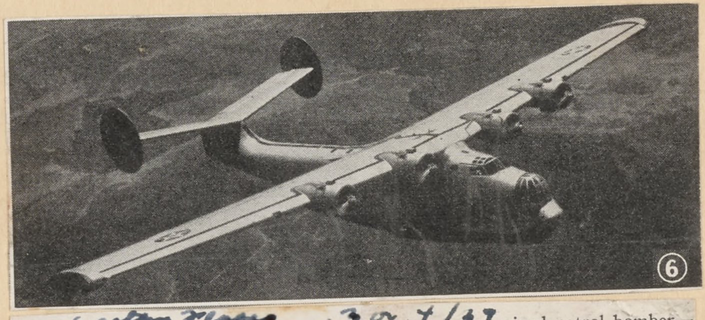
Model 28 (2 Wasps, 1800 h.p.)



Consolidated Model 28

Western Flying 3 or 4/39

TYPE: Cabin, flying boat, monoplane.
DIMENSIONS: Length overall, 67 ft. 1 in. Span, 104 ft.
WEIGHTS: Gross weight loaded, 27,000 lbs.
POWER PLANT: Two Pratt & Whitney Twin-Row Wasp engines, R1830-SCG., rated 900 h.p.
PERFORMANCE: Maximum cruising distance over 4000 miles.
CONSTRUCTION: Wings, aluminum alloy, stressed skin type construction with fabric-covered ailerons and trailing edges. Hull: All-metal aluminum alloy monocoque type. Empennage, fabric-covered elevators and rudder, stressed skin stabilizer and fin.



Western Flying 3 or 4/39

6. The XPB2Y-1, a Consolidated product, is a four-engined patrol bomber—the biggest and one of the most secret of the Navy's aerial weapons.

4/5/39 The Aeroplane

A Long-range Boat

BRITISH NEWSPAPERS have recorded that a new big twin-motor flying-boat is being built in secret by the Consolidated Aircraft Corporation at San Diego, California, U.S.A. The stories mention a maximum range of 12,000 miles and that the machine should be ready in about two months. We first heard of this boat nearly a year ago. At that time we could say nothing about it. And even now we should not care to say how much we believe in it.

Apparently it is to have two of the new 2,500 h.p. Pratt and Whitney 18-cylinder radial motors. The all-up weight is to be about 50,000 lb. (22,600 kg.). The empty weight is about 20,000 lb. (9,070 kg.). Thus the disposable load is about one-and-a-half times the empty weight of the flying-boat; an extraordinarily good figure if it works out so.

The range is said to be 5,000 miles (8,050 km.) with 8,000 lb. (3,620 kg.) of bombs; 2,500 miles (4,020 km.) with 11,000 lb. (5,000 kg.) of bombs; and 9,000 miles (14,460 km.) with no bombs.

The present World's Distance Record set up by the British Vickers Wellesleys is 7,157 miles (11,520 km.), but could easily be raised by 1,500 miles by the same machines.

The new Consolidated boat is reputed to be designed for a maximum speed of 360 m.p.h. and to cruise normally and economically at somewhere about 280 m.p.h.

The Consolidated Corporation has some scheme for an assisted take-off for this flying-boat whereby the maximum range could be increased to 12,000 miles (19,300 km.). If this really does prove to be possible the Consolidated flying-boat will be able to fly non-stop to any point in the World from any other given position in one hop.

S. D. PLANES AT CANAL ZONE

S.D. SUN 1/11/39

Largest Mass Hop In History Completed

Completing the largest mass hop in U. S. aviation history, all but three of 48 planes which took off here yesterday for the Canal Zone, landed at Coco Solo today.

First of the airboats in the lead squadron, commanded by Lieut. Comdr. B. L. Braun, landed at 10:07 a. m. (P. S. T.), after 25 hours, 43 minutes in the air. Comdr. Braun's squadron began taking off from San Diego at 8:25 a. m. yesterday.

Averaging better than 116 miles per hour, the giant ships were aided by weather, marred only occasionally by tropical rain squalls.

Half an hour after arrival of the first squadron of nine, a second squadron of 11 landed, led by Flight Comdr. Marc A. Mitscher. The other two squadrons followed, except for three planes from Squadron VP-7, which landed in the Gulf of Fonseca off Nicaragua. Otherwise the flight was without incident. The squadrons making up the flight were VP-9, VP-7, VP-12 and VP-11, flying in that order.

Throughout the night radio contact was maintained at two-hour intervals with the North Island base, although reception at times was poor because of static conditions.

The best time of a San Diego-Coco Solo non-stop flight was made by 14 Consolidated bombers Dec. 8, 1937—22 hours, 20 minutes.

Meanwhile, unfavorable weather today in Texas delayed the flight of 18 amphibian planes en route from San Diego to Guantanamo Bay, Cuba, for Fleet Problem 20.

Officials at Biggs Army Field said a "cold front" was expected to prevent the take-off of the planes that spent last night in El Paso, Midland and Abilene.

One of the 10 Sikorsky planes developed motor trouble and returned to El Paso yesterday. Lieut. F. L. Ashworth, pilot, said his plane had been repaired but would not leave until the weather was more favorable. The other nine Sikorskys spent the night in Abilene while the eight slower Grummans stayed in Midland, Tex.

From Coco Solo, the patrol bombers will fly with 40 bombers of Patrol Wing Three in reconnaissance missions over the West Indies to the Virgin Islands on the east and the equator on the south. They will operate for a short time out of Aruba, small Dutch island north of Venezuela, during the war games.

The 66 airboats and amphibians will conduct exercises on the Atlantic coast after the Fleet Problem, and will return to San Diego next summer.

SAN PEDRO SHIPS AT CANAL ZONE

BALBOA, C. Z. — Twenty-two units of the U. S. Fleet Base Force at San Pedro, Cal., reached here today to swell the number of vessels attached to the Pacific Fleet en route to the Atlantic ocean for the forthcoming annual maneuvers of America's combined sea forces.

The ships were commanded by Rear Adm. W. C. Watts, who arrived aboard his flagship, the USS Argonne.

Aero Club President

EARL PRUDDEN

S.D. TRIBUNE 1/4/38

S. D. LEADS LIST IN NATIONAL AVIATION UNIT

Earl Prudden, Ryan Aeronautical Co. vice president, will be installed president of the Aero club, San Diego chapter of the National Aeronautic association, at a meeting in Hotel San Diego next Monday night. Other officers are William Van Dusen, president of the board of air control, vice president; Douglas T. Kelly, Airtech president, second vice president; R. S. Madison, fiscal secretary of Consolidated Aircraft Corp., treasurer, and J. H. Waterbury, Consolidated Aircraft Corp. official, secretary.

The club promotes aviation activity in San Diego and disseminates aviation information. The club, composing 170 members, is the largest national aeronautic association chapter.

Friday, January 6, 1939

S.D. SUN

FIRM AWARDS SERVICE PINS

Service pins for 10 and five years' continuous employment have been awarded to 51 Consolidated Aircraft Corp. employes by Maj. Reuben H. Fleet, it was announced today

They are:

Ten years: S. C. McGuiness, Kurt Klein, Garner C. Green, H. I. Mandolf, J. L. Kelley, M. E. Taylor, W. B. Wheatley, H. V. Atkinson, Irma K. Robbins, Agnes C. Howard, A. J. Dolan, R. B. Dilling, T. P. Butterfield, R. A. Bussey, R. C. Hager, F. W. Bornemann, A. H. Sprenger, R. J. Hartmayer, C. V. Duddinski.

Five years: R. K. Whitney, Leta P. Davis, Robert Lamont, E. H. Watts, J. L. Theuws, H. E. Weihmiller, Otto C. Voss, E. P. Ehlert, David R. Kern, W. C. Bowlen, W. H. Hassler, F. A. Rosso, H. A. Fink, Charles C. Farnsworth, Leslie L. Wade, R. R. Biddle, A. Stieringer, B. M. Sheehan, H. D. Naseef, M. E. Aldrich, C. M. Szymczak, M. C. Hottleman, N. J. Hayman, K. F. Edelmaier, Leo Budzynski, E. F. Merlau, F. J. O'Connor, J. L. Weaver, Frank Cary, W. J. Gramse A. F. Rohloff, and Harry E. Walters.

---

66 S. D. NAVY PLANES WILL START LONG HOPS TO WAR GAMES MONDAY

S.D. UNION Jan. 5, 1939

Two sensational flights, one of 48 twin-motored bombers comprising Fleet Patrol Wing 1 under command of Capt. Marc A. Mitscher, from San Diego to Aruba, West Indies, via Panama, and the other of 18 amphibians from San Diego to Miami, Fla., thence to Guantanamo, are scheduled for next Monday.

The 18 Sikorsky and Grumman amphibians, comprising the utility wing and commanded by Comdr. Allen I. Price, are to attempt the first mass flight of this type ship from Pacific to Atlantic.

The flight track will be from San Diego to Phoenix, El Paso, and thence direct to Miami, where the planes will refuel before taking off for Cuba.

The flight track of the 48 bombers will be along the Mexican and Central American west coasts to the Gulf of Fonseca, over the Nicaraguan jungles to Chiriqui lagoon, thence on a southward course to Coco Solo, the naval air base at the eastern entrance to the Panama canal.

On Jan. 19, the 48 local-based bombers, augmented by 50 more from Coco Solo under command of Capt. Frederick C. Sherman, will take off from Panama for the 1100-mile flight to Aruba, near St. Thomas.

The 116 patrol and utility planes will operate out of Guantanamo and Aruba in Fleet Problem 20, making reconnaissance flights over an area extending from the equator to well north of the Lesser Antilles.

"San Diego Business" Vol. 8, No. 1, January 1939

Aircraft Industry Aircraft manufacturing continues to be the greatest industry in San Diego, and prospects for 1939 are that the present volume of business and employment by the three aircraft factories at Lindbergh Field will materially increase.

Consolidated Aircraft Corporation, as of January 1, has orders on its books in excess of $3,400,000, and on its payroll 1350 men. The 1938 payroll was approximately $4,000,000. This company now is installing four huge drop hammers, one weighing 68,400 pounds and the others from 11,000 to 22,000 pounds each. These drop hammers, together with other equipment, are being installed by Consolidated in anticipation of additional business during 1939. The Navy has accepted the first Consolidated 4-engined flying boat, and contemplates letting a contract for a quantity of this type of boat in the spring.

The Ryan Aeronautical Corporation reports a backlog of unfilled orders in excess of $375,000, with certain contracts for additional business expected early in January. During 1938 this company has sold $600,000 worth of airplanes and parts and has paid out $270,000, or 45 percent of the gross sales, in wages to local workmen. Ryan now is employing over 200 men and plans to construct additional factory space immediately. A contract has recently been let for additions to the Ryan Administration building. The Ryan company, in addition to producing two types of metal planes, is manufacturing exhaust collector rings for the Army and for Lockheed Aircraft and Douglas Aircraft.

This company recently received an order for 432 cabin seats for installation in Army transports; and has recently completed a contract for 641 seats to be installed in Navy bombers.

Solar Aircraft Company reports 146 men employed and sales during 1938 in excess of $611,000. Total wages paid in 1938 were $316,000, more than 51 percent of gross sales. The company has a considerable backlog of orders on its books, with additional orders anticipated early in 1939. Solar has an international reputation for the manufacture of exhaust manifolds and other aircraft accessories.

Consolidated, Ryan and Solar during 1938, paid a total of $4,586,000 in wages in San Diego. As practically the entire output of these three factories was sold outside of San Diego, the wages paid represent new money placed in circulation in business channels in San Diego. Aircraft factory wages amount to approximately 45 percent of the total gross sales of these plants.

SKIES CLEAR FOR 18 S. D. PLANES TO START GUANTANAMO HOP TODAY

S.D. UNION — 1/9/39

With favorable weather prevailing over the San Diego-Miami and San Diego-Coco Solo routes, naval aviation authorities yesterday announced the flight of 66 long-range bombers and utility planes, comprising Fleet Patrol Wing 1 and VJ-1 squadron, will leave today and tomorrow as scheduled.

Taking off at 6 a. m. today for Guantanamo, Cuba, 18 amphibian planes commanded by Comdr. Allen I. Price, will split into two groups.

Comdr. Price said the Sikorsky unit of 10 planes will stop at El Paso, San Antonio, Pensacola and Miami before making the overwater hop to Cuba.

The Grumman unit of eight planes will refuel at Tucson, El Paso, Midland and San Antonio, Tex., New Orleans, Pensacola, Tampa and Miami and again at Pan-American Airways base at Camaguey, Cuba, before making the last leg of the flight to Guantanamo.

Comdr. Price was notified by naval meteorological officers that the planes of VJ-1 squadron would have a ceiling of 3000 feet under broken clouds for the take-off. Between El Paso and San Antonio scattered showers are predicted but not of sufficient intensity to warrant emergency landings.

Commanded by Capt. Marc A. Mitscher, squadrons VP-7, VP-9, VP-11 and VP-12 of Fleet Patrol Wing 1, comprising 48 twin-motored long-range bombers manned by 336 officers, flying cadets and enlisted men, will begin leaving the seaplane launching ramp at Naval Air station at 8 a. m. tomorrow. They are expected to go aloft at minute intervals after a run down the two-mile take-off course which will be patrolled by navy launches. The planes are bound for the West Indies via Panama. The first leg of the flight, 2800 miles from San Diego to Coco Solo, is expected to be completed within 25 hours.

Meteorological reports from station ships—the carrier Saratoga at Cape San Lucas, cruiser Milwaukee at Manzanillo, destroyer Cummings at Salina Cruz, aircraft tender Wright at Gulf of Fonseca and the aircraft tender Gannet at Chiriqui lagoon—indicate normal flying conditions over the entire route.

"We will begin launching the first planes promptly at 8 a. m. Tuesday," Capt. Mitscher said last night.

The 3600-mile flight of the 18 bombers from San Diego to Aruba, West Indies, will be the greatest and longest mass flight in history for planes of this type.

---

18 S. D. PLANES FORCED BACK

S.D. SUN 1/9/39

Weather Too Bad; Take Off Tomorrow

Torrential rain and a thick overcast condition in the Laguna Mountain area forced 18 Navy amphibians which took off from North Island on a transcontinental flight at 7:30 a. m. today to return one hour later.

Meanwhile, Navy officials announced the planes will take off at dawn tomorrow, weather permitting.

With Guantanamo Bay, Cuba, as their ultimate goal, the combination land and sea planes will make several stops across southern United States.

STOP AT TUCSON

The slower group of Grumanns, with only a 600-mile cruising range, commanded by Lieut. A. E. Dupuy, is expected to remain at Tucson, Ariz., or El Paso tomorrow night, while the Sikorskies, commanded by Lieut.-Comdr. Henry T. Stanley, are due to land either in El Paso or San Antonio.

Both sections will attempt to reach Pensacola, Fla., Wednesday, although the Grumanns, with refuelling stops planned Wednesday at El Paso or San Antonio, may not arrive until Thursday. After a one-day stopover, the craft will fly to Miami, and then to Guantanamo Bay, operating base for the Fleet during the war games in the Caribbean and South Atlantic. The utility planes will perform patrol and convoy duty and are due to maneuver along the east coast after the Fleet Problem, with several of them scheduled to visit the New York World's Fair.

48 BOMBERS READY

Meanwhile, final preparations for the greatest non-stop mass flight in Navy history—48 patrol bombers from San Diego to the Canal Zone, were completed today, with the takeoff time set at 8 a. m. tomorrow.

Eighty-seven enlisted men and 16 officers comprise the flight crews of the utility craft, while 336 officers and men will operate the 13-ton Consolidated airboats to Coco Solo. Tomorrow's hop, which will be guarded by five surface craft along the Mexican and Central American coasts, will be led by Capt. Marc A. Mitscher, commander of Patrol Wing One.

At the Canal Zone, the bombers will be joined by three squadrons of 40 PBY planes in reconnaisance missions over the West Indies.

S.D. UNION 1/10/39

S. D. Aero Club Hears U. S. Training Plan

Details of the government's plan for a coordinated setup for aviation training were given San Diego Aero club members last night by Col. Joseph Marriott, Pacific coast supervisor of the new civil aeronautics authority.

The club installed Earl Prudden as president; William Van Dusen, first vice president; Douglas Kelley, second vice president; R. S. Madison, treasurer, and James H. Waterbury, secretary. Maj. R. H. Fleet, life member, was installing officer.

Warren Cary, governor of the California division, National Aeronautic association, gave a short talk and was named to represent the local club at the N.A.A. convention in St. Louis late this month

---

S.D. SUN 1/6/39

SAN DIEGO AERO CLUB TO INSTALL OFFICERS

Recently elected officers of the Aero Club, San Diego chapter of the National Aeronautical Association, will be installed by Col. Joseph Marriott, southern California commander of the Air Corps Reserve, at a dinner meeting in Hotel San Diego.

New executives to be installed are Earl Prudden, president; William Van Dusen, first vice-president; Douglas T. Kelley, second vice-president; R. S. Madison, treasurer and J. H. Waterbury, secretary.

Consair Planes Take Lead In Navy Performance

S.D. SUN 1/9/39

With the Navy's 48-plane mass flight due to eclipse all other aviation undertakings of this kind ever attempted in the United States, the previous achievements of the Consolidated PBY-type patrol bombers, which will make the hop, passed in review today.

In 1936, the San Diego factory began deliveries on the first of its four contracts for 209 airboats—plus spares—and the first PBY mass flight occurred Jan. 28, 1937, when 12 craft astounded the aviation world by the ease with which they conquered the Pacific, flying to Pearl Harbor in 21 hours, 43 minutes.

AERIAL BRIDGE

In quick succession during the past two years, scores of the airboats made a 2500-mile aerial bridge of the Pacific between San Diego and Hawaii, or spanned the 3000 miles to the Canal Zone. These hops included:

April 3, 1937—12 planes to Pearl Harbor, in 21 hours, 21 minutes.

June 21, 1937—12 planes to Canal Zone, in 27 hours, 58 minutes.

December 8, 1937—14 planes to Canal Zone, in 22 hours, 20 minutes—the record to Coco Solo.

Jan. 19, 1938—18 planes to Pearl Harbor, in 20 hours, 30 minutes.

Aug. 31, 1938—14 planes to Canal Zone, in 26 hours, 40 minutes.

RECORD FLIGHT

Sept. 7, 1938—17 planes to Pearl Harbor in 17 hours, 17 minutes—the record to Hawaii.

This does not include the mass flight of 36 bombers to Seattle in the summer of 1937 and 47 last June; nor the subsequent operations over the Gulf of Alaska.

A PBY airboat made a round-trip crossing of the continent last April and July, with Lieut. (jg) James M. Peters piloting the craft to Newport, R. I., via Pensacola.

ARCHBOLD TRIPS

Most notable civilian use of this type of plane included the three transcontinental flights by Richard Archbold—twice to Miami and once to New York, and Sir Hubert Wilkins' search for the missing Russian polar fliers in the Far North, where he flew 19,000 miles during the futile hunt.

Perhaps the outstanding achievement of a commercial adaptation of the PBY's was the 7500-mile flight by Richard Archbold to Dutch New Guinea last June, in the course of which he piloted seaplane from Wake Island to the Netherlands Island for the first time in history. For the past half year, the plane, known as "Guba," has been operating in the East Indies, in a two-mile high lake where the scientists' camp was established, and has made jaunts to Australia for supplies.

American Aviation 12/1/38

Consolidated Aircraft Corp.

On Sept. 30, 1938, current assets of Consolidated Aircraft Corp. exceeded current liabilities by about $3,300,000 and cash balance then was $3,100,000. Deliveries in the 10 months ended Oct. 31 totaled $10,300,000. Deliveries of planes and spare parts for the year will be about $12,000,000, approximately the same as in 1937. About 70% of the 1938 deliveries have been patrol bombers for the Navy. Backlog on Oct. 31 was $4,600,000 as compared with $6,600,000 on June 30.

NAVY AIR ARMADAS BEGIN GREATEST LONG MASS HOPS

S.D. UNION — 1/11/39

Churning up a foaming white wake one of the 48 patrol bombers speeded for a take-off in the bay yesterday morning.

1/10/39 S. D. UNION

66 San Diego Sky Cruisers Hop Today for West Indies

Amphibians, Patrol Bombers In Air Armada

San Diego skies will throb this morning with the roar of America's air might as two great flights of sky cruisers—66 ships in all—will take off, one bound for Guantanamo, Cuba, and the other for Aruba, West Indies.

The double-barreled show will start before sunrise because the Guantanamo flight, which began yesterday, was forced back by stormy weather over the mountains.

Starting at 5:30 a.m. the 18 amphibians comprising Utility Squadron VJ-1, Comdr. Allen I. Price commanding, will prepare to take the air. It was estimated they all would be aloft and headed eastward within 45 minutes after the first ship hops.

START AT 8:30 A.M.

At 8 the first of 48 mighty patrol bombers of Fleet Patrol Wing 1, Capt. Marc A. Mitscher commanding, will move down the runway and taxi to its starting position. The first of the giant airboats is expected by Capt. Mitscher to leap into the air at 8:30. In all, the departure of the 48 great sky cruisers is estimated to require two hours.

As the big ships leave the water they will rendezvous two miles high over the Coronado islands and when all have taken off the flight will start southward to Coco Solo, Canal Zone. Surface guard ships to be stationed along the route include the aircraft carrier Saratoga, cruiser Milwaukee, destroyer Cummings and the aircraft tenders Wright and Gannett.

From San Diego the utility squadron will fly the regular "ferry" route to Florida, thence to Guantanamo for use in a utility capacity with the fleet during its Caribbean exercises. Several stops on the way east are planned. The Sikorsky unit of 10 amphibians is scheduled for stops at El Paso, San Antonio, Pensacola and Miami. The Grumman unit, eight ships, is listed for stops at Tucson, El Paso, Midland, San Antonio, New Orleans, Pensacola, Tampa and Miami. On the way to Guantanamo from Miami the Grummans are to pause at Camaguey, Cuba.

REACH PENSACOLA TODAY

Tentative schedules call for arrival of the utility squadron at Pensacola tomorrow, Miami Thursday and Guantanamo Friday. The ships are expected to return here ~~in April.~~

Route of the 48 ships of Patrol Wing 1 will be along the Mexican coast to the Gulf of Fonseca, thence eastward over the Nicaraguan jungles to Chiriqui lagoon in the Caribbean and then to the eastern entrance of the Panama canal.

At Coco Solo the wing will be joined by 50 more sky cruisers from Patrol Wing 3, Capt. Frederick C. Sherman commanding, and the reinforced armada is scheduled tentatively to take off for Aruba, West Indies, Jan. 19.

The patrol bombers are expected to take part in flights from the equator to the Virgin islands during the fleet operations and after the fleet review at New York April 26 are to return to San Diego, with the exception of one squadron, VP-12, which has been assigned to Hampton Roads. This squadron is to be replaced by Squadron 16, whose officers and men are now here awaiting delivery of new planes from Consolidated aircraft.

Special Consair Dividend

Consolidated Aircraft Corp, has declared a special dividend of $1 on the common stock, payable Dec. 19. On Dec. 27, 1937, a 50c declaration was made on this class. American Aviation 12/1/38

S.D. ~~Union~~ TRIBUNE 1/10/39

Fast Pace Set On 3087-Mile Flight

Nearing the group rendezvous area over the carrier Saratoga at the tip of Lower California, 800 miles below Pt. Loma, 48 navy patrol bombers set a fast pace on their 3087-mile flight from San Diego to the Canal Zone today.

Will Unite Over Saratoga

The planes, which took off from the bay between 8:20 and 11:12 a.m., are to assemble in a giant formation over the Saratoga at 5 p.m., naval aviation authorities reported.

Meanwhile, a second group of 18 planes, all amphibians, which departed from North Island at 6:30 a.m. for Guantanamo, Cuba, via Pensacola and Miami, Fla., was flying over Texas this afternoon. Ten of the 18 Sikorsky amphibians refueled at El Paso and began leaving at 1:30 p.m. (MST) for Abilene, The Associated Press reported. Flight Comdr. Allen I. Price said they would spend the night in Abilene, instead of continuing to San Antonio, as planned. Eight Grumman amphibians will spend tonight in Midland, Tex., said Price.

The 48 planes en route from here to Coco Solo, C. Z., flew in four groups of 12 planes each along the Lower California coast. The first squadron, VP-9, was 450 miles south of Pt. Loma at 1 p.m., four hours and 15 minutes after it left San Diego. Trailing it were squadrons VP-7, VP-12 and VP-11, in the order named, with squadron VP-11, which left here at 11:12 a.m., 120 miles in the rear.

S. D. Planes to Hop From Texas Today

S.D. UNION 1/13/39

Eighteen amphibian planes which left here Tuesday for Cuba were widely separated in Texas last night, The Associated Press reported.

Eight Grumman planes, Lt. Albert Dupuy commanding, reached Dallas after a flight from Midland, Tex. and are expected to continue eastward today.

Nine Sikorsky amphibians spent the day in Abilene, Tex., because of bad weather. The 10th Sikorsky with Lt. F. L. Ashworth and a crew of seven joined the others at Abilene after repairing motor trouble which delayed it at El Paso.

The 48 patrol bombers, which left here Tuesday after the amphibians, are at Coco Solo naval base, Panama Canal zone.

48 NAVY BOMBERS SAFE AT PANAMA; 18 OTHER SHIPS GROUNDED IN TEXAS

S.D. UNION 1/12/39

San Diego-based navy bombers yesterday safely completed the greatest mass non-stop flight in U. S. naval history—a 3000-mile trip to the Panama Canal Zone in one day.

Eighteen other navy planes en route from San Diego to Cuba were grounded in central Texas by bad weather.

THREE PLANES REFUEL

Three of the 48 planes descended en route for refueling alongside the aircraft tender Wright in the Gulf of Fonseca, off the coast of Honduras.

Officers belittled the feat, saying it was routine and uneventful, and that the refueling simply was a "precautionary measure."

Leading the fleet in the mass formation flight, planes of VP-9 squadron began settling gracefully at Coco Solo air base at 10:07 a.m. yesterday. The squadron took off from San Diego bay at 8:47 the previous morning. Last of the 48 planes, including the three which stopped for refueling, had landed in the Canal Zone at 12:10 p.m.

Flight officers reported weather conditions were excellent, but poor radio reception made difficult direct contact between North Island and the Canal. Efforts were being made to establish a relay through the U. S. S. Milwaukee, stationed off Manzanillo, Mex. Isolated squalls and headwinds slowed speeds on the last leg of the trip. The Consolidated-built planes weathered the flight without mishap.

AVERAGE SPEED 121 M. P. H.

Average speed for the lead squadron was said to have been 121 land miles an hour. Squadrons VP-7, 12 and 11, tail-enders on the flight, maintained an estimated average speed of 140 miles an hour to close the gap between them and the leaders. The flight was commanded by Capt. Marc Mitscher, Patrol Wing 1 commander.

From Coco Solo the squadron will join the fleet for the Caribbean war games. Wing 1 will remain in the Canal Zone for two weeks for a check-up, The Associated Press reported from Cristobal. Three squadrons of Patrol Wing 3, based at Coco Solo, will take off next month for a secret destination, also to engage in fleet maneuvers.

Nineteen merchant vessels, southbound, were rushed through the Panama canal yesterday, and eight merchantmen and eight units of the U. S. Base force fleet passed through, northbound, in last-minute clearance to prepare for Saturday, when the United States fleet will pass northbound through the locks, proceeding to the Atlantic for war games.

The 18 planes of VJ-1 squadron, en route from San Diego to Florida and Cuba to participate in the Caribbean maneuvers, were held in Texas by the weather, the Associated Press reported from Abilene.

Eight Grumman amphibians awaited improved take-off conditions at Midland, Tex., and nine Sikorsky planes were at Abilene. One Sikorsky was forced down at El Paso for repairs.

4/5/39 The Aeroplane

A Long-range Boat

BRITISH NEWSPAPERS have recorded that a new big twin-motor flying-boat is being built in secret by the Consolidated Aircraft Corporation at San Diego, California, U.S.A. The stories mention a maximum range of 12,000 miles and that the machine should be ready in about two months. We first heard of this boat nearly a year ago. At that time we could say nothing about it. And even now we should not care to say how much we believe in it.

Apparently it is to have two of the new 2,500 h.p. Pratt and Whitney 18-cylinder radial motors. The all-up weight is to be about 50,000 lb. (22,600 kg.). The empty weight is about 20,000 lb. (9,070 kg.). Thus the disposable load is about one-and-a-half times the empty weight of the flying-boat; an extraordinarily good figure if it works out so.

The range is said to be 5,000 miles (8,050 km.) with 8,000 lb. (3,620 kg.) of bombs; 2,500 miles (4,020 km.) with 11,000 lb. (5,000 kg.) of bombs; and 9,000 miles (14,460 km.) with no bombs.

The present World's Distance Record set up by the British Vickers Wellesleys is 7,157 miles (11,520 km.), but could easily be raised by 1,500 miles by the same machines.

The new Consolidated boat is reputed to be designed for a maximum speed of 360 m.p.h. and to cruise normally and economically at somewhere about 280 m.p.h.

The Consolidated Corporation has some scheme for an assisted take-off for this flying-boat whereby the maximum range could be increased to 12,000 miles (19,300 km.). If this really does prove to be possible the Consolidated flying-boat will be able to fly non-stop to any point in the World from any other given position in one hop.

S. D. PLANES AT CANAL ZONE

S.D. SUN 1/11/39

Largest Mass Hop In History Completed

Completing the largest mass hop in U. S. aviation history, all but three of 48 planes which took off here yesterday for the Canal Zone, landed at Coco Solo today.

First of the airboats in the lead squadron, commanded by Lieut. Comdr. B. L. Braun, landed at 10:07 a. m. (P. S. T.), after 25 hours, 43 minutes in the air. Comdr. Braun's squadron began taking off from San Diego at 8:25 a. m. yesterday.

Averaging better than 116 miles per hour, the giant ships were aided by weather, marred only occasionally by tropical rain squalls.

Half an hour after arrival of the first squadron of nine, a second squadron of 11 landed, led by Flight Comdr. Marc A. Mitscher. The other two squadrons followed, except for three planes from Squadron VP-7, which landed in the Gulf of Fonseca off Nicaragua. Otherwise the flight was without incident. The squadrons making up the flight were VP-9, VP-7, VP-12 and VP-11, flying in that order.

Throughout the night radio contact was maintained at two-hour intervals with the North Island base, although reception at times was poor because of static conditions.

The best time of a San Diego-Coco Solo non-stop flight was made by 14 Consolidated bombers Dec. 8, 1937—22 hours, 20 minutes.

Meanwhile, unfavorable weather today in Texas delayed the flight of 18 amphibian planes en route from San Diego to Guantanamo Bay, Cuba, for Fleet Problem 20.

Officials at Biggs Army Field said a "cold front" was expected to prevent the take-off of the planes that spent last night in El Paso, Midland and Abilene.

One of the 10 Sikorsky planes developed motor trouble and returned to El Paso yesterday. Lieut. F. L. Ashworth, pilot, said his plane had been repaired but would not leave until the weather was more favorable. The other nine Sikorskys spent the night in Abilene while the eight slower Grummans stayed in Midland, Tex.

From Coco Solo, the patrol bombers will fly with 40 bombers of Patrol Wing Three in reconnaissance missions over the West Indies to the Virgin Islands on the east and the equator on the south. They will operate for a short time out of Aruba, small Dutch island north of Venezuela, during the war games.

The 66 airboats and amphibians will conduct exercises on the Atlantic coast after the Fleet Problem, and will return to San Diego next summer.

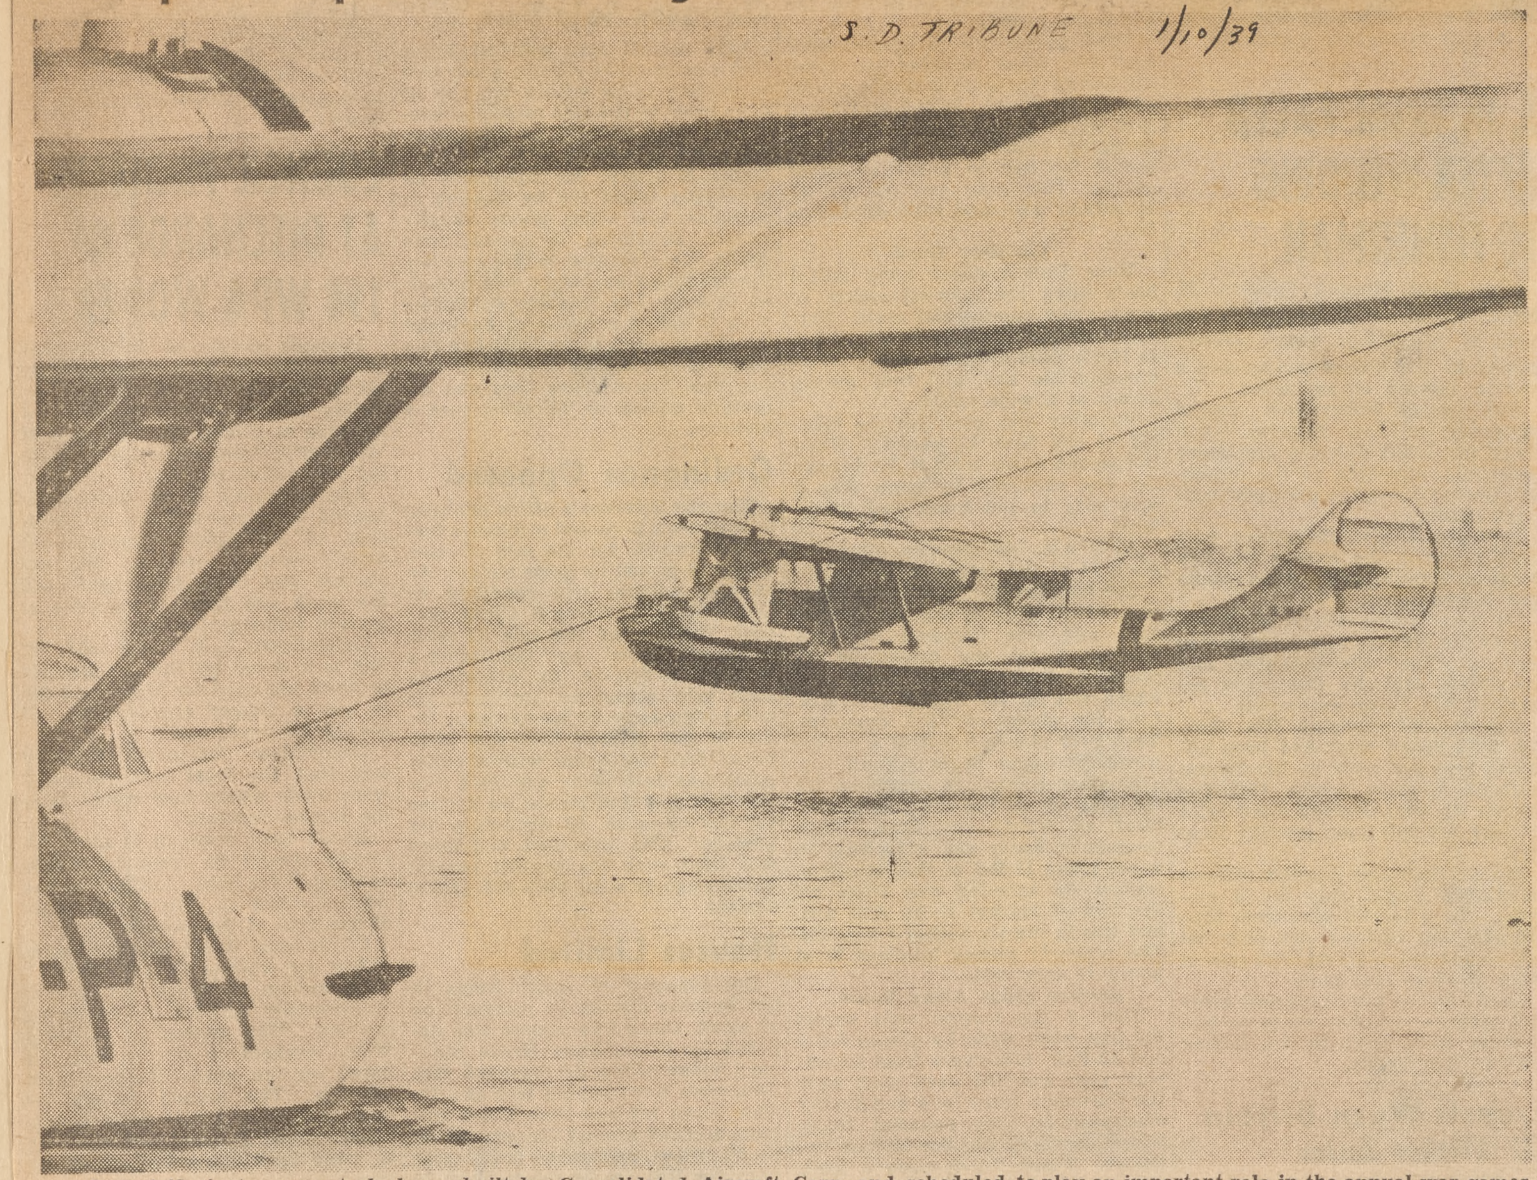
SAN PEDRO SHIPS AT CANAL ZONE

BALBOA, C. Z.—Twenty-two units of the U. S. Fleet Base Force at San Pedro, Cal., reached here today to swell the number of vessels attached to the Pacific Fleet en route to the Atlantic ocean for the forthcoming annual maneuvers of America's combined sea forces.

The ships were commanded by Rear Adm. W. C. Watts, who arrived aboard his flagship, the USS Argonne.

66 Warplanes Hop From S. D. for Gigantic Naval Maneuvers in Caribbean

S.D. TRIBUNE 1/10/39



One of 48 giant navy patrol planes, built by Consolidated Aircraft Corp. and scheduled to play an important role in the annual war games in the Caribbean next month, is shown here as it took off from San Diego bay this morning, bound for the Canal Zone. The nose of another plane, which has just entered the water from the North Island ramp, is shown at the lower left.

S.D. TRIBUNE 1/12/39

Hop Resumed By S. D. Navy Amphibians

Delayed a day in Texas by bad weather, eight navy Grumman amphibian planes took off from Midland, Tex., today headed east on a flight from San Diego to Guantanamo, Cuba, The Associated Press reported.

Nine other planes, all Sikorsky amphibians carrying 75 men headed by Comdr. A. I. Price, also en route from San Diego to Cuba, remained grounded at Abilene, Tex., because of unfavorable flight conditions between there and Shreveport, La.

A 10th Sikorsky is reported delayed at El Paso by engine trouble.

A flight of 48 navy patrol bombers built here by Consolidated Aircraft Corp., ended at the Canal Zone yesterday, 25 hours after the planes took off from San Diego bay.

TAKE-OFF DELAYED BY CALM SEAS, LACK OF WIND

In a spectacular demonstration of the navy's long-range flight strength, 66 planes roared away from here today, bound for Caribbean waters to participate in Fleet Problem 20.

First to leave were 18 Sikorsky and Grumman amphibian planes, bound for Guantanamo, Cuba, via Pensacola and Miami, Fla. In the air by 6:30 a.m., they were followed at 8:20 a.m. by the first of 48 giant patrol bombers, bound for Aruba, West Indies, via the Canal Zone.

Although hampered by a lack of wind and an almost glassy surface on the bay, the heavy bombers took to the air with a minimum of difficulty. Forty-four took to the air after take-off runs of from one-half mile to two miles each, and the remaining four were successful on their second attempt.

The last plane to leave, 11-P-1, was reported off the bay at 11:12 a.m.

Due at Goal Tomorrow

Under command of Capt. Marc A. Mitscher, the patrol bombers, comprising Patrol Wing 1, are expected to land at Coco Solo, C. Z.,

(Continued on Next Page, Col. 3)

early tomorrow, taking from 20 to 25 hours for the 3087-mile flight. There, joined by 50 more planes of the same type, they will take off for Aruba, strategically located off the northern coast of South America.

The 12 planes of VP-9 squadron were the first in the air. Moving one by one down the bay from north beach, North Island, they sped in a southeasterly direction, climbing into the air before reaching the ferry lane after runs of from one-half mile to two miles. Once aloft, they continued toward the southeast over Coronado strand to a rendezvous believed to be over the Coronado Islands.

VP-7 squadron's 12 planes were next off. They reversed the take-off procedure, taxiing slowly southeast from North Island and then, just before reaching the ferry lane, swinging around and racing back across the bay in a northwesterly course. They rose into the air off Broadway pier, and well out in the bay.

VISIBILITY GOOD

More than a dozen navy patrol boats lined the take-off course to warn away commercial craft. Star and Crescent shore boats which ply to North Island were the only craft crossing the bay, and they swung across at a wide angle.

Visibility was good for the take-off of the first 12 planes. When the second dozen tried in, Pt. Loma's tip was obscured by haze, and it was hazy to the south and southwest.

At 9 a.m., 40 minutes after the start, 14 of the bombers were aloft.

The first plane of the third squadron, VP-12, took to the air at 10:01 a.m., and was followed in rapid succession by the remaining 11 planes of the squadron, the last of which was off the bay at 10:28 a.m. Like the planes of VP-7 squadron, the VP-12 planes followed a northwesterly course in taking off.

Weather conditions improved for the take-off of the final 12 planes, those of VP-11 squadron. With roughened water and a pick-up in wind, plane 11-P-2 of this squadron started its take-off run from off the foot of Market St., at 10:45 a.m. and was in the air within 3 minutes. The other 11 planes followed it at 2-minute intervals.

Surface Ships Along Route

Two of the longest runs across the bay were made by planes 7-P-6 and 12-P-2. Observers from Broadway pier watched each start near the Coronado ferry lane and finally disappear as they rounded North Island, heading for the harbor entrance. Plane 7-P-6 made a long, unsuccessful take-off run before returning to the starting point to trail the other planes of its squadron.

From San Diego the patrol planes follow the west coast of Mexico and Central America to Nicaragua, where they fly overland to continue on to Coco Solo. Several navy vessels, including the U.S.S. Saratoga, Milwaukee, Cummings, Weight and Gannet, are stationed along the flight route.

The amphibian planes, under command of Comdr. A. I. Price, began their take-off at North Island at 6 a.m., and after swinging out over Spanish bight and circling the bay they formed groups of three and droned high over the city. Black storm clouds over Jacumba, which forced themto return yesterday within two hours after their departure, were gone today, and greatly-improved flight weather conditions were reported along the route over the southern states.

TO STOP FOR FUEL

Several stops for fuel will be made by these Florida-bound planes. Ten Sikorsky planes in the group are scheduled to pause at El Paso, San Antonio and Pensacola. The other eight, Grumman amphibians, are to make shorter hops, stopping at Tucson, El Paso, Midland, San Antonio, New Orleans, Pensacola and Tampa. After leaving Miami, they will stop at Camaguey, Cuba, before landing at Guantanamo.

S.D. SUN 1/12/39

Bombers Fold Wings At Panama After Mass Hop

Forty-eight San Diego-based Navy bombers, which wrote a new chapter in naval history with their flight from here to Coco Solo, Canal Zone, in less than 26 hours, today were being prepared for participation in the Caribbean war games.

Eighteen other planes making a flight to Cuba were grounded by inclement weather in central Texas, the United Press reported.

The bombers will remain at Coco Solo for two weeks for a complete checkup before joining the war games.

In Texas, eight Grumman amphibians awaited improved take-off conditions at Midland, and nine Sikorsky planes were at Abilene. One Sikorsky was forced down at El Paso for repairs. When weather permits, the planes will resume their journey.

Nineteen merchant vessels, southbound, passed through the Panama Canal yesterday and eight merchantment and eight units of the U. S. base force fleet went through northbound, to clear the canal for Saturday when the U. S. Fleet will move through the locks northbound, proceeding to the Atlantic.

Planes Halfway On Panama Hop

All 64 Craft Safe On 2 Long Flights

Flying in scattered formations, 48 giant patrol bombers en route non-stop to Panama in the greatest mass-distance flight yet attempted by the "long arm" of the navy, were reported 1500 miles south of here, or almost halfway to their goal at 10 last night.

After almost 12 hours of flying, officers in command of the flight reported it was "without incident" and that the planes were picking up speed under "excellent" weather conditions, according to reports received at Naval Air station radio headquarters.

* * *

Flying in six sections over widely separated routes to Cuba and the West Indies, 48 offshore patrol bombers comprising Fleet Patrol Wing 1, and 18 amphibians of squadron VJ-1 took off from Naval Air station starting at 6:30 a. m. yesterday.

ALL SAFE IN TEXAS

In two sections of 10 Sikorsky and 8 Grumman planes under command of Comdr. Allan I. Price, the amphibians took to the air a few minutes after dawn. They are 24 hours behind schedule, since they were forced to return Monday when flying conditions over the mountains became too hazardous for planes in squadron formation.

Last night the 18 amphibians were safe in three Texas cities, The Associated Press reported. Nine of the Sikorsky craft landed at Abilene about 5 p.m. to spend the night. The 10th was forced down by motor trouble and remained in El Paso. The eight Grumman planes spent the night in Midland. Originally all were to ground for the night in San Antonio, but the flight commander reported fog and low ceiling forced a change to the northern route.

GUANTANAMO DESTINATION

The destination of VJ-1 squadron is Guantanamo, Cuba. Stops are being made en route to Miami, where the squadron wil assemble for the overwater jump to Guantanamo via Camaguey, Cuba.

With almost perfect weather conditions prevailing along the 2800-mile airway from San Diego to Coco Solo, Capt. Marc Mitscher, commander of Fleet Patrol Wing 1, ordered the four squadrons—7, 9, 11 and 12—to proceed southward as rapidly as they formed into squadrons.

Lt. R. M. Gibbons of Plane 12, Squadron 9, was the first to launch his ship into the bay from the air station seaplane ramp.

TAKE-OFF DIFFICULT

With the bay as smooth as glass and unaided by even a slight breeze, the first three planes of Squadron 9 had to taxi at full throttle for nearly four miles before their two 1050-horsepower engines succeeded in getting the 15-ton craft into the air. Planes of this squadron started taking off near La Playa, skirted the north shore of the air station and barged down past the ferry fairway before hulls were free of the swirling water.

Fearful that some of the planes might blow out cylinders on the take-off, Capt. Mitscher ordered the three remaining squadrons to reverse the take-off course. This worked better. Virtually all remaining planes were aloft after runs of from 1½ to 2 miles.

Capt. Mitscher said reports from station ships along the Coco Solo airway indicated that bright skies and little wind would greet the planes from San Diego to the Gulf of Fonseca. Partly cloudy weather prevailed last night over the Nicaraguan jungle route from the Gulf of Fonseca to Chiriqui lagoon. In the Caribbean the sea was choppy, but the sky was clear.

GREATEST LONG MASS HOP

Three hours elapsed before the first and last planes of the patrol wing went aloft. The squadrons took off in the following order: Squadron 9, Squadron 7, Squadron 12 and Squadron 11. Capt. Mischer's flagplane was plane 1 of VP-11, with Lt. Comdr. R. D. Lyon, squadron commander, at the controls.

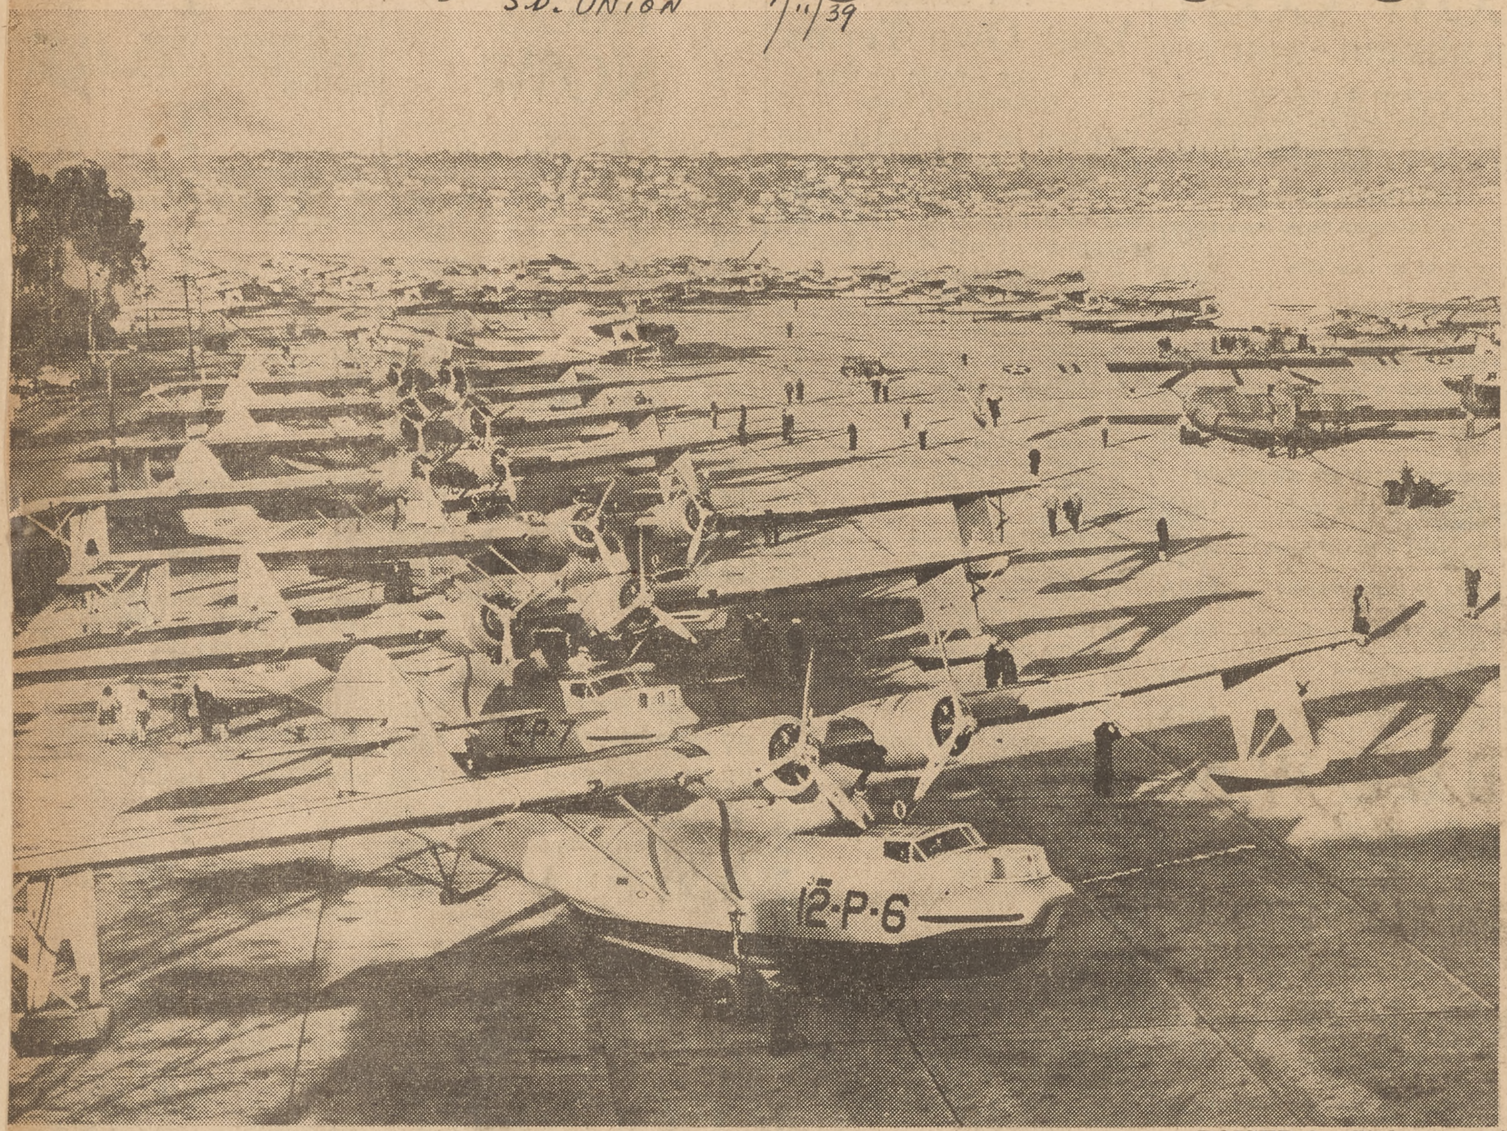
The two flights were the greatest massing of planes for long-distance flights in American naval history.

Capt. Arthur L. Bristol characterized the flights as "routine transfer of planes participating in certain phases of Fleet Problem 20." He said the planes were operating after they left San Diego, under wartime conditions.

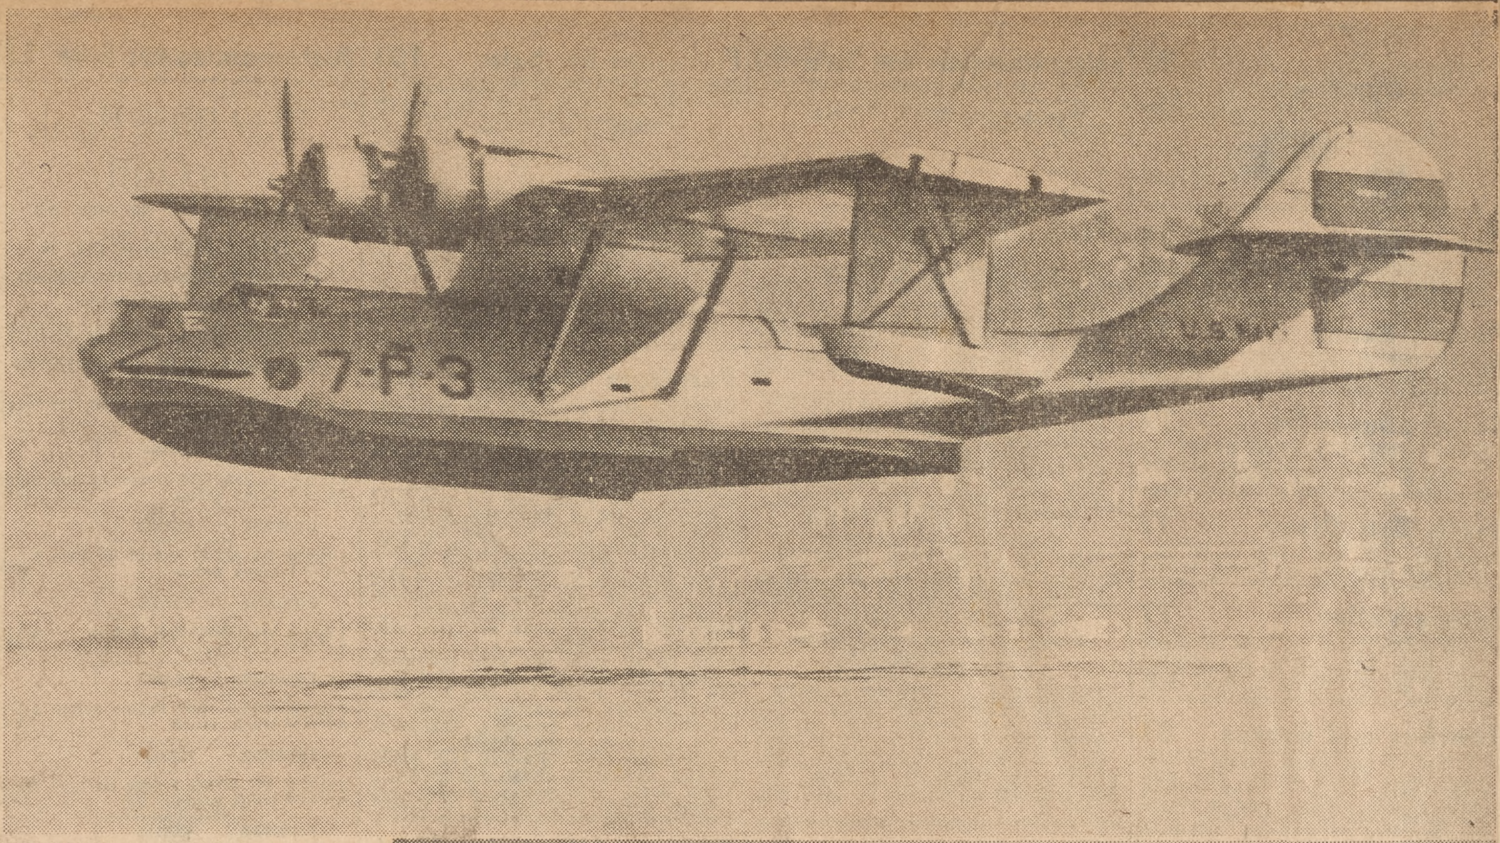
Squadron VJ-1 is due to return to North Island early in April. Fleet Patrol Wing 1 is to start on the return flight from the West Indies early in May.

Cameras Flash as S. D. Sky Armada Roars Away on Long Training Flights

S.D. UNION 1/11/39



POISED for flight, San Diego's air armada made an impressive picture yesterday a few minutes before they took off on a non-stop flight to Panama. Only a part of the 48 patrol bombers are shown.

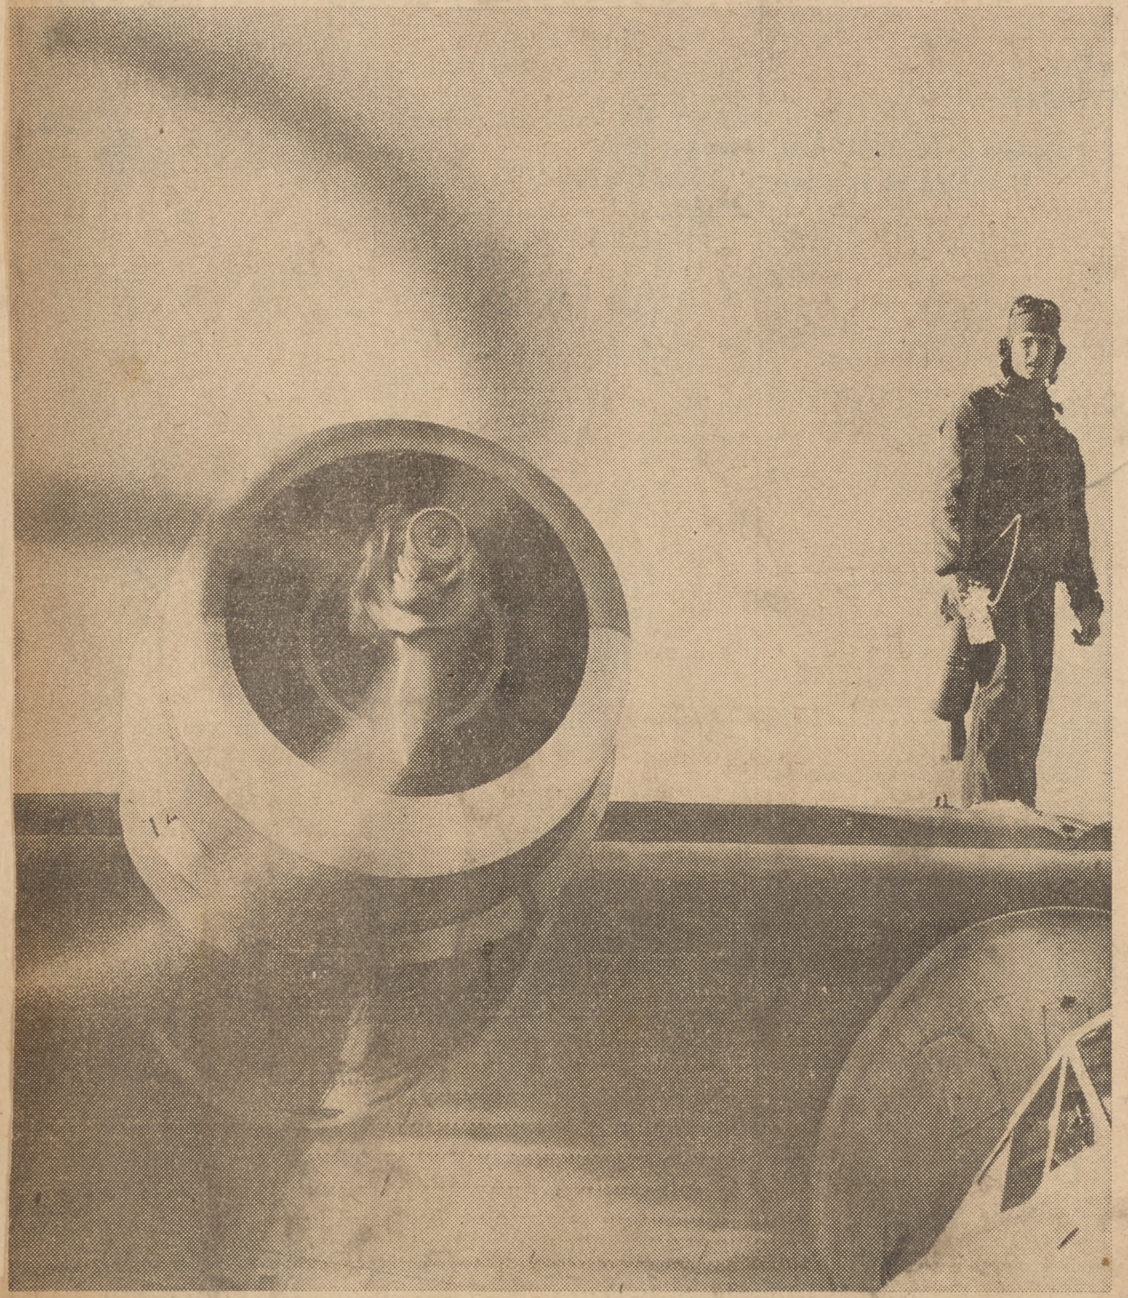


RISING gracefully from the waters of the bay, one by one, the giant bombers sailed away on the greatest mass flight in the navy's history. This photo was snapped as one of the huge planes shook the last drops of water from its pontoons.

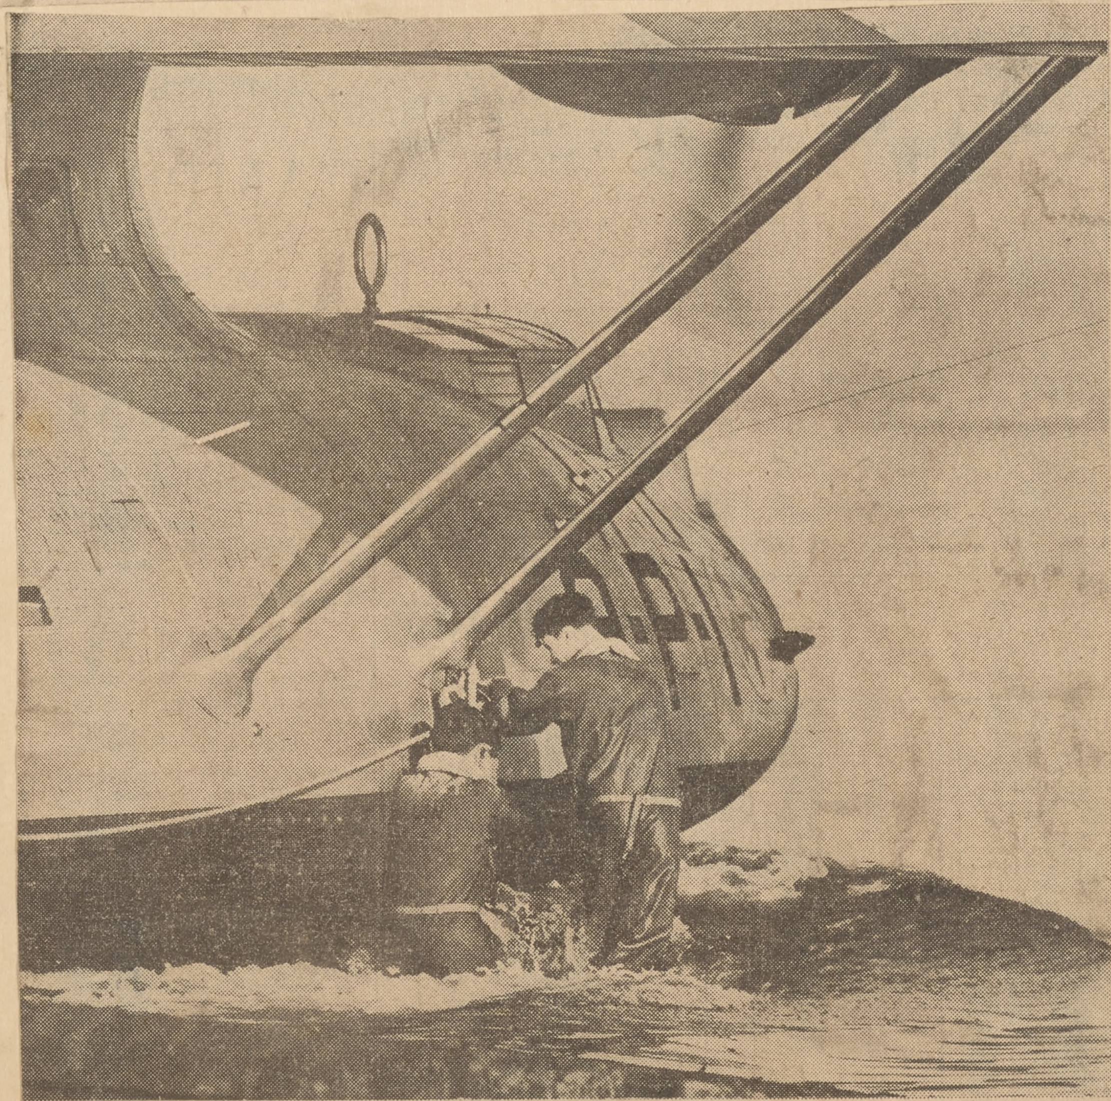
* * *

MACHINE-LIKE precision marked the take-off of the big planes. As one roared down the take-off course to take flight, another waited in the background and a third (left) was slid down the ways →

and into the water. All planes went into the air "without incident," officers reported, while thousands watched from vantage points on North Island and along the shore.



UNIQUE in photography is this telephoto lens shot by Harry T. Bishop, head of The Union photo department. Note how the propellor arms appear bent and the reflected light (white line) under the propellor hub looks like miniature lightning.



RIDING down into the water with the big planes as they were launched, sailors retrieved the wheeled carriages on which the craft rest while on land. Each set of wheels was then taken back to the hangar to await the return of the ships.

What Offers?

CONSOLIDATED PBY-4 two motor long range flying-boats and amphibians, one of the most successful of American designs, are available for export. 2/22/39

According to the London Representatives, Aviation Corporates Ltd., 50, Pall Mall, London, S.W.1, the Consolidated Aircraft Corporation, San Diego, California, have placed all the drawings, designs, jigs, tools and dies at the disposal of the British Government. Alternatively they have offered the present factory-output of these boats.

The Consolidated have shown in the service of the U.S. Navy that they have a good performance. Commercial versions are to be operated over the North Atlantic this Summer by American Export Air Lines.

At a full load of 27,080 lb., a disposable load of 13,540 lb. and 2,240 lb. of payload the PBY-4 can cruise for 4,000 miles at between 150 and 160 m.p.h. For a shorter range of 1,000 miles the payload can be increased to 10,000 lb.

The PBY-4 can be had as an amphibian with a tricycle undercarriage. The payload is reduced but still remains fair.

But we cannot see why good English money should go abroad either to human exports or foreign aeroplanes which want refuge abroad because there is no room for them at home while we have 2,000,000 unemployed and want our own money, and can make things better ourselves.

The Aeroplane

Below is another interesting American prototype, the Consolidated XPB2Y-1 with four Pratt and Whitney Twin Wasps.

66 AIRBOATS SPREAD WINGS

S. D. Aerial Armada Off To War Games

BULLETIN

Patrol Squadron 9, first to leave San Diego for the Canal Zone this morning, radioed the North Island base at 1 p. m. that it was over Magdalena Bay, 450 miles south, in clear weather. Patrol Squadron 11, last of the four groups comprising 48 planes, was 120 miles behind the leaders.

By HAROLD KEEN
Navy Editor

Sixty-six San Diego Navy planes were flying to a war-game rendezvous in the Caribbean-South Atlantic area after a spectacular takeoff here today.

With eastern skies barely lighted by the first traces of dawn, 18 amphibians, of Utility Wing One, commanded by Comdr. Allan I. Price, soared from North Island, headed across the southern airline route to Guantanamo Bay, Cuba, via Tucson, El Paso, San Antonio, Pensacola and Miami.

The 10 Sikorsky twin-engined craft and eight Grumanns are expected in Pensacola tomorrow night. After a one-day stop-over, they will continue to the Cuban operating base for the warships' Fleet Problem 20.

EIGHT STOP AT TUCSON

The eight Grumann planes landed at Tucson at 11 a. m. for refueling, while the 10 Sikorskys went directly to El Paso, and were to proceed to Abilene instead of San Antonio tonight.

Clear weather along the entire route was anticipated by the fliers, who were turned back yesterday when they ran into a severe storm over mountains in Laguna, east of here.

HISTORY-MAKING FLIGHT

In a flight which has no parallel in U. S. aviation annals, 48 Consolidated patrol bombers of squadrons VP-7, VP-9, VP-11 and VP-12, with 336 officers and men, took to the air from San Diego Harbor beginning at 8:25 a. m.

Squadron VP-9, commanded by Lieut. Comdr. B. L. Braun was the first to take off. In spite of the fact that the 13-ton bombers carried capacity gasoline loads which forced them to ride deep in the water, there were no mishaps. The planes, after being launched from long island ramps, taxied toward Point Loma, turned about and sped southeast down the harbor along the two-mile runway.

Pilots of the remaining three squadrons took off in the opposite

Turn to Page 2, Col. 6.

(See Typewritten portion)

direction to keep from being blinded by the rising sun. The wind was slight and the water almost glassy, rendering the takeoffs difficult and causing several planes to make false starts or to plow through spindrift as far as the harbor entrance channel before they could rise.

By 11:10 a.m., two hours, 45 minutes after the first bomber took to the air, the last plane, flagship of Capt. Marc. A. Mitscher, leader of the flight, left the water.

In contrast with the throng of wives and sweethearts who crowded the North Island shore on previous and much less important mass-flights, only a scattering of civilians bade farewell to the aviators.

Guarding the planes, in case they are forced down by engine trouble or require refueling, are the aircraft carrier, Saratoga, at Cape San Lucas; the light cruiser Milwaukee, at Manzanillo; the destroyer Cummings, at Salina Cruz; the aircraft tender Wright at Gulf of Fonesca, and the seaplane tender Gannet, at Chiriqui Lagoon, on the east coast of Panama.

The bombers will join 40 similar airboats stationed at the Canal Zone and will be reinforced by older-type patrol bombers from Norfolk, Va., in sweeping a vast area of the Caribbean and South Atlantic. Their duties will consist primarily of seeking the hypothetical enemy fleet steaming toward the western hemisphere with intentions of capturing a base in the West Indies or on the coast of South America from which to operate in an attack on the mainland of the United States.

Already at the Canal Zone is the flagship of the Aircraft Scouting Force, the light cruiser Memphis, aboard which is Rear Adm. Charles A. Blakely and his staff.

The reconnaissance missions will start in earnest soon after arrival of Patrol Wing 1 in Coco Solo. While the main body of the Fleet operates from Guantanamo Bay, the patrol squadrons will spread out, fan-like, to cover a zone extending as far east as the Virgin Islands and south to the equator. The southernmost base for the craft will be the small Dutch island of Aruba, 12 degrees above the equator and just off the coast of Venezuela.

Other stations taken by the bombers will be at San Juan, Puerto Rico; Haiti and St. Thomas, in the Virgin Islands.

. Contact! And May You Have Many Happy Landings!

Aviation 2/1939

FlyingFlagshipForAdmiral

The four-engined Consolidated PB2Y bomber, flying flagship for Rear Admiral Arthur B. Cook, aircraft scouting force commander, is now in active service with the Pacific Fleet and has made a number of outstanding flights, including a San Diego-Seattle flight, and a flight from Seattle to Alaska.

Aviation 10/39

Consolidateds Do It Again

Aviation 2/1939

THE LONG, BRILLIANT SERVICE RECORD of the Navy's twin-engined Consolidated patrol-bombers grew brilliantly longer last month as 48 of these big boats made their way to the current "war zone" in the Caribbean.

Led by Capt. Marc A. Mitscher, the formidable four dozen, comprising PB Squadrons 7, 9, 11 and 12 from Fleet Patrol Wing No. 1 lifted off the bay at San Diego just before noon on January 10, then headed southward in what local reporters described as a 120 mile parade. Some twenty-five hours later 45 of the planes were riding quietly at Coco Solo, Canal Zone, 2,500 non-stop miles from their take-off. A few hours after that, three planes of Squadron 7 which had stopped at the Gulf of Fonseca, presumably for refueling, rejoined their fellows.

The same day the Consolidated's left San Diego for the Canal Zone, nine Sikorsky Amphibians and eight Grummans headed eastward across our southern border to join fleet forces at Guantanamo, Cuba. All in all, there seems little wrong with the mobility of our naval air arm.

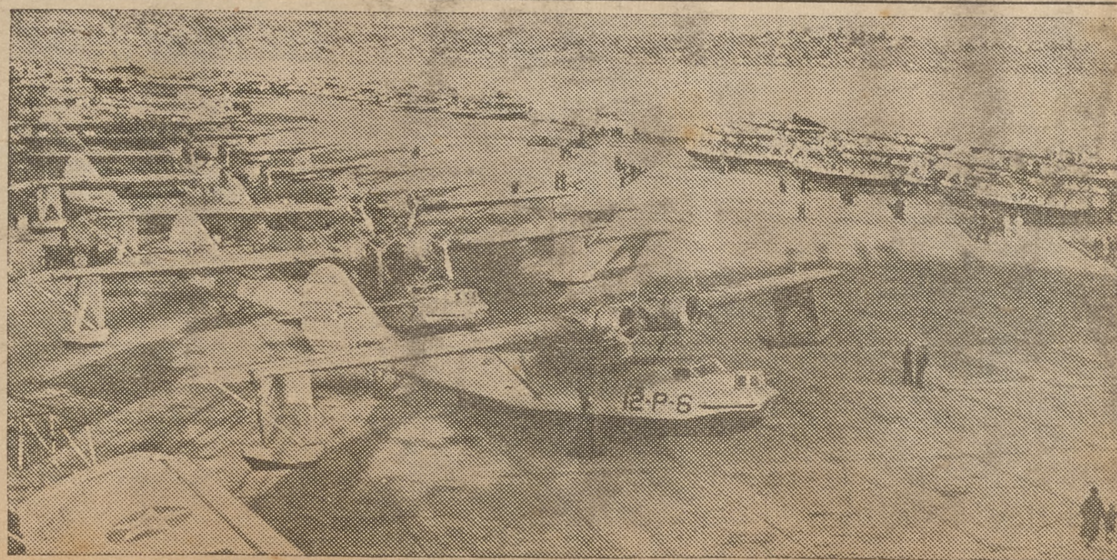
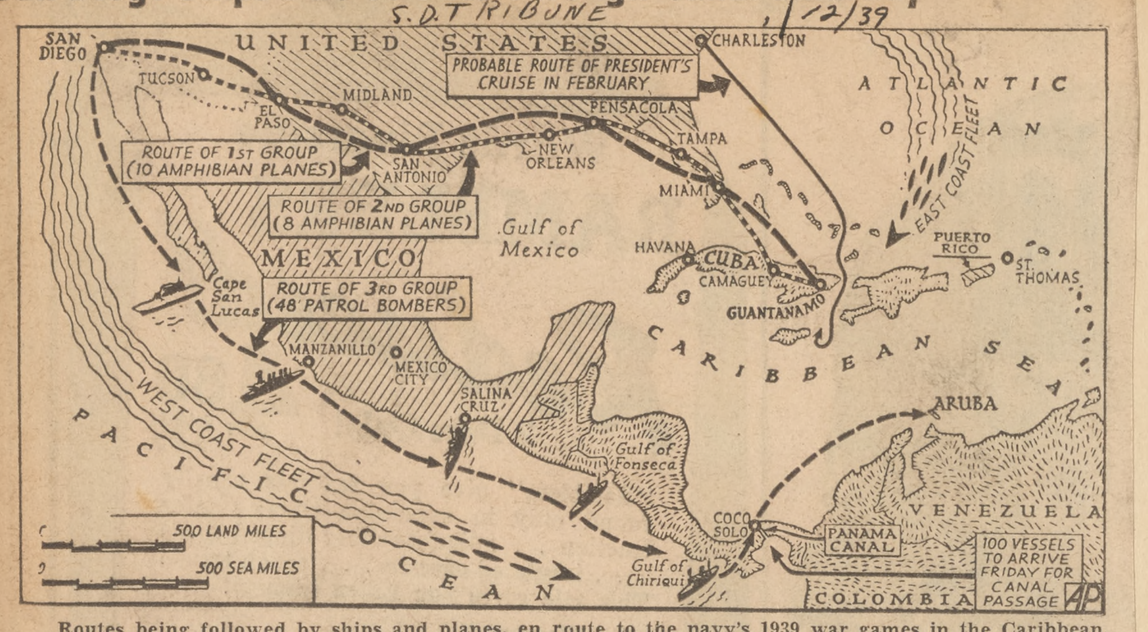
Planes Which Made Hop to Panama



This formidable assembly of Naval fighting planes is shown at San Diego, Cal., being made ready their flight to Coco Solo, C. Z. Forty-eight planes completed the flight to Panama.

San Diego Ships Due To Pass Through Canal Saturday

S.D. TRIBUNE 1/12/39



Routes being followed by ships and planes, en route to the navy's 1939 war games in the Caribbean, with the route for President Roosevelt's proposed cruise to witness part of Fleet Problem 20, are shown on the above map.

AMPHIBIANS OFF FROM TEXAS CITIES ON WAY EAST TODAY

With the main force of the United States fleet, which left San Diego last week, expected to arrive at the Canal Zone tomorrow, en route to the Caribbean sea, where Fleet Problem 20 will be held, 48 giant patrol bombers were at Coco Solo today after a flight of approximately 25 hours from San Diego. The planes landed in Canal Zone waters yesterday after an uneventful flight along the Mexican and Central American coasts.

Another group of San Diego planes, 18 amphibians, were expected to continue east from Texas points today. The planes, grounded by unfavorable weather conditions, are at Midland, Abilene and El Paso, The Associated Press reports.

President Roosevelt is reported planning a cruise from Charleston, S. C., next month to witness part of the exercises of Fleet Problem 20. He is expected to make the trip on the U.S.S. Houston, cruiser.

The last of the 48 patrol bombers settled down at Coco Solo at 12:10 p.m. yesterday. All but three made the flight nonstop, the three landing to refuel alongside the aircraft tender Wright off the Honduras coast. As the planes neared the Canal Zone, difficulties were encountered here in radio reception from the squadrons. The fleet is expected to transit the Panama canal Saturday.

BIDS TO OPEN ON AIRBOATS

Consolidated Seeks Big Contract

S.D. SUN 1/17/39

With alterations on Consolidated's four-motored million-dollar experimental patrol bomber being completed by the factory, bids on a contract to manufacture several of the 25-ton airboats will be opened in the bureau of aeronautics tomorrow, it was reported here today.

Two concerns—Consolidated and Sikorsky Aircraft Corp.—will compete for the contract to build a maximum of 15 craft. Cost per plane will be far less than the $1,000,000 required to engineer and construct the prototype.

Although the Consolidated XPB2Y-1, which was launched 13 months ago, has yet to be officially accepted by the Navy, it has gained favorable recognition in influential military circles in Washington as result of its round-trip transcontinental flight last October and November, with Lieut.-Comdr. Andrew Crinkley as pilot.

---

18 S. D. PLANES LEAVE MIAMI FOR CUBA

With Guantanamo Bay, Cuba, as their goal, 18 San Diego-based Sikorsky and Grumman amphibian planes commanded by Comdr. Allan I. Price, took off from the Miami municipal airport today, the United Press reported. The craft left here last Tuesday, making several stops on the journey across country.

Out of this Cuban base for the Fleet during the 1939 war games to start soon, the planes will operate in patrol and convoy missions until March, when they will begin tactical exercises along the east coast prior to their returning to San Diego.

Meanwhile, at the Canal Zone, 48 San Diego patrol bombers which made a record-breaking 3000-mile flight from San Diego last week, were being prepared for difficult long-range scouting missions over the West Indies to gain information on the movements of an "enemy" fleet seeking to gain a foothold in the western hemisphere.

Bids on Navy Bombers To Be Opened Friday

Bids on the navy's new 30-ton, four-motored, long-range bombers on which Consolidated Aircraft Corp,. Lindbergh field, and Sikorsky Co. have submitted proposals, will be opened today at Washington. The bureau of aeronautics is reported to be planning construction of a squadron.

Comdr. R. G. Mayer, inspector of aircraft at Consolidated, flew to Seattle yesterday to visit the Boeing plant.

NAVY OPENS BIDS TODAY ON 30 BOMBING PLANES

Bids on new 30-ton, four-motored, long range bombers, on which Consolidated Aircraft Corp. has submitted proposals, were opened today by the Navy Department in Washington.

Consolidated's experimental entry, completed here last year, recently made a successful overland flight to the east coast.

Bids also will be opened soon on three 11th Naval District projects, Comdr. J. T. Mathers (CEC), public works officer, announced. Bids will be opened Jan. 31 on a project to repair the oil pumping plant at the fuel depot.

STRANGE WORLD

Kangaroos climb trees, rats are three feet long. It is not Baron Munchausen speaking but a serious scientist, Richard Archbold, leader of the expedition of the American Museum of Natural History into the jungles of Dutch New Guinea. This little scientific item comes from a place called Hollandia, in the heart of a wilderness rarely entered by white men, a land of strange birds and animals and plants and aborigines who have developed an amazingly advanced system of agriculture.

The three-foot rat found by Mr. Archbold and his associates is a powerful animal, a mammal formidable enough to hold his own in dangerous combat. On the other hand, the kangaroos are friendly, tame creatures and they do their tree-climbing by a technique in imitation of the New Guinea natives.

The Archbold outfit has made many valuable contributions to assist scientists in knowledge of the world about us. The remarkable finds it has made, the discovery of many new species, are repayment for the hardships and discomforts encountered by these intrepid men who are impelled by the urge to know. We have enjoyed reading every word of the Archbold report; it is a confirmation of what Shakespeare said in Hamlet: "There are more things in heaven and earth, Horatio, than are dreamt of in your philosophy."

Consolidated Low Bidder

S.D. UNION 1/19/39

Consolidated Aircraft Corp. is low bidder on a squadron of giant four-motored long-range bombing planes for the navy, Maj. R. H. Fleet, company head, said last night. Bids were opened by the navy department at Washington yesterday.

"We have received word that our bid was low on all items," said Maj. Fleet. "However, the navy probably will not announce an award for a month."

Consolidated and the Sikorsky Co. competed for the building of the new sky warships.

Bid totals will have to come from the navy department, Maj. Fleet said, as the cost will depend on the number of ships ordered up to the 15 maximum.

Report Consair Low On Bomber Bids

S.D. TRIBUNE 1/19/39

Consolidated Aircraft Corp., bidding against the Sikorsky Co. on a project to construct a squadron of giant four-motored long-range bombing planes for the navy, was low bidder, according to report by Maj. R. H. Fleet, president. Bids were opened yesterday at Washington, D. C. Fleet said the navy department will announce bid totals, probably within a month, and that the cost will depend upon the number of planes ordered up to the 15 maximum.

Bombers Reach Caribbean Base

The 48 patrol bombing planes of Patrol Wing 1, which left here Jan. 10, arrived yesterday at their Caribbean base for participation in the war games, The Associated Press reported from San Juan, Puerto Rico. They flew non-stop from the Canal Zone.

Commanded by Capt. Marc Mitscher, the big Consolidated seaplanes, except three which en route stopped alongside the U.S.S. Wright, station ship, made the 2800-mile flight from here to Coco Solo, C. Z., non-stop, in 25 hours, 43 minutes.

The planes are to begin the return flight here early in May, after completing maneuvers of Fleet Problem 20.

S.D. SUN 1/19/39

San Diego Engineers Form Institute

San Diego has a new organization of engineers today. It is the American Institute of Engineers, formed at a dinner meeting in Army and Navy Y. M. C. A. last night. With 28 members in the club, its officers, elected last night, are (front, left to right) W. L. BRYANT, vice chairman; F. E. EVENSON, chairman, and C. J. NEVITT, secretary-treasurer. In back (left to right) are Directors R. P. THOMPSON, E. E. EILER, H. A. CAMPBELL and D. W. PROEBSTEL.

S. D. Bombers Fly In Navy Air Film

S.D. UNION 1/25/39

San Diego's bombing planes have "gone Hollywood" and will make their screen debut in "Wings of the Navy," Warner Bros.' impressive aviation drama which will be shown in world premiere at the New Spreckels Feb. 3.

In the film, a large group of bombers thunders into the air from the surface of San Diego bay and in one dramatic sequence, 44 of the air ships are seen as they arrived in massed flight after completing summer maneuvers in southern Alaska.

Each of the bombers is valued at $260,000, completely equipped with the navy's secret devices that make them potent instruments of war defense. "Wings of the Navy" was filmed with the cooperation of navy officials. The stars are George Brent, Olivia De Haviland, John Payne and Frank McHugh.

The premiere promises to be of unusual glamour, with a large party of screen stars and studio executives to witness the first showing.

S.D. TRIBUNE 1/25/39

S. D. Bombers Shown In 'Wings of Navy'

Sixty San Diego-made navy bombers will make their screen bow when Warner Bros,' aviation drama, "Wings of the Navy," wil be shown in world premiere at the New Spreckels theatre Feb. 3. The premier promises to be of unusual glamour, with a large party of screen stars and studio executives to witness the first showing here.

In the film, a large group of bombers thunder into the air from the surface of San Diego bay. In one dramatic sequence, 44 of the air ships are seen as they arived in massed flight after completing summer maneuvers in southern Alaska. Each of the bombers is valued at $260,000, completely equipped with the navy's secret devices that render them potent instruments of defense.

The film, made in cooperation of navy officials, stars George Brent, Olivia De Havilland, John Payne and Frank McHugh.

MAJ. FLEET OFF TO CAPITAL

Bomber Contracts To Be Discussed

S.D. SUN 1/27/39

Aviation

Frankly desirous of obtaining specific information on steps being taken by the Navy Department toward awarding a contract for production of four-motored patrol bombers, the three highest ranking Consolidated Aircraft Corp. executives left San Diego by plane for Washington this week, it was revealed today.

Maj. Reuben H. Fleet, president; C. A. Van Dusen, vice president; and I. M. Laddon, chief engineer, of the local concern are conferring with Navy aviation officials in the nation's capital. They were accompanied by David G. Fleet, son of Maj. Fleet and his assistant at the factory.

SABOTAGE DISCUSSION

Departure of the officials shortly after Harry Bridges, west coast director of the CIO, charged that sabotage existed in the plant, also raised conjectures as to whether this subject will be discussed during their Washington stay.

Consolidated bid "much lower," according to factory sources, than its only competitor, Sikorsky Aircraft Co. of East Hartford, Conn., on all items in estimates to build as many as 15 bombers based on its experimental prototype, the 25-ton XPB2Y-1, which cost more than $1,000,000 to engineer and construct.

OPTION INCLUDED

An option to build 15 more than the maximum was included in the advertisement for the bids.

Exact figures of the Consolidated and Sikorsky bids are being kept confidential for the time being by the Navy Department. It is known, however, that the larger the order, the less each plane will cost the government.

Maj. Fleet recently announced that any contract would not be forthcoming for at least one month after the opening of bids Jan. 18, and that four more months would be required to order and obtain delivery of necessary materials.

LE XVI^E SALON DE L'AERONAUTIQUE

Le Figaro - Vendredi 9 Décembre 1938

APRES UN SUCCES SANS PRECEDENT L'EXPOSITION FERMERA SES PORTES DIMANCHE SOIR

Le Salon de l'Aéronautique touchant à sa fin voit son succès s'amplifier. Une foule considérable a visité hier l'Exposition, s'intéressant vivement aux divers modèles exposés par les stands français et étrangers.

C'est le stand du ministère de l'Air, avec la maquette grandeur nature de l'hydravion transatlantique S.E. 200, qui a connu la plus grande affluence. Parmi les avions français les plus remarqués, il convient de citer l'Hanriot N.C. 510 de travail, le Potez 63, bombardier rapide, le Caudron-Renault « Cyclone », le « Centre 2.234 », avion de transport rapide d'un rayon d'action de 8.000 kilomètres.

◆

Aux côtés du grand public, les visiteurs de marque continuent à s'intéresser aux productions de l'industrie française de l'aéronautique. Après la visite de sir Kingsley Wood, ministre britannique de l'Air, de nombreuses missions étrangères ont examiné le matériel exposé au Grand Palais. On a noté les missions suivantes : Yougoslavie, Tchécoslovaquie, Lithuanie, Suède, Danemark, Turquie, Italie, Pologne, Roumanie, Belgique, Suisse, Japon, Bulgarie.

Rappelons pour terminer que l'Exposition est ouverte jusqu'à dimanche 11 décembre inclus, chaque jour de 9 heures à 19 h. 30, à un prix que les organisateurs ont tenu à maintenir très abordable (6 francs par entrée).

◆

Parmi les marques de moteur, il convient de signaler tout particulièrement la production Salmson, qui présente une gamme complète de moteurs dont la puissance varie de 40 CV à 1.000 CV.

Voici la liste des moteurs produits par cette grande marque :

Le 9 ADR 60 CV, qui équipe les avions légers ;

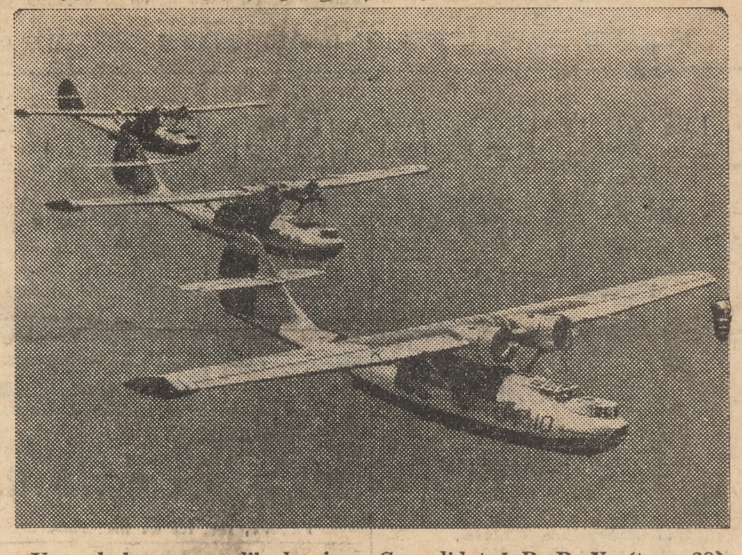
Le 5 AP-01 85 CV, nouveau-né pour le tourisme ;

Le 9 NG 175-195 CV. Ce moteur est dérivé du 9 NC 135 CV, dont les performances sur différents appareils et notamment sur le Salmson « Phrygane » sont connues de tous ;

Le 9 ABa 280-320 CV, dérivé du 9 AB 230 CV, équipe les Morane-Saulnier d'entraînement militaire;

Le 9 AG-01 390-435 CV, qui est monté sur Morane-Saulnier 405.

Tous ces moteurs sont en étoile, mais Salmson présente également deux types de moteurs en ligne, à cylindres inversés refroidis par l'air .



Un vol de groupe d'hydravions Consolidated P. B. Y. (type 28) commandés en série par la marine américaine.

L'hydravion Consolidated P. B. Y. patrouilleur et bombardier unique au monde

Les chiffres ont une éloquence dont il faut savoir tirer parti. C'est ce que font les Américains, c'est ce qu'a fait Fokker, représentant pour l'Europe de la Consolidated Aircraft Corporation, de San-Diego (Californie), qui montre au 16^e Salon de l'Aéronautique, par des chiffres, la place prise par l'hydravion Consolidated P.B.Y. (type 28).

On voit ainsi que le nombre des hydravions P. B. Y. livrés ou en cours de livraison s'élève, avec les rechanges, à 250 unités. C'est la plus importante commande d'hydravions à coque d'un seul et même type jamais passée à un constructeur et totalisant :

1.420.212.000 francs,

la plus forte somme jamais consacrée par le gouvernement des Etats-Unis à l'achat d'un type déterminé.

De belles performances

De telles références montrent l'intérêt que porte le gouvernement des Etats-Unis à cet hydravion Consolidated P. B. Y. (type 28), patrouilleur, bombardier et de transport.

Cet appareil est un monoplan semi-cantilever, entièrement métallique bimoteur, équipé soit de moteurs Wright Cyclone, soit de Pratt et Whitney « Twin Wasp ».

La marine des Etats-Unis a vu immédiatement dans cet hydravion l'appareil indispensable, pour la patrouille et le bombardement, et passa à Consolidated une forte commande sur laquelle 200 appareils ont été livrés. Chacun des hydravions s'est rendu par la voie des airs, sans escale, de San-Diego à Pearl Harbour, Coco Solo, Zone du Canal de Panama, accomplissant ainsi des distances de 4.100 à 5.000 kilomètres d'un seul vol.

Rayon d'action : 6.400 km. Autonomie de vol : 35 heures

L'hydravion Consolidated P.B.Y. est considéré actuellement comme le patrouilleur et le bombardier le plus remarquable au monde. Un tel résultat a pu être atteint après de nombreuses années de développement et de recherches. Le P. B. Y. peut être comparé aux hydravions quadrimoteurs du service transocéanique, par la charge utile qu'il peut transporter et par sa vitesse de croisière élevée. Les aménagements spéciaux dont bénéficie le P. B. Y., comme les ballonnets escamotables et les réservoirs d'essence dans l'aile, permettent enfin à cet hydravion d'emporter de très fortes charges. Son rayon d'action est de 6.400 kilomètres pour une autonomie de vol de 35 heures et, dès sa mise en service, le P. B. Y. a établi un nouveau record international de distance avec 5.540 kilomètres, cependant que quotidiennement les P. B. Y. établissent de nouveaux records.

Des vols de groupes impressionnants

Les vols de groupes fameux accomplis par les hydravions P. B. Y. sont encore présents à la mémoire. En maintes circonstances, en effet, des groupes de 12, 14, 17 ou 18 appareils comportant des équipages allant de 80 à 127 hommes, ont réalisé la liaison de San Diego- à Pearl Harbor, ou Coco Solo, soit 4.108 kilomètres et 4.967 kilomètres, sans le moindre incident. Le dernier vol des 17 hydravions P. B. Y. de San-Diego à Pearl Harbor en septembre, soit 4.108 kilomètres, s'effectua en 17 heures 17.

«La sentinelle du Pacifique»

L'hydravion P. B. Y. est considéré comme l'engin le plus redoutable de la marine américaine. Il a été baptisé « La Sentinelle du Pacifique ». L'armement défensif du P. B. Y. se compose de quatre mitrailleuses, une dans le nez du fuselage, une de chaque côté du pont, juste à l'arrière de l'aile, et une tirant en arrière, dans le fond de la coque, juste en avant de la queue. La mitrailleuse avant, montée dans une tourelle enfermée, couvre un champ comprenant l'hémisphère avant ; l'hémisphère supérieur est couvert par les deux mitrailleuses du pont, dont les champs de tir recouvrent en partie celui de la mitrailleuse avant.

L'armement offensif se compose de bombes ou de torpilles accrochées aux ailes. En cas d'équipement par des bombes ou des torpilles, la quantité d'essence transportée est réduite en proportion du poids des engins emportés. En réduisant les quantités de carburant, on peut donc transporter pour ainsi dire n'importe quelle combinaison et quel poids de bombes.

Selon la puissance des moteurs qui équipent le P. B. Y. on enregistre des vitesses qui varient entre 298 et 306 kilomètres à l'heure et 324 et 331 kilomètres à l'heure. Selon la charge d'essence et le poids des bombes transportées, le P.B.Y. peut parcourir de 4.500 à 6.000 kilomètres. Ses qualités de maniabilité et de vol sont remarquables. Les facilités du décollage — même avec un seul moteur — sont uniques au monde et permettent d'affirmer que de telles performances n'ont jamais été réalisées par aucun autre hydravion.

André Reichel.

Foreign Aviation Experts Visit Consolidated Plant—For Ideas

S.D. SUN 1/27/39

Are foreign aircraft representatives now touring the United States hoodwinking American manufacturers?

This question was raised here today when it was learned that a large number of European military aviators and civilian technical experts have been conducted through Consolidated Aircraft Corp. and other Southern California plants, with the implied intention of possible future orders resulting from their visits.

Actually, however, the outlook for foreign contracts has been little, if any, better, following their tours of the factory than before, it was pointed out at Consolidated today.

MISSIONS ON TOUR

Aviation missions from Great Britain, Netherlands, France, Australia and Sweden have visited in the past few months or are scheduled to visit Consolidated in the near future, it was revealed.

Although their tours are necessarily restricted because of confidential work being performed in certain parts of the San Diego factory, these officers and representatives of civilian flying companies are shown enough to get a fairly complete idea of production methods.

BACK WITH IDEAS

Then they go home with brief cases full of ideas to step up and modernize their own factory systems to turn out planes with American efficiency.

In certain cases, such as that of the recent British mission to the United States, an actual order was placed—for 400 planes to be built by North American and Lockheed. Now a French mission has arrived to buy 600 aircraft, an announcement in Washington said yesterday.

However, the majority of foreign tours—at least through Consolidated—have been unproductive of contracts, though highly productive of ideas to the guests from abroad.

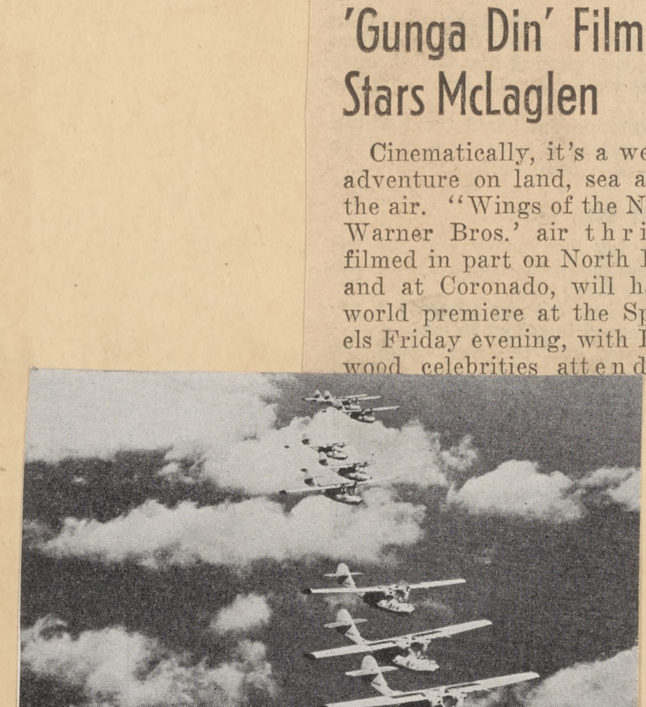
"Guba" Records

A recapitulation of the around-the-world flight of the Consolidated "Guba" flown by Richard Archbold, shows that the following records were established:

1. The first airplane to fly around the world at its greatest diameter.
2. The longest over-ocean non-stop flight by a flying boat, Dakar to St. Thomas, Virgin Islands, 3300 miles.
3. The first flying boat to fly around the world.
4. The first airplane to cross the Indian Ocean from Australia to Africa.
5. The first flying boat to fly across Africa.
6. The first flying boat to fly across Australia.

During the time Archbold operated the Guba in New Guinea, more than 500 hours were flown under extremely primitive operating and service conditions, transporting hundreds of thousands of pounds of supplies and hundreds of people to various points in the interior.

Aviation 10/39



ROUTINE TRANSFER: Forty-eight big Consolidated patrol-bombers of Fleet Patrol Wing No. 1 last month left San Diego en route for the Caribbean war games. First stop was Coco Solo in the Canal Zone, 2,500 miles from the point of take-off. (Story on page 94)

Warner Bros. will present a world premiere of their impressive new aviation drama, "Wings of the Navy," at the New Spreckels Friday. George Brent (top), John Payne and Olivia De Havilland (below) play leading roles in the film, which was produced partly at Pensacola and partly at North Island.

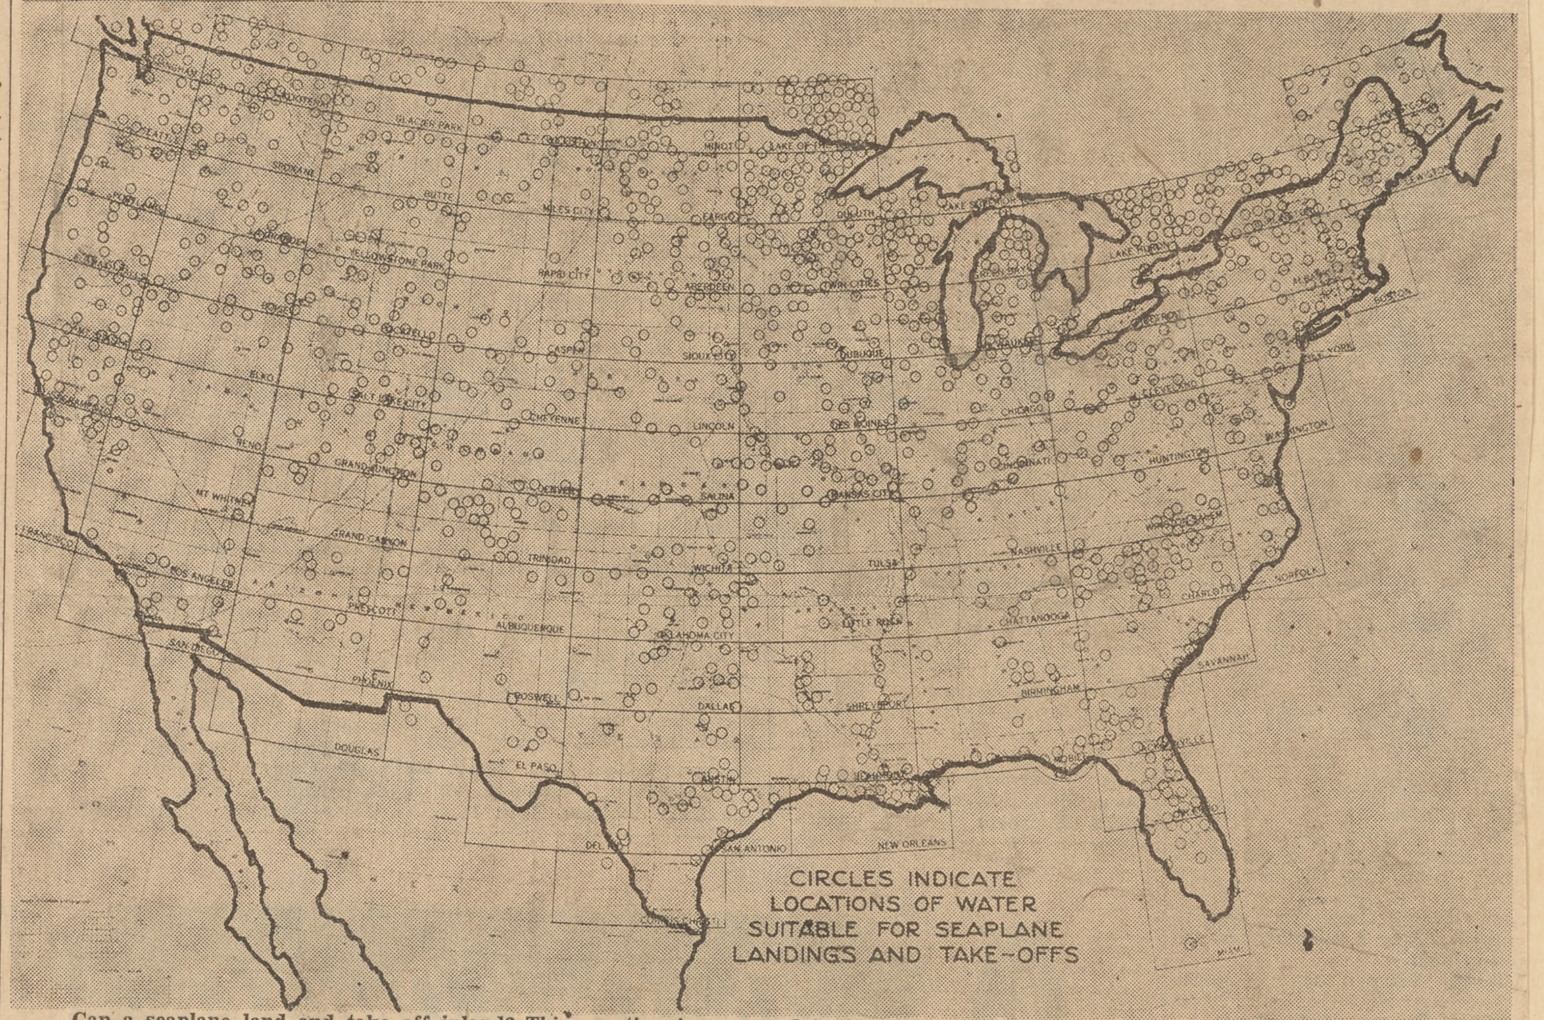
Nature Casts Smiling Eyes on Seaplanes

~~S.D. UNION~~ S.D. TRIBUNE · 1/18/39

NATION LITERALLY DOTTED WITH INLAND PORTS FOR SEAPLANE TRAFFIC

Map Blotched With Solid Black If Every Suitable Landing Area Indicated With Tiny Circle

Bottoms Designed To Take Shocks



Can a seaplane land and take off inland? This question is answered in the accompanying map, where the circles represent areas suitable for seaplane landings and takeoffs.

"Nature still prefers flying boats," writes T. M. Hemphill in the January issue of Consolidator, monthly publication of the Consolidated Aircraft Corp.

"Some time ago the author write 'Nature Prefers Flying Boats,' pointing out the fact that nature has generously dotted the country with lakes, rivers and reservoirs suitable for landing flying boats," stated Hemphill. "In the accompanying map each circle shown indicates a body of water suitable for taking off or landing a large flying boat.

"All the suitable bodies of water are not shown. In some places they are so numerous that the map would appear solid black if an attempt were made to indicate them all. Only the largest are shown in such cases.

"These are nature's seaport landing fields."

Hemphill's article, in part, contiues as follows:

If our airlines had developed around flying boats instead of land planes other problems which have arisen would not have done so. For example, our coastwise airlines fly over the ocean, at least over part of their routes. While this practice is safe enough because f the reserve of power carried, there is always the possibility, however remote, of having to land at the nearest convenient spot which would be the water's edge. Unfortunately this inviting spot is usually rough enough to make short work of any land plane.

Safer Method

It might be supposed at first that seaplanes operating over land are in similar straits. However, this is not the case. In an extreme emergency, land planes will land on their belly with the wheels retracted because, by experience, this has proven to be the safer method. Flying boats are well suited to this type of landing since their hull bottom is designed to withstand landing shocks. In fact, seaplanes are more suited to emergency landing on land than landplanes are because the part that is designed for landing (the hull bottom) takes the shock. The wings, tail, propellers and other parts which must be designed to clear the water, will also clear the ground and small protuberances in an emergency landing on land. Consequently, these parts will not catch and cause the ship to careen around into some unfavorable or destructive attitude. This is not the case with a landplane with its landing gear retracted, when the clearances become less for the emergency landing.

There have already been several instances of flying boats making forced landings on land and in no such case, to the author's knowledge, has there been a serious injury. A Consolidated Commodore operated by Pan American Airways was forced to land in a clearing in Cuba. No one was injured. The story goes that one of the passengers riding in a Commodore at a later date accosted the pilot and related his part in the event. The pilot remarked that it was quite a coincidence for, said he, "I was the pilot of that ship," "and," after a pause "This is the ship."

Not Unduly Hazardous

A navy patrol boat was recently landed on a beach in San Diego with no one injured. And even more recently, an amphibian landed at the Glendale airport with wheels up, "without a scratch." The intentional daily landings and take-offs of the Cub seaplane on the grass airport at the Cleveland Air races also bears witness to the fact that the procedure is not unduly hazardous.

The realization that flying boats overland is not hazardous cannot help but become more widespread when Uncle Sam's newest and fastest Dreadnaught of the Air, the Consolidated XPB2Y-1 is on short notice ordered to proceed across the United States from San Diego to Anacostia. The return flight, also made overland, was flown over an entirely different route showing that the naval navigators were fully aware of the numerous landing places available. Another factor of considerable importance is that the landings at the termination of both flights were made at night without any elaborate preparation such as is necessary for the usual landplane landing.

Commercial operation of land transports has meant that a great deal of money, time and effort has been spent in their development. Consequently the development of landplanes has preceded that of flying boats by a considerable margin. Only recently have flying boats begun to have the clean strutless appearance that landplanes have shown for the past eight years. Flying boats have more or less copied the developments that were demonstrated on landplanes. Although this is still being done, the gap between the developments is rapidly closing. Whether or not flying boats will attain the practical speed of landplanes is still a moot question, however, it is becoming evident that flying boats are likely to far outstrip landplanes in load carrying capacity which is equally as important as speed. The superior load carrying capacity of flying boats is due to the fact that large take-off areas which are necessary for highly loaded aircraft, are already available. We do not have to wait for the development of suitable airports before we can increase the load carryinn efficiency of flying boats.

This situation has not just occurred. The opportunity to operate flying boats commercially without a great deal of airport preparation has existed all along. The point is that this opportunity still exists. There are many points which could be served by flying boats which can never afford to support an adequate flying field. Air transportation is still in its infancy and even though it has been growing by leaps and bounds, the next ten years will probably see undreamed-of expansion.

Nature has already provided the ground facilities for expansion of flying boat airways and whoever takes advantage of them is likely to profit thereby. Nature still prefers flying boats.

LIEUT.-COMDR. MAYER . . He can boast 6000 lighter-than-air hours.

S.D.SUN ~~1/29/39~~ 1/29/39

By HAROLD KEEN

He helped the Boeing Aircraft company—in a modest way, of course—develop from the hobby of a rich lumberman's son into one of the largest airplane plants in the nation.

He supervised the engineering on the first American-built rigid airship, the Shenandoah, made every one of its flights, and survived the disaster which demolished it.

He served on the doomed Akron and Macon and at the time of the latter's loss, he had compiled 6000 flight hours in lighter-than-air craft, more than any other Navy officer.

And, today, as naval inspector at Consolidated Aircraft Corp., Lieut.-Comdr. Roland Mayer has been notified that he will be promoted to the rank of commander, one of the few non-Naval Academy alumni to reach this high grade.

A graduate of the University of Washington in mechanical and marine engineering in 1916, Comdr. Mayer went to work as a draftsman for William Boeing in the shack he had built alongside his father's lumber mill in Georgetown, a suburb of Seattle.

For six months he toiled on the design of ships in the first Boeing service contract, Navy training planes which were destined for use at Pensacola in the training of aviators later to pilot fighting and scouting craft over France.

Came this nation's entry into the World War, and he transferred to the Navy Bureau of Construction and Repair as a civilian aeronautical draftsman. Just before the Armistice, he received a temporary commission as junior grade lieutenant in the Construction Corps, gaining a permanent appointment as senior lieutenant in 1922.

When the Shenandoah was authorized in 1919, Comdr. Mayer was shifted to duty in charge of engineering at the Naval Aircraft Factory in Philadelphia, where the airship was built piecemeal.

It took four years to manufacture the Shenandoah, four years of pioneering along several fronts.

Assigned duty as its first lieutenant, he was aboard on the ship's second anniversary, when it broke in two during a line squall above Ava, Ohio.

At the time of the catastrophe, he was inspecting the craft forward. While the after end and the control car split, shooting 13 crew members to earth through the broad gaps in the structure, Lieut.-Comdr. Mayer and his mates struggled for one and one-half hours "free-ballooning" the intact bow to earth as slowly as possible by controlling the valving of helium.

CONSOLIDATED DELIVERS SHIPS

Contract For Navy Craft Now Nearly Fulfilled

S.D.SUN 1/29/39

Aviation

Consolidated Aircraft Corp. has delivered all but nine of its PBY type planes to Navy patrol squadrons in its four contracts to build 209 planes and spares, it was reported at the plant.

Because of special equipment to be placed on these airboats, they may not all be delivered until as late as May, Lieut.-Comdr. Roland Mayer, inspector of naval aircraft at the local factory, said.

Fifteen of the latest PBY-4 ships will be ferried to Pearl Harbor in a mass flight in June by Patrol Squadron One, normally based at Pearl Harbor, and now in training at North Island.

The Martin Aircraft Co. of Baltimore, Md., is manufacturing 22 large twin-engined seaplanes of the patrol bomber type.

A new squadron, VP-22, will receive some of these craft, according to present allotments.

To Fly In S. D.

S.D.SUN 1/29/39

He'll fly the bombers his dad manufactures. Having just completed his training course at Pensacola, Aviation Cadet C. A. Van Dusen, son of the vice president of Consolidated Aircraft Corp., has been assigned active duty with a San Diego-based patrol squadron.

S.D. UNION 2/1/39

Plane Makers Elect Gott

Edgar N. Gott, Consolidated Aircraft Corp. vice president, was elected one of three vice presidents of the Manufacturers Aircraft association. The Associated Press reported yesterday from New York. The association administers the cross-licensing patent agreement for the domestic plane manufacturing industry. Frank H. Russell, New York, was re-elected president; John A. Sanborn, New York, general manager; Joseph T. Hartson, Baltimore, secretary, and James P. Murray, Seattle, treasurer.

Edgar Gott

Serving with Gott as vice presidents will be E. E. Wilson, East Hartford, Conn., and John M. Rogers, Santa Monica.

Gott is in Washington with Maj. R. H. Fleet, president, and other Consolidated officials.

Propellors May Become Brakes

S.D.SUN 2/12/39

Consolidateh Aircraft Corp. officials yesterday noted with interest projected experiments to test the power of airpane propellors as brakes for the big transoceanic flying boats of the future.

Airboat designers at a plant near Washington have asked an experimental firm to test this seemingly paradoxical idea, Science Service reported.

REVERSIBLE PITCH

Propellors with reversible pitch blades can do the trick, and will be manufactured for the test.

Such propellors, with the blades twisted opposite to their usual position, would reverse the direction of the airstream they create. Instead of slipping it back past the wing, it would blow it forward, slowing the plane. The scheme, of course, is intended for planes on the water. Loss of airspeed in the air may mean a fatal plunge.

HELP IN TURNING

The whirling brakes woulh help in maneuvering big flying boats with four or more engines by enabling a pilot to use one or two of his motors producing their reverse effect, while running the others as usual. Thus, he would be able to turn quickly—like an oarsman pulling his oars in opposite directions. In addition, all four motors could be used as brakes to come to a quick stop—something which now is difficult.

in the case of the Rheinelbe Union bonds, of the principal value of the securities deposited for acceptance.

LA Times 2/1/39

Aircraft Makers Re-elect Bradley

NEW YORK, Jan. 31. (AP)—Samuel S. Bradley today was re-elected chairman of the board of the Manufacturers' Aircraft Association, which administers the cross-licensing patent agreement for the domestic plane manufacturing industry. Frank H. Russell was re-elected president and John A. Sanborn general manager. All are from New York. Vice-presidents elected included E. E. Wilson, East Hartford, Ct.; Edgar N. Gott, San Diego, and John M. Rogers, Santa Monica, Cal. Other officers: Joseph T. Hartson, Baltimore, secretary, and James P. Murray, Seattle, treasurer.

CONSOLIDATED PLANE SABOTAGE CHARGED

S.D. SUN 1/23/39

Bridges Files Complaint; Naval Inspector Admits 'Possibility'

Charges today that Nazi agents are sabotaging airplanes under construction in San Diego's Consolidated Aircraft Corp. were denied by company officials, but a high ranking Navy officer admitted sabotage "could exist without our detecting it."

The accusations were made by Harry Bridges, west coast director of the Congress of Industrial Organizations. He alleged that offlicials of Consolidated and of the North American Aviation Co. of Los Angeles, aware of the asserted sabotage, but have ignored it, the United Press reported.

Mr. Bridges made his charges to President Roosevelt in a telegram from San Francisco. He asked government officials personally conduct an investigation of his accusations.

CRASHES CITED

"Approximately 12 Navy bombers manufactured by Consolidated Aircraft have, in a period of little over a year, fallen with deaths of crews," the wire stated.

C. A. Van Dusen, vice president of Consolidated, voiced a blanket denial of Mr. Bridges' charges.

"We absolutely and unqualifiedly deny any sabotage exists in this plant," he declared. "The naval intelligence office knows everything that goes on here."

Lieut.-Comdr. Roland G. Mayer, naval inspector at Consolidated, acknowledged there might be some sabotage in the plant.

"Anybody might commit sabotage and we could not detect it," he said. "It would be the duty of any citizen, knowing of sabotage, to report it to authorities under the Espionage act. But, Bridges is not a citizen. I believe this is just a publicity stunt of some sort. Our inspectors are very thorough, and I doubt the veracity of these charges."

DISCHARGED, CLAIM

Mr. Bridges charged information relative to the purported sabotage has been gathered by employes in the plants, but those making complaints were discharged by company officials. He alleged some information has been placed in the hands of the National Labor Relations Board and that Federal Bureau of Investigation agents and the Navy have been notified.

He contended it would have been impossible for the supposed sabotage to have been committed without knowledge of employers or Federal agents.

"We say that company officials and government officials have had these complaints and have not acted," Mr. Bridges commented. "I call that collusion. You will probably find that certain minor government officials have stock in these companies and it proves to their financial benefit to have these planes rushed through, regardless of their condition.

"We don't want a bunch of crackpots like the Dies committee investigating these charges," he added.

Mr. Bridges' wire to President Roosevelt read:

"Nazi agents and sympathizers working on planes of North American Aviation Co., subsidiary of General Motors Corp., Los Angeles, and Consolidated Aircraft, San Diego, are engaged in wholesale sabotage during manufacture of airplanes for the U. S. Government.

"Numerous complaints to local Army, Navy and employer officials and inspectors responsible for inspection of the planes, that unsafe planes have been inspected and passed, only resulted in persons making the complaitns being discharged or demoted."

"Approximately 12 Navy bombers manufactured by Consolidated Aircraft have, in period of little over a year, fallen with deaths of crew," the wire continued.

"Due to intimidation of union workers who have attempted to expose sabotage and the fact that alliance undoubtedly exists between company and government officials locally, we urge immediate investigation be conducted by special government representatives from Washington.

"CIO unionists in past have been blamed for much sabotage under barrage charges, while in reality company has operated under this Communist smoke screen to employ Nazi agents, Bund members, who serve a two-fold purpose in acting as labor spies and union disrupters, while deliberately sabotaging Army planes under construction.

"Abundant evidence and official records now exist to prove these drastic charges providing investigation is put in hands of proper government agency, free from any local employe pressure."

Amazing Tale Of Men Who Dared To Venture

A great parade of men of heroic stature and sublime faith passes in time-haloed glory before the engrossed reader of "Unsolved Mysteries of the Arctic" by Vilhjalmur Stefansson, president of the noted Explorer's Club and himself an Arctic adventurer of no mean accomplishment.

This is one of those rare books which once taken up are not placed down until, with a sigh of sincere regret, the reader comes to the closing phrase.

FRIGID MYSTERY

All the frigid mystery—and the glory—of the "friendly Arctic" are here, and the tragedy which has so often—and so unnecessarily, says Mr. Stefansson—been visited upon those who sought to ferret out its ice-locked secrets.

Mr. Stefansson begins his startlingly clear-cut narrative in 795 A. D., when the Irish, or at least people from the British Isles, crossed the main stream of the Atlantic to discover Iceland. He then traces polar exploration from that time down to the present, when the Soviet aviator, Sigismund Levanevsky, and his companions vanished into the Artic night on their flight from Moscow over the top of the world.

MEN WHO DARED

It is an amazing narrative of the men who dared they knew not what to discover and open to commerce the famous "North-west Passage"—a truly Homeric saga of chilled-steel men whose resolve to succeed was as coldly steadfast as the Pole, itself, and whose daring and hope flamed higher and brighter than the Aurora Borealis.

What happened to the ill-starred Franklin expedition, and how; why did 9000 Europeans disappear from an early colony; what dark secret lay behind the mysterious gunshot death of Thomas Simpson, deep in the Arctic wastes; what happened to Andre and his two companions who so blithely sailed from Spitzbergen in one of the earliest balloons, and whose half-clothed bodies were found in 1930, dead in their tent on a lonely isle?

FOR SAN DIEGANS

The reader who can shut the covers of Mr. Steffonsson's grand book before he reads the author's well-documented explanation of these events is devoid indeed of human sensibility and curiosity about the little-known!

And, for California and San Diego readers, particularly, this book contains an added fillip, for in it Mr. Stefansson pays high tribute to the Arctic exploratory efforts and scientific ability of Dr. Harald U. Sverdrup, now director of the Scripps Institution of Oceanography at La Jolla. In fact, it is Dr. Sverdrup whose explanation of the death of Andree is quoted in "Unsolved Mysteries" and which now is accepted by polar experts as the best authority as to his haunting fate.

S.D. SUN 2/12/39

VILHJALMUR STEFFANSSON . . . mystery and tragedy.

Also of note to San Diegans is Mr. Stefansson's recount of the part played by the flying boat "Guba" in the international search for the lost Levanevsky party. Built in San Diego for the prominent explorer, Richard Archbold, the "Guba" was a modified version of Navy's long-range patrol bombers, manufactured by Consolidated Aircraft Corp.

Postponing his own plans for a New Guinea exploratory trip, Mr. Archbold eagerly consented to sell the "Guba" to the Russian government for use in the search, after certain military features had been eliminated. Mr. Stefanssen pays honor to the boat, one of the most successful and satisfactory of any plane ever used for Arctic work, and to Sir Hubert Wilkins who directed her activities.

Here is a tale of high adventure —a story that if filmed would be received with incredulity by a cinematic audience. Mr. Stefansson deserves special commendation for careful documentation and insistence upon presenting views divergent to his own. No fancy-dancy writing, true, but as clear and sparkling as the Arctic night, itself. The subject may be cold, but his book is warm, human and intensely dramatic.—C. L. D.

BRIDGES HITS S. D. SABOTAGE

S.D. TRIBUNE 1/23/39

CONSOLIDATED DENIES NAVY PLANE SABOTAGE AS CHARGED BY BRIDGES

S.D. UNION 1/24/39

Charges made yesterday by Harry Bridges, west coast Congress of Industrial Organizations director, that Nazi agents were sabotaging planes at the plants of Consolidated Aircraft here and North American Aviation in Los Angeles brought prompt denials from the two companies and from navy intelligence here.

Bridges, The Associated Press reported from San Francisco, telegraphed President Roosevelt to ask a department of justice investigation.

"Evidence to support the charges has been turned over to the national labor relations board at Los Angeles," Bridges said, charging that complaints to army, navy and employer officials and inspectors "have only resulted in persons making complaints being discharged or demoted. The C.I.O. director said his labor group is only trying to point out "who actually is" sabotaging government planes as a reply to complaints that sit-down strikers at the Douglas plant had damaged planes last year. The Douglas company is not mentioned in the telegram, however.

Bridges charged that "approximately 12 navy bombers manufactured by Consolidated Aircraft have, in the period of a little over a year, fallen with deaths of crews. Due to intimidation of union workers who have attempted to expose sabotage and the fact that an alliance undoubtedly exists between company and government officials locally, we urge immediate investigation be conducted by special government representatives from Washington."

"We have no knowledge of any sabotage in our plant," Consolidated Aircraft reported. North American Aviation made a similar statement.

Consolidated referred inquirers to "O.N.I." for further comment. This is the office of naval intelligence. Comdr. E. M. Zacharias, intelligence officer, 11th Naval district, said:

"If we had knowledge of any sabotage there'd probably be some action. We don't know of any at the plant and if there is we haven't run across it. No information has come to us about the matter to which he's referring."

Informally, Consolidated officials pointed out that they did not believe total crashes of Consolidated planes exceeded 10, instead of the 12 in a year mentioned by Bridges.

Local crashes involving Consolidated planes include a mid-air collision between two bombers Feb. 2, 1938; disappearance of a bomber and crew of 8 the night of Jan. 5, 1938; two wrecked in landing on the bay Aug. 15, 1938, and another wrecked when it struck a log while landing. It was questioned that any factory sabotage could be involved in these crashes.

Navy planes, it was pointed out, are built under supervision of a navy inspector stationed at the plant. Present inspector is Lt. Comdr. Roland G. Mayer. After construction they are tested out by the navy before acceptance.

Dr. Towne Nylander, regional labor board director at Los Angeles, said that no "statements, charges or affidavits have been made to me relative to Consolidated Aircraft," The Associated Press reported.

He said that in connection with a labor complaint against North American Aviation, a series of statements was filed. "The matter is now under investigation and no further statement can be made until the case has been closed."

Deny Sabotage Of S. D. Planes

S.D. TRIBUNE 1/24/39

Local naval intelligence and Consolidated Aircraft Corp. officials today issued denials of charges brought yesterday by Harry Bridges, west coast Congress of Industrial Organizations director, that Nazi agents were sabotaging planes at the Consolidated plant.

"If we had knowledge of any sabotage there would probably be action," said Comdr. E. M. Zacharias, 11th naval district intelligence officer. "We don't know of any at the plant and if there is we haven't run across it. No information has come to us about the matter to which Bridges is referring."

Bridges wired President Roosevelt to ask a department of justice investigation. The Associated Press reported. He said evidence to support the charges of sabotage at both the Consolidated plant and the North American Aviation Co. plant, Los Angeles, had been turned over to the national labor relations board at Los Angeles, and cited the 1938 accidents to "approximately 12 navy bombers manufactured by Consolindated" as evidence of sabotage.

Making Giant Patrol Ships

Consolidated officials declared they have "no knowledge of any sabotage in our plant." A similar statement was made by North American Aviation Co. representatives.

The number of employes now at Consolidated is approximately 1300, it was reported at the plant today. While no figures are available, a plant election last year, held under the supervision of the national labor relations board, showed an A.F.L. majority. The company, which transferred its factory from Buffalo, N. Y. to San Diego in 1935, is manufacturing giant patrol planes for the navy which are to be flown from San Diego to Hawaii this summer.

Approximately 1000 were employed at the North American Aircraft Co. plant two months ago, but there have been some lay-offs recently there, The Associated Press reported. Dr. Towne Nylander, of the national labor relations board, said the C.I.O. claims a majority at the North American plant and that an election will be ordered soon, the exact date undetermined.

Under Navy Supervision

Informally, Consolidated officials pointed out that they did not believe total crashes of Consolidated planes exceeded 10, instead of the 12 in a year mentioned by Bridges.

Local crashes involving Consolidated planes include a mid-air collision between two bombers Feb. 2, 1938; disappearance of a bomber and crew of 8 the night of Jan. 5, 1938; two wrecked in landing on the bay Aug. 15, 1938, and another wrecked when it struck a log while landing. It was questioned that any factory sabotage could be involved in these crashes.

Navy planes, it was pointed out, are built under supervision of a navy inspector stationed at the plant. Present inspector is Lt. Comdr. Roland G. Mayer. After construction they are tested by the navy before acceptance.

Nylander, regional labor board director at Los Angeles, said that no "statements, charges or affidavits have been made to me relative to Consolidated Aircraft," The Associated Press reported.

He said that in connection with a labor complaint against North American Aviation, a series of statements was filed. "The matter is now under investigation and no further statement can be made until the case has been closed."

Expose Repaid With Job Loss, Tale; Denied

Consolidated Aircraft Corp., of San Diego, is one of two southern California airplane manufacturing plants in which alleged Nazi agents and sympathizers working on planes being constructed for the government have been engaged in wholesale sabotage, Harry Bridges, west coast C.I.O. director, charged today in a telegram to President Roosevelt, The Associated Press reported from San Francisco. Named with Consolidated by Bridges is the North American Aviation Co., at Los Angeles.

Bridges said "evidence to support the charges has been turned over to the national labor relations board in Los Angeles," and urged that the investigation from now on be put in the hands of the department of justice at Washington.

He charged that complaints to army, navy and employer officials and inspectors "have only resulted in persons making complaints being discharged or demoted."

Bridges said the C.I.O. was trying to point out who actually was sabotaging government planes, as a reply to complaints that C.I.O. workers involved in a sit-down strike at the Douglas plant last year had damaged planes. The Douglas firm was not named in the telegram, however.

"Approximately 12 navy bombers manufactured by Consolidated Aircraft have, in the period of a little over a year, fallen with deaths of crews," the telegram alleged.

"Due to intimidation of union workers, who have attempted to expose sabotage, and the fact that an alliance undoubtedly exists between company and government officials locally, we urge immediate investigation be conducted by special government representatives from Washington."

"We deny completely Bridges' charges," said a Consolidated official this noon. The navy maintains inspectors at plants where navy planes are being constructed.

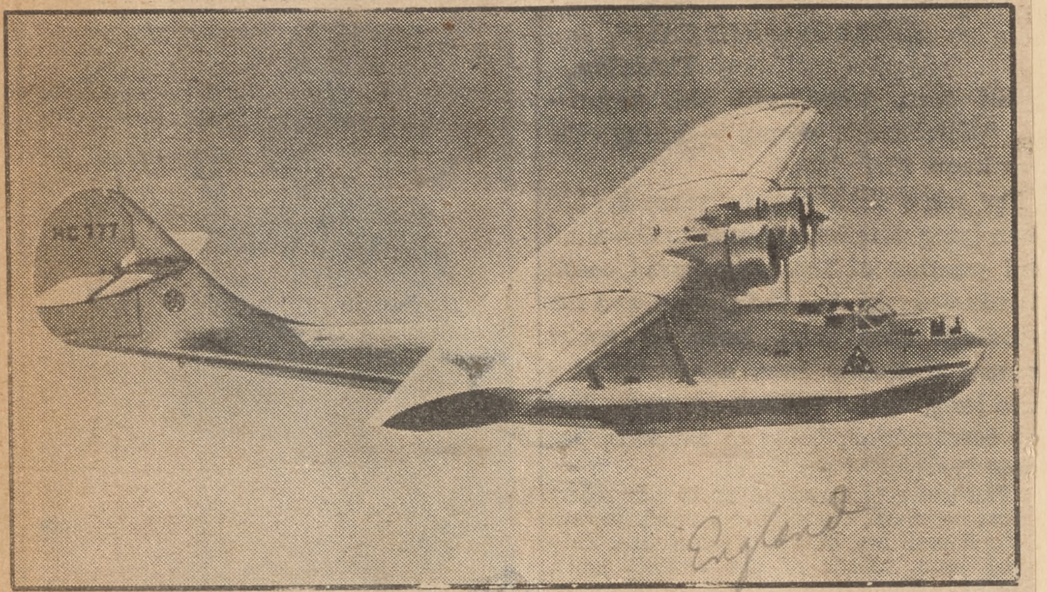
U.S. OFFER TO SUPPLY MILITARY FLYING BOATS TO THE R.A.F.



England

The American modern type flying boat.

By WILLIAM COURTENAY
Evening Standard Aviation Correspondent

AN American aircraft manufacturing company who have supplied over 200 modern-type flying boats to the U.S.A. navy have made an offer to the Prime Minister to supply Great Britain with a number of these aircraft.

The firm are the Consolidated Aircraft Corporation, of San Diego, California, and the flying boat is the 15-ton twin-engined PBY-4 type.

About 230 have been delivered to the U.S.A. navy to date, and they are being turned out rapidly each month.

They have wing-tip floats which turn up during flight to form part of the wing, and in this way resistance to flight is lessened and speed is increased. The two 1200 h.p. engines give a cruising speed of 180 m.p h.

A civil version of the flying boat has been prepared for American Export Air Lines, who recently concluded an agreement with Ala Littoria, the Italian national air company, to operate experimental air services between America and Mediterranean ports.

Efforts are to be made to introduce this aircraft on the South Atlantic air route for British Airways.

They are responsible for developing the South Atlantic air route, but have not yet decided whether to attempt this with flying boats or landplanes.

The Fairey Aviation Company are building a landplane of high performance for ocean flights, and Short Bros., Rochester, are building other ocean-going landplanes of giant size, as well as large-scale four-engined flying boats, so that both can be given trials.

Local Air Enthusiasts Teach Club Members To Fly

S.D. Evening Tribune

SAN DIEGO FLYING CLU

Officers of the San Diego Flying club, pictured at the club's Grande Vista airport, are, left to right: Frank Buzelli, social chairman; Henry Leboffe, secretary; Thomas P. Butterfield, president; Orville Hubbard, vice president and operations manager; Melvin Knutson, operations treasurer, and John Baker, corporation president.

AVIATION BOOSTED BY 58 MEMBERS OF FLYING CLUB

Safe—Sane—Sure.

With that as its motto, the San Diego Flying club, in its three years of existence, has gone a long way in its purpose of furthering the cause of aviation throughout San Diego county and among its own membership.

The club was started in 1936 by 10 young men who sought to devise the most economical and practical way of learning to fly. Today it boasts 58 members whose ages range from 16 to 40 years; owns three planes and has its own, three-hangar airport—the Grande Vista station—a few miles south of Chula Vista.

Each member has at least 4000 miles of flying to his credit. Thirty-seven of the group have soloed; 16 possess private licenses; one has a commercial license and an instructor's rating. Some 60 percent of the membership is employed in aircraft firms. Professional and business men, ranchers and college students comprise the remainder of the membership. Many plan to continue their flying in army or navy reserve flying corps.

Since its inception, the club has expended more than $6000 for ships and facilities. In the light of the government's attitude toward building up its aviation program, the club is looking forward to the possibility of obtaining federal aid in its objective of encouraging young men to fly. Meanwhile, all members are contributing time and money to maintain flying equipment, forward aviation in the county, and to become experienced pilots.

At present, the group is headed by Thomas P. Butterfield, president. Orville Hubbard, vice presi-

Archbold Builds Radio Station In Hollandia

Richard Archbold, associate director of the American Museum of Natural history, who left San Diego nearly a year ago in his Consolidated-built plane for a two-year scientific expedition in New Guinea, is constructing a short-wave radio station and expedition headquarters at Hollandia.

Word to this effect was received yesterday by Barney Boyd, local radio amateur, who has kept in communication with the expedition since it left San Diego.

Boyd reported several of the expedition members are at Port Moresby in Netherlands New Guinea obtaining supplies which will be transported this week by plane to the main base at Hollandia.

"Archbold reported the expedition is making splendid progress," Boyd said. "Hundreds of specimens of animal and bird life have been collected and shipped through the port of Makassar to the museum in New York."

Transatlantic Airline Company Survey Ship Lands On Dam Lake

Boulder City Journal - 3/4/39

A flying boat, which is expected to be used to blaze an air trail across the Atlantic ocean for the American Export Airlines, and thus establish America's prior rights to transatlantic air service, nestled down on Boulder lake yesterday afternoon following a test flight from San Diego, where the plane was assembled.

Under the present plans of the company, the line will be established from New York to Syria, the latter landing place being selected because of the present unrest in Spain and France. Eventually, if things quiet down in Europe, the line will extend from New York to Paris.

James M. Eaton, vice president f the American Export Airlines, Inc., and formerly an official of the Pan American Airways, is in charge of the undertaking.

At the present time the company has a steamship line across the Atlantic, and officials have expressed the theory that with weather reports received from the surface boats, these air passenger flights would be possible.

The military forerunners of this flying boat are the PBY's that have established the record long-distance massed flights from San Diego to Pearl Harbor, Hawaii (2553 miles) and from San Diego to Colo Solo in the Canal Zone (3087 miles). The latest of these outstanding flights was of 48 PBY's from San Diego to Coco Solo for participation in the current military maneuvers, and added again to the remarkable record of outstanding performance with a consistency that is hard to grasp. Over 200 of these PBY's are in the service of the United States navy.

The original commercial adaptation of the PBY, purchased by Richard Archbold for work with the American Museum of Natural History, established the unusual precedent of flying non-stop across the continent from San Diego to New York (2700 miles entirely over land). This plane was purchased by the Russian government, and piloted by Sir Hubert Wilkins over 19,000 miles of Arctic wastes in a search for the lost Russian trans-Polar fliers. Archbold's second plane has been flown from San Diego to Dutch New Guinea in three hops, a trip of 7,178 miles and is now being used for exploration research, working as backbone of the expedition's transportation system, as they are operating in impenetrable jungle. Both supplies for the base camps and supplies and equipment have been carried across the jungles to inland lakes and rivers, scenes of the exploration and research work.

Aboard the airplane were M. J. Doyle and E. Stuhrman of the American Export Airlines, Inc.; and W. B. Wheatley, J. Kline and G. R. Tibbs of Consolidated.

S.D. UNION 3/8/39

6 Bombers to Fly To Base in Seattle

Six long-range patrol bombers attached to squadron 16 of patrol wing 4 will leave here tomorrow morning on a sustained flight to Seattle.

The squadron is commanded by Lt. Comdr. Delbert L. Conley. The six planes arrived here several weeks ago for installation of deicing equipment.

Five squadrons of long-range bombers, VP-16, VP-17, VP-19, VP-20 and VP-21, are based in the Puget Sound-Alaska area. Squadron 20 is at Sitka.

Flights of the four squadrons based at Seattle to Alaska are scheduled for May and June.

Plane Bid Results Awaited Here

Local officials of Consolidated Aircraft Corp. are awaiting with interest results of bids opened at Washington yesterday for new twin-motored navy bombers. These bids are entirely separate from the proposals opened last month by the navy department for the new four-motored long-range bombers on which Consolidated submitted the lowest figure.

Unofficial advices from Washington are that contracts are being held up temporarily due to the debate in congress on profits being made by manufacturers on aircraft built for the government.

Contracts totaling millions of dollars are expected to be awarded soon to Consolidated, Martin and Sikorsky for new navy long-range patrol bombers.

Maj. R. H. Fleet, president of Consolidated, who has been in Washington conferring with navy aviation authorities, will return here today. He has been at Palm Springs since Monday.

S. D. NAVY BOMBER FEARED LOST

S.D. SUN 3/9/39

One of the six patrol bombers which took off for Seattle this morning has been unreported for three hours, and pilots of all airboats now at North Island were ordered at 12:30 p. m. to stand by for orders to make an extensive search. The plane, believed to have six men aboard, was separated from its sister ships in thick weather off Humboldt Bay.

Six Consolidated PBY Navy bombers today were winging northward from San Diego to their home base in Seattle on a non-stop, 1200-mile flight.

The planes, of Squadron VP-16 and commanded by Lieut. Comdr. Delbert L. Conley, took off from the bay at 6:40 a. m., North Island officials reported.

They had been here several weeks receiving de-icer equipment in the Consolidated plant, to enable year-around operations in the Pacific Northwest and in Sitka, Alaska.

S.D. Sun March 7, 1939

SIX BOMBERS HOP TOMORROW

Non-Stop Flight To Seattle Scheduled

Aviation

Six Consolidated patrol bombers of Squadron VP-16 are scheduled to leave here tomorrow on a non-stop 1200-mile return flight to the Sand Point Naval Air Station at Seattle, Wash., North Island officials announced today.

The airboats were flown to San Diego several weeks ago for installation of de-icing equipment at the Consolidated plant. This work, a necessity on planes operating in the region of the Puget Sound-based Navy squadrons, has just been completed.

Squadrons VP-16,, VP-17 and P-19, consisting of 12 PBY bombers each, alternate between Seattle and Sitka, Alaska, in their year-around operations. Lieut.-Comdr. Delbert L. Conley is commander of VP-16.

S.D. UNION - 3/10/39

Five S. D. Planes Land in Seattle

One Loses Squadron In Storm, Returns

Five long-range patrol bombers of VP-16 squadron commanded by Lt. Comdr. Delbert L. Conley, reached Seattle soon before sundown last night. A sixth plane with Lt. William A. Schoech at the controls returned to North Island at 1:45 p.m. when it got lost from the squadron.

The six planes took off at 6:40 a.m. Off the central California coast they encountered a severe rain and wind storm. Plane 5, commanded by Schoech, attempted to break through and rose to an attitude of 20,000 feet in a fruitless effort to reach clear skies. Failing in this Schoech headed about and returned to San Diego. He will leave for Seattle in company with another plane early next week.

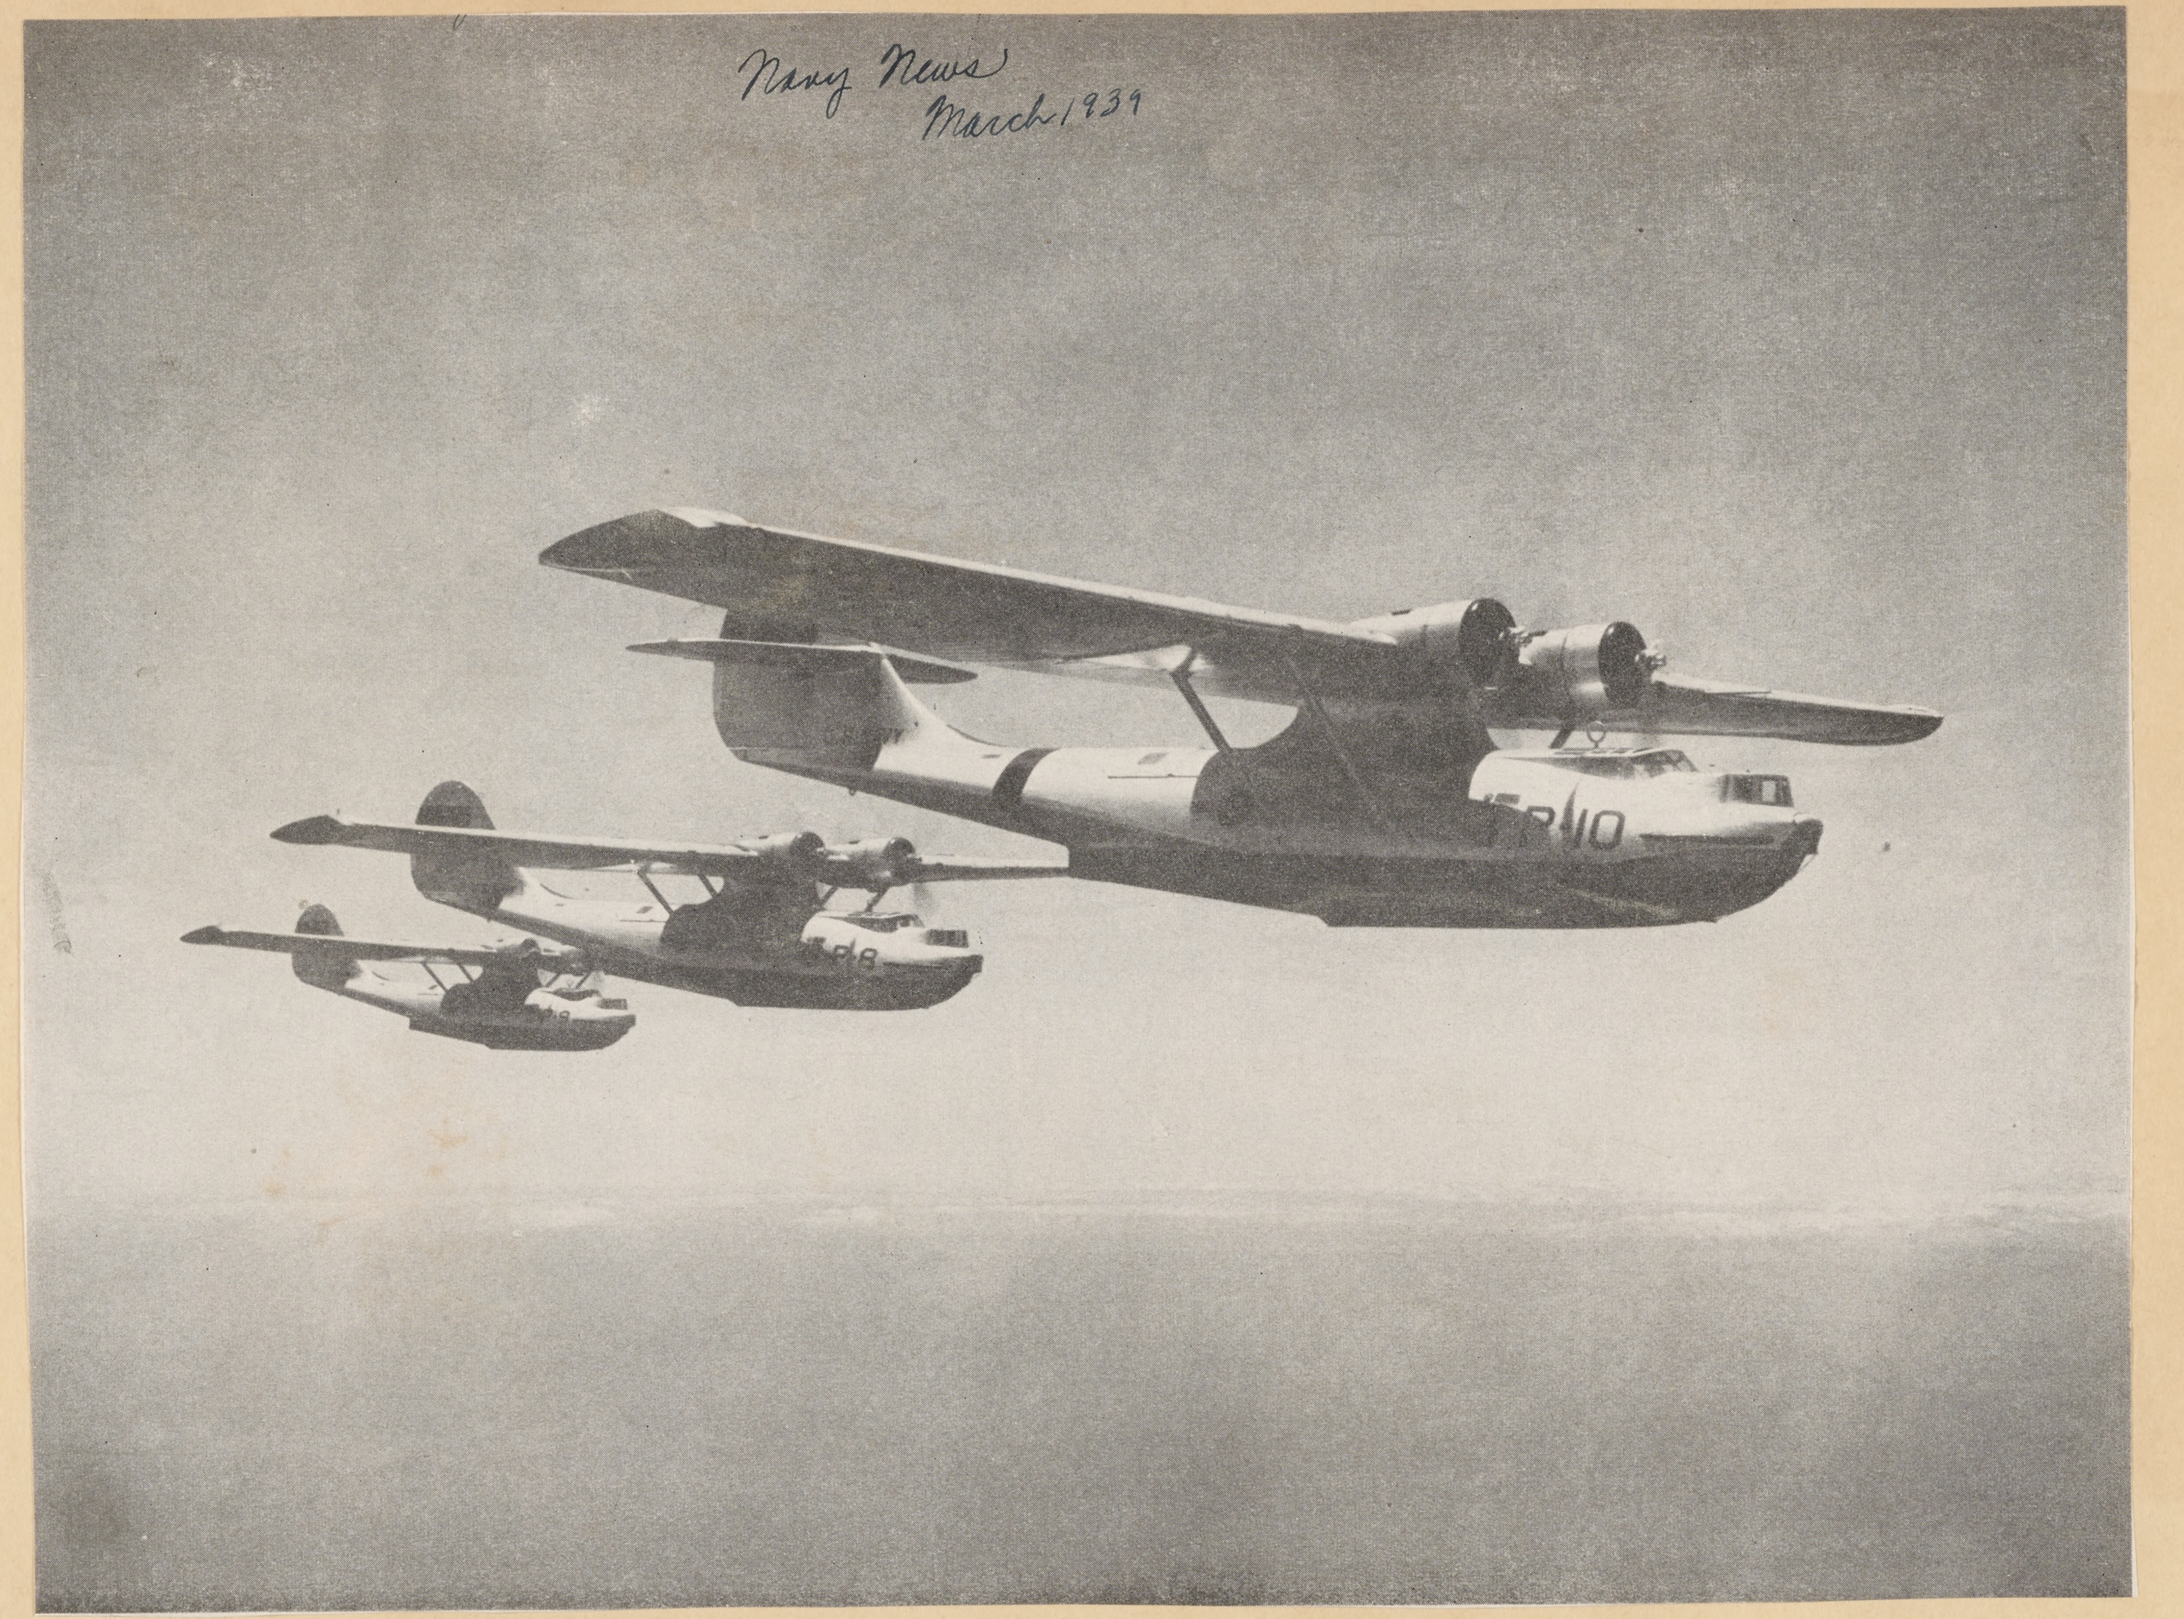
Squadron 16 is attached to patrol wing 4. The planes were flown here last month for installation of deicing equipment.

NAVY PLANE FORCED BACK BY WEATHER

S.D. SUN 3/10/39

A Consolidated P2Y Navy patrol bomber en route from its Seattle base to San Diego for overhaul was forced back to San Francisco today by bad weather off the central California coast, Naval Air Station officials reported. A second attempt to fly south may be made today.

The airboat, with less cruising range than the newer PBY planes, stopped at San Francisco overnight. Six men are in the crew.



Navy News
March 1939

S.D. SUN 3/14/39

Consolidated Airboat Ready For Transatlantic Service

A commercial replica of the Navy's PBY patrol bombers, sold to American Export Airlines for transatlantic survey flights this summer, will fly across country from San Diego to New York probably next month, Consolidated Aircraft Corp. officials announced today.

The recently completed 13-ton airboat, purchased at a cost of $200,000, has been test flown and is ready for delivery. The American Export aviation officials—M.J. Doyle, maintenance chief, and Ed Stuhrman, radio engineer—have been inspecting the plane here, and flight crew is expected here soon to make the transcontinental hop. William Wheatley, chief test pilot for Consolidated, is slated to accompany the eastern concern's personnel on the cross-country flight.

IN MOTION PICTURE

The plane was to be photographed at the Coast Guard air base ramp today for scenes in the Paramount picture, "Magnificent Fraud," a story of a South American dictatorship written by Charles A. Booth of Grossmont.

Consolidated is receiving $4000 for the rights to photograph the plane, according to officials of the movie company.

American Exports transatlantic venture is regarded as a challenge to the U. S. monopoly heretofore held by Pan-American Airways in air transportation across oceans. The company operates a fleet of steamships to Mediterranean and Black Sea ports, and expects to fly its planes across the South Atlantic with the aid of weather data wirelessed periodically from its surface craft.

4000-MILE RANGE

The flight performance demanded by the transportation company of the Consolidated airboat is a top speed of more than 200 miles per hour at 8000 feet, and a range of 4000 miles with a 200-pound payload and six-man crew.

Consolidated officials already have submitted to American Export Airlines specifications for a 100-passenger super- transport it is prepared to build whenever regular transatlantic service is ready to start.

S. D. BOMBERS PLAN TAKEOFF TOMORROW

S.D. SUN 3/16/39

Weather permitting, two Consolidated Navy bombers will take off from the bay tomorrow for their Seattle base via a stop in San Francisco.

The planes are a PBY, piloted by Lieut. William A. Schoech, who was separated from Squadron VP-16 on a flight to Seattle last week during a sleet storm north of Pt. Arguello, and an older P2Y, just overhauled, piloted by Lieut. L. W. Williams, of Squadron VP-19.

Plane Held Up By Weather

S.D. SUN 3/13/39

Poor flying weather along the coast today continued to delay the non-stop flight from San Diego to Seattle of a PBY patrol bomber piloted by Lieut. William A. Schoech and manned by a crew of seven.

The plane became separated from six sister airboats of Squadron VP-16, near Point Arguello, on a mass flight last week to Seattle. In an attempt to climb above a layer of sleet and snow, Lieut. Schoech took his plane to 22,000 feet, where the men, unequipped with oxygen tanks, became severely ill. With great difficulty, the pilot brought his craft back to San Diego.

Meanwhile, a P2Y bomber of Squadron VP-19, en route to San Diego from Seattle for overhaul, still was in San Francisco, where it had landed late last week for only an overnight stop.

Consolidated Aircraft Corp.'s latest flying boat, 28 D-4, will be used in a sequence today and tomorrow. The ship will join American Export airlines' service for Atlantic duty next month.

S.D. UNION [illegible]

S.D. SUN 3/15/39

36 San Diego Patrol Bombers Due Home Early In May

Thirty-six Consolidated patrol bombers of three Navy squadrons which have been participating in Caribbean and Atlantic maneuvers since January will fly to San Diego, probably via Nicaragua, the first week in May, North Island officials announced today.

Twelve of the original group of 48 which left San Diego on a record-breaking mass flight to the Canal Zone more than two months ago will remain in Norfolk, Va. They are units of Patrol Squadron 12, permanently transferred to the east coast.

SAFEST ROUTE

To save distance and to follow the safest route for a mass flight, the bombers are expected to fly from Florida to Nicaragua in one non-stop hop, then head north to San Diego.

Although the definite itinerary has not been released by Fleet officials, it was believed at the Naval Air Station that a cross-country flight along the Gulf of Mexico, then spanning Texas, New Mexico and Arizona, would be too risky for a large number of planes, although PBY's previously have made such jaunts successfully.

Meanwhile, the eight-man crew of a Navy bomber which last week was separated from Squadron VP-16 on a flight to Seattle, and returned to San Diego, awaited command to leave for its northern base.

COMPANY NORTH

Piloted by Lieut. William Schoech, the craft will fly north in company with an airboat piloted by Lieut. L. W. Williams of Squadron VP-19. The latter has been weatherbound for several days in San Francisco, en route to San Diego with a Consolidated bomber due for overhaul. He will take delivery on a similar ship on which repairs have just been completed here.

Consolidated Seeking Large Contracts For Army Planes

S.D. SUN 3/14/39

By HAROLD KEEN

With its Navy work dwindling and with possibilities of Navy contracts requiring capacity production in the near future uncertain, Consolidated Aircraft Corp. once again is seeking large Army contracts, it was revealed today.

Two high officials of the company, C. A. Van Dusen, vice president, and D. M. Carpenter, production manager, returned yesterday after a several weeks stay in Washington, D. C., and Dayton. O., site of the Army Air Corps' Wright Field.

Of admitted significance was the fact that the company's chief engineer, I. M. Laddon, and David G. Fleet, son and assistant to Maj. Reuben H. Fleet, president, are still at Wright Field, the Army's procurement and testing headquarters for new planes.

Consolidated officials indicated that the two are obtaining information on specifications for new planes necessary for later bidding.

Meanwhile, although bids on a contract to produce a maximum of 15 four-motored patrol bombers similar to Consolidated's million-dollar experimental plane, were opened two months ago, nothing definite has resulted. The San Diego firm was low bidder against its only competitor. Sikorsky Aircraft Co., of East Hartford, Conn.

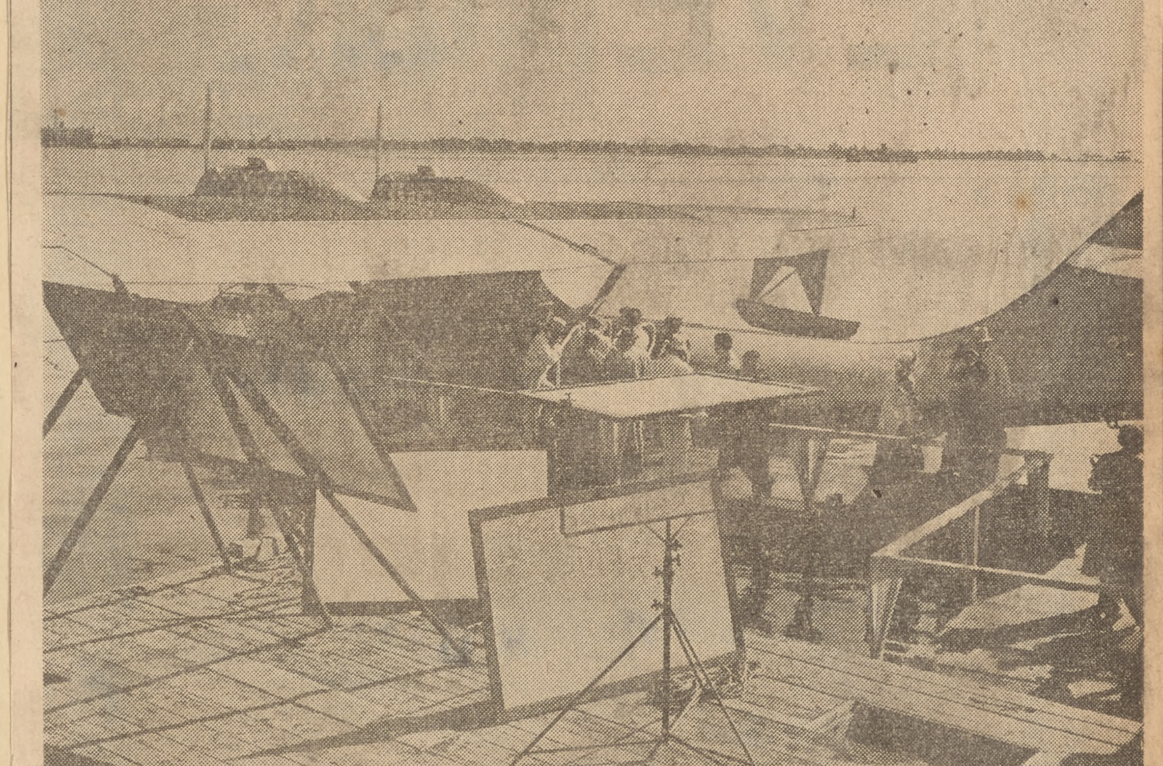
Maj. Fleet and his assistants went east soon after the bids were opened. They were frankly anxious to get quick action out of the Navy Department, but it was not forthcoming.

A four-months' delay between awarding the contract and actual start of production is expected while materials are ordered and delivered, according to Maj. Fleet. Consolidated figuratively laid all its eggs in one basket, concentrating on production of Navy airboats. They have manufactured more than 200 since moving to San Diego from Buffalo in 1935.

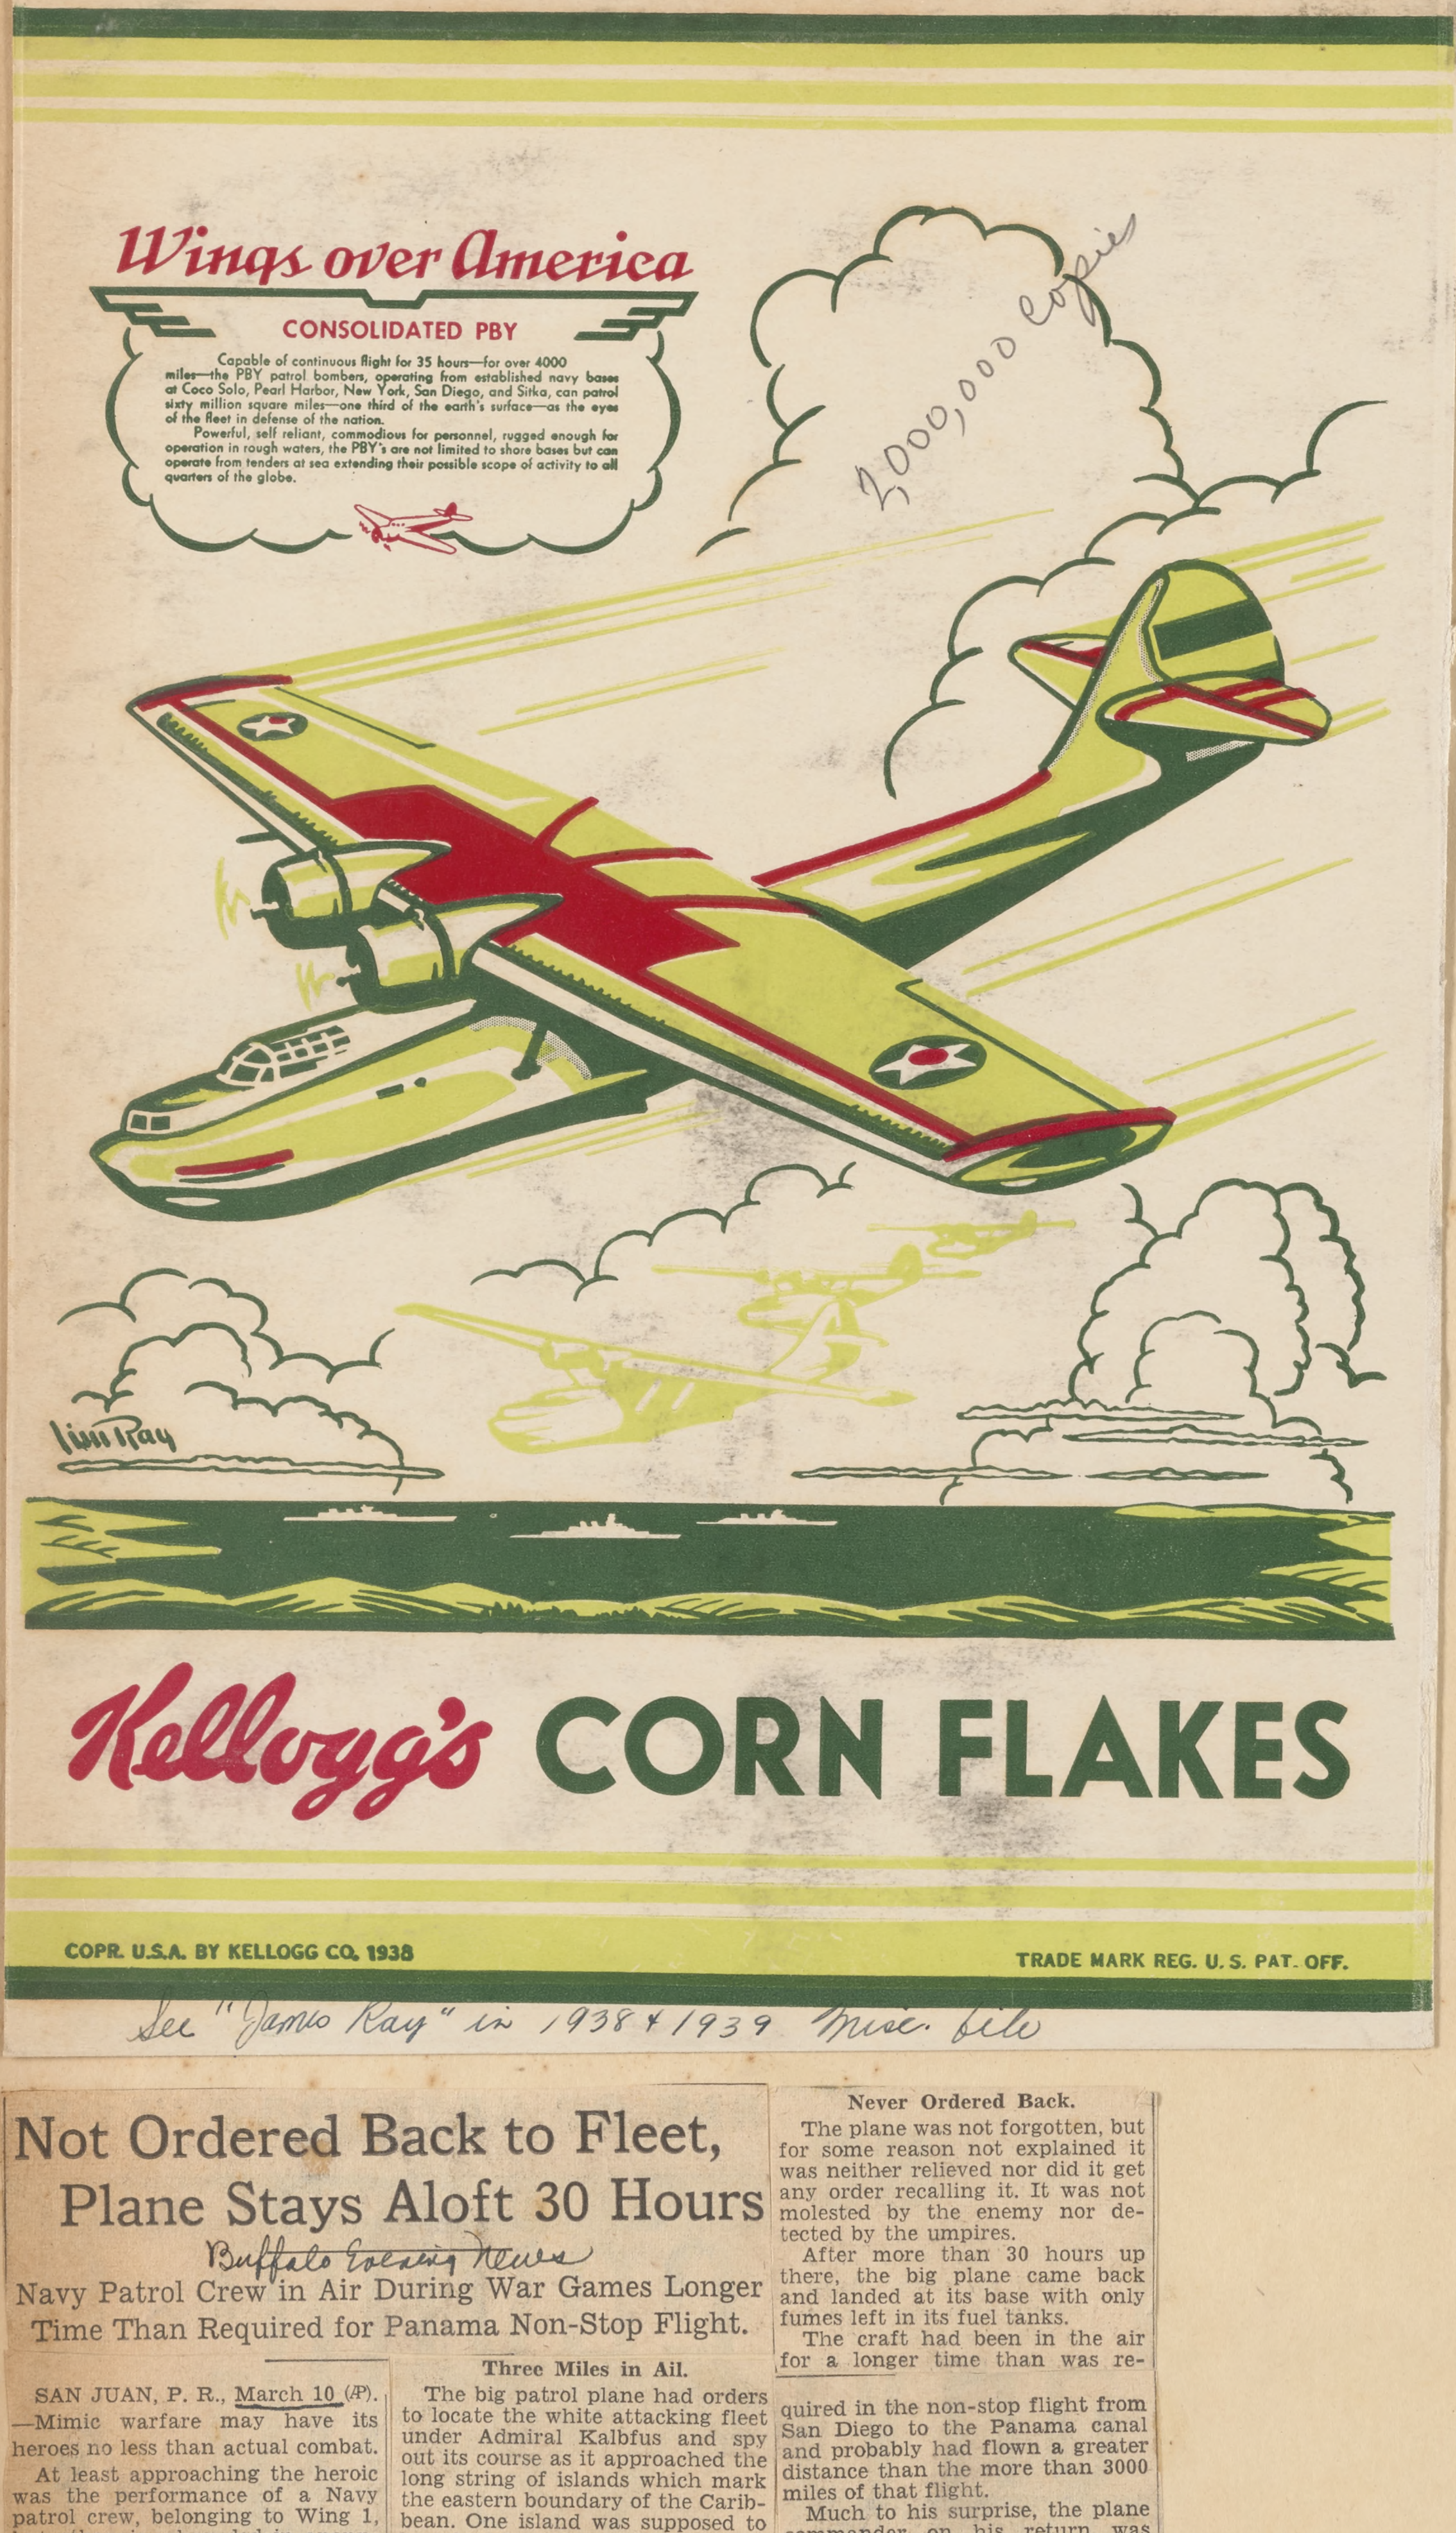
Previous to this period, however, the company turned out several models for the Army in large numbers.

EVENING TRIBUNE, San Diego, Calif., Wednesday, March 15, 1939

New Consolidated Plane Gets Part in Paramount Film



Consolidated Aircraft Corp.'s new 15-ton plane, built for the American Export Air Lines, was to be filmed at Lindbergh field today in air scenes of Paramount studio's "Magnificent Fraud." The plane, soon to go to the east coast for transatlantic survey flights for American Export, was on the ramp at the coast guard air base at the south end of the municipal airport early this morning in preparation for the movie flights, showing passengers departing and arriving. Stars in the picture are Lloyd Nolen, Patricia Morison, Mary Boland and Atkim Tamiroff. While the 15,000-pound plane is not fitted for carrying passengers on the transatlantic survey flights, it is of the type that will carry 24 passengers.



Wings over America

CONSOLIDATED PBY

Capable of continuous flight for 35 hours—for over 4000 miles—the PBY patrol bombers, operating from established navy bases at Coco Solo, Pearl Harbor, New York, San Diego, and Sitka, can patrol sixty million square miles—one third of the earth's surface—as the eyes of the fleet in defense of the nation.

Powerful, self reliant, commodious for personnel, rugged enough for operation in rough waters, the PBY's are not limited to shore bases but can operate from tenders at sea extending their possible scope of activity to all quarters of the globe.

Not Ordered Back to Fleet, Plane Stays Aloft 30 Hours

Buffalo Evening News

Navy Patrol Crew in Air During War Games Longer Time Than Required for Panama Non-Stop Flight.

SAN JUAN, P. R., March 10 (AP).—Mimic warfare may have its heroes no less than actual combat.

At least approaching the heroic was the performance of a Navy patrol crew, belonging to Wing 1, but otherwise shrouded in anonymity, about which there is more talk than of any other single incident which has come to light since the completion of the Navy's Problem XX last week.

The opposing forces of Admiral E. C. Kalbfus and Vice Admiral Adolphus Andrews were assembled under Admiral C. C. Bloch, the fleet commander, off Culebra islands long enough at the end of the war game for the story to get around. The more than 130 ships are now temporarily scattered.

Three Miles in Ail.

The big patrol plane had orders to locate the white attacking fleet under Admiral Kalbfus and spy out its course as it approached the long string of islands which mark the eastern boundary of the Caribbean. One island was supposed to be seized for an enemy base if the attack succeeded.

The plane left its base near here and disappeared in the eastern sky. It located the enemy far out at sea from a height of 3 miles, so the story goes. It followed the wake of Admiral Kalbfus' ships hour on hour.

Darkness followed day and daylight came again. The patrol plane remained aloft.

Never Ordered Back.

The plane was not forgotten, but for some reason not explained it was neither relieved nor did it get any order recalling it. It was not molested by the enemy nor detected by the umpires.

After more than 30 hours up there, the big plane came back and landed at its base with only fumes left in its fuel tanks.

The craft had been in the air for a longer time than was required in the non-stop flight from San Diego to the Panama canal and probably had flown a greater distance than the more than 3000 miles of that flight.

Much to his surprise, the plane commander on his return was asked where he had been. His explanation was brief and simple. He quoted his orders. He had been sent on a mission and he had stuck to it at 15,000 feet in the air.

S.D. SUN 3/20/39

Army, Navy Air Forces To Join In Mock War Games

Training in coordination of the Army and Navy air arm will be the object of the first joint air exercise of this type, scheduled for April 17 to 22 in the New England area, it was learned here today.

Naval units, including both planes and surface vessels required for the mock war games, will include a large number of San Diego-based craft.

The naval forces will be divided into a defending group, commanded by Rear Adm. W. T. Tarrant, former commandant of the local 11th Naval District, and now commandant of the First Naval District, Boston; and an attacking force, commanded by Rear Adm. Alfred W. Johnson, commander of the Atlantic Squadron.

S. D. PLANES DEFENDERS

The defenders will include the light cruiser USS Memphis, flagship of Rear Adm. Charles A. Blakely, commander of Aircraft Scouting Force; the 48 San Diego patrol bombers which flew non-stop from here to the Canal Zone last January and have since participated in Fleet Problem 20; three destroyers, six submarines, and three seaplane tenders.

The attackers will comprise, among other units, the battleships New York, Rear Adm. Johnson's flagship, and the Texas.

ZONE OF ACTION

The zone of action will extend from a line drawn due east from Sandy Hook to the boundary line between Massachusetts and New Hampshire, extended seaward.

Coast Guard ships and planes available at the time in this vicinity will see action on the side of the defending force.

CRINKLEY TO FERRY PLANE FROM EAST

S.D. SUN 3/21/39

Lieut.-Comdr. Andrew Crinkley, chief pilot of the Consolidated Navy four-motored bomber, who made a last-minute decision to accompany the Pan-American Clipper No. 20 on its flight from San Diego to Baltimore, will ferry an overhauled Curtiss scout observation plane back here from Norfolk, Va., it was reported at North Island today.

S.D. UNION

Tax on Consair Arouses Ire

3/22/39

Imposition of a 3 percent sales tax by the state board of equalization against all planes manufactured by Consolidated Aircraft Corp. aroused the ire yesterday of Maj. Reuben H. Fleet, president.

"There is no other state that imposes such a tax against manufacturers building planes for the government," Fleet said. "We are not selling anything in California. Such a procedure is unfair. We will never get any business if we have to compete with out-of-state aircraft manufacturers under such a handicap."

Major Fleet denied that the Lindbergh field plant secretly has developed for the navy a new twin-engined monoplane capable of flying 12,000 miles at a speed of 350 miles an hour. Such a report was current yesterday.

SEA SCOUTING FEAT OF PLANE REVEALED

Patrol Craft Dogged 'Enemy' Fleet 30 Hours Far at Sea Undetected

ON JOB TILL GAS RAN OUT

Marines in Landing Exercises in Caribbean This Week as Part of Navy Manoeuvres

By **HARWOOD HULL**

Special Cable to THE NEW YORK TIMES.

SAN JUAN, P. R., March 5.—Mimic warfare may have its heroes no less than actual combat. At least approaching the heroic was the performance of a navy patrol plane and crew, belonging to Wing 1, but otherwise shrouded in anonymity, about which there is more talk than of any other single incident which has come to light since the completion of the Navy's Problem XX last week.

The opposing forces of Admiral E. C. Kalbfus and Vice Admiral Adolphus Andrews were assembled under Admiral C. C. Bloch, the fleet commander, off Culebra Island long enough at the end of the war game for the story to get around. The more than 130 ships are now temporarily scattered.

The big patrol plane had orders to locate the White attacking fleet under Admiral Kalbfus and spy out its course as it approached the long string of islands which mark the eastern boundary of the Caribbean, of which one island was supposed to be seized for an enemy base if the attack succeeded.

The plane left its base near here and disappeared in the eastern sky. It located the enemy far out at sea from a height of three miles, so the story goes. It followed the wake of Admiral Kalbfus's ships hour on hour.

Darkness followed day and daylight came again. The patrol plane remained aloft, reporting back to its base the White fleet's movement.

Unmolested and Unrelieved

The plane was not forgotten, but for some reason not explained it was neither relieved nor did it get an order recalling it. It was not molested by the enemy nor detected by the umpires.

A[illegible] more than thirty hours up there, the big plane came back and landed at its base with only fumes left in its fuel tanks.

The craft had been in the air for a longer time than was required in the non-stop flight from San Diego to the Panama Canal and probably had flown a greater distance than the more than 3,000 miles of that flight.

Much to his surprise, the plane commander on his return was asked where he had been.

His explanation was brief and simple. He quoted his orders. He had been sent on a mission and he had stuck to it at 15,000 feet in the air.

When no relief came, he had just continued dogging the enemy fleet and watching its foaming wake until only enough gas remained to fly back to his base.

There may be no official record involved in the performance, but quite possibly when all the facts are checked, this plane's tour of duty may be found to mark a new high for sustained operation in simulated warfare.

At any rate the incident is being cited as demonstrating the value of the air service in hemisphere defense, as well as the possibilities for greater range at sea of planes operating from an advance base in the Eastern Caribbean, the importance of which President Roosevelt stressed on his return from the manoeuvres.

To Meet at Guantanamo

Today the ships of the combined fleet were in scores of ports on the Caribbean and the Gulf of Mexico or en route to ports. Many cruisers went to their name ports, some for the first liberty for their crews since they left the West Coast late in December.

But the Winter's work is not finished. Most of the war vessels are due at the base at Guantanamo, Cuba, on March 15, when a critique of Fleet Problem XX is scheduled to take place aboard Admiral Bloch's flagship, the Pennsylvania.

As chief umpire as well as commander of the fleet, Admiral Bloch is continuing the secrecy surrounding Problem XX. From his temporary base off Culebra, where the greatest number of American warships ever assembled, remained for some time the past week, Admiral Bloch sent word ashore that it was still the navys' policy not to discuss for publication any phase of the problem.

The rendezvous at Culebra coming immediately after the war game, revived speculation on the prospect of future greater use for fleet operations of Viegues Sound.

For several days this area had a thorough test as a fleet anchorage. Vieques Sound extends twenty to thirty miles east and west between Puerto Rico and the Virgin Islands channel and more than ten miles between Culebra and a string of small islands on the north and Vieques Island on the south.

All the islands afford many sheltered anchorages for all types of ships, generally of easy access and with optional exits. Land batteries mounted on heights on the islands might provide adequate protection against possible enemy approach. The area has been the subject of several navy surveys since soon after the purchase of the Virgin Islands from Denmark more than twenty years ago.

With Problem XX ended, new light is shed on the reasons the army did not participate beyond having observers with the navy's key units.

Essentially is was a problem in manoeuvring opposing forces far at sea, supported by airplanes operating either from shore or from sheltered bases. The use of troops ashore or getting them ashore was outside the scope of the problem. When the quitting whistle blew the White and Black fleets were scattered over more than 1,000 square miles of water.

Actual landing exercises, such as those in which units of the army's First Division participated last year, will be under way this week at Vieques. The ships of the Atlantic squadron under Rear Admiral Alfred W. Johnson and the First Brigade of the fleet marine force participating.

Whole War Game Photographed

Much information, particularly photographic, which was gained during the development of Problem XX will be available for the smaller-scale activities now scheduled. New aerial maps have been prepared for all the areas to be utilized in the coming exercises.

In fact, photography has played a far greater part in this Winter's manoeuvres than in any previous large-scale navy operation. Practically every action recordable by the photographic lens, whether from the air or from surface ships, has been supplied in pictures to Admiral Bloch.

One technique carried to a new point in the war game has been simultaneous photography from two or more planes with cameras operating under radio control.

These pictures will supplement the maps in telling the story of the White and Black Fleets at the critique. Both maps and pictures will be seen for the first time by the navy flag and staff officers when they assemble at Guantanamo.

Six weeks after the critique, the fleet will be at New York for the World's Fair.

PBY

L'AERONAUTIQUE NAVALE

"parente pauvre"

NOUS avons appris récemment que, sur les 600 et quelques avions que la France commandait aux Etats-Unis pour renforcer son potentiel aérien, se trouveraient 20 avions destinés à l'aéronautique embarquée, et plus particulièrement aux porte-avions.

C'est bien, c'est très bien ! mais, que représentent deux escadrilles d'avions d'attaque, par rapport à ce qu'exigerait notre flotte rénovée ? Dans le même temps où cette nouvelle se faisait jour, le monde apprenait également dans quelle mesure l'Angleterre était prête à faire effort pour perfectionner le réarmement militaire aérien et naval, qu'elle a entrepris voici bientôt trois ans : pour 1939, 580 millions de Livres, au total (102 milliards de francs) dont plus d'un tiers pour l'aviation !...

Il ne s'agit pas de comparer la flotte anglaise et ce qui s'y rattache, à la flotte française et ses dépendances. Il faut cependant considérer dans quelle mesure l'harmonie des forces, telle qu'elle est comprise chez nos voisins, peut avoir d'influence sur la composition (ou le manque de composition) de nos propres forces. Les Britanniques annoncent, pour 1939, que leur programme naval comporte, comme l'an dernier, un nouveau porte-avions. En France, notre programme 1938 en prévoit deux, qui seront mis en service, vraisemblablement, vers la fin de l'année 1941. Avec ce nouveau porte-avions, l'Angleterre pourra aligner 11 bâtiments de ce type, capables de mettre en jeu des forces aériennes fortes de 500 à 600 appareils : grosso modo, *une cinquantaine d'escadrilles. La flotte britannique, quand elle aura atteint le point culminant de sa rénovation, vers 1941/1942, comportera 2 millions de tonnes de bâtiments divers. Sur ces 2 millions de tonnes, 250.000 tonnes sont représentées par des porte-avions.*

En France, pour une flotte moderne de 700 à 750.000 tonnes, nous aurons, à cette même époque, deux porte-avions qui représentent, à eux deux, à peu près 45.000 tonnes. Le programme d'expansion de l'aéronautique navale embarquée britannique vise à atteindre 1.000 avions d'ici trois ans. Ce programme ne tient probablement aucune compte des forces aériennes de coopération navale, telles que les « Flying Boats », et les multimoteurs de reconnaissance maritime à grande distance, car ces forces, en Angleterre, sont rattachées à l'armée de l'air.

On nous a annoncé qu'en France nous aurions, à la fin du printemps prochain, plus de 300.000 tonnes en chantier, sur les cales de constructions navales. Au 31 mars 1939, si l'on en croit les déclarations du Premier Ministre britannique devant son Parlement, l'Angleterre possédera 660.000 tonnes (d'ores et déjà il y a 550.000 tonnes en chantier). C'est donc sensiblement le double de ce que représentent nos constructions neuves.

Pour un pays d'esprit aussi peu naval que l'est la France, un pays qui a toujours fait de ses frontières terrestres l'objet de ses préoccupations dominantes, il est intéressant de constater quel effort formidable nous sommes en train d'accomplir pour la rénovation de notre flotte, et ceci prouve, soit dit en passant, que notre capacité de production au point de vue naval est assez remarquable.

Que n'en est-il de même en ce qui concerne notre capacité de production aéronautique, et plus particulièrement de production d'aéronautique navale ? En effet, au terme de l'effort (si tant est que ce terme existe ?) nous nous trouverons, dans la marine, possesseurs de deux porte-avions modernes et d'une trentaine de bâtiments dotés de catapultes susceptibles de mettre l'arme aérienne en œuvre. Mais alors, qu'aurons-nous réalisé comme expansion aérienne, en ce qui concerne l'exploration à grande distance, et, d'une façon plus générale, l'éclairage continu des forces navales à la mer ? Toujours pour prendre un point de comparaison, nous constatons chez nos voisins qu'il existe, à l'heure actuelle, plus d'une douzaine d'escadrilles susceptibles d'opérer en liaison avec les forces maritimes, tout en étant basées à terre.

En dehors de ces escadrilles, l'Angleterre s'intéresse, à des titres divers (civils et commerciaux), au perfectionnement des hydravions de gros tonnages, susceptibles de rendre des services, non seulement en temps de paix, sur les lignes aériennes océaniques, mais aussi en temps de guerre, comme éclaireurs à grand rayon d'action. Pendant ce temps, nous assistons aux louables progrès des Latécoère 523 (dérivés directs du Lieutenant-de-Vaisseau-Paris*), et nous déplorons la cruelle malchance des prototypes nouveaux (tels que le Breguet qui s'est perdu, en juillet 1938, à Cherbourg), sur l'achèvement desquels nous comptions pour rénover notre flotte d'éclaireurs, composée, à l'heure actuelle, de quelques unités ! Il en résulte qu'en ouvrant l'annuaire des Flottes de Combat, on trouve pour la marine française (soit : 200 bâtiments de guerre : 700.000 tonnes) une vingtaine d'escadrilles, armées de matériel ancien ; pour l'Angleterre (380 bâtiments : 1.800.000 tonnes) près de cinquante escadrilles (dont une douzaine de grande reconnaissance) équipées actuellement et destinées à être doublées dans les deux années à venir.*

Bref, l'aéronautique navale française, quant au matériel, est de moins en moins à la hauteur de la flotte à la disposition de laquelle elle se trouve. Si encore nous pouvions entrevoir, comme chez nos amis britanniques, le jour où cet équipement se renouvellera par le jeu des programmes et l'accomplissement d'une expansion prévue et raisonnée, nous saurions prendre patience. Malheureusement, si nos programmes navals ont de quoi réjouir le cœur des marins, ils demeurent muets, ou peu s'en faut, sur les accomplissements susceptibles d'apporter enfin aux aviateurs-marins le progrès sur lequel ils sont en droit de compter. Tandis que, chez nos voisins, on a su apporter des modifications aux statuts des officiers, telles que ceux qu'intéresse plus particulièrement la branche aéronautique de la marine peuvent prétendre y faire carrière ; chez nous, bien au contraire, nous avons gardé cette méthode (si l'on peut l'appeler ainsi !) qui consiste à ratifier une sorte de pis-aller entre le métier de marin proprement dit et celui d'aviateur, ce dernier n'étant considéré qu'en tant qu'occupation de circonstances. L'aéronautique navale britannique prévoit que, d'ici quelques mois, elle sera forte de 10.000 officiers, sous-officiers et hommes. Parmi ceux-ci, il en sera un grand nombre qui seront spécialisés à vie, sans aucune autre possibilité de commandement naval. Cette mesure a eu pour effet de mettre en valeur les possibilités considérables qu'offre, de nos jours, cette activité si particulière de l'aéronautique navale.

En France, au contraire, les officiers de marine aviateurs sont toujours tenus d'accomplir des stages à bord d'unités plus ou moins navigantes, sous prétexte de reprendre contact avec le métier de marin. Les lois des cadres ne précisent guère dans quelle mesure l'aéronautique navale bénéficiera des progrès que l'on réserve aux forces navales pour lesquelles elle opère... En un mot, l'aéronautique navale, dans la marine française, continue à être la « parente pauvre », bien que la France prétende, par ailleurs à conserver cet Empire de 100 millions d'êtres, pour la sécurité duquel il importe tellement de posséder une flotte dont l'efficacité soit basée sur la mobilité et conséquemment une aéronautique navale appropriée à ses desseins.

Le budget de notre défense est trois fois moindre que le budget de l'Angleterre. Celle-ci, en 1939/1940, va dépenser plus de 100 milliards de francs, tandis que nous n'en dépenserons que trente-cinq. Mais sur ces 100 milliards, la seule aéronautique embarquée peut prétendre à une part intéressante, estimée à 3 ou 4 milliards pour l'année qui vient. Sur nos 35 milliards, que peut espérer l'aéronautique navale française ?... A peine de quoi faire vivre les avions existants, car elle a l'inconvénient d'être considérée comme indépendante (elle l'est en effet pour son utilisation...) et ceci fait que les bureaux d'études du Ministère de l'air, dont dépend la réalisation des prototypes, ne lui accordent pas un intérêt bien marqué...

Nous n'avons jamais considéré que le nombre, en valeur absolue, des avions susceptibles de sillonner les airs présentât un intérêt capital. Ce qui comptera dans le prochain conflit (conflit prolongé, *comme tout semble l'indiquer dans les pronostics que permet d'établir, dès aujourd'hui, la situation économique internationale ?) ce sera l'aviation en puissance, c'est-à-dire l'aviation que chaque nation sera capable de créer et de mettre en jeu au bout du troisième ou du quatrième mois de cette conjoncture, quand les forces, dites de première ligne, auront été, par suite des circonstances, déjà éliminées du jeu. Il ne faudrait pourtant point que cette élimination s'accompagnât de l'élimination de forces beaucoup plus précieuses, parce que plus difficiles à remplacer. L'avenir dira si la véritable économie n'eût pas consisté précisément à donner à la marine de nos jours, marine de réalisation plus coûteuse que jamais, le moyen de protéger, au mieux des possibilités aériennes, ses unités flottantes. Ce n'est certainement pas les quelques « avions d'attaque » que vont nous expédier les Etats-Unis qui nous permettront de renforcer, dans une mesure sensible, la sécurité de nos forces à la mer.*

Commandant BARGE.

S.D. TRIBUNE 3/22/39

CONSAIR GETS BIG CONTRACT;

$4,699,057 Order for Naval Planes

By JOE KNEFFLER

Receipt of an order for $4,699,057 in new planes and parts for the navy was confirmed today by Consolidated Aircraft Corp. officials.

Details Withheld

Pursuant to instructions by the navy and war departments, details of the type and number of aircraft covered in the contract were withheld.

Consolidated, on Jan. 18, was announced by the navy department to have been low bidder against several other manufacturers on a contract to construct a squadron of planes of its four-motored type, the first of which recently completed successful tests over the bay here and was flown overland to the east coast and return. Consair authorities would not state whether the planes ordered today were included in that bid.

Work under the new contract will not begin until necesasry materials are received from the east, Consair authorities stated. This may take several months, during which time there will be no additions to the 1150 employes now working on uncompleted navy contracts.

The plant employed 3800 workers at the peak of construction under contracts for building the navy's famed "flying dreadnaughts," cited as Uncle Sam's most potent long-range aerial weapon.

These seaplanes, of the PBY series, have added illustrious chapters to naval history, participating in many non-stop mass flights to Hawaii, the Canal Zone and Alaska, as well as overland to the east coast. The ships also have taken an active and successful part in the current Caribbean war games.

Meanwhile, Consair authorities vehemently denied published reports that they are developing for the navy a super flying boat capable of flying 12,000 miles non-stop at 350 miles an hour.

Rumors of the "secret" craft have been current for some time. Consolidated officials have admitted they are building a plane, as a private, speculative venture, but have released no information on its specifications.

According to the rumors and published reports, the new air giant would utilize two 2000-horsepower gines, secretly developed for the avy by Pratt & Whitney at Hartrd, Conn.

Could Fly to China

Its 12,000-mile range would enable to fly non-stop from San Diego China and back to Midway island. s reported speed would be more an double that of the 150-mile-an-our Pacific clippers. Its nearest ompetitor in performance would be e new Boeing super-clipper, degned for the Atlantic and Pacific ervices. This ship reportedly will ruise at 170 miles an hour and will e able to fly 5000 miles non-stop r 7000 miles with extra fuel tanks.

According to one rumor, the Conolidated super-plane will be ready or its first flight within 60 days.

Maj. Reuben Fleet, Consair presient, yesterday protested a 3 perent sales tax levied by the state oard of equalization against planes anufactured by his firm.

"There is no other state that imoses such a tax against manucturers building planes for the overnment," said Fleet. "We are ot selling anything in California. uch a procedure is unfair." He id the tax is an "unfair handicap" competing with plane builders other states.

$14,000,000 NAVY CONTRACTS DUE FOR CONSOLIDATED; FIRST AWARD, TOTALING $4,699,000 RECEIVED

S. D. UNION 3/23/39

First of a series of navy contracts which by midsummer, it is reported, will exceed $14,000,000, the navy department yesterday awarded a $4,699,000 contract to Consolidated Aircraft Corp.

Under a new national defense policy adopted by the government the exact type of planes to be built was not revealed. It is known, however, that the navy plans the expenditure of more than $40,000,000 during the fiscal year 1939-40 in the construction of new type long range patrol bombers, twin-engined and four-engined, as additions to its patrol wings based on the Pacific, Atlantic and Hawaii.

Although Consolidated officials are pledged to secrecy, it is believed the contract awarded yesterday is only the forerunner of additional contracts that will keep the huge Lindbergh field plant operating at top speed for at least three years and possibly four.

3-YEAR OPERATION SEEN

Maj. R. H. Fleet, president of Consolidated, announced yesterday that no new men will be added to the present force of 1100 until material for the new planes starts arriving at the factory this fall. He said several months will be required for eastern manufacturers of raw material to effect delivery because of the tremendous construction program now being carried out in aircraft factories throughout the U.S.

PBY SHIPS DELIVERED

The contract came on the eve of Consolidated's last delivery of 209 twin-motored bombers of the PBY type to the navy. Only three of these ships are now in the shops receiving minor modifications before being sent to North Island.

Consolidated recently submitted the lowest bid for the new four-engined long range bombers which the navy is planning to add to its sky fleets. Consolidated's chief competitor for this type of plane was Igor Sikorsky.

CONSOLIDATED GIVEN $4,699,057 NAVY JOB

Order Believed For 4-Motor Craft; Number, Type Held Confidential

By **HAROLD KEEN** S. D. SUN 3/22/39
Navy Editor

Consolidated Aircraft Corp. today was awarded a $4,699,057 contract for the construction of airplanes and parts, the number or type of which was ordered kept secret by the Navy Department.

It was believed, however, that the order was for four-motored bombers similar to the airboat which last year spanned the continent non-stop twice and has been in engineering and building stages more than three years. The experimental prototype plane required an expenditure of more than $1,000,000, shared by the Navy and Consolidated.

There was also the possibility that the contract might be for advanced two-motored bombers, on which confidential bids were opened in Washington several weeks ago.

Consolidated officials were notified in a letter from Capt. John H. Towers, assistant chief of the Bureau of Aeronautics that the number and specific classifications of planes procured through confidential or restricted bids must not be revealed, inasmuch as this is information relating to a vital feature of national defense.

MORE CONFIRMATION

Announcement by Consolidated today that no new men would be employed for several months until necessary material for fabrication of the planes is received from the East bore out the assumption that the contract was for the four-motored bombers on which the Navy had sought estimates up to a maximum of 15 ships. Consolidated was the low bidder against its only competitor, Sikorsky Aircraft Corp. of East Hartford, Conn.

In a statement to The Sun Jan. 19, Maj. Reuben H. Fleet, Consolidated president, pointed out that even if a contract for the four-motored planes was obtained, it would require four to six months to obtain the specialized material for the 25-ton craft.

EQUIPMENT IN

For the past few months, Consolidated has been installing drop hammers and hydraulic presses larger than any of their type in the country. This equipment will enable the firm to fashion most of the pieces formerly shaped in sub-contracts let to other aircraft concerns and will cut down the man-hours per plane by eliminating the need for thousands of rivets.

At present there are approximately 1100 men employed in the Consolidated plant, less than one-third the peak of 3600 workers on the company's payroll in 1937. Consolidated's backlog has dipped below the $2,000,000 mark, it is believed. At one time there was $13,000,000 worth of unfinished business on the concern's books.

WORK WAS SLACK

Its last contract, for 33 two-motored Navy PBY-4 bombers, obtained more than a year ago, rounded out production on a total of 209 planes and parts that has kept the factory humming since it moved to San Diego from Buffalo in 1935. Virtually all of the planes in the last PBY-4 contract have been finished and delivered.

The four-motored experimental plane, which recently was officially accepted by the Navy, has been in the plant receiving minor changes recommended by the trial board which inspected it.

Considered the most powerful Navy bomber in the world, the XPB2Y-1, as it is known in the service, was launched Dec. 17, 1937, in San Diego harbor. It is powered with four 1050-horsepower engines, has a wingspan of 115 feet and a cruising range of more than 4000 miles. Top speed is more than 200 miles an hour and cruising speed is in excess of 150 miles.

'WONDER' PLANE REPORTS DENIED

Consolidated Aircraft Corp. officials today denied reports the firm is secretly building the world's "most formidable, fastest, longest-range oceanic aircraft" able to fly 12,000 miles non-stop.

Statements in The Los Angeles Times quoting "informed sources" announced that the plane, powered with 2000-horsepower engines, was under construction for the United States Navy and would be ready for its first flight in about 60 days.

360 M. P. H.

The reports claimed that this "miracle plane" might attain a maximum speed of 360 miles per hour and its range would enable it to fly without refuelling from San Diego to China and back to Midway Island—an almost unbelievable performance, as judged by present standards of heavier-than-air craft.

Consolidated officials were quoted in The Times as stating they were building the plane for themselves—not the Navy.

Maj. Reuben H. Fleet, president, today admitted that experiments are continuously under way with new equipment.

"But we are not developing such a plane," he said. "I only wish we had a plane capable of such performance."

NOT SO LARGE

Despite its speed and range, the plane, according to the reports which have been contributed by Consair executives, will be smaller than the new Boeing clippers, two of which have stopped overnight in San Diego enroute to trans-atlantic service out of Baltimore.

The Times claimed the airboat's wingspan was 140 feet, and the ship was 75 feet from nose to tail. Its weight would be about 35,000 pounds.

FLEET PROTESTS PLANE SALES TAX

If Consolidated Aircraft Corp. must pay a 3 per cent state sales tax on its planes, a severe handicap will be imposed on the concern in its competitive bidding for contracts against concerns not subjected to such a levy, Maj. Reuben H. Fleet, president, declared today.

"We will never get any business if we have to compete with out-of-state manufacturers under such conditions," he said.

It was reported that the State Board of Equalization had ordered such a tax imposed.

'Frontier Days' Dance Arranged By Aero Club

"Spirit of Frontier Days" has been chosen as the theme for the public dance tomorrow evening at 8:30 in the Pompeiian room, Hotel San Diego, by the aviation colony of city and county. Some 500 persons are expected to fill that cleverly decorated room for the affair, dressed in costume suggestive of the evening's topic. Proceeds are designed to benefit aviation promotion.

The party is given under auspices of the Aero club of San Diego, a chapter of the National Aeronautic association, working with aviation committees of the chamber of commerce and the junior chamber of commerce. Other organizations assisting are San Diego Flying club, Women's National Aeronautic association, Sheriff's Aero squadron, Air Corps Reserves and the Glider clubs.

On the reception committee with Phil Sharp, general chairman and Earl Prudden, Aero club president, and his board are the following committee heads of the various organizations and their wives: Messrs. and Mmes. Ted Starke, Jackson Hicklin, William Van Dusen, Thomas Bomar, Ed Price, T. C. Ryan, W. G. Waterbury and R. S. Fleet.

OCEAN FLIGHT CREW READY

Consolidated Airboat To Survey Route

S.D. SUN 3/28/39

Aviation

The American Export Airlines flight crew for a Consolidated airboat to be used in trans-Atlantic survey flights this summer has assembled in San Diego and soon will pilot the 13-ton plane across country to its New York base.

Arrival yesterday of First Officer T. S. Terrill completed the group of six men now at the Consolidated plant making final arrangements for the cross-country hop in April. Others in the flight personnel are Capt. P. J. Byrne, chief pilot; M. J. Doyle, second officer and flight engineer; R. V. Carlson, third officer and assistant flight engineer; William Ehmer, radio operator; and E. Stuhrman, radio engineer.

TEST FLIGHTS

Test flights have been made in the plane, a de-militarized replica of the Navy's twin-engined PBY-4 ships, during the past few weeks, and a motion picture company recently used it in the filming of scenes at the Coast Guard ramp on Lindbergh Field.

On the granting of an airworthiness certificate by the Civil Aeronautics Authority, the plane will be taken across country, probably following the same route as the two 74-passenger Pan-American clippers took on leaving San Diego recently—via Galveston and New Orleans.

Five or six round-trip survey flights across the Atlantic are planned this summer, Capt. Byrne said. The probable route will be from Boston to the Azores, then to Lisbon, Portugal; and Bordeaux and Marseilles, France. On the return trips, an air track from Ireland or the Azores to Newfoundland will be followed.

AIDED BY SHIPS

In competition with Pan-American Airways, American Export Airlines will have the advantage of cooperation from 18 steamships of the parent company, American Export Lines, plying between the east coast and Mediterranean and Black Sea ports. These ships will serve as floating weather stations, giving periodic reports to the ocean-spanning plane.

The experimental work has been financed at a cost of $450,000, with about $200,000 spent on the airboat alone.

American Export Airlines has manifested interest in Consolidated's four-motor plane for use when regular passenger and mail service is undertaken. The smaller PBY-type ship carries too small a payload to make trans-Atlantic operation profitable.

UNIT'S POSITION STRONG

By Louis F. Holtzman

SAN DIEGO—Award by the Navy Department to Consolidated Aircraft Corp. of a contract for planes and parts amounting to $4,699,000 should enable the company to maintain a fair rate of operations during the coming months. The company's backlog now is probably in the neighborhood of $7,000,000.

While excellent from the viewpoint of earnings, 1938 produced only a small amount of new business for the company, although it carried over into 1939 with good prospects for replenishment of its backlog. Unfilled orders on December 31, 1938, had dwindled to $2,796,881 and have since been depleted further by delivery of Navy craft, no new orders having been received this year until the present award. As against deliveries of more than $12,000,000 last year, new orders received approximated only $1,000,000.

Consolidated currently is completing its order from the Navy for the PBY model two-engine patrol bomber, and commercial business at the moment is conspicuous by its absence.

PBY Performance Satisfactory

Performance of the PBY models, which have been under delivery to the Navy for three years, has been eminently satisfactory. Several months ago 48 of these planes completed a mass flight from San Diego to Coco Solo, approximately 3,000 miles.

While details of the present Navy award are not revealed, Consolidated earlier this year was low bidder in competition with Sikorsky on a Navy call for a large four-engine flying boat similar to a type turned out previously. A minimum of six of this type was specified, with the indication that up to 15 could be ordered by the Navy.

While the major part of Consolidated's business last year was consigned to the Navy Department, observers believe that the company should be solidly in the running in connection with the rearmament program.

Company Prepared for New Orders

With one of the most modern aircraft manufacturing plants in the country, with experience and trained construction and engineering personnel, the company is in excellent shape to get into production with minimum loss of time on any new business either for the Army or the Navy Department. It is recalled that in 1936 Consolidated turned out for the Army a fast pursuit ship, which, judged even by current standards, could make an imposing showing.

Consolidated Aircraft sales last year reached a new record at $12,425,067, with a profit ratio to sales of 12.2%. This compared with $11,907,493 in 1937 when profit margin was only 4.1%.

Net profit after all charges, for 1938 was $1,535,110, equivalent, after preferred dividends, to $2.25 a share on 574,760 common shares outstanding. Net profit in 1937 was $462,959, or 68 cents on common.

During 1938, Consolidated made noteworthy progress in building up its cash position. On December 31, 1938, current assets totaled $5,225,715, of which $3,586,478 was cash, as compared with total current assets of $2,875,707 at the close of 1937. Year-end current liabilities, respectively, were reported at $1,554,491 and $464,919.

S. D. FIRM TO BID ON ARMY PLANES

Consolidated Asks For Specifications

S.D. SUN 3/29/39

Aviation

Consolidated Aircraft Corp. plans to bid on contracts for Army planes in the near future, and has applied for specifications on which to base its estimates, it was revealed today by officials of the concern.

The disclosure was made on the heels of an announcement by the contracting officer of the Air Corps Material Division, Wright Field, Dayton, O., that bids on a maximum of 4150 planes, from small training ships to four-motored bombardment planes, will be opened July 5 to 8.

TALKED WITH ARMY MEN

Consolidated's intentions to depart from its program of the last few years of concentrating on Navy airboat work were made known recently when it was reported that several high-ranking officials of the firm had spent some time at Wright Field in conference with Army men.

Consolidated last week obtained a $4,700,000 contract for Navy patrol bombers, with construction to get under way in four to five months, on receipt of necessary materials from eastern factories.

BIDS ADVERTISED

The Army Air Corps, about to embark on its greatest expansion since the World War, is advertising for bids on the following planes, with maximum number mentioned:

Four-engined bombardment, 250; two-engined bombardment, 700; advanced training, 500; primary training, 1000; basis training, 1000; multiplace fighter, 100; observation, 400; twin-engined pursuits, 200.

Consair Will Get Total Of $14,000,000 Navy Contracts Soon

The first of several contracts which by midsummer will exceed $14,000,000, was awarded to the Consolidated Aircraft Corp. last week by the U. S. Navy which kept rigid silence as to the type of planes ordered.

The initial order was for $4,699,000 worth of airboats, believed to be for some of the new type long-range bombers.

This will considerably stimulate industry in this section, but Maj. R. H. Fleet made it plain his company cannot expand in the twinkle of an eye, and that no new workers to the present force of 1100 will be taken on for some time.

S. D. Firm May Bid On Army Planes

S.D. UNION 3/30/39

With Maj. R. H. Fleet, president, presiding, the anual meeting of Consolidated Aircraft Corp. directors was held yesterday at the Lindbergh field plant. Financiers from the east attended, according to a report.

Officials announced Consolidated is considering bidding for a part of the 4100 planes on which the army will open bids at Washington July 5. These planes will range from training ships to huge four-motored long-range bombers.

Consolidated last week received a contract of $4,699,000 for navy bombers. Production is expected to start early this summer.

Seaworthy Sensation: New Navy Plane Is Developed for Rough Water Landing

Though the Navy's scouting seaplanes take off by catapult from the decks of warships, they must land in the ocean. Consequently, seaworthiness is a problem that must be licked if the "eyes of the fleet" are not to remain closed during rough weather.

Last week, naval officials were so pleased with the seaworthiness of a new observation plane that they released spectacular pictures of its battles with big waves in tests some weeks ago—though they remained tight-lipped concerning its speed and other performance data. Developed in the Navy's Philadelphia aircraft factory, the ship has been accepted and designated the SON-1. Contracts for its manufacture probably will be let to successful bidders among commercial manufacturers.

The Caribbean fleet maneuvers proved the performance of another Navy plane. A big patrol ship spying on the attacking fleet, it flew over its objective at 15,000 feet for 30 hours and returned safely with nothing left in its fuel tanks but fumes.

PBY

Archbold Plans Hop Over Africa On Flight to U. S.

S.D. UNION 4/3/39

Famed Lake Victoria in British East Africa will be visited by Richard H. Archbold, associate director, American Natural History museum, on his proposed flight from Onslow, Australia, to the African coast, it was learned here yesterday.

Flying his $250,000 Consolidated-built seaplane, named the Guba, Archbold plans to return here in September after an air voyage that will take him over the Indian ocean, the African continent, the south Atlantic, and nonstop from Miami to San Diego.

Archbold will leave the American Natural History museum expeditionary base at Hollandia, Netherlands New Guinea, May 15, for Australia. He will take off from Onslow in June for Mombasa, Africa, on a trail-blazing flight for the British government.

From Mombasa the Guba will fly to the British Imperial airways' base at Kisumu on Lake Victoria. The next leg of his 20,000 - mile homeward voyage will take him to Uganda, across French equatorial Africa to Lagos, Niegra, and over the Gold coast to Dakar, Senegal.

From Dakar the Guba will wing its way over the South Atlantic to the Azores and thence to the Gulf of Mexico.

S.D. UNION 4/5/39

Consair Calls Back Tool, Pattern Crew

Donald Frye, personnel director of Consolidated Aircraft Corp., announced yesterday that a small group of tool makers and pattern makers who were laid off recently at the Lindbergh field plant have been called back to work.

"Although we have received a navy contract for new planes it will be several weeks before material begins arriving and we can proceed with production," Frye said. "For this reason, no steps will be taken to expand the company's present force at this time."

'Forgotten' Bomber Just Flew And Flew 'Til Gas Ran Out!

The strange tale of a San Diego Navy patrol bomber "overlooked" by its dispatching officers in the recent Caribbean war games was revealed here today.

The airboat was sent from its base at San Juan, Puerto Rico, to scout for the attacking White Fleet and report its movements to the defending force.

After climbing to 15,000 feet, the ship flew east and located the "enemy" far at sea, meanwhile remaining undetected at its tremendous altitude. For hour after hour reports of the fleet's position were sent back to the Patrol Wing One headquarters.

When darkness came, the crew began to get fidgety. They apparently had accomplished their mission, yet had not been recalled. They could not understand it, but in the Navy one has but to follow orders, and there were no orders to return.

So the giant bomber patiently kept on the trail of the "enemy." There may have been a limit to the memory of the officers at the base, but the gasoline supply could not last forever.

Thirty hours after taking of and with the tanks virtually dr the craft and its exhausted cre came back to San Juan—having flown more than 3000 miles.

And the crowning touch of irony came when, after returning from one of the most sensational non-stop patrol flights ever made in simulated war conditions, the plane commander was asked:

"Where have you been?"

They apparently hadn't even missed him!

The story, being circulated freely on North Island and in the Consolidated Aircraft Corp. plant here, does not reveal the identity of the fliers, although the plane is reported to be one of the ships flown non-stop from San Diego to the Canal Zone last January.

CONSAIR BOATS BUILT TO 'TAKE IT' IN HARD LANDING ON ROUGH SEA

EVENING TRIBUNE 3/24/39

The marked difference in structural requirements of land planes and seaplanes is discussed in the following article appearing in the current issue of Consolidator, monthly publication of Consolidated Aircraft Corp.:

While it is designed to take tough loadings, as everyone knows, the landplane nevertheless is designed for, and accustomed to, landing on an airport of reasonable smoothness. It is not designed for landing on, and definitely not designed for landing into, a mountainside . . . not with any degree of alacrity at least. The flying boat, while probably it will not be called upon throughout its entire life to alight upon "fields" other than those relatively smooth as those of the landcraft, nevertheless is designed to take a whambaming into mountains of water, and a rough water test is a thorough proof of its ability to take just such treatment.

No Chance To Pick Spot

In these tests the plane does not have the normal advantage of easing down onto the surface of the water by encountering it at a very slight angle. There are waves and groundswells to contend with, and these become mountains in both substance and feel, as the speed of the flying boat increases. The landings and take-offs must of course be made into the wind and nature generally arranges for the wind to cross and augment the action of the swells and waves. At the very moment of landing, a touch on the far stern of a boat on the crest of one wave may have the tendency of forcing the boat to plow its nose with the full force of its momentum into the next coming swell.

In our normal encounter with water we are apt to feel that it will yield the right of way to our inclinations with little resistance. And this it does, but as the speed with which we wish to push it aside increases, so does its tenacity for remaining "as is." The inertia of a small drop of water to the speeding vanes of a steam turbine will shatter the steel blades, so violent does this action become at very high speeds. Thus, but to a lesser extent than that of the turbine blades traveling at perhaps 400 miles per hour, the landing seaplane in the particularly severe rough water testing of its worthiness, takes what might be likened to a slide down a full flight of stairs on the seat of the trousers.

Several sound smacks of solid water on the hull are to be expected before the plane can make a take-off during one of these tests, and a similar number as it again comes to rest. The rough water test proves the flying boat fully capable of a tilt with open water at its most cantankerous, ready to take normally rough conditions with the greatest ease.

The essential difference between the land and sea craft in basic structural requirement is that the landplane has its landing loads somewhat conveniently concentrated in the three points of the landing gear, and normally receives the loads through these points only. The seaplane, however, is apt to have the full brunt of a blow in maneuvering on rough water delivered to it from almost any quarter, highly loading that particular vicinity and throwing, likely as not, a strong wrenching twist to the whole hull and structure. The seaplane just naturally has to be tough all over, the landplane in concentrated spots.

FORGOTTEN BOMBER JUST FLEW AND FLEW

S.D. SUN 4/5/39

The strange tale of a San Diego Navy patrol bomber "overlooked" by its dispatching officers in the recent Caribbean war games was revealed here today.

The airboat was sent from its base at San Juan, Puerto Rico, to scout for the attacking White Fleet and report its movements to the defending force.

After climbing to 15,000 feet, the ship flew east and located the "enemy" far at sea, meanwhile remaining undetected at its tremendous altitude. For hour after hour reports of the fleet's position were sent back to the Patrol Wing One headquarters.

When darkness came, the crew began to get fidgety. They apparently had accomplished their mission, yet had not been recalled. They could not understand it, but in the Navy one has but to follow orders, and there were no orders to return.

So the giant bomber patiently kept on the trail of the "enemy." There may have been a limit to the memory of the officers at the base, but the gasoline supply could not last forever.

Thirty hours after taking off and with the tanks virtually dry, the craft and its exhausted crew came back to San Juan—having flown more than 3000 miles.

And the crowning touch of irony came when, after returning from one of the most sensational non-stop patrol flights ever made in simulated war conditions, the plane commander was asked:

"Where have you been?"

They apparently hadn't even missed him!

The story, being circulated freely on North Island and in the Consolidated Aircraft Corp. plant here, does not reveal the identity of the fliers, although the plane is reported to be one of the ships flown non-stop from San Diego to the Canal Zone last January.

Consolidated Gets Navy Order for Nearly Five Million Dollars—Notes

U. S. Air Services April 1939

WHILE NO DETAILS were released by the Navy Department as we went to press, yet the concrete fact emerged that Consolidated Aircraft Corporation, San Diego, Calif., had been awarded on March 22 an order for airplanes and spare parts, in the sum of $4,699,057.62.

We shall look forward with pleasure to giving our readers many details pertaining to the manufacture of new airplanes on this large contract.

Consolidated Lowest of Eight Bidders On Group Production of Army Planes

S.D. TRIBUNE ~~4/18~~ 4/18/39

Consolidated Aircraft Corp., of San Diego, today was named by United States army corps engineers as lowest of eight bidders on a project for constructing attack bomber planes in the government's program to boost the army air corps planes to between 5500 and 6000 during the next two years.

The Consolidated bid was for $585,000 if a single plane were built and $48,951 per plane if 1000 planes were built, The Associated Press reported from Dayton, O.

Bids for the attack bombers ranged from $1,225,000 for a single plane, submitted by Lockheed Aircraft Co., to Consolidated's $48,951 for each on a 1000-plane order. Two firms, Bell Aircraft Co. and the Douglas Santa Monica division, turned in lower bids than Consolidated on single planes, but fell short by several thousand dollars of the Consolidated group bid.

The San Diego aircraft firm's low bid on the army planes was announced less than a month after Consolidated was awarded a $4,699,000 contract for new navy planes. The navy contract, awarded March 22, came on the eve of Consolidated's last delivery of 209 twin-motored bombers of the PBY-type to the navy. Maj. Reuben H. Fleet, Consolidated president, announced at the time that no new men would be added to the existing force of 1100 until material for the new planes starts arriving at the factory here this fall.

Pledged to Secrecy

Pledged by the government to secrecy, Consolidated officials today could make no statement on either the army or navy planes, either as to design, type or number. The navy, however, is understood to be planning to increase its twin-engined long-range patrol planes and to construct several 4-engined patrol planes. The army, in a report from San Francisco headquarters of the ninth corps area, plan new 4-engined bombers as well as twin-engined attack bombers of the monoplane type, each weighing from 8½ to 9 tons.

When the Consolidated Aircraft Corp. factory was moved to San Diego from Buffalo, N. Y., in 1935, the firm was working on an order of 50 PB-2A army pursuit ships of the two-seater, low-wing type.

The list of bids announced today from Dayton, on the basis of one plane and the price per plane if an order of 1000 were placed, is as follows:

Consolidated Aircraft Co., San Diego, $585,000 and $48,951; Curtiss-Wright Corp., Buffalo, N. Y., $878,385 and $89,940; Glenn L. Martin Co., Baltimore, $950,000 and $64,000; Bell Aircraft Co., Buffalo, $504,000 and $78,000; Lockheed Aircraft Co., Burbank, Calif., $1,225,000 and $75,540; North American Aviation Corp., Inglewood, Calif., $760,000 and $58,190; Douglas Aircraft Corp., El Segundo, Calif., $742,000 and $55,623, and Douglas Santa Monica division, Santa Monica, Calif., $207,500 and $56,000.

Consair Bids Low on Order Of 1000 Planes

S.D. UNION 4/19/39

With a bid of $585,000 for a single new-type army bomber and $48,951 a plane if the company received a contract for 1000 war planes of this type, Consolidated Aircraft Corp. submitted the lowest proposal of eight bidders, The Associated Press reported from Dayton, O., yesterday.

Bids were opened by army air corps engineers at the experimental plant at Wright field, Dayton.

Proposals for the attack bombers ranged from $1,225,000 for a single ship, submitted by Lockheed Aircraft Co., to Consolidated's $48,951 each on a 1000-plane order.

The Associated Press reported Bell Aircraft Co. and the Douglas plant at Santa Monica submitted lower bids than Consolidated on single planes but were much higher on the group proposal.

HUGE PROGRAM PLANNED

The Curtiss-Wright Corp., Buffalo, was second lowest in both categories with $878,385 for a single plane and $89,940 for each ship of 1000 or more.

The war department recently announced its plans to expend $600,000,000 in the next fiscal year in the construction of about 6000 planes of all types.

Consolidated recently received a $4,699,000 contract for a sqaudron of new, four-motored long-range bombers for the navy. Production on these ships is to be started this summer.

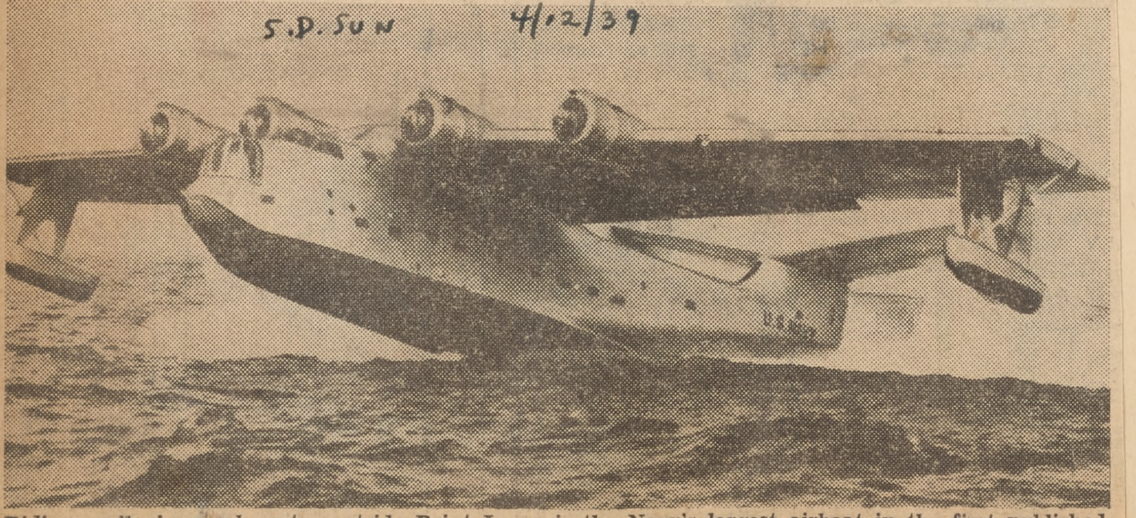
HIGH SPEED POSSIBLE

The army's bombers, in contrast to the navy's 30-tonners, will weigh nine tons but the lighter planes will be faster and will have a greater cruising range.

Consolidated officials explained that as in any manufacturing plant, it would be cheaper to produce planes in quantity than a single one, as dies and other machinery are as essential for one plane or for 1000. The greater the production the lower the unit cost, they said.

Biggest Airboat Breasts' Rough Waters

S.D. SUN 4/2/39



Riding easily in rough water outside Point Loma is the Navy's largest airboat in the first published photograph of a takeoff of this nature. Production of an unrevealed number of these 25-ton four-motored craft will be started by Consolidated Aircraft Corp. in about three months. The San Diego plant must wait for necessary materials from eastern factories before it can begin work on a recently awarded $4,700,000 order.

S.D. SUN 4/18/39

BULLETIN

Consolidated Aircraft Corporation today submitted a low bid of $585,000 for a single plane, and 1000 planes at $48,951 each, as bids were opened by the U. S. Army Air Corps, the United Press reported from Dayton, O.

18 NAVY PLANES DUE NEXT WEEK

Amphibians To Return From War Games

S.D.SUN 4/7/39

National Defense

Preceding 36 San Diego Navy bombers by more than a month, 18 utility amphibian planes of Squadron VJ-1 will return here from the Caribbean war games next week, weather permitting, North Island officials announced today.

The planes — 10 long-range Sikorskies and eight old-type Grummans, commanded by Comdr. Allan Price — are scheduled to leave Guantanamo Bay, Cuba, Monday on a transcontinental trip expected to take them two days.

GUARDED BY SHIPS

The 36 Consolidated airboats of Squadrons VP-7, VP-9, and VP-11, will leave Norfolk May 18 and will proceed to Pensacola and the Gulf of Fonseca, Nicaragua, before heading up the west coast to San Diego. They will be guarded by only two destroyers, stationed off the west coast of Mexico, according to present plans. About three days will be required for this flight.

Squadron VP-12, whose 12 planes were in the original group of 48 that flew non-stop from San Diego to the Canal Zone last January, will be permanently based in Norfolk. Succeeding this unit in San Diego will be Squadron VP-18, formerly of Pearl Harbor.

OCEAN HOP IN JUNE

Next trans-Pacific mass flight — of Hawaii's Patrol Squadron One, which has been in training at North Island for several months — will occur June 28, with approximately 14 PBY-4 ships, Consolidated's most advanced two-engined type, to make the hop.

Capt. Marc Mitscher, commander of Patrol Wing One, will lead the 36-plane flight from Norfolk, it was reported. He is due to become the next assistant chief of the Bureau of Aeronautics in Washington, D. C.

GUBA TO FLY TO AUSTRALIA

Archbold Plans Flight May 15

S.D.SUN 4/7/39

Aviation

Richard Archbold, millionaire scientist-aviator, will pilot his San Diego-built Consolidated airboat Guba from Netherlands, New Guinea to Australia, between May 15 and 20, then across the Indian Ocean to Africa, it was learned here today.

The flier, who has been leading an American Museum of Natural History expedition in the New Guinea jungles since last June, when he and a five-man crew flew the Guba from San Diego via Honolulu and Wake Island, is in constant communication with Barney F. Boyd, local amateur radio operator.

RARE SPECIMENS

The plane has been used to transport personnel, and tons of supplies and equipment from Hollandia, on the seacoast, to the scientists' base camps in the interior. Rare specimens for the museum in New York have been brought out of the jungles by the Guba, which has flown more than 100,000 miles in the past 10 months.

Mr. Archbold has decreed a vacation for members of the expedition next fall, and expects to return here in September to have the big airboat overhauled at the Consolidated plant.

SURVEY FLIGHT

After a month's stay in Sydney, conferring with aviation representatives of the Australian government, which is chartering the Guba to survey a commercial flight route to Africa, the plane will go to Onslow, on the west coast, and take off for Mombasa, Africa, via several islands in the Indian Ocean, including Cocos, Diego Garcia, and Seychelles. This will be the first flight of a seaplane across this water body, according to Consolidated officials.

From Mombasa, the Guba will be flown to San Diego in a leisurely itinerary.

S. D. FIRM PLANS ARMY AIR BIDS

Consolidated Studies Plane Specifications

S.D.SUN 4/14/39

Plane Manufacture

Consolidated Aircraft Corp., may bid on all but one of the eight types of planes on which the Army Air Corps is asking U. S. manufacturers to submit estimates, company officials disclosed today.

They emphasized, however, that no decision has been reached as to exactly which craft they will bid on, with studies of specifications still under way. The estimates will be opened at Wright Field, Dayton, O., July 5 to 8.

TRAINING PLANE

The one type on which the San Diego firm positively will not compete is the primary training plane. It was revealed that Consolidated has just sold all its primary training plane designs and construction rights to the Brewster Aeronautical Co., east coast firm now building the Navy's fastest fighting planes.

Although Consolidated has not built any such craft for five or six years, their engineering is not out-of-date even now, it was pointed out. For the Army, the company built P2's and for the Navy NY trainers.

BIDS ON BOMBERS

The Army is seeking bids on four-engined and two-engined bombers, basic and advanced trainers, multiplace fighters, observation ships, and twin-engined pursuits, as well as the primary trainers.

With a tremendous increase in Army planes authorized, the Air Corps personnel must be more than doubled within the next two years, it was pointed out today. The present strength of 19,408 men must be boosted by approximately 25,000 men, resulting in a large number of promotions among non-commissioned officers for the many responsible duties in the enlarged force.

S.D. Union 4-17-39

Australia Envoy To Make Flight With Archbold

Word that a representative of the Australian government will accompany him on the trail-blazing flight from Onslow, Australia, to Mombassa, British East Africa, was received here yesterday from Richard H. Archbold, associate director of the American Museum of National History.

Archbold, now at Hollandia, Netherlands, New Guinea, on a scientific mission for the New York museum, reported he plans to abandon his advance base at Lake Habbema May 1. He will leave Hollandia in his $250,000 San Diego-built "flying laboratory" for Sydney, Australia, May 5. Ten days later he will take off from Onslow for the flight to Mombassa.

Archbold is said to have chartered his Consolidated-built plane to Imperial Airways of Great Britain for charting a new airway between Australia and Lake Victoria in Africa. En route to Mombassa and Lake Victoria he will touch at famed Cocos islands.

From Lake Victoria Archbold will return to San Diego via Lagos, Dakar, St. Thomas in the West Indies and Miami. He plans to arrive here July 15.

LOW BID FILED BY S. D. FIRM

Consolidated Seeks Army Contract At 48 Million

4/19/39

Read Maj. Al Williams— Page 12. S.D. SUN

Consolidated Aircraft Corp. of San Diego submitted the lowest bid of $48,951,000—$48,951 per plane—for construction of 1000 attack bombers for the Army Air Corps, the United Press reported.

Bids of eight manufacturers were opened yesterday in Wright Field, Dayton, O., with estimates ranging from cost of one plane to that for 1000. Consolidated's bid for a single prototype craft was $585,000, with this sum appreciably decreased in lots of 10 additional planes up to 1000.

Only a month ago, Consolidated was awarded a $4,700,000 contract for construction of Navy patrol bombers, believed to be the four-engined type which has been test flown in San Diego for 16 months.

The attack bomber, new to the United States, is one of the fastest of fighting planes, capable of speed approaching 400 miles per hour. Types of it have been used by European nations for several years and American military experts now concede it to be one of the most important flying weapons. It is used for attack upon ground troops and carries a light load of bombs as well.

BUILT BY DOUGLAS

A large number of these ships are under construction by Douglas Aircraft Corp., Santa Monica, for the French government. Four prototype planes already have been built, by North American, Martin and Stearman, in addition to Douglas. The North American and Douglas craft were demolished in recent crashes on test flights.

The Army Air Corps will be ultimately expanded to 6000 planes in the new defense program. Consolidated, which has concentrated on Navy work for the past three years, is studying specifications for seven other types of planes, on which bids will be opened in Wright Field July 5-8.

OTHER BIDS

The single and 1000-plane bids of other firms on the attack bomber follow:

Curtiss Wright Corp., Buffalo, $878,385 and $89,940.

Glenn L. Martin Co., Baltimore, $950,000 and $64,000.

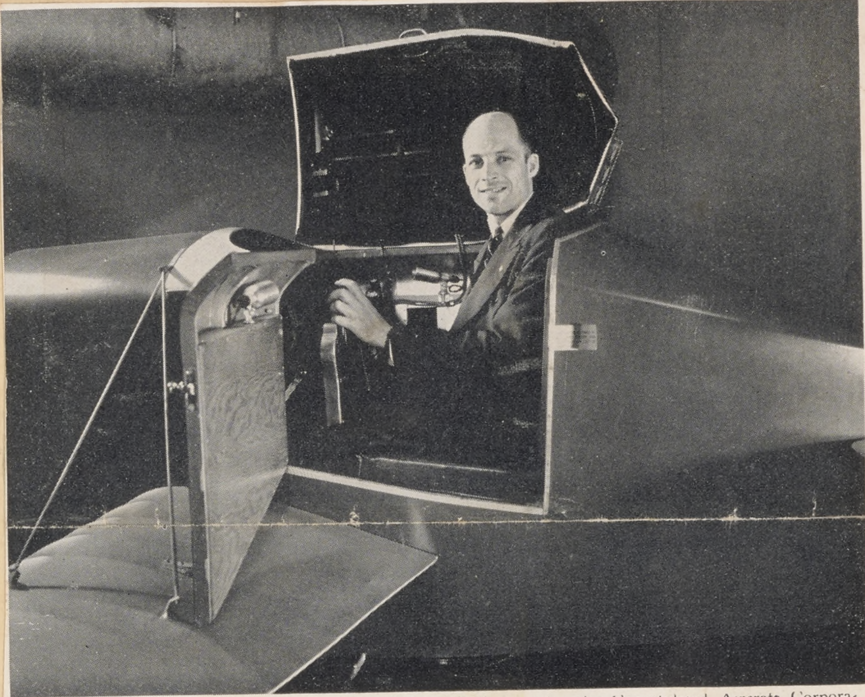
Bell Aircraft Co., Buffalo, $504,000 and $78,000.

Lockheed Aircraft Corp., Burbank, $1,225,000 and $75,540.

North American Aviation Corp., Inglewood, $760,000 and $58,190.

Douglas Aircraft Corp. El Segundo, $742,000 and $55,623.

Douglas Aircraft Corp., Santa Monica, $207,500 and $56,000.



WILLIAM B. WHEATLEY, Chief Test Pilot and Service Manager for the Consolidated Aircraft Corporation for the past ten years, pauses a moment before lowering the hood for a lesson in instrument and radio beam flying in one of Boeing School's Link trainers.

Consolidated's Chief Test Pilot Impressed With Boeing Training

Boeing School News - Number 4, 1939

William B. Wheatley, chief test pilot and service manager for the Consolidated Aircraft Corporation of San Diego, California which builds large, two-engined and four-engined flying boats for the U. S. Navy, recently completed the Instrument Rating Course at the Boeing School of Aeronautics.

"The importance of being able to fly and navigate across continents and oceans with the use of instruments and radio is now recognized, as it is seldom possible to go such great distances in one general direction without encountering at least a patch of weather where use of such equipment is absolutely necessary. Test pilots make their routine test flights usually in fair weather, but frequently such pilots participate in long demonstration or delivery flights. For example I flew as pilot with a squadron of Navy patrol bombers from San Diego to Hawaii in 1937, later the same year flew from San Diego nonstop to New York City and again to Miami, while in 1938 I flew as one of the pilots in the four-engined Consolidated Navy Patrol Bomber from San Diego to Washington, D. C., and later returned to San Diego, nonstop."

"I took advantage of a lull in test flying to come to the Boeing School of Aeronautics and take the same advanced flying work which is given to students training for airline pilot jobs, United Air Lines' pilots, and to some of Pan American Airways' flying personnel. *I believe it to be the most up-to-date and best training obtainable. I am heartily pleased with the quality and thoroughness of the training I have received at Boeing School and cannot speak too highly of it.*"

Wheatley is now thirty-six years of age. He was born in Chester, New York in 1902, exactly one year to the day prior to the Wright brothers' first flight at Kitty Hawk.

Wheatley took examinations for appointment as flying cadet with the U. S. Army and started his training in March 1925, graduating from Kelly Field the following year. The newly organized Pratt and Whitney Aircraft Company at Hartford, Connecticut had just turned out engine number seven when he arrived for work in 1926. Working there as final assembly mechanic, test-house operator, and service representative, he maintained his flying skill by taking a commission in the Connecticut National Guard Air Service. Some of his assignments with Pratt and Whitney were unique. As examples, he installed the first P. & W. engine ever to go in the nose of the famous Ford Trimotor; he was in charge of P. & W. engine service work for Boeing Air Transport (predecessor division of United Air Lines); and he was the first test pilot for Pratt and Whitney. He gave the president and vice president of that organization at that time their first ride in an airplane powered with one of their own products.

As an airmail pilot Mr. Wheatley inaugurated the Albany-Buffalo-Cleveland airmail route for Colonial Western Airways on June 1, 1928. He joined the staff of Consolidated Aircraft Corporation in 1929 when the company was located in Buffalo, New York. It was moved to San Diego in August 1935. While attending Boeing School he celebrated his tenth year with Consolidated. He believes that test flying is just as safe a job as the pilot and manufacturer make it and says that the work is not at all like the portrayal given in Hollywood motion pictures.

Some of the well known planes which Mr. Wheatley has taken up on test flights include the Fleet Trainer, Thomas Morse Army observation planes, Consolidated Fleetster (some were used in recent years by T. W. A., Ludington, and other airlines), Prestone liquid-cooled, low-winged Army PB-2A Pursuit, and all models of multi-engined Consolidated Navy patrol bombers.

Consolidated Gets Navy Order for Nearly Five Million Dollars—Notes

U.S. AIR SERVICES 4/39

WHILE NO DETAILS were released by the Navy Department as we went to press, yet the concrete fact emerged that Consolidated Aircraft Corporation, San Diego, Calif., had been awarded on March 22 an order for airplanes and spare parts, in the sum of $4,699,057.62.

We shall look forward with pleasure to giving our readers many details pertaining to the manufacture of new airplanes on this large contract.

AIR WAR GAME HERE WILL PRECEDE FAIR

N.Y. TIMES 3 April 1939

Exercise to Include 16 Navy Vessels, 100 Planes and Coast Guard Ships

OVER A 360-MILE FRONT

Manoeuvres Will Be Staged Off the New England-New York Coast in April

Sixteen or more naval vessels, 100 to 175 army and navy planes and several Coast Guard vessels will participate in a mimic war game off the New England-New York coast late in April, just before the fleet visits New York for the World's Fair, it was learned yesterday.

The war game—though known as "Joint Air Exercise No. 1"—is similar in scope and pattern to several others held in the past, but will probably test more thoroughly than any before the degree of cooperation between the military and the naval flying fleets, a controversial subject for years.

For the forthcoming problem the order limiting flights of army planes to 100 miles from shore has been lifted and it is expected that some of the army's famous Boeing "flying fortresses," as well as the navy's long-range Consolidated patrol planes, will fly far to sea.

Rear Admiral W. T. Tarrant, commandant of the First Naval District with headquarters at the Boston Navy Yard, will command the defending naval forces, which, in accordance with the old tradition of service games, will be designated as Blue. The army forces, a part of the Blue defending force, will be commanded by Major Gen. Hugh A. Drum, commanding the First Army, who will establish his headquarters at Providence State Airport, Providence, R. I.

The problem is scheduled for April 17 to 22, with the active phase of the exercise probably not starting until noon on April 20.

To Extend 400 Miles to Sea

The area of operations will extend over a 360-mile sea front from the New Hampshire-Massachusetts border to Southern New Jersey, but most of the active operations are expected to be off the New England and New York coasts, extending 400 miles or more to sea.

Under the terms of the problem the traditional enemies Black and Blue are at war. The main Blue (American) fleet which takes no actual part in the problem, is supposed to be steaming to the northward from the Caribbean area, its vessels going into various ports south of New York for refueling.

The main fleet of the Black coalition is supposed to be on the other side of the Atlantic, but a Black raiding detachment has been sent across the Atlantic toward the New England coast with three missions: To attack, and, if possible, destroy isolated ships of our main fleet steaming into ports for refueling; to raid coastal shipping, and to raid coastal points.

This Black raiding force will include two battleships—the New York and Texas—which will represent an enemy force of six heavy cruisers and eighteen destroyers. An aircraft carrier as yet unnamed is scheduled to operate with the two battleships. If the carrier does participate, seventy-five naval planes are to take off from her decks and raid Boston, New York, or other coastal points, if the Black attackers succeed in eluding the Blue defenders.

The Black attacking force will be commanded by Rear Admiral Alfred W. Johnson, commander of the Atlantic Squadron, who flies his flag from the New York.

The defending naval forces will consist of various units operating under the First and Third Naval Districts, which will consist almost entirely of Coast Guard ships and planes, commanded respectively by the district commanders—Admirals Tarrant and Clark H. Woodward—and of especially designated supporting forces. These forces will include six submarines of Squadron Two, normally stationed at New London; S-boats, three destroyers to act as plane guards, three seaplane tenders and the light cruiser Memphis, flagship of Rear Admiral C. A. Blakely, commander of the Aircraft Scouting Force, who will be in charge of the naval aerial operations and who probably will make his headquarters somewhere in the Narragansett Bay area.

Under his command as one of the most important parts of the Blue defending force will be forty-eight Consolidated long-range patrol planes of Patrol Wing One—the planes that flew non-stop from San Diego to Panama and which can fly 3,000 miles without refueling. Two or three other utility and general service planes also will be available to Admiral Blakely.

Includes "Flying Fortresses"

The army forces, under General Drum's command, will include about the same number of planes, all of them of two types—the famous Boeing "flying fortresses" that have made aviation history on their long-range flights and the Douglas B-18A bombers and reconnoissance planes. All these planes will be of the Second Wing of the army's General Headquarters Air Force. Brig. Gen. Arnold N. Krogstad, commanding the Second Wing, will establish his headquarters with those of General Drum at the Providence State Airport.

The Second Bombardment Group, with about ten of the seventeen-ton B-17 "flying fortresses," under command of the "flying fortress" veteran, Lieut. Col. Robert Olds, also will be based at Providence.

Twelve to eighteen planes, Douglas bombers and reconnoissance machines, will operate from the Boston Airport. The Fifth Bombardment Squadron from Mitchel Field with six to twelve bombers, under command of Major Ross F. Cole, will base there, as will planes of the Twenty-first Reconnoissance Squadron from Langley Field, under Major Howard A. Craig.

Except for the Fifth Bombardment Squadron, which is being shifted to Boston, the Mitchel Field planes will continue to operate from their home station on Long Island. The Ninth Bombardment Group, commanded by Lieut. Col. Carl W. Connell, and the Eighteenth Reconnoissance Squadron, commanded by Major Phillips Melville, both operating from Mitchel and both equipped with Douglas B-18A bombers and reconnoissance machines, probably will operate about thirty planes.

Immediately after the completion of the aerial war game the "enemy" ships New York and Texas will come to New York to embark reservists of the Merchant Marine Naval Reserve on April 25, four days before the bulk of the fleet of almost 100 ships is scheduled to arrive here for the opening of the World's Fair. The New York and Texas will complete this cruise on May 8 at Norfolk and will then return to the New York area.

The Memphis, flagship of Admiral Blakely, also will come here, perhaps several days ahead of the fleet, and the forty-eight Consolidated planes of Patrol Wing One may also base in the New York area for several days after the war game.

Lighter Than Air

LIEUT. COMDR. ROLAND G. MAYER is almost like a man without a country; he is one of America's leading authorities on lighter-than-air craft, but America has only one dirigible.

◇ ◇ ◇

That's one reason San Diego may claim him—temporarily at least. He is now naval inspector at Consolidated, and he is in terrific demand as a luncheon speaker. People like to hear him tell about the crack-up of the Shenandoah. He knows about that because he was aboard at the time.

Willis Werner

◇ ◇ ◇

Not only that—he helped build her. He was on every flight she ever made, and has flown with every airship the Navy has had. And although he has seen the Shenandoah and the Akron and the Macon pass, his faith in lighter-than-air remains unshaken.

◇ ◇ ◇

Comdr. Mayer virtually grew up with aviation, thanks to a fortunate decision he made one day in 1917. He was a student at the University of Washington when a chap named William Boeing came around and asked for volunteers to work in the airplane factory he had started in one of his father's saw-mill buildings. Hardly anybody responded.

◇ ◇ ◇

Young Mayer, in fact, was all set to join the then-booming Franklin automobile works back East, but two of his classmates persuaded him to go along with them to the little airplane factory. Those men were Phil Johnson, now establishing an air-mail system in Canada, and Claire Egtbedt—today president of Boeing Aircraft.

◇ ◇ ◇

A year later, war was declared and Mr. Mayer went into the Navy and was sent to the Bureau of Aeronautics construction and repair division in Washington, advancing from there to the Philadelphia Naval Aircraft factory. And because he landed in the aircraft factory instead of an automobile works, he had the rare opportunity of becoming project engineer for the Navy's first dirigible—the Shenandoah.

◇ ◇ ◇

Although built in Philadelphia, the dirigible was assembled and flown at Lakehurst, N. J., and it was an exciting moment for Mr. Mayer when she first left her moorings.

◇ ◇ ◇

"WE HAD a little data from German, English and Italian experiments, but mostly we were starting from scratch," he recalls. "For one thing, the Shenandoah was the first to use helium gas instead of hydrogen. That's expensive and we couldn't afford to waste it by releasing it, so we had to learn new methods of handling the ship.

◇ ◇ ◇

"The low, movable mooring mast is one of the developments. At first the mast was hauled by a caterpillar, but later it was put on a track.

◇ ◇ ◇

"America was first to carry airplanes aboard an airship, or to moor an airship to a surface vessel. And America's system of condensing the exhaust from the engines into water for ballast to compensate for the fuel as it is consumed, has been copied by the German designers."

◇ ◇ ◇

Comdr. Mayer made his first trip to San Diego in the Shenandoah—she tied up to a 168-foot mast on North Island for four days—and of course he was aboard during the storm that split the ship in two. "There really wasn't much to it," he says quietly. "Our half floated like a free balloon and all we had to do was operate it as such until the wind went down and we could land it by releasing gas. We never got a scratch."

◇ ◇ ◇

The experience didn't make him a bit nervous and he went right into the Los Angeles—spent four years with her. In 1931 he came west again to help establish the base at Sunnyvale, then went to the Akron—and that fatal day when she cruised over Kearney Mesa with a seaman dangling from the landing ropes, it was Comdr. Mayer who engineered the rescue.

◇ ◇ ◇

Comdr. Mayer has even dangled in a tiny gondola 1500 feet beneath the dirigible, swinging along through the sky on the end of a steel cable no thicker than a pencil. That maneuver permits observation of enemy ships while the airship remains out of sight above the clouds. How does it feel? "You don't feel anything," avers the commander. Suppose the cable broke? "No danger," is his answer; "it's tested to 10 times its maximum load and anyway, you wear a parachute."

◇ ◇ ◇

Speaking as a man who can fly anything, Comdr. Mayer thinks the day will come when dirigibles will supplant the present giant clipper planes for trans-ocean service. He thinks they'll be the aircraft carriers of the future, too—you could, he explains, build 10 flying mother ships for the cost of one surface carrier, and thus wouldn't be putting all the eggs in one basket.

◇ ◇ ◇

Comdr. Mayer has a daughter in high school and a son at Annapolis—but whether or not the latter follows in his father's footsteps is entirely up to him. When not up in the sky, Comdr. Mayer really gets down to earth. One of his main hobbies is gardening.

NEXT: He trusts you.

PERFECT PLANE WING CLAIMED

Plane Speed Raised 20 Pct., Says Designer

Aviation

By United Press

LOS ANGELES—Development of "the perfect airplane wing" was claimed today by David R. Davis, veteran aeronautical designer and former partner of Donald Douglas, airplane builder.

From an aerodynamic standpoint, Mr. Davis said that the wing he developed is 100 per cent effective and will increase the speed of planes at least 20 per cent.

INVOLVED FORMULA

The new type of wing was worked out by Mr. Davis in an involved mathematical formula which, when translated geometrically, gave the proportions of "the perfect wing," he said.

The designer reported he submitted his formula to the Guggenheim Aeronautical Laboratory at California Institute of Technology where a sample wing was constructed and then tested in wind tunnels.

Mr. Davis reported that the wing solved the problem of giving a plane the maximum possible lift with the minimum possible drag.

Previously, he said, aeronautical engineers worked by rule of thumb in shaping the wings of a plane, and often a heavy drag was created, cutting down the speed of the ship and increasing its hazard.

10 YEARS OF STUDY

By means of mathematics Mr. Davis said he evolved his new wing which is based on a formula for the ideal "airfoil" or wind cross section.

He said he and an associate, Walter Brookins, a veteran airman, spent 10 years studying the rotor motion of air around a plane's wing before working out the formula for the perfect curve of a wing section.

LINDY SAN DIEGO VISIT IN DOUBT

Navy, Airplane Plant Heads Uncertain

S.D. SUN 4/21/39

Personalities

Whether Col. Charles A. Lindbergh will visit San Diego naval and commercial aircraft facilities during his quick tour of the country while on active duty in the War Department was unknown by local officials today.

Consolidated Aircraft Corp. executives assumed that if Col. Lindbergh plans to inspect all the important airplane factories in the country he probably will go through the local plant. However, they have not been notified of his intentions. Similarly, officers at the Naval Air Station, largest Navy operating base in the country, do not know whether the Lone Eagle will call there.

If Colonel Lindbergh does come to San Diego, he will be returning to familiar territory. It was here his "Spirit of St. Louis" was built, and in this vicinty that he and his wife learned many fundamentals of glider flying.

High School Students To Hear 60 Speakers On Vocations

San Diego High School students will hear 60 speakers on vocational subjects at 10:40 a. m. Thursday. Dean Arthur Peterson, of San Diego State College, will lead discussions on work offered at the college at a session open to the public in Russ auditorium. Officers of the State College student body will also speak.

Following are the speakers and their vocational topics:

Agriculture, room 180, Eric E. Eastman; aircraft industry, room 144, Donald Frye; airplane pilot, room 354, Lieut. H. L. Hopping; air conditioning, room 178, W. H. Hermes; architecture and drafting, room 136, Sam Hamill; art careers, room 351, Miss Ilse Hamann; banking, room 158, Ed Clapp; bookkeeping and accountancy, room 164, Harold A. Tenney; building trades, room 2, H. B. Greer; California Nautical School, room 3, Lieut. Comdr. Conrad Ridgley; chemistry, room 184, Dudley Robinson; cosmetology, room 159, Mrs. Sunny Harwell; dental hygienist, room 120, Mrs. L. C. Clarkson; dentistry, room 110, Dr. Robert D. Mercer; diesel engine, room 404, to be announced; department store occupations, room 183, Mrs. Frances Torbert; diplomatic service, room 186, Dr. Clarence C. Osborn; civil engineering, room 314, B. D. Phelps;

Electrical engineering, room 312, G. H. P. Dellman; structural engineering, room 157, Paul Beerman; fingerpinting, room 8, Lieut. John Dougherty; fire department, room 218, J. E. Parrish; fishing industry, room 7, Edward Chapman; forestry, room 135, Ira W. Roberts; household management, room 220, Mrs. E. S. LaSalle; industrial occupations, room 6, Walter Thatcher; insurance, room 172, Byron Gilchrist; journalism, room 303, W. B. France; kindergarten and nursery school, room 365, Mrs. Irving Outcalt; juvenile court work, room 116, Miss Winifred Hutchinson; landscape gardening, room 156, Milton Sessions; laboratory technician, room 170, Miss Viola Sommermeyer; law, room 308, Robert B. Burch Jr.; library work, room 304, Miss Anne Allsebrook; medicine, room 131, Dr. R. Emerson Bond; music, public school, room 140, Miss Christine Springston; navigation, room 174, Capt. Frank Benham; nursing, room 210, Miss Bessie Barnes; oil industry and service stations, room 313, W. A. Cole;

Pharmacy, room 4, P. J. Simon; photography, room 133, George Vreeland; police department, room 307, Lieut. F. V. Merritt; post office and civil service, room 176, E. A. Bowman; printing, room 417, J. E. Hutchinson; radio broadcasting, room Little Theater, Richard Cutting; radio technician, room 1, H. W. Hasenback; retail selling, room 218, Miss Anne Montgomery; San Diego State College, auditorium, Dean A. G. Peterson, Will Koller, Betty Curtis; secretarial work, room 166, Miss Ruth Ware; social service, room 222, Dr. Edna Hawley; teaching, room 364, Dean Jesse W. Ault; teaching of dancing, room 114, Miss Louise Hansen; teaching of boys' physical education, room 142, Don Clarkson; U. S. Army, room 168, Maj. J. M. Roamer; U. S. Marine Corps, room 162, Maj. A. H. Fricke; U. S. Navy, room 300, Comdr. P. C. Sowell; veterinarian, room 5, Dr. George W. Foelschow; vocation, how to choose, room 112, Ralph Troge; weather bureau and aviation, room 146, George W. Kahlstrom; x-ray technician, room 302, Dr. A. J. Present.

Archbold To Chart Aerial Route As Aid If War Comes

Military significance is attached to the projected survey flight of Richard Archbold's twin-engined, $250,000 airboat "Guba" across the Indian Ocean from Australia to Africa, Consolidated Aircraft Corp. officials reported.

Australian authorities see in the venture—which will be the first time a seaplane will have spanned the Indian Ocean—the blazing of an alternate air route which would help link Australia and England in time of war. Use of such a route would enable the avoidance of the vulnerable trans-Mediterranean and Singapore-to-Australia laps.

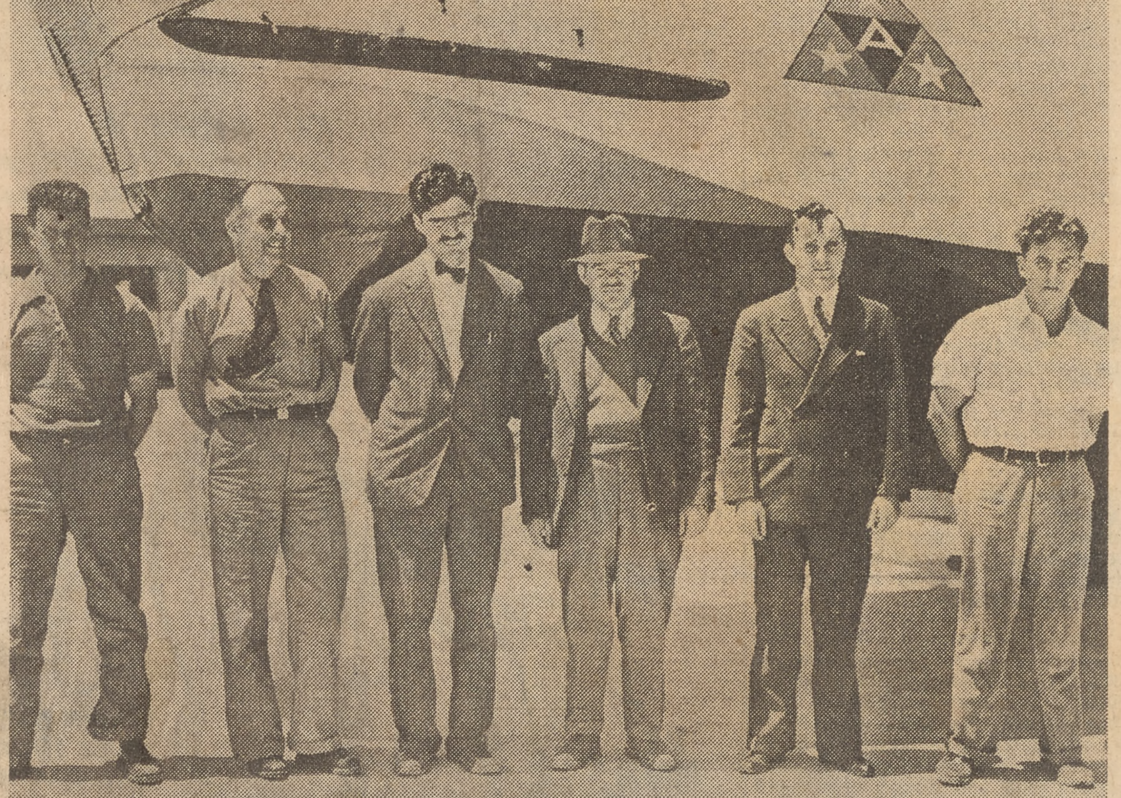
The 5500-mile flight will be started in mid-June, with two Australians—Capt. P. G. Taylor, former flying companion of the late Sir Charles Kingsford-Smith, and P. J. Percival, an Australian newspaperman — accompanying Mr. Archbold and the "Guba's" regular crew.

The plane now is in Hollandia, Netherlands New Guinea, where Mr. Archbold has been leading an American Museum of Natural History expedition since flying from San Diego last June. After completing the survey mission, for which the Australian government is paying him $15,000, Mr. Archbold will continue across Africa, on to the Virgin Islands, Miami and San Diego, arriving here in July. He does not expect to resume the New Guinea expedition until October, 1940.

S. D. Flier To Blaze Wartime Trail for Britain

'Guba' Chartered by Australian Commonwealth

S.D. TRIBUNE 4/22/39



Richard Archbold, flying scientist, and his San Diego crew members, who will cross the Indian ocean this summer on a survey flight for the Australian government in Archbold's $250,000 San Diego-built Consolidated flying boat. Left to right: Stephen Barrinka, Lewis A. Yancey, Archbold, Russell R. Rogers, Ray Booth and Gerald Brown.

WILL CROSS INDIAN OCEAN IN CONSAIR-BUILT CRAFT

By HAROLD OSBORNE

Richard Archbold's flight from Australia across the Indian ocean, planned for this summer, will be of strategic military value to the British empire, according to reports received from Australia by officials of Consolidated Aircraft Corp. here, builders of Archbold's $250,000 scientific research flying boat, the "Guba."

A survey flight, the 5454-mile route to be flown by the "Guba" will cover the British empire's proposed "reserve empire route," which in time of war would link England with Australia and avoid two sections of the existing route regarded as particularly vulnerable in wartime—the Mediterranean and the section of imperial airways between Singapore and Australia.

"Because of the existing emergency in Europe, the strategic aspect of the flight eclipses its interest as the crossing of the last ocean of the world to be conquered by the airplane," states an account in the Melbourne Herald received at the Consolidated plant.

Archbold, who made aviation history last summer when he flew the "Guba" from San Diego to New Guinea, a distance of 9178 miles, in 51 hours, 5 minutes elapsed time to carry on scientific work for the American Museum of Natural History, of which he is a research associate, will be accompanied on the flight by Capt. P. G. Taylor, colleague on several ocean flights with the late Sir Charles Kingsford-Smith and the late C. T. P. Ulm, and one of Australia's greatest aviators. Others in the flight will be J. Percival, newspaper man and official correspondent, and the following members of the Archbold party, all from San Diego: Capt. Lewis A. Yancey, navigator and Atlantic flier; Russell R. Rogers, pilot; Ray Booth, Gerald Brown and Stephen Barrinka.

Start Set for May 14

The Australian government, which chartered the "Guba" at a cost to the commonwealth of nearly $15,000, declared that the Indian ocean flight must be made between June 10 and Aug. 1. Archbold, now at Hollandia, on the north coast of New Guinea, is expected to depart from there about May 14, proceeding to Port Moresby, on the southern New Guinea coast; Sydney and Melbourne, and thence around southern and western Australia to Onslow, on the western Australian coast, where the flight across the Indian ocean will start.

Before reaching Mombasa, Kenya, Africa, from where he plans to continue on to San Diego after a flight across Africa and the Atlantic, Archbold and his companions will visit three groups of islands, spending some days at each to take soundings in lagoons and seeking both flying-boat and landplane airdromes by air and ground surveys. These are the Cocos group, 1435 miles from Onslow; Diego Garcia, in the Chagos islands group, 1717 miles from Cocos, and the Seychelles islands, 1192 miles distant. From the Seychelles to Mombasa it is 1110 miles.

"Because the longest of these stages is 500 miles shorter than the San Francisco-Hawaii air route which Pan-American Airways has been operating for three years, no doubts about the feasibility of the route are entertained," states the Melbourne Herald. "Preparations for the flight have been the best-kept secret in Australian aviation."

Famous in History

"Thumb-nail sketches of the island groups to be visited by the "Guba" are given in the Melbourne Herald as follows:

"Cocos islands are famous in Australian history as the scene of our first distinctive sea battle, the destruction of the German raider Emden by H.M.A.S. Sydney. Early in the great war the Emden had been carrying out a campaign of destruction in the Indian ocean, and because of this Australian troopships had to be heavily guarded. The Sydney, sturdy battleship among the convoys, smashed the Emden at a distance of three miles, and left the raider a broken wreck on one of the islands. Because of their isolation, the islands remained unclaimed for centuries after their discovery in 1609 by Capt. William Keeling, but in 1823 Alexander Hare, an English adventurer, settled on the southernmost island with a number of slaves, and in 1857 the islands were declared a British possession. The population of the Cocos islands is approximately 1300.

"The Chagos islands, belonging to Great Britain, lie about 1000 miles south of Ceylon. The total land area is about 76 square miles. Most of the population, about 500, mostly Negroes, lived on Diego Garcia, which is the largest of the islands, being 13 miles long and six miles wide. Diego Garcia has an excellent lagoon, typical of most of these coral atolls. It is there, presumably, that the 'Guba' will rest. The Chagos group have belonged to England since 1814.

"The last of the three island links in the new airway chain is the Seychelles group, having total area of 156 square miles and a population of nearly 30,000. Lying about 600 miles northeast of Madagascar and about 800 miles from the coast of Africa, the Seychelles consist of 10 islands, and a large number of coral banks. The largest and most central island, Mahe, is 17 miles long and about seven miles across at its widest point. It has a very good harbor, Port Victoria, and it is here that the 'Guba' will land. Most of the population is Negro, the white residents numbering only about 1000. The Seychelles have been known for at least 400 years, and have been occupied by the British since 1810."

At Home in Mid-July

From the Seychelles group, Archibald will continue on to Mombasa, on the southeastern coast of Kenya, from where, after a short stay he will start across Africa, stopping en route at Kisumu, on the shores of Lake Victoria. From Lake Victoria his route takes him to the west coast of Africa, with stops at Lagos, Nigeria, and Dakar, and thence to St. Thomas, West Indies, and Miami, Fla., from where he will continue on to San Diego. He is expected here between July 10 and 15.

Consolidated authorities point out that with the return flight route Archbold has mapped out, by the time he reaches San Diego he will have circled the globe virtually on the equator, covering more than 26,000 miles. Archbold left San Diego last June 2, covering 2553 miles from here to Honolulu in 18 hours, seven minutes; 2300 miles from Honolulu to Wake island in 16 hours, 45 minutes, and 2325 miles from Wake island to New Guinea in 16 hours, 13 minutes. He arrived at Hollandia June 9, and since then has flown more than 100,000 miles in transporting supplies and specimens in the New Guinea scientific work.

MONDAY MORNING, APRIL 24, 1939.

'Perfect Plane Wing' Seen in Mathematical Formula

Efficiency Increase Worked Out With Figures; Amphibian to Make Test Flight in Few Days

L.A. TIMES

David R. Davis, veteran of 20 years in the aeronautical industry and first partner of Donald Douglas, yesterday disclosed that he has constructed the "perfect airplane wing"—an airfoil so aerodynamically clean that it will increase an airplane's efficiency 20 per cent.

Caltech has tested his principle, which consists of a many-page mathematical formula for arriving geometrically at this "perfect wing," and pronounced it almost 100 per cent effective.

Within 10 days an amphibian flying boat, with a wing embodying the Davis theory, will be launched in the Southland and will, engineers believe, stagger the aeronautical world with its high speed, load-carrying and range qualities.

NO EXTRA COST

Yet because Davis' formula is just that—a mathematical, on-paper system of arriving at the "perfect wing"—such increased efficiency of planes won't cost a penny more, he said.

Briefly, this is what the scientist has accomplished: Using a series of curves based on the rotor motion of air around a plane's wing, he has plotted by definite mathematical formula the ideal "airfoil"—wing cross section.

This permits, Davis declared, the maximum lift with the minimum drag.

URGED FOR WARCRAFT

Today's aircraft tend to build up a stone wall of pressure against their thick wings as they fly faster. Davis claims his wing becomes more efficient as the ship roars at a greater speed. Thus fighting planes which today move at 400 m.p.h., with his wing would increase their speed to almost 500 m.p.h., Davis believes.

He is sure of this theory. One major California aircraft plant spent $40,000 testing it at Caltech's Guggenheim Laboratory and has contracted for its use on a royalty basis.

Davis says no apparatus is used to obtain his principle, only figures. It isn't magic. It is merely a formula to plot that perfect curve of the wing section that aeronautical engineers, working by rule of thumb rather than geometry, till now haven't found.

SOUGHT FORMULA 10 YEARS

For 10 years Davis sought it. Today he and Walter Brookins, also a veteran airman and first civilian pupil of the Wright brothers, declare they have it.

Too technical for the layman to grasp, Davis' airfoil, they aver, is to aviation what the invention of the round wheel was to primitive transportation. Because it gives "lift" to a plane when the wing is at a minimum "angle of attack"—tilted only slightly into the onrushing air—the "airfoil" will permit flying boats to take off on an even keel, rather than with their hulls riding half off the surface of the water.

NAVY BUYS 6 PLANES AT CONSOLIDATED

S.D. Sun 4/21/39

Seven hundred thousand dollars a plane!

This will be the cost of the Navy's most expensive flying equipment—six four-motored patrol bombers to be built by Consolidated Aircraft Corp. in a $4,699,057 contract awarded March 22.

The number of planes to be constructed under this order was learned authoritatively here today for the first time after a period of secrecy imposed both by the Navy Department and the San Diego aircraft concern.

With a $700,000 estimate on the unit cost per plane, approximately $500,000 would remain for furnishing of parts. The terse explanation of the Navy Department in awarding the contract was that it was for building of "airplanes and parts."

Orders have been placed with eastern mills to supply the required materials to enable fabrication of the planes. Work is expected to be in full swing in June or July, plant officials estimated.

More than $1,000,000 was spent by the Navy and Consolidated for the engineering and construction of the experimental prototype bomber, on whose design manufacture of the six giant airboats will be based.

Western Flying 3 or 4/39

New Texas Line

INAUGURATION of plane connections between Amarillo and Houston by Essair, Incorporated, was a highlight of developments this month in West Texas aviation circles. Sam Marshall Jr., is president of the new air line with headquarters at Amarillo.

Stops on the route will be at Lubbock, Big Spring, San Angelo, and Austin. Seven passenger Consolidated Fleetster ships are being used on the line, which will have to await action by the Civil Aeronautics Authority before being permitted to carry air mail.

West Texas bankers and oil men will find the Amarillo-Houston service offered by Essair of considerable advantage, since plane schedules were inaugurated to shuttle operators between points in the Permian Basin oil fields.

Diagrammatic explanation of the test

March 1939

IN order to use modern materials to their best advantage in aircraft construction it is necessary to heat treat them and bring them to a state where their maximum strength may be utilized. This permits an appreciable saving in weight and in turn makes possible the production of dependable high performance aircraft.

To properly check and control the heat treatment, some means was necessary whereby the hardness of the conditioned metal could be accurately determined on a production basis.

The most satisfactory method of checking materials on a production basis for hardness and in turn for tensile strength, by manner of comparison, is performed by using a Rockwell Hardness Testing machine.

These highly sensitive, precision-built machines, are in use at all times and checkers are constantly examining material in process to see that they meet design requirements. The operation of these machines is quite simple.

A load of 10 kg. is first applied. This seats the penetrator in the surface of the material being checked. The dial is then set to zero and the major load is applied. The type penetrator may be a 1-16" diameter or ⅛" diameter steel ball or a 120° diamond "Brale." The major load may be 60, 100, or 150 kg. depending on the thickness of the material being checked for its hardness.

The Brale is a penetrator with a Black Diamond cemented in the tip of the cone and ground to mathematical and microscopic accuracy. The accuracy of this type penetrator is extremely important because, when the fixed testing load is applied, if this penetrator is so sloped that it indents .00008" too much or too little, the hardness number will be in error one point. The angle of the cone must be exactly 120° and the spherical tip must be ground to a radius of .008" and be truly tangent to the sides of the cone.

In the *"Rockwell"* tester, although the value given on the dial depends upon the actual depth of penetration, the real measurement that is automatically accomplished by the machine is a measurement of the vertical motion of the plunger rod which carries the penetrator as that plunger rod moves up and down in the head of the machine. This makes the depth measurement quite independent of the behavior of the surface of the material in the vicinity of the penetration. An extremely important feature in the "Rockwell" is that the dial gauge is not set to zero when the penetrator first meets the surface of the material to be tested. Instead of that there is applied a minor load before the dial gauge is set for zero. The "Rockwell" hardness number is based upon the increase of depth, due to increment of load from minor load to major load. This guarantees the accuracy of the hardness measurement.

The Rockwell Hardness Number is based on the additional depth to which a test point or ball is driven by a heavy load beyond the depth to which the same penetrator has been driven by a definite light load. Without moving the piece to be tested, the minor load is applied and quickly thereafter the major load is applied and the hardness number is automatically indicated on the dial and only from five to ten seconds is consumed for the entire operation of testing, including removal of the work preliminary to making the next test.

The Rockwell reading may be expressed with nine different letter prefixes, the letter denoting the type penetrator used and the amount of weight applied as the major load.

Scale Symbol	Penetrator	Load
A	Brale	60 kg.
B	1-16" Dia. Ball	100 kg.
C	Brale	150 kg.
D	Brale	100 kg.
E	⅛" Dia. Ball	100 kg.
F	1-16" Dia. Ball	60 kg.
G	1-16" Dia. Ball	150 kg.
H	⅛" Dia. Ball	60 kg.
K	⅛" Dia. Ball	150 kg.

Consolidated Aircraft Rearranges Plant; Will Install Considerable New Equipment

Prepares for Possible New Foreign Business, Inauguration Of U. S. Defense Program

This is the twenty-second article in a series on aviation, and the sixth to give consideration to individual companies in the aircraft manufacturing field.

BY T. C. SULLIVAN

ARTICLE XXII

Taking advantage of the tapering off of operations following the completion of a group of contracts for the construction of patrol bombers for the United States Navy, Consolidated Aircraft Corp. has rearranged its plant and will install considerable new equipment in preparation for possible new foreign business and the inauguration of the airplane expansion program for this country.

The company is now completing the last of its several orders from the Navy for PBY two-engined patrol bombers, bringing the total to 210 units delivered in less than three years and placing the company as the leading manufacturer of large flying boats for the Navy. With spare parts, the aggregate of the Navy orders for PBY's has been in excess of $20,000,000, exclusive of engines.

Backlog of unfilled orders at Consolidated now totals approximately $6,000,000, consisting principally of a $4,700,000 contract awarded late in March by the Navy for the new four-engined patrol bomber which the company developed in competition with other manufacturers. The experimental plane of this type built by Consolidated was accepted by the Navy after flying overland nonstop from San Diego, California, to Washington, D. C., and later a return trip was made over the same route. These overland flights by flying boats demonstrated the mobility of the Navy's air force in moving from one ocean to the other. The company's investment in the experimental four-engined plane was charged to cost of products sold during 1938.

[illegible] not where this

450,000 Miles Without Mishap

Several times during the past two years the Navy has made "routine" delivery of Consolidated two-engined patrol bombers by flying the planes from San Diego to Hawaii and the Panama Canal Zone. Recently, 48 of these planes completed a mass flight from San Diego to Coco Solo, a distance of approximately 3,087 miles. In flights ranging from 2,500 to 3,000 miles each, the planes have been flown, without mishap, an aggregate distance of approximately 450,000 miles.

Consolidated moved its location from Buffalo, N. Y., to San Diego in 1935, constructing an entirely new plant on the water front where bulk of the Navy's airplanes are based. The plant was enlarged in 1936 and now contains 450,000 square feet of floor area, in addition to which the company has a paved yard containing approximately 215,000 square feet which is available throughout most of the year for assembly work.

The plant rearrangement and installation of additional presses and drop-hammers which are now under way are designed to increase the productive capacity and make Consolidated one of the most modern aircraft plants in the country. The present backlog will by no means tax its facilities so that the company is about the only major unit in the industry ready to accept new business that can be delivered within a comparatively short time. As at December 31, 1938, current assets amounted to $5,225,715, including $3,586,478 of cash, $504,273 in accounts receivable, and the balance in inventories. Current liabilities were $1,554,491, or considerably less than one-half the amount of cash.

1938 Sales, Profits Set Record

Both sales and net profit established new records for Consolidated during 1938. It has been the consistent practice of the company, however, not to take up profits during any year on contracts unless they were substantially completed. At the same time, all operating costs and expenses, including depreciation and amortization of experimental expenses, incurred during the year are considered as elements of cost in determining inventories and cost of products sold.

This accounting policy has been considered necessary in view of the regulations governing Naval contracts. In the case of several related contracts, such as those held by Consolidated for 210 large patrol bombers delivered over a period of more than two years, it has tended to distort the company's actual earning ability. Results for the year 1937, for example, provided a ratio of net sales to net profit of only 3.6%, while during 1938 the ratio jumped sharply to 12.5%. Sales volume for the two years were about equal, the difference, however, was that the selling price of over 80% of the reported sales for 1937 was carried at cost pending final determination of costs upon completion of the contracts. The profits on these deliveries were taken up during 1938, thus distorting the earnings picture for both years. An average for the two years brings the ratio of net sales to net profit to 8.3% which is more in keeping with actual operations. Net sales, net profit and their ratio for Consolidated Aircraft Corp. for the past two years, are shown in the following table:

	Net sales	Net profit	Ratio
1938	$12,245,067	$1,535,110	12.5%
1937	11,907,493	462,959	3.6
Two years....	$24,152,560	$1,998,069	8.3%

Started With $25,000 Capital

Consolidated Aircraft is headed by R. H. Fleet, president and general manager, who has held that position since 1923. Major Fleet joined the Army in 1917 as an airplane pilot and later served as contracting officer for the Air Corps., business manager of McCook Field, and was in charge of inaugurating the air mail service.

The company was formed in 1923 with an initial capital of $25,000 and has been built up to its present size almost entirely through reinvestment of earnings. The only public financing having been the sale of 22,976 shares of $3 convertible preferred stock in 1936, proceeds of which were used to provide equipment and additions to the San Diego plant, and to supply additional working capital.

During the 15 years through 1938, the company made delivery on $51,427,721 of planes and parts. About 58% of this total has been to the Navy, 23% to the Army, and 19% to commercial and export purchasers. Sales of more than $24,000,000 during the past two years represent 46% of the total business done by the company since its inception.

Consair Bid Low, Accessory Firms Submit Offers

S.D. UNION 4/27/39

San Diego aircraft firms are hoping for word today that they have been awarded a large share in the war department order for 571 warplanes to cost $50,000,000.

Consolidated Aircraft Co. has bids entered on two of the five types of planes to be built and local plane accessory firms have submitted bids for parts.

The army high command placed the record-breaking order for 571 planes immediately after President Roosevelt signed the $549,000,000 war department appropriation bill yesterday, The Associated Press reported.

PARTS ORDERS EXPECTED

Local hopes for a share in the order are high since Consolidated recently submitted low bids on four-motored bombers and on pursuit ships, it was reported here. Ryan and Solar Aircraft plants expect to share in the orders for parts.

Details of the big order are expected to be announced by the war department today.

The aircraft orders were signed with a speed that surprised the capital, the Associated Press reported.

Moreover, Secy. of War Woodring, declaring that he wanted to assure the American people as to the "readiness and adequacy" of the army, disclosed moves to weed out over-aged and physically unfit among the service's 12,500 officers.

These developments occurred on the same day that Great Britain announced conscription, and two days before Chancellor Hitler's scheduled speech replying to President Roosevelt's recent request for peace guarantees.

There was no formal announcement that the events here were timed to impress Hitler, and perhaps induce him to give a favorable response.

However, it was noted that the President, in a speech today to a White House conference on children's problems, emphasized his recent plea anew by quoting from it. He pointed out that he had told Hitler and Mussolini that "the leaders of great nations have it in their power to liberate their people from the disaster that impends."

BILL SIGNING RUSHED

The war department appropriation, most of which is for the fiscal year beginning July 1, 1939, is the largest since the A.E.F. was demobilized. Usually, it is several days from the time a measure is finally voted by congress until the President signs it. But in this case the bill, which was finally approved by congress only yesterday, was rushed to enactment.

The warplane purchase, as announced by Louis Johnson, assistant secretary of war, was the initial step in a program to treble the army's air strength by increasing it to 6000 planes.

The order was split among five manufacturers, and there were additional orders for engines and equipment. In the late day rush, officials said details would be withheld until tomorrow.

Five types were ordered—four-engine bombers, single-engine pursuit planes, fast climbing "pursuit interceptors," attack bombers and a small number of photographic planes. Aviation sources understood some of the "fighter" craft, designed to bring down bombers, would be able at least to approach 400 miles an hour.

FUNDS INCLUDED

The huge single order was made possible by inclusion in the regular appropriation bill of some funds for immediate purchases.

Johnson said that much money would be saved by placing orders now without awaiting the fiscal year opening July 1.

Woodring, announcing the steps to "vitalize" army personnel, said many present officers were "far in advance of the age in which they could be expected to carry on the physical requirements of field duty" in their grade.

He announced immediate physical examinations and proposed legislation to retire officers from captain to brigadier-general who have failed to advance. Physical examinations will be given prior to June 30 to all officers of the rank of captain and above.

Proposing also that the test should apply to the national guard, Woodring said he would make such a request to state governors.

'TO ANSWER CONCERN'

"In connection with congressional action now being taken with respect to armament and equipment, the measures will aid materially in answering the concern of the people as to readiness and adequacy of its military forces," the war secretary said.

Other defense developments included:

1—President Roosevelt asked congress for $31,621,000 to start work on 12 naval air bases in Alaska, several Pacific islands, Puerto Rico and the continental United States. Expected to cost $66,800,000, the bases were authorized in a bill he approved yesterday. The navy said the work could start this summer and it would require about three years.

2—To speed deliveries of steel plates for warship construction, the navy announced that a small part of its $25,000,000 World war ordnance plant at South Charleston, W. Va., would be leased to the Carnegie-Illinois Steel Corp. The plant long has been idle.

NAVY OFFICERS RETAINED

3—The house approved legislation to retain until 1944 upward of 400 naval officers who otherwise would have to retire though adjudged "fitted."

4—The house likewise passed a measure permitting the navy to keep aviation cadets on active duty for seven instead of three years, as at present.

5—In a negative development, senate-house conferees eliminated from a $160,000,000 deficiency appropriation bill $4,000,000 to establish at Sunnyvale, Calif., a second aviation research center for the national advisory committee for aeronautics. Army, navy and civilian aviation officials urged the appropriation.

In addition to new planes, the $549,000,000 war department bill carried funds to give the army additional modern equipment including anti-aircraft guns, semi-automatic rifles and ammunition. It also contained $7,250,523 for strengthening of seacoast defenses, and $6,433,878 for construction at army posts, chiefly in Hawaii and the Panama Canal Zone. Another item was $1,000,000 for construction at national guard camps.

---

24 BOMBERS SET FOR HOP TO S. D.

San Diego Sun

Takeoff Next Tuesday; Arrival May 12

4/27/39

Twenty-four San Diego patrol bombers of Squadrons VP-7 and VP-9 will take off from Norfolk next Tuesday, weather permitting, on a return mass flight to their North Island base from east coast maneuvers, Naval Air Station officials announced today.

Two sister squadrons, VP-11 and VP-12, will remain permanently based in Norfolk. The latter unit will be replaced here by the former Hawaii squadron, VP-18, while the former may be substituted by another Pearl Harbor squadron, VP-1, now tentatively scheduled to fly 15 bombers from San Diego to Honolulu June 28.

Capt. Marc A. Mitscher, Patrol Wing One commander, will lead the flight to San Diego via Guantanamo, Cuba; Coco Solo, Canal Zone; Gulf of Fonseca, Nicaragua; and Magdalena Bay, Mexico. Ten days will be required for the mission, with the planes expected here about May 12.

Guilding the flight and supplying fuel will be the aircraft tenders Sandpiper and Lapwing at Guantanamo, the Aircraft Scouting Force flagship Memphis at Coco Solo, the aircraft tender Wright at Gulf of Fonseca and the destroyers Childs and Williamson at Magdalena. The Memphis, with Rear Adm. Charles A. Blakely, Aircraft Scouting Force commander, aboard, will arrive here about May 16.

Tribune

24 Planes Due In S. D. From East May 12

4/27/39

Return flight to San Diego of 24 giant navy patrol planes, which flew east from here in January, will start Tuesday at Hampton Roads, with the two squadrons, Nos. 7 and 9, due to arrive here May 12. They will arrive at Guantanamo, Cuba, May 3, the Canal Zone May 9, and Magdalena bay May 11.

Two other squadrons of Patrol Wing 1, Nos. 11 and 12, which went to Caribbean waters in January, will remain on the east coast, having been assigned permanently to duty at Norfolk, Va. Surface ships for the 24-plane flight will be the tenders Sandpiper and Lapwing in the Caribbean, the tender Wright in the Gulf of Fonseca, and the destroyers Childs and Williamson along the west coast of Mexico.

A flight of 15 patrol bombers of squadron VP-1, from San Diego to Honolulu, is scheduled for June 28. The squadron is commanded by Comdr. Sam LaHache.

Blakely Relieving King

Rear Adm. Charles A. Blakely, commander of aircraft scouting force, is to arrive here from Hampton Roads May 16 aboard the cruiser Memphis. In June he relieves Vice Adm. Ernest J. King as commander of aircraft, battle force. Blakely will be relieved of the scouting force air command by Adm. Arthur B. Cook, who next week is to be relieved as chief of the bureau of aeronautics, navy department, by Rear Adm. John H. Towers.

The home port of the aircraft carrier Ranger, formerly based at San Diego, has been changed to Norfolk. Lt. Comdr. Cecil B. Gill, assistant operations officer at North Island, has received orders transferring him to the Ranger June 1.

$2,880,000 FOR CONSAIR

S.D. TRIBUNE APRIL 17, 1939

Army Calls For S. D.-Built Bombers

Award to Consolidated Aircraft Corp., San Diego, of a $2,880,000 contract for "heavy four-engine bombers, a new type 24," is included in the army air corps' new contracts for 571 warplanes, largest order ever placed by the war department in peacetime, The Associated Press reported today from Washington, D. C.

Expansion Initiated

The contracts initiated a vast air corps expansion approved by congress. Initial funds were made available yesterday. The announcement did not specify the number of planes in each category.

A Consolidated Aircraft Corp. official said at noon that no official word of the award to the firm had been received up to then, and that no comment on the award could be made.

"We have nothing to say, because of restrictions against publicity imposed by the war department," said the official.

On the question of employment at the aircraft firm, the official declared it "will be some time before we employ additional people," pointing out that much preliminary

(Continued on Next Page, Col. 2)

work on plans and specifications must be done before actual construction work begins on the planes.

To save months of delay, Congress provided that the first planes might be ordered without awaiting the start of the next fiscal year. The bulk of the contracts, however, will be placed after July 1. Funds yet have to be voted.

Keyed to a new tempo in keeping with fast-moving world developments, army officials and manufacturers got preliminaries out of the way while waiting for congress to act. Stores of materials were on hand in anticipation of the starting signal.

Five Firms Get Work

Acting to put into effect the Army Air Corps expansion to 6000 planes, Louis Johnson, assistant war secretary, signed the contracts with five plane manufactures of engines and equipment.

E. T. Price, president of Solar Aircraft Corp., said his firm had equipment on several experimental models at Wright field and he anticipated that his firm would participate in the manufacture of parts for such planes built for the war department. His firm specializes in engine manifolds.

Also anticipating a part of the business, although withholding definite comment pending receipt of more specific information, was T. Claude Ryan, president of Ryan Aeronautical Co., makers of cowlings, manifolds and other parts, as well as complete planes. Ryan explained that parts manufacture probably would be done under sub-contract with contracting plane building firms, while any aircraft orders his firm might receive would be on direct contract with the war department.

Ryan Optimistic

Ryan expressed the opinion that the beneficial effect of the huge warplane order would be felt throughout the industry, both by directly and indirectly participating firms.

President Roosevelt yesterday asked congress to make available immediately $31,621,000 to start a program authorized in a bill he signed yesterday to strengthen the navy's air base system, The Associated Press reported.

The war department appropriation bill also was finally acted upon by congress. It provides for the purely military expenses of the department. The appropriation for the civil phases has not been passed by congress yet.

Of the total in the present bill, approximately $95,000,000 will go toward purchase of about 600 modern fighting planes. Another $53,000,000 will be spent for equipment, including semi-automatic rifles, anti-aircraft guns and tanks.

The total of the war department appropriations bill reported by the White House included direct appropriations of $508,789,824 plus a reappropriation of $5000 and contractual authorizations amounting to $40,205,988.

In addition to the request for cash to start the air base program, Roosevelt also asked that the navy be give nauthority to enter into contracts aggregating $65,000,000. The new air base law authorized outlays of $66,800,000.

ARCHBOLD DUE BACK IN JULY

S.D. SUN 5/4/39

New Guinea Museum Work Completed

Aviation

With work for the American Museum of Natural History expedition in Dutch New Guinea virtually complete, Richard Archbold, millionaire scientist-aviator, next Tuesday will begin a series of four flights to inland jungle country in his San Diego-built airboat, Guba, to transfer personnel and equipment to the seacoast.

This was learned today in short-wave conversations between Mr. Archbold and Barney Boyd, San Diego amateur radio operator.

The Guba, a replica of the Navy's PBY bombers, has flown more than 100,000 miles into hitherto inaccessible regions of New Guinea, carrying scientists, native carriers, escorting soldiers, equipment and supplies, since last June, when Mr. Archbold and his five-man crew made the 7500-mile jaunt to the tropical island from San Diego.

The four flights to the interior will remove 40 of the 100 men of the expedition remaining there and will be finished one week from today.

In mid-May the Guba will be flown to Sydney, Australia, to have her instruments checked before taking off about June 15 on a 5400-mile survey flight across the Indian Ocean to Africa for the Australian government.

Mr. Archbold expects to return to the United States with the Guba in the latter part of July.

Consair Wins $2,880,000 Contract for Army Bombers

S.D. UNION 4/28/39

Will Build Navy Planes; Bid Low On Attack Craft

Bringing the total of local orders for army and navy bombers to $7,580,000, a war department contract for constructing a squadron of four-motored planes at a cost of $2,880,000, was received by Consolidated Aircraft Corp. yesterday.

Last month the Lindbergh field plant received a $4,700,000 contract for building nearly a squadron of four-motored long range bombers which will be twice the tonnage and of greater cruising range than the PBY-type planes now in service. These 30-ton ships are to be delivered to the navy.

DETAILS SECRET

In accordance with government restrictions, Consolidated officials could not reveal any details of the war and navy department contracts although it is generally understood actual construction on the navy bombers will begin early in June and on the army planes in August.

The Consolidated contract does not include the cost of engines, propellers, instruments and accessories or the armament which, it is reported, will exceed the battery of five machine guns carried by the army's "flying fortresses."

SUBMITTED LOWEST

The company recently submitted the lowest bid of eight manufacturers for 1000 attack bombers.

The war department has $19,000,000 to expend on this type of ship and contracts are expected to be awarded within the next two weeks, it was reported from Washington, D. C.

At one period since Consolidated established its plant at Lindbergh field, the number of employes exceeded 3000. At present there are 1400 employed, but officials declare it will be some time before this number is materially increased owing to the delay in obtaining material for the new bombers.

'World Beater' Ordered

LOS ANGELES, April 27 (A.P.)—Two radically new types of military planes manufactured in southern California with considerable secrecy are included in the army air corps' orders for additional fighting craft announced today in Washington.

The number of each type ordered was disclosed neither in Washington nor here, although one has been officially described as a probable "world beater."

Little is known of the heavy 4-engined bomber for which Consolidated Aircraft Corp., San Diego, received a $2,880,000 order. It is a far departure, however, from Consolidated's customary product—the long-range ship-hulled patrol bombers which the navy regards as one of its most potent defense units.

Lockheed Aircraft's $2,180,000 order was reported to include at least a dozen or more 2-engine pursuit inter-centor planes known as the Lockheed XP-38. If the first dozen work all right, the army may order 100 more.

ALMOST FLYING WING

This ship is almost a flying wing. It broke out of army secrecy into the headlines last February when the first one produced crashed in New York after streaking across the continent in less than eight hours, attaining speeds exceeding 400 miles per hour.

Maj. Gen. H. H. Arnold, air corps chief, has said this plane "probably exceeds in performance any military plane in the world."

The plane has a bulgy little single-seat cockpit, a single broad wing and a tail structure appended to a pair of steel frames. It carries six heavy-caliber machine guns in its blunt nose.

Mission to Soviet Told by Designer In Consair's Suit to Recover Advance

S.D. UNION 5/9/39

Gilbert A. Henry, airplane designer, testified yesterday in Los Angeles superior court that he was sent to Russia in 1937 to design for the Soviets "mail cargo flying boats, the same as the Consolidated PBY-1 now used by the United States navy, definitely a bomber with the turret and armor omitted," The Associated Press reported from Los Angeles.

Henry is being sued by Consolidated, San Diego firm, for recovery of $1910 advanced him for the trip. He is asking $2747 from the company. In his complaint he said Consolidated contracted with Russia to aid it in plane construction and that he was one of a group of 13 designers and technical experts who formed the air mission. He said he and two others returned to the United States.

Consolidated asks return of the money on the grounds Henry did not go on from Moscow to his Tagarong destination and the designer countered that Russian conditions were not as represented.

S.D. UNION 5/9/39

Navy Planes Alight On Gulf of Fonseca

After a five-hour flight from Coco Solo, Canal Zone, 24 long-range navy patrol planes arrived at the Gulf of Fonseca yesterday at 12:35 p. m., the Naval Air station here reported.

The planes, under command of Capt. Marc A. Mitscher, are on the way to San Diego from fleet maneuvers. Reports yesterday were that they would leave the Gulf of Fonseca tomorrow for Magdalena Bay, Mex., and leave there Friday morning for San Diego.

S.D. UNION

S.D. Navy Planes At Coco Solo

~~#~~ 5/3/39

Twenty-four planes of Squadrons 7 and 9, Fleet Patrol Wing 1, were reported to have arrived yesterday afternoon at Coco Solo, Canal Zone, en route to San Diego from Hampton Roads, Va., via Guantanamo.

The squadrons, Capt. Marc A. Mitscher in command, left Hampton Roads Monday. They are two days ahead of schedule with a probability they may arrive here Monday instead of May 12. The planes will refuel at Magdalena bay after taking off from Coco Solo for the second leg of the homeward bound flight via the Gulf of Fonseca.

No official word of the probable change in arrival has been received at Naval Air station from Capt. Mitscher.

Buffalo NY

MYSTERY PLANE READY FOR INITIAL AIR TESTS

Consolidated's Giant Craft Excites Much Interest.

SAN DIEGO, Cal., May 5 (AP).—Aviation experts looked today for some of the mystery surrounding a new type giant craft to be dispelled with initial test flights next week. The plane is a twin-motored 50,000-pound flying boat capable of a take-off horsepower of 4000 and accommodating 52 day-time passengers and five crewmen.

Indicating U. S. Navy interest in the craft, the Consolidated Aircraft Corporation, manufacturers, withheld performance figures in a brief description released today. There have been almost incredible unconfirmed reports of the plane's capabilities.

The company statement said "although no performance figures may be released, Model 31 greatly exceeds the PBY's in speed, range and load capacity."

The PBY is the giant two-motored flying boat now used by the Navy in mass flights from here to Hawaii and the Canal Zone. Although built years ago, its true performance abilities have been suppressed by the Navy.

Unofficial analysts of the new ship have estimated its top speed may be almost 300 miles an hour and its range up to 10,000 miles.

The company statements said that "while the Navy department was cognizant of the construction, the development has not been financed by the government."

The craft measures 110 feet across the wing, 73 feet down the hull and stands 22 feet high on its retractable beaching wheels.

The hull has two full decks, one above the other. There are eight cabins besides the large flight control compartment.

CONSOLIDATED WINS U. S. BID

S.D. SUN 4/27/39

3-Million Army Plane Contract Awarded

Consolidated Aircraft Corp. today was awarded a $2,880,000 contract for constructing an unnamed number of heavy, four-motored Army bombers, similar to the "flying fortress" type, the United Press reported from Washington, D. C.

This was one of several orders placed with aircraft manufacturers all over the country by the War Department in a $50,000,000 appropriation for 571 planes, from the huge bombers to swift pursuit and interceptor planes and small photographic craft.

The Consolidated award was made after secret negotiations by the company with the Army, came as a surprise locally.

SECRECY ON DETAILS

Officials of the San Diego concern said they were bound to continued secrecy by the War Department and could give no further details on the type of plane, the number to be built, or when construction would start.

Last month, Consolidated was awarded a $4,700,000 contract for four-motored Navy patrol bombers, the manufacture of which will begin in June or July as soon as necessary materials are received from eastern factories.

The outlook for Consolidated, which was gloomy early this year because of a small backlog of unfilled orders, was brightened considerably today. Not only did the company actually have $7,500,000 in Army contracts, but it had strong possibilities of obtaining a large percentage of future work in the Army Air Corps' expansion program.

LOWEST BID

Its bid on 1000 attack bombers, opened last week, was the lowest of eight manufacturers. An additional $19,000,000 in contracts for this type will be awarded within a few days, the War Department announced.

Consolidated's biggest planes have been two and four-engined seaplanes for the Navy. Its Army land plane contract was received only on the basis of engineering designs submitted, rather than on an actual experimental prototype craft.

Congress has authorized the building up of the Army Air Corps to a total of 6000 planes by July 1, 1941. This means the construction and delivery of 3000 new planes within a two-year period.

300 MILLIONS FOR PLANES

Performance of the four-motored bombers now used by the Army, which the Consolidated product is expected to equal if not excel, includes a flying speed higher than 250 miles per hour and an extremely long range. The "flying fortress' carries five machine guns and a crew of six to nine men.

A total of $300,000,000 will be spent for Army planes by 1941.

The Consolidated contract does not include the cost of engines, propellers, instruments and accessories. The remainder of the first $50,000,000 now available will be used to purchase these parts from manufacturers in quantity lots and will be furnished by the government to the aircraft factories for installation in the planes.

Other Awards

Contracts for four other types of planes were awarded to the following concerns:

Curtiss-Wright Corp., New York, $12,872,398, for single-motored pursuit planes, one of the fastest in the world.

Lockheed Aircraft Corp., Burbank, $2,180,728, for twin-engined pursuit interceptor planes.

Bell Aircraft Corp., Buffalo N.Y., $1,073,445, single-engined pursuit interceptor planes, a new type.

Beech Aircraft Corp., Wichita, Kan., $528,749, photographic planes.

F.R. Signs 549 Million War Department Bill

Washington: The automobile industry has spent millions enlarging its plants for government armament orders and the Army has ordered fighting planes superior to any in the world, it was revealed today as the government pressed to complete its gigantic defense program with all possible speed.

The War Department signed contracts for 571 bombers and pursuit planes to cost $50,000,000, launching the program that will expand its aerial strength to 6000 planes soon after President Roosevelt signed the $549,000,000 War Department appropriation bill from which the money comes.

U. S. Navy Planes Copied in Designs For Soviet by Consair, Testimony

Testimony he was sent to Russia to design "mail cargo flying boats, the same as the Consolidated PBY-1 now used by the United States navy, definitely a bomber with the turret and armor omitted," came today from Gilbert A. Henry, airplane designer, The Associated Press reported from Los Angeles.

Henry testified in trial of a suit filed by Consolidated Aircraft Corp., San Diego, to recover $1910 advanced to him for the trip, and of his cross-complaint asking $2747 from the company.

In his complaint, Henry asserted Consolidated had a contract with the Soviet government to aid it in construction of the planes. He said he was one of 13 engineers, designers and technical experts sent by the company to Russia in 1937, and that he and two others returned to the United States.

Consolidated asks return of money advanced to Henry because he did not go on from Moscow to his ultimate destination, Taganrog, as agreed. Henry answered that Russian conditions fell short of what were represented.

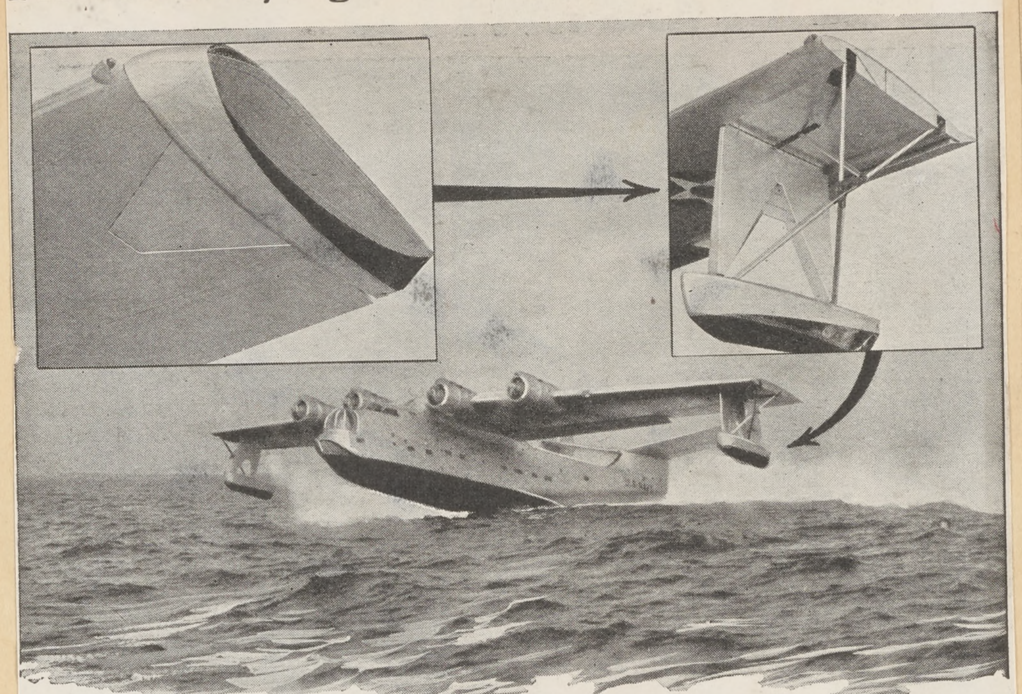
Floats of Flying Boat Retract into Wing Tips



Official U. S. Navy photograph

The Consolidated "XPB2Y-1" caught at the instant it stepped from the water for full flight. Insets show wing-tip floats in retracted and lowered positions; they are sturdily built to support ship in heavy seas

To cut down their drag while in flight, the skiff-like floats of the giant "XPB2Y-1" flying boat withdraw into the wing tips, and it takes just thirty seconds to raise or lower them. The torque-tubes of the retracting mechanism travel through 100 feet of wings from the power source and must turn 3,000 revolutions per minute. As the ship prepares to alight on the water, the lowered floats act as air brakes to slow the approach. The navy has not yet released the details or performance records of this four-motored patrol bomber built by Consolidated Aircraft Corporation.

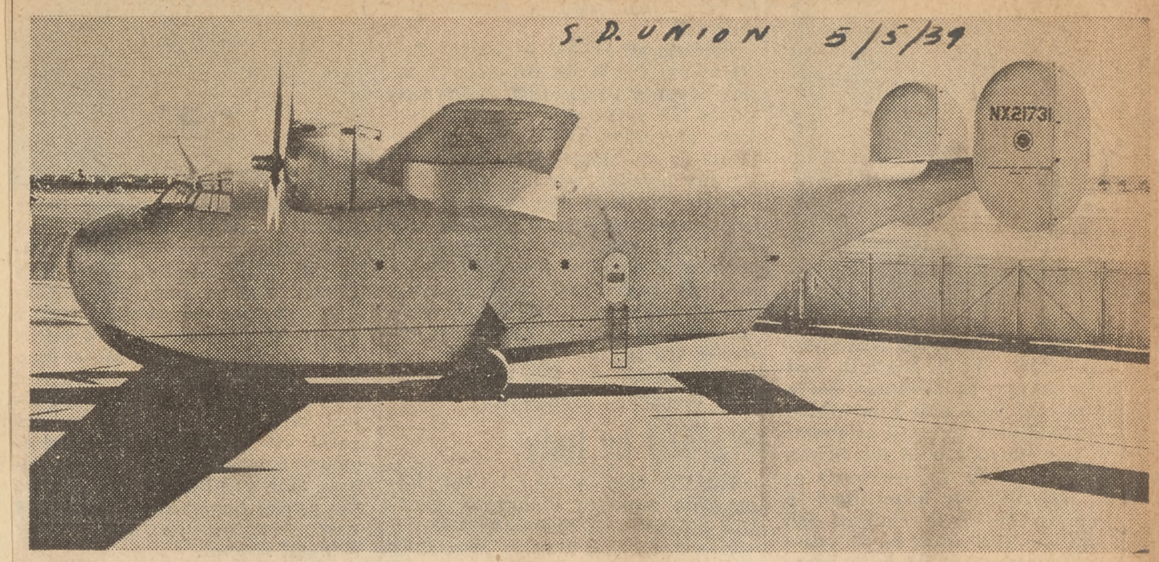
NEW AIR GIANT ROLLS OUT OF S. D. PLANT

S. D. UNION 5/5/39



Consolidated's 50,000-pound two-decker awaits trial flight.

* * *

52-PASSENGER FLYING BOAT COMPLETED BY CONSOLIDATED

2 Motors Power Huge Ship Capable Of Transporting 28 Fares Across Atlantic

A new giant of the sky lanes, a 50,000-pound flying boat designed primarily for the aerial pathways of peace, was rolled out of Consolidated Aircraft's factory at Lindbergh field yesterday and preparations were started for its trial trip, scheduled to begin within the next few days. Capable, its builders say, of carrying 28 passengers across the Atlantic, the big two-decker craft is powered with two 18-cylinder twin-row radial engines, each capable of generating 2000 horsepower at the take-off. For shorter day trips the liner can carry 52 passengers.

Emergence of the planes supplied some of the answers to questions raised when it was learned that Consolidated was grooming a new creation for long-range travel, apart from its noted PBY line of naval flying boats, whose full performance records never have been made public.

HIGH SPEED ESTIMATED

While no data on speed is available, it was estimated that speeds up to 300 miles an hour would be possible with the ship's great power, said to be the most ever put into a two-engined commercial craft.

Designated as Model 31, twin-engine flying boat, the ship has a wing span of 110 feet, is 73 feet long, 22 feet high and has a maximum wing chord of 14 feet.

It is constructed of aluminum-coated aluminum alloy skin internally reinforced with longitudinal stiffeners and transverse bulkheads and frames.

Fuel tanks are built into the wing's center section and the outboard floats retract to the underside of the outer wing panels. This is a departure from the PBY practice of having floats retract to outer wing tips.

Two full decks, one above the other, provide a large flight control room and eight other large compartments.

Beaching gear is of the tricycle type, with the nose wheel housed in the bottom of the hull and side wheels both removable and retractable.

BUILT IN 10 MONTHS

Ten months were required for design and construction of the craft, but no cost estimate was given out.

"Unlike previous experimental flying boats which were constructed under government contract. Model 31 is the corporation's private venture," a company statement said. "While the navy department was cognizant of the construction, the development has not been financed by the government nor subjected to the ordinary procurement routine which adds materially to the cost and time for construction. Development of types of similar magnitude has required from two to three years heretofore."

Latest type instruments are on the control cabin's flight panels.

While the ship was built primarily as a private venture, its military possibilities have not been overlooked, it was indicated in the company statement.

"As a military plane the ship would augment the famous series of twin-engine patrol bombers built for the navy," said a company official. "Although no performance records may be released, the ship greatly exceeds the PBYs in speed, range and load capacity."

The ship is designed to operate with a crew of five—pilot, co-pilot, flight engineer, radio operator and navigator.

ARCHBOLD PLANS AUSTRALIA HOP; WILL GIRDLE WORLD IN JUNE

S. D. UNION 5/8/39

Preparatory to attempting one of the longest seaplane flights in history, Richard H. Archbold, director of American Museum of Natural History, will leave Hollandia, Netherlands, New Guinea, May 16, for Port Moresby, Australia, via Batavia.

According to radio advices from Archbold, he is going to Batavia to extend appreciation to Netherlands government officials for their assistance to the Museum of Natural History's scientific expedition in New Guinea.

Early in June Archbold, in his $250,000 San Diego - built flying boat, the Guba, will leave Sydney for a trail-blazing flight over the Indian ocean, thence to British East Africa, the West Indies, Miami, and overland to San Diego.

Stops will be made at Cocos island, Diego Garcia in the Chagos islands, the Seychelles islands, Mombasa, Lake Victoria, Dakar, St. Thomas and Miami. The plane is due here July 15 where it will be turned over to Consolidated Aircraft Corp., the builders, for overhaul.

During the 20,000-mile flight Barney Boyd, local amateur radio operator, will keep in constant touch with Archbold. The trip from Sydney to Lake Victoria in Africa is being made at the request of the Australian government, Capt. P. G. Taylor of the British royal flying corps, will accompany Archbold on this trail-blazing trip.

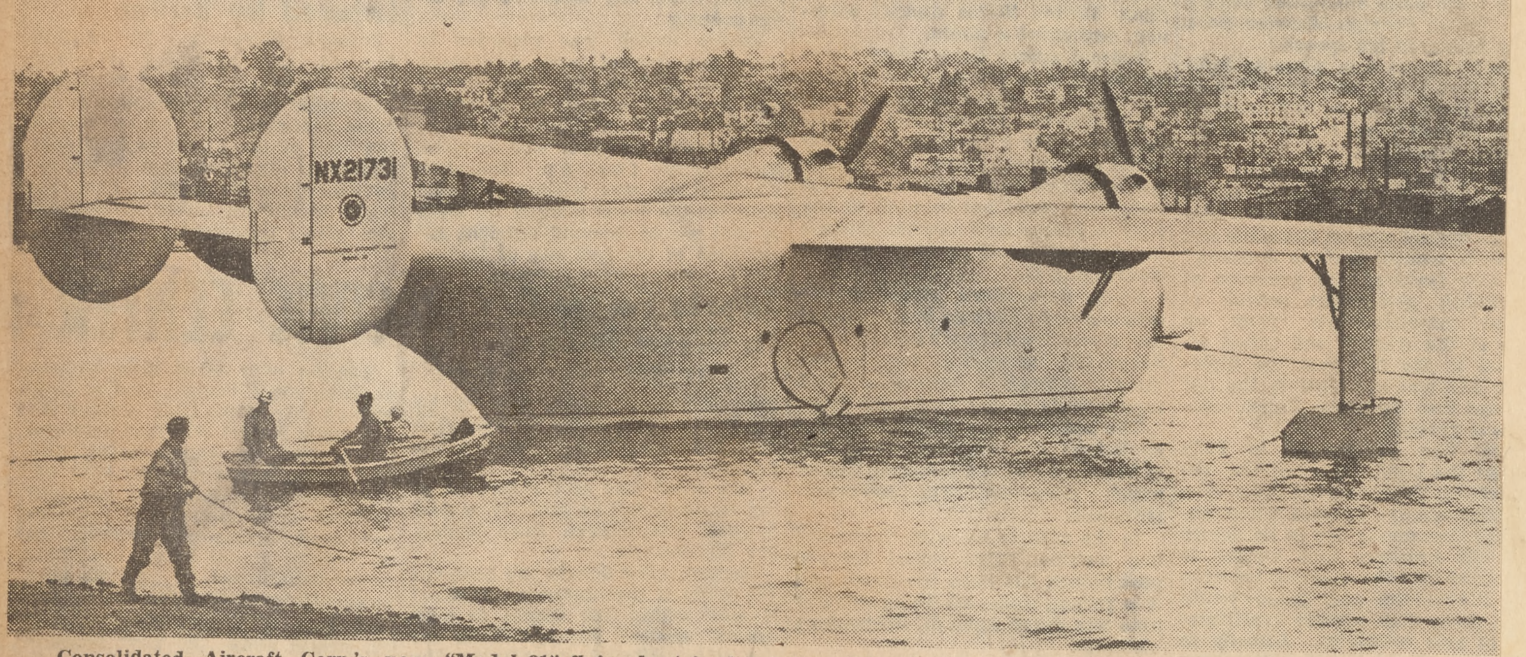
Monster Craft Developed in Local Plant 'Lifts' Easily in Initial Hop

San Diego Evening Tribune - 5 May 1939 --



Consolidated Aircraft Corp.'s new "Model 31" flying boat is shown here lying just off the seaplane ramp at Lindbergh field before it took off today on its initial test flight. The plane's "ground crew," riding in a rowboat, is shown in the foreground.

25-Ton Consair Flying Boat Takes Air In Test Flight; Accommodates 52

Rising easily from the waters of San Diego bay, a new 25-ton, twin-engined flying boat developed in the last 10 months at the Consolidated Aircraft Corp. plant, took off shortly after 11 a.m. today on its initial test flight. The plane, reported carrying three persons, William Wheatley, chief test pilot; George Newman, co-pilot, and Jack Kline, flight engineer, soared over a course from Mission Beach to Imperial Beach.

The take-off came within six hours after the plane was wheeled from the factory to the seaplane ramp at the south end of Lindbergh field. On a short trial run on the bay early this morning, the craft rose for a few feet off the water. During most of the morning it rode in the shallow water at the edge of the ramp, while a crowd of several hundred assembled to witness the take-off.

The giant craft, though carrying no armament, is designed for use either as a military plane or as a commercial airliner, with a maximum capacity of 52 passengers for day operations and 28 passengers for night operations.

"Unlike previous experimental flying boats which were constructed by the Consolidated Aircraft Corp. under government contract, the new plane, known as Model 31, is the corporation's private venture," stated a report from the plant. "While the navy department was cognizant of the construction, the development has not been financed by the government, nor subjected to the ordinary procurement routine which adds materially to the cost and time for construction. Only 10 months were required for the design and construction of the airplane, whereas development of types of similar magnitude has required from two to three years heretofore."

Faster Than Bombers

Although no information was released as to speed possibilities of the craft, it was reported the plane carries two Wright Aeronautical Corp. 18-cylinder twin-row radial engines, each rated at 2000 horsepower for take-off. The plane has a wing span of approximately 110 feet and an over-all length of 73 feet. It stands 22 feet high.

For transatlantic flights, the air giant has accommodations for 28 passengers. On its ability as a military plane, Consolidated officials declared it would augment the famous series of twin-engined patrol bombers built by Consolidated for the navy, and said that although no performance figures may be released, Model 31 greatly exceeds the PBY's in speed, range and load capacity. The navy has been using the PBY-type patrol planes, developed several years ago, in Hawaiian and Panama flights from here.

To Carry Crew of Five

The blunt-nosed flying boat will carry a crew of five, consisting of pilot, co-pilot, flight engineer, radio operator and navigator. Its two full decks, one above the other, provide a large flight control room and eight other large compartments.

The following general description and type of construction of Model 31 was released at the Consolidated plant:

Propellers: Two 16-inch diameter 3-blade Hamilton Standard hydromatic full-feathering propellers.

Construction: Aluminum coated aluminum alloy skin, internally reinforced with longitudinal stiffeners and transverse bulkheads and frames. The wings, tail surfaces and the planing surface of the hull bottom are flush riveted.

Beaching Gear Retractable

Wing: Full cantilever; integral fuel tanks in center section (following Consolidated standard practice); hydraulically operated fowler flaps extend from inboard side of aileron to hull. Outboard floats retract to underside of outer wing panel (tips too small to permit retraction at the tip, as on PBY's). Ailerons and flaps are fabric-covered.

Tail surfaces: Full cantilever stabilizer with twin fins and rudders. Rudders and elevators are fabric-covered.

Hull: Two full decks, one above the other.

Beaching gear: Hydraulically operated retractable tricycle beaching gear. The nose wheel is housed in a well in the bottom of the hull, and the side wheels swing upward into wells in the side of the hull. The side wheels are removable, as well as retractable. The nose wheel well and side wheel wells are completely enclosed by doors for maximum efficiency in flight.

Flight compartment: Completely sound-proofed and furnished with all latest type instruments and equipment.

Planes to Hop From Panama For Nicaragua

S.D. UNION 5/8/39

On the second leg of their homeward bound flight from Hampton Roads, Va., 24 long-range patrol bombers of Squadrons 7 and 9 will leave Coco Solo, Canal Zone, this morning for the Gulf of Fonseca, it was announced yesterday at Naval Air station. The planes will refuel and remain overnight in Nicaraguan waters.

According to radio advices from Capt. Marc Mitscher, commander Patrol Wing 1, the 24 planes will leave the Gulf of Fonseca Wednesday for Magdalena bay where they will remain until Friday at daybreak before taking off for the final stage of the flight. They are scheduled to arrive early Friday afternoon.

The cruiser Memphis, flagship of Rear Adm. Charles A. Blakely, commander scouting force aircraft, will leave the canal zone today for San Diego arriving May 16. The aircraft tender Wright will act as plane guard and station ship in the Gulf of Fonseca. The destroyers Childs and Williamson are to act as plane guards at Magdalena bay.

No more extended flights will be made by patrol wing bombers until June 28 when 15 planes of VP-1 squadron are scheduled to leave here for Pearl Harbor, Hawaii. The squadron is commanded by Comdr Sam La Hache.

S.D. UNION

24 Bombers Flying Non-Stop to S. D.

5/10/39

Twenty-four navy patrol bombers left Gulf of Fonseca, 2100 air miles from San Diego, yesterday, 2 p. m., and are expected to reach here this morning, probably before 10 o'clock, the Naval Air station reported. One hundred and seventy men are aboard.

Under command of Capt. Marc A. Mitscher, the big flying boats left here in January for navy maneuvers in the Caribbean and, like the rest of the fleet, were ordered back home when the stay on the east coast was curtailed. They left the Canal Zone Monday for Fonseca, reaching there in early afternoon, following a 540-mile flight.

Decision to fly to San Diego without stopping at Magdalena bay was made by Capt. Mitscher when aerological officers reported weather conditions were ideal.

The planes were averaging 120 miles an hour.

COL. CHARLES A. LINDBERGH

. . . in the cockpit of the new pursuit plane in which he is making a tour of inspection of the nation's aircraft plants for the war department.

The famed airman departing from the Consolidated Aircraft Corp. plant.

* * *

Lindbergh Lands in San Diego to View Local Plant in National Air Survey

At the controls of a new pursuit plane, Col. Charles A. Lindbergh yesterday arrived at the muncipal airport named in his honor. His plane was taxied to the army air corps reserve hangar where it was serviced preparatory to leaving today for March field, Riverside. In striking contrast to his appearance on the March morning in 1927 when he arrived here from St. Louis to complete arrangements for construction of the plane in which three months later he vaulted to fame, Lindbergh yesterday wore the uniform of a colonel of the army air corps.

He was called to special duty by Maj. Gen. Henry H. Arnold and assigned to make a complete survey of the nation's aircraft industry. His report will be submitted to the war department for transmittal to the military affairs committees of the house and senate.

Accompanied by Maj. R. H. Fleet, Consolidated Aircraft Corp. president, Lindbergh was taken for an inspection tour of the plant. He viewed with interest the new 25-ton, 52-passenger plane which was taken aloft on its first test flight

Friday. The plane, which has a flush rivet wing, is reported to be capable of cruising 10,000 miles without refueling, or approximately three times the distance of the navy's PBY craft.

Last night Lindbergh was a dinner guest of Maj. and Mrs. Fleet

Lindbergh Here On Survey Trip

(Continued from Page 1)

at their Pt. Loma home. He spent the night there.

The army flier did not visit the Ryan Aeronautical Co. plant which adjoins the Consolidated factory, although he cordially greeted T. Claude Ryan, Douglas Kelley and several men who worked on the Spirit of St. Louis when it was fabricated at the old B. F. Mahoney plant in the former fish cannery at the foot of Juniper st.

Of the four key men who played a prominent part in the construction of Lindbergh's transatlantic flight plane, Mahoney is engaged in selling trailers, Hawley Bowlus is building and flying gliders. A. J. Edwards is a local automobile salesman and Donald Hall is employed at Consolidated.

Mahoney owned the factory, Bowlus was the plant superintendent, Hall was the designer of the Spirit of St. Louis, and Edwards closed the deal with Lindbergh for the building of the plane.

Lindbergh at San Diego

SAN DIEGO, Calif., May 6 (AP).—Col. Charles A. Lindbergh landed here at the airport which bears his name today after a fast flight from March Field, near Riverdale, Calif.

He was met by Maj. Reuben G. Fleet, president of Consolidated Aircraft Corp., who whisked him to the Consolidated plant, where the colonel apparently made an inspection.

Eagle Photographed on Way to S. D.

Col. Charles A. Lindbergh, San Diego visitor today, is shown here at St. Louis on his way to the coast. With him is Master Sgt. James Tate of the 35th division aviation, Missouri national guard. Tate packed three parachutes which saved Lindbergh's life in jumps made while he was a pilot in St. Louis.

5-7-39

LINDY INSPECTS CONSAIR PLANT; STAYING OVERNIGHT ON S. D. VISIT

Col. Charles A. Lindbergh, here on a tour of local aviation facilities, will spend tonight in San Diego, it was reported following a conference between the famous flyer and Maj. R. H. Fleet, president of Consolidated Aircraft Corp. The speedy plane in which Lindbergh arrived here at 10:30 a. m. from March field, was wheeled into the army air corps reserve hangar at the south end of Lindbergh field.

Lindbergh, making no statements for the press, emerged from the Consolidated Aircraft Corp. plant at 1 p. m., after spending more than two hours in the factory with Fleet. As he departed from Consolidated for luncheon at Fleet's house, the flier was met by newspaper photographers, but declined to pose for a picture.

Lindbergh, who spent last night at Winslow, Ariz., en route to southern California from Washington., D.C., wore a uniform on his arrival here. When he began his tour of the nation to inspect army air corps facilities and aviation centers, he wore civilian clothes but by the time he reached St. Louis he had attired himself in uniform, The Associated Press reported.

TRANSPORT

May 22 - 39

Perfect Wing

From the sprawling Consolidated Aircraft Corp. factory on Lindbergh Field a huge flying boat waddled down to landlocked San Diego Bay one day last week. In the bright California sun her slim wing looked absurdly frail, her huge hull with its upswept stern grotesquely fat. Nevertheless, her little band of professional observers knew they were watching a plane designed to be the last aerodynamic word of 1939.

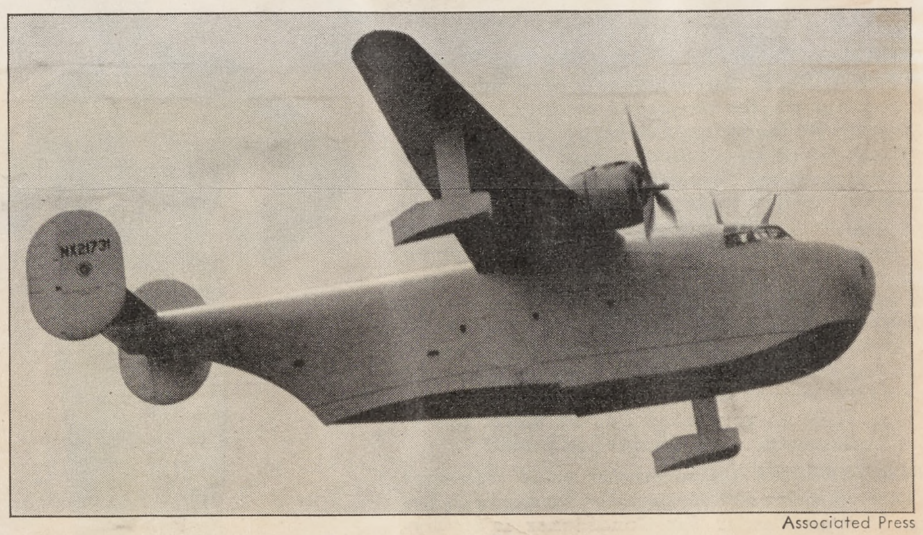
With her two 2,000-h.p. Wright Cyclones rumbling, she taxied out to open water, swung into the wind and poised for flight. Spindrift ripping from her slim stern, she was up on the step. Then she was in the air.

From the beach, factory executives in shirt sleeves, mechanics in overalls watched the new 52-passenger ship as she swung out past Point Loma. Among them, none watched more intently than Engineer David Richard Davis, because none had a bigger stake in her than he. For David Davis had designed her slim 110-foot wing, had calculated on the drawing board and in the wind tunnel that it was close to perfection.

What Pilot Bill Wheatley had to say when he landed confirmed Designer Davis' calculations. Consolidated's new 25-ton Model 31 had a high speed of 275 m.p.h. (75 miles faster than Boeing's four-motored *314* clipper), handled nicely in the air. Gasoline consumption showed that she had a range of 10,000 miles with a light passenger load, that she could lug 28 passengers in Pullman accommodations across the Atlantic at a speed unprecedented for commercial flying boats.

Designer Davis' wing, flush-riveted and smooth of contour, had justified his prediction that it would be 20% more efficient than any in the air today. The product of ten years of work, it had been tried in Caltech's aeronautical laboratories and in test rigs of its designer's own devising. Whether he had achieved a smooth flow of air over virtually its entire surface as National Advisory Committee for Aeronautics has done with its new wing curve (TIME, May 15), David Davis modestly declined to say.

With the Davis "perfect wing" as a starter, Consolidated in ten months built its new boat from the ground up without help from Army or Navy. Long before the ship had flown, however, the news of its spectacular 10,000-mile cruising range was out, and the Navy, one of Consolidated's best customers, poked in its nose. At week's end it appeared likely that Model 31's first assignment will be as a patrol bomber for the fleet.



Associated Press

CONSOLIDATED'S MODEL 31
Her wing and range attracted the Navy's nose.

Pilots' Teeth

After long flights at high altitudes, many commercial pilots are temporarily deaf, hear waterfalls or hissing and crackling sounds that make them sour-tempered and touchy. Army and Navy pilots have the same sensations after tactical flights involving high-speed dives. These sensations were long ago traced to failure of the Eustachian tubes—passages connecting the throat and middle ear—to equalize ear pressures with changes in altitude.

Two and a half years ago Dr. Glenn E. Willhelmy of St. Louis, a Naval Reserve dentist, reported to the Navy that such ear troubles, along with attacks of vertigo (". . . if mild the pilot does not mention it . . . if severe, he crashes"), were most often found in older airmen. His conclusion was that normal wear and loss of teeth make jaws shut out of position, cause a partial closure of the Eustachian tubes. His remedy: an up-building of teeth by inlays and other dental means to make a youthful jaw-fit.

To carry on Dr. Willhelmy's research, the Navy assigned Lieutenant Raymond Andrew Lowry of the Dental Corps. Last week 32-year-old Dr. Lowry, now de-

Consolidated Aircraft Rearranges Plant; Will Install Considerable New Equipment

Prepares for Foreign Orders and Inauguration of U. S. Expansion Program

This is the twenty-second article in a series on aviation, and the sixth to give consideration to individual companies in the aircraft manufacturing field.

Article XXII

By T. C. Sullivan

Taking advantage of the tapering off of operations following the completion of a group of contracts for the construction of patrol bombers for the United States Navy, Consolidated Aircraft Corp. has rearranged its plant and will install considerable new equipment in preparation for possible new foreign business and the inauguration of the airplane expansion program for this country.

The company is now completing the last of its several orders from the Navy for PBY two-engined patrol bombers, bringing the total to 210 units delivered in less than three years and placing the company as the leading manufacturer of large flying boats for the Navy. With spare parts, the aggregate of the Navy orders for PBY's has been in excess of $20,000,000, exclusive of engines.

Backlog of unfilled orders at Consolidated now totals approximately $6,000,000, consisting principally of a $4,700,000 contract awarded late in March by the Navy for the new four-engined patrol bomber which the company developed in competition with other manufacturers. The experimental plane of this type built by Consolidated was accepted by the Navy after flying overland nonstop from San Diego, California, to Washington, D. C., and later a return trip was made over the same route. These overland flights by flying boats demonstrated the mobility of the Navy's air force in moving from one ocean to the other. The company's investment in the experimental four-engined plane was charged to cost of products sold during 1938.

how does he know

450,000 Miles Without Mishap

Several times during the past two years the Navy has made "routine" delivery of Consolidated two-engined patrol bombers by flying the planes from San Diego to Hawaii and the Panama Canal Zone. Recently, 48 of these planes completed a mass flight from San Diego to Coco Solo, a distance of approximately 3,087 miles. In flights ranging from 2,500 to 3,000 miles each, the planes have been flown, without mishap, an aggregate distance of approximately 450,000 miles.

Consolidated moved its location from Buffalo, N. Y., to San Diego in 1935, constructing an entirely new plant on the water front where bulk of the Navy's airplanes are based. The plant was enlarged in 1936 and now contains 450,000 square feet of floor area, in addition to which the company has a paved yard containing approximately 215,000 square feet which is available throughout most of the year for assembly work.

The plant rearrangement and installation of additional presses and drop-hammers which are now under way are designed to increase the productive capacity and make Consolidated one of the most modern aircraft plants in the country. The present backlog will by no means tax its facilities so that the company is about the only major unit in the industry ready to accept new business that can be delivered within a comparatively short time. As at December 31, 1938, current assets amounted to $5,225,715, including $3,586,478 of cash, $504,273 in accounts receivable, and the balance in inventories. Current liabilities were $1,554,491, or considerably less than one-half the amount of cash.

1938 Sales, Profits Set Record

Both sales and net profit established new records for Consolidated during 1938. It has been the consistent practice of the company, however, not to take up profits during any year on contracts unless they were substantially completed. At the same time, all operating costs and expenses, including depreciation and amortization of experimental expenses, incurred during the year are considered as elements of cost in determining inventories and cost of products sold.

This accounting policy has been considered necessary in view of the regulations governing naval contracts. In the case of several related contracts, such as those held by Consolidated for 210 large patrol bombers delivered over a period of more than two years, it has tended to distort the company's actual earning ability. Results for the year 1937, for example, provided a ratio of net sales to net profit of only 3.6%, while during 1938 the ratio jumped sharply to 12.5%. Sales volume for the two years were about equal, the difference, however, was that the selling price of over 80% of the reported sales for 1937 was carried at cost pending final determination of costs upon completion of the contracts. The profits on these deliveries were taken up during 1938, thus distorting the earnings picture for both years. An average for the two years brings the ratio of net sales to net profit to 8.3%, which is more in keeping with actual operations. Net sales, net profit and their ratio for Consolidated Aircraft Corp. for the past two years are shown in the following table:

	Net sales	Net profit	Ratio
1938	$12,245,067	$1,535,110	12.5%
1937	11,907,493	462,959	3.6
Two years	$24,152,560	$1,998,069	8.3%

Started With $25,000 Capital

23

Consolidated Aircraft is headed by R. H. Fleet, president and general manager, who has held that position since 1932. Major Fleet joined the Army in 1917 as an airplane pilot and later served as contracting officer for the Air Corps., business manager of McCook Field, and was in charge of inaugurating the air mail service.

The company was formed in 1923 with an initial capital of $25,000 and has been built up to its present size almost entirely through reinvestment of earnings, the only public financing having been the sale of 22,976 shares of $3 convertible preferred stock in 1936, proceeds of which were used to provide equipment and additions to the San Diego plant, and to supply additional working capital.

During the 15 years through 1938, the company made delivery on $51,427,721 of planes and parts. About 58% of this total has been to the Navy, 23% to the Army, and 19% to commercial and export purchasers. Sales of more than $24,000,000 during the past two years represent 46% of the total business done by the company since its inception.

SEA SCOUTING FEAT OF PLANE REVEALED

Patrol Craft Dogged 'Enemy' Fleet 30 Hours Far at Sea Undetected

ON JOB TILL GAS RAN OUT

Marines in Landing Exercises in Caribbean This Week as Part of Navy Manoeuvres

By HARWOOD HULL

Special Cable to The New York Times.

SAN JUAN, P. R., March 5.—Mimic warfare may have its heroes no less than actual combat. At least approaching the heroic was the performance of a navy patrol plane and crew, belonging to Wing 1, but otherwise shrouded in anonymity, about which there is more talk than of any other single incident which has come to light since the completion of the Navy's Problem XX last week.

The opposing forces of Admiral E. C. Kalbfus and Vice Admiral Adolphus Andrews were assembled under Admiral C. C. Bloch, the fleet commander, off Culebra Island long enough at the end of the war game for the story to get around. The more than 130 ships are now temporarily scattered.

The big patrol plane had orders to locate the White attacking fleet under Admiral Kalbfus and spy out its course as it approached the long string of islands which mark the eastern boundary of the Caribbean, of which one island was supposed to be seized for an enemy base if the attack succeeded.

The plane left its base near here and disappeared in the eastern sky. It located the enemy far out at sea from a height of three miles, so the story goes. It followed the wake of Admiral Kalbfus's ships hour on hour.

Darkness followed day and daylight came again. The patrol plane remained aloft, reporting back to its base the White fleet's movement.

Unmolested and Unrelieved

The plane was not forgotten, but for some reason not explained it was neither relieved nor did it get an order recalling it. It was not molested by the enemy nor detected by the umpires.

After more than thirty hours up there, the big plane came back and landed at its base with only fumes left in its fuel tanks.

The craft had been in the air for a longer time than was required in the non-stop flight from San Diego to the Panama Canal and probably had flown a greater distance than the more than 3,000 miles of that flight.

Much to his surprise, the plane commander on his return was asked where he had been.

His explanation was brief and simple. He quoted his orders. He had been sent on a mission and he had stuck to it at 15,000 feet in the air.

When no relief came, he had just continued dogging the enemy fleet and watching its foaming wake until only enough gas remained to fly back to his base.

There may be no official record involved in the performance, but quite possibly when all the facts are checked, this plane's tour of duty may be found to mark a new high for sustained operation in simulated warfare.

At any rate the incident is being cited as demonstrating the value of the air service in hemisphere defense, as well as the possibilities for greater range at sea of planes operating from an advance base in the Eastern Caribbean, the importance of which President Roosevelt stressed on his return from the manoeuvres.

To Meet at Guantanamo

Today the ships of the combined fleet were in scores of ports on the Caribbean and the Gulf of Mexico or en route to ports. Many cruisers went to their name ports, some for the first liberty for their crews since they left the West Coast late in December.

But the Winter's work is not finished. Most of the war vessels are due at the base at Guantanamo, Cuba, on March 15, when a critique of Fleet Problem XX is scheduled to take place aboard Admiral Bloch's flagship, the Pennsylvania.

As chief umpire as well as commander of the fleet, Admiral Bloch is continuing the secrecy surrounding Problem XX. From his temporary base off Culebra, where the greatest number of American warships ever assembled, remained for some time the past week, Admiral Bloch sent word ashore that it was still the navys' policy not to discuss for publication any phase of the problem.

The rendezvous at Culebra coming immediately after the war game, revived speculation on the prospect of future greater use for fleet operations of Viegues Sound.

For several days this area had a thorough test as a fleet anchorage. Vieques Sound extends twenty to thirty miles east and west between Puerto Rico and the Virgin Islands channel and more than ten miles between Culebra and a string of small islands on the north and Vieques Island on the south.

All the islands afford many sheltered anchorages for all types of ships, generally of easy access and with optional exits. Land batteries mounted on heights on the islands might provide adequate protection against possible enemy approach. The area has been the subject of several navy surveys since soon after the purchase of the Virgin Islands from Denmark more than twenty years ago.

With Problem XX ended, new light is shed on the reasons the army did not participate beyond having observers with the navy's key units.

Essentially is was a problem in manoeuvring opposing forces far at sea, supported by airplanes operating either from shore or from sheltered bases. The use of troops ashore or getting them ashore was outside the scope of the problem. When the quitting whistle blew the White and Black fleets were scattered over more than 1,000 square miles of water.

Actual landing exercises, such as those in which units of the army's First Division participated last year, will be under way this week at Vieques. The ships of the Atlantic squadron under Rear Admiral Alfred W. Johnson and the First Brigade of the fleet marine force participating.

Whole War Game Photographed

Much information, particularly photographic, which was gained during the development of Problem XX will be available for the smaller-scale activities now scheduled. New aerial maps have been prepared for all the areas to be utilized in the coming exercises.

In fact, photography has played a far greater part in this Winter's manoeuvres than in any previous large-scale navy operation. Practically every action recordable by the photographic lens, whether from the air or from surface ships, has been supplied in pictures to Admiral Bloch.

One technique carried to a new point in the war game has been simultaneous photography from two or more planes with cameras operating under radio control.

These pictures will supplement the maps in telling the story of the White and Black Fleets at the critique. Both maps and pictures will be seen for the first time by the navy flag and staff officers when they assemble at Guantanamo.

Six weeks after the critique, the fleet will be at New York for the World's Fair.

AMERICA'S NEW AIR MONARCH . . . Consolidated Aircraft Corp.'s "mystery plane" shown at top on a practice power run down the bay shortly after launching this morning. Below, the steep-hulled, pot-bellied ship as she slid into the bay. Unique retractable landing gear is being withdrawn into the airboat's body. Pontoons are drawn to underside of wings when plane is in flight. (Story on Page 1.)

CONSOLIDATED'S NEW MYSTERY GIANT AIRBOAT TRIES WINGS

Pictures on Page 3

By HAROLD KEEN
Aviation Editor

Consolidated Aircraft Corp. today rolled its vaunted "mystery plane" out of the plant where it has been under secret, high-speed construction for 10 months, and claimed that with its launching in San Diego bay this single product may revolutionize the world's airboat industry.

The giant 50,000-pound ship, which presented a startling appearance in comparison with its graceful predecessors, the twin-engined PBY's and the four-motored PB2Y-1, is expected to more than double the cruising range of any seaplane ever built and will be the fastest airboat of aviation history.

Designated simply as 'Model 31' and built ostensibly for commercial use, this air monarch of the future will have a cruising range of at least 10,000 miles and a top speed in excess of 275 miles per hour.

It will be able to fly from San Diego to Moscow non-stop the long route—across the United States, the Atlantic, and over Europe.

It can quickly be converted into an aerial arsenal, with a minimum of eight machine guns or small cannons mounted on all sides of its narrow, extremely steep hull.

But when the 'Model 31' was launched this morning, there was no sign of armament, no gun turrets Navy officials attempted to conceal.

2000-H.P. MOTORS

From tail to engines, the ship is a radical experiment. The motors are 2000-h.p. Wright Cyclones, more powerful than any previously mounted on a plane, and so husky that they require the firing of eight-gauge cartridge shells to turn over the crankshafts.

The wing span is 110 feet, six more than the PBY's, and five less than the four-motored bomber. The over-all length is 73 feet, and the height is 22 feet.

A sharply inclined stern, thus designed to keep the body as light as possible, slants away from the twin-ruddered tail to give the ship a stubby, awkward appearance.

HARD TO START

"She's not good looking, but she's an awfully business-like plane," commented Vice President C. A. Van Dusen today as he watched preparations for launching the "Model 31."

The craft's first dip into San Diego bay was accomplished after more than an hour and a half's attempts to start the engines. The cartridge mechanism of the left motor apparently was defective and about a dozen shells were fired before the engine burst into action. The airboat entered the water at 7:25 a. m. and Test Pilots Bill Wheatley and George Newman, with a large crew of technicians watching their own specialties, spent most of the morning taxiing the plane to get the "feel" of the controls, occasionally racing it on a simulated take off.

At 11:10 a. m., with only four men at the controls — Pilots Wheatley and Newman and Flight Engineers Jack Kline and Robert Keith—the craft rose for the first time.

Only 1000 gallons of the gasoline-carrying capacity of more than 5000 gallons were in the midwing tanks and the airboat, after a fast run of 15 seconds toward North Island. took to the air easily. The plane circled over the bay and the coast north of here for more than an hour and a half while more than 100 persons watched the municipal ramp near the Coast Guard air base.

52-PASSENGER CAPACITY

Five men will be able to operate the ship when in full commission, and as a commercial airliner, the Model 31 will accommodate 52 passengers for day flights and 28 in berths for night travel.

Although planned and built entirely by the company out of its own funds, at a cost of about $500,000 the Model 31's development was closely watched by the Navy, and military secrecy had been imposed during its construction.

AIRLINE INTERESTED

A long study of scores of airboat designs by I. M. Laddon, chief engineer, and his assistants, preceded the adoption of the present ship's lines.

Mr. Van Dusen today admitted that its efficiency as a military plane as well as for commercial use was given consideration in the engineering.

American Export Airlines, which will compete with Pan-American Airways in transatlantic air service, has evinced interest in the Model 31 for its fleet of craft when it is ready to begin regular schedules.

Buffalo NY

Secret Plane Of Consolidated Is Given First Test

San Diego, Cal., May 5 (AP)—Rising easily from the bay, the new 25-ton flying boat built in secrecy by Consolidated Aircraft Corporation, made a successful test flight today.

Bill Wheatley was at the controls. The plane, flying low, shuttled back and forth over a ten-mile course.

The new model 31 is a twin-engined craft with rated horsepower of 4,000 for take-off. It has sixteen-foot three-bladed propellers and daytime capacity of 52 passengers and five crewmen. The wingspread is 110 feet, the height 22 feet from retractable beaching wheels. The 73-foot hull contains two full decks, one above the other, including eight compartments besides the large flight control room.

---

2 Planes Rejoin Patrol Wing

5/12/39
S.D. UNION

Lts. Tom Hamilton and R. E. Coombs of Squadron VP-9, delayed by engine trouble in the Gulf of Fonseca from completing a flight with Patrol Wing 1 from Hampton Roads to San Diego, arrived at 9:50 a. m. yesterday. Both fliers spent Wednesday night at Magdalena bay. Twenty planes of Squadrons VP-7 and VP-9 arrived Wednesday morning after a 2100-mile nonstop flight from the coast of Honduras.

Naval Air station officials announced no word has been received from Pan American Airways as to the departure of the giant new passenger plane now at San Francisco. This ship is to fly to Baltimore via San Diego and New Orleans.

It will join two sisterships in transatlantic passenger and mail service out of Baltimore to French and British ports. This service is to be inaugurated May 20 on the 12th anniversary of Col. Charles A. Lindbergh's flight to Paris.

LONE EAGLE TAKES OFF FROM SAN DIEGO AGAIN

S. D. UNION 5/8/39

Young America watches the nation's idol of the airlanes, Col. Charles A. Lindbergh, take off from municipal airport. The youngster is giving a left-handed salute to shade his eyes from the sun. Inset, Lindbergh in the cockpit of his 300-mile-an-hour pursuit plane in which he is making a tour of the country.

Lindy Finishes Inspection Here

Ending a 24-hour stay in which he inspected the Consolidated and Ryan aircraft factories and conferred with local aviation executives, Col. Charles A. Lindbergh took off from the municipal airport at 12:15 yesterday. He landed an hour later at March field, Riverside.

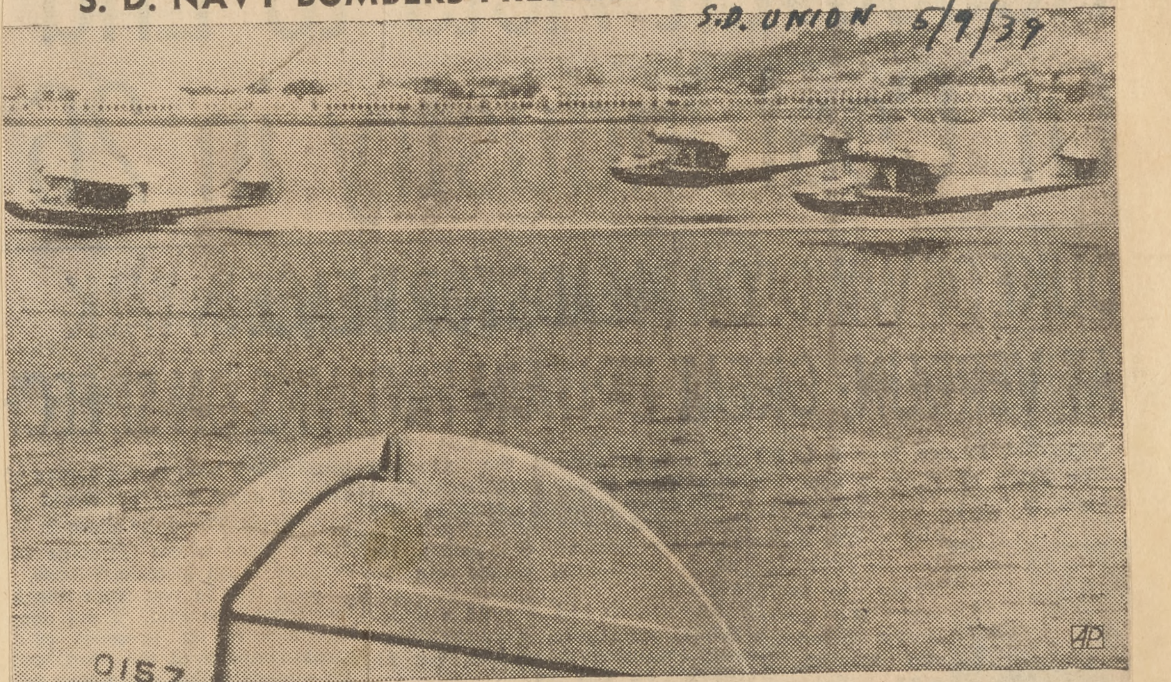
Lindbergh spent the night at the home of Maj. R. H. Fleet. After breakfast he visited the Ryan plant and just before noon went to the army air corps reserve hangar where his 300-mile-an-hour pursuit plane was housed Saturday night.

This morning Lindbergh will visit California Institute of Technology, Pasadena, where with Dr. Clark Millikan, he will inspect the Guggenheim Aeronautics laboratory. He then will visit the Lockheed Aircraft Corp. plant at Burbank, the Douglas Aircraft Co. at Santa Monica, the Vultee Co. plant at Downey and the North American Aviation Co. at Inglewood. From the Los Angeles area he will fly to Seattle to visit the Boeing factory.

At Consolidated Lindbergh's chief interest was in the new four-motored long-range bombers which are being constructed for the army and navy and the new 25-ton commercial passenger plane for transoceanic service. Consolidated has submitted bids for additional army planes on which the army plans to award contracts early next month.

S. D. NAVY BOMBERS PREPARE FOR HAWAII CRUISE

S.D. UNION 5/9/39



Three of the 15 offshore patrol bombers of Squadron VP-1 in a training flight preparatory to leaving here June 28 on a nonstop flight to Hawaii. In background are the Marine base barracks. On the flight to the crossroads of the Pacific the squadron will be commanded by Comdr. Sam La Hace.

S.D.SUN 5/8/39

LINDY EXPECTED TO RE-VISIT CITY

Col. Charles A. Lindbergh, after a thorough inspection of Consolidated Aircraft Corp.'s planes now under construction or being planned, has returned to March Field, Riverside, after indicating to officials of the Ryan Aeronautical Co. he may return later this week to complete unfinished business here.

The flier was in conference for two hours with Maj. Reuben H. Fleet, Consolidated president, in the plant Saturday, and spent the afternoon and evening in further talks with Consolidated executives in Maj. Fleet's Point Loma residence, where he was a luncheon and dinner guest. He stayed there overnight, and took off at 12:15 p. m. yesterday after a brief stop at the Ryan plant.

While on the West Coast in his current inspection of U. S. production and research facilities during special active duty with the Army, Colonel Lindbergh expects to visit Caltech to see the Guggenheim Aeronautical laboratory, the Lockheed plant in Burbank, the Douglas Aircraft Co. in Santa Monica, the Vultee Co. in Downey, the North American Aviation Co. in Inglewood, and the Boeing factory in Seattle.

He Didn't Go, So Firm Sues

S.D.SUN 5/9/39

Because he failed to go to Taganrog, the destination in Russia of a group of Consolidated Aircraft Corp. engineers two years ago, the San Diego concern is suing Gilbert Henry, a former employe, for return of the $1910 it gave him as expenses for the trip, the United Press reported from Los Angeles.

Ten engineers were sent to the Soviet aircraft factory on the Sea of Azov to help establish production methods on a replica of the Navy's PBY bombers. The design of the plane had been purchased from Consolidated with the permission of the U. S. Government.

Mr. Henry, who turned back to Moscow, 500 miles short of Taganrog, has filed a countersuit for $2747 against Consolidated, which he claims greatly misrepresented living conditions in Russia.

The other engineers and their families, numbering 23 persons, returned to San Diego last fall after 15 months in the Soviet.

---

24 NAVY BOMBERS BACK FROM EAST

S.D.SUN 5/10/39

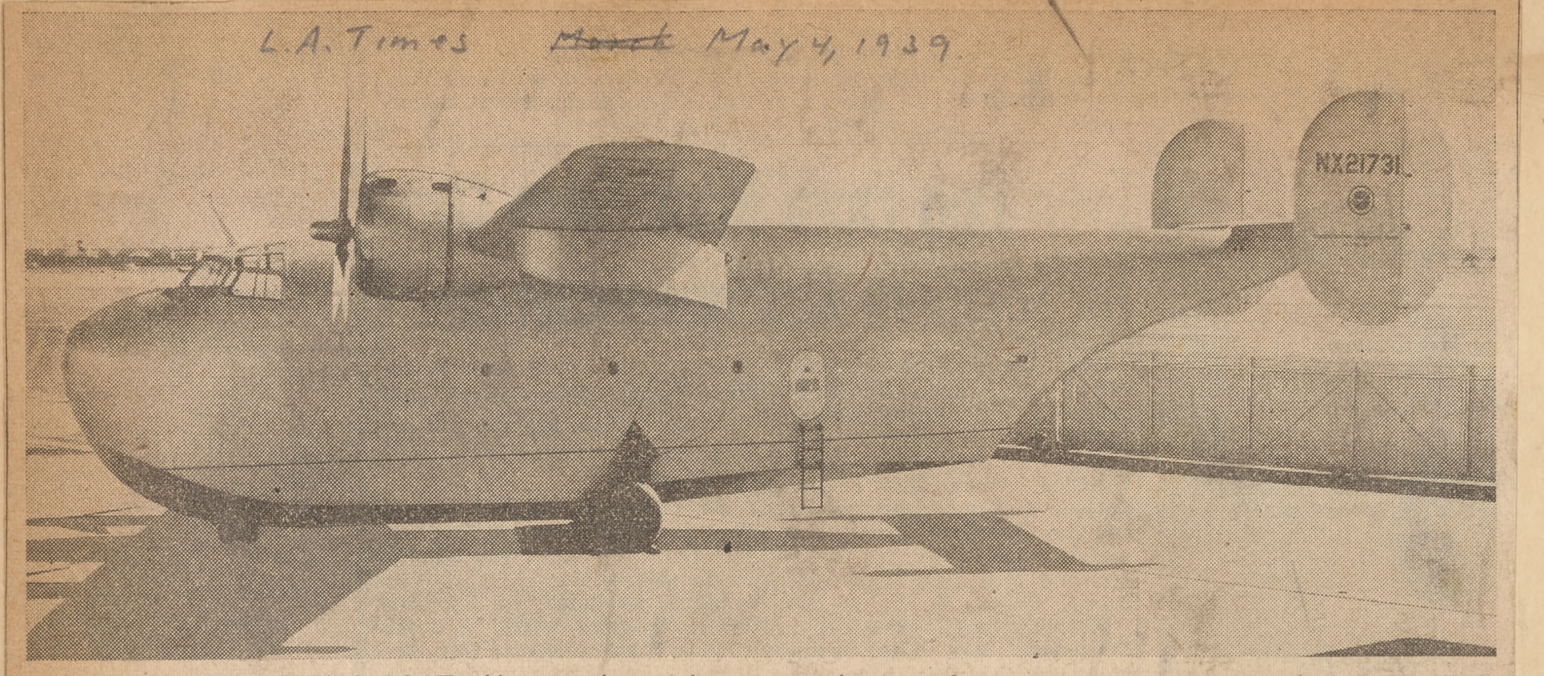
Twenty-four Navy patrol bombers landed on the bay off North Island during a 35-minute period today, after a 2100-mile non-stop flight from the Gulf of Fonseca.

Carrying 170 men under command of Capt. Marc A. Mitscher, the two-motored flying boats left San Diego in January for Navy maneuvers in the Caribbean. With the rest of the Fleet, they were ordered home when the East Coast stay was cut short.

The planes, averaging 120 miles an hour, originally were to stop en route from the Gulf at Magdalena Bay, but when aerological officers reported flying weather ideal, Capt. Mitscher decided to push straight through to the home base. They left the Canal Zone Monday for Fonseca, a 450-mile flight.

The first ship landed in the bay today at 8:30 a. m. and the last at 9:05 a. m.

L.A. Times ~~March~~ May 4, 1939



CONSOLIDATED FLYING BOAT—Here is the mighty 50,000-pound flying boat that may open new chapter in history of over-ocean transportation before it rolled down ramp at Consolidated Aircraft factory in San Diego.

Mighty New Plane Built

Consolidated Flying Boat May Set Precedents; Top Speed 300 M.P.H.

SAN DIEGO, May 4. (Exclusive)—Powered with the strongest engines ever used in an aircraft, a mighty 50,000-pound flying boat that may well set precedents in over-ocean transportation today rolled down the ramp at the Consolidated Aircraft Corp. factory.

First tests will begin next week.

ONLY TWO MOTORS

Emergence of the unique sky monster—which approaches the San Diego firm's four-engined "flying dreadnought" in size while utilizing only two huge powerplants—from the secrecy of its experimental hangar confirmed a story appearing exclusively in The Times last March.

Details of the Consolidated flying boat remained meager.

From company officials, however, it was learned that the 25-ton craft's wing is 110 feet long, that its flush-riveted hull is 73 feet long, that it stands 22 feet high on its retractable beaching wheels.

FIVE IN CREW

Five crewmen, a pilot, co-pilot, flight engineer, radio operator and navigator, will operate the plane.

"Unlike previous experimental flying boats which were constructed by the Consolidated Corp. under government contract, this Model 31 is our private venture," company executives said.

"While the Navy Department was cognizant of the construction, the development has not been financed by the government . . . Only 10 months were required for the design and construction of the airplane, whereas development of types of similar magnitude has required from two to three years heretofore."

EXCEEDS PBY TYPE

Significantly, the company's statement continued: "Although no performance figures may be released, Model 31 greatly exceeds the PBY's in speed, range and load capacity."

The PBY type is the giant twin-engined flying boat currently used by the United States Navy in its mass flights over the 3000-mile routes from San Diego to Pearl Harbor (Hawaii) and Coco Solo (Canal Zone.) Built years ago, its true performance specifications have been jealously guarded by the Navy.

Estimates of the new craft's speed and range have been breathtaking. Based on the fact that Consolidated's latest machine has a wing-loading greatly in excess of anything yet built, observers have figured its top speed almost 300 m.p.h., its range up to 10,000 miles.

CARRIES 52 PASSENGERS

As a commercial over-water transport, Model 31 will carry 52 passengers in daytime operations, 28 in sleeper-travel.

Other features of the giant craft include tricycle beaching gear which permit emergency landings on terra firma as well as easy withdrawal from the water onto seaport runways; a mighty, full-cantilever wing that boasts Fowler flaps which extend outward on long metal fingers to act as efficient "air brakes."

Oddly-shaped, the plane's wing narrows from 14 feet at its maximum chord to a tip so small that outboard floats retract to the underside of the outer wing panel rather than into the tip.

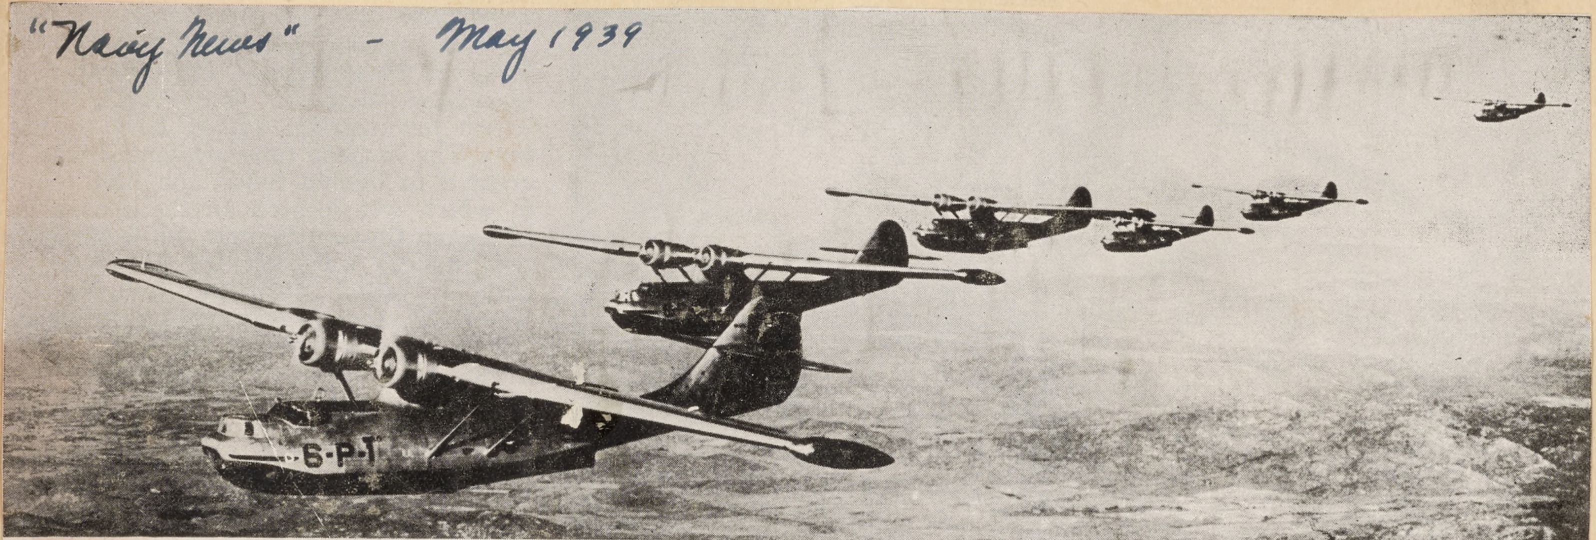
TWO FULL DECKS

Inside the deep hull are two full decks, one above the other, providing a large flight-control compartment and eight additional cabin sections.

Developed as a Navy Department secret, the mighty Wright engines generate 2000 horsepower each at take-off. Partly because of this, and the fact that two engine nacelles offer far less head-resistance than four motors drawing the same total (4000) horsepower, Model 31 will gain its terrific speed, it is believed.

Two 16-foot, three-blade propellers will drive the ship through the skies. These can be full-feathered in the event of engine stoppage in mid-air.

"Navy News" - May 1939



Patron Bombers are Supplanting the Destroyers for Scouting Purposes

---

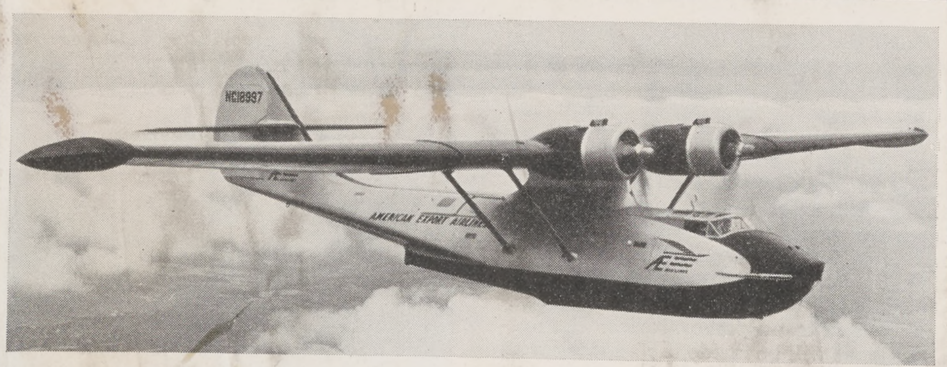


Photo by American Export Airlines

American Export Airlines' new $200,000 survey ship is a Consolidated Aircraft flying boat, released by the Navy from its production line. It is a commercial version of the ships which have successfully completed many notable over-water flights. Equipped with two Pratt & Whitney Wasp engines of 1,200 horse-power each, it has a top speed of 202 miles per hour. Its interior resembles a laboratory and its equipment includes all the latest instruments for long over water journeys. Its sole mission will be to gather scientific information on navigational and meteorological conditions along a route direct from New York to Horta in the Azores, thence to Biscarrosse, France's new trans-Atlantic air base, and on to Marseilles; to check and cross check findings, and to mould data and experience into a routine operation between the eight or more boats along the route, which will be in constant radio contact with the plane. Following the survey flights, American Export Lines plans to acquire sufficient number of these boats to operate two weekly round trips, carrying mail and express. Present plans call for the addition of forty passenger flying boats sometime in the future. P. J. Byrne, loaned to the airline by the Navy, will be in command of the ship.

NATIONAL AERONAUTICS
MAY, 1939

S.D. Union 5/17/39

New Big Engine In Consolidated Flying Boat

WASHINGTON, May 16 (A.P.)—A step forward for the United States in the world race for air supremacy was disclosed today when the army disclosed development of "the world's largest and most powerful air-cooled aircraft engine."

Its strength is indicated by an announcement from Louis Johnson, assistant secretary of war, that only two of them were required to fly the long-range Consolidated flying boat, which carries 52 passengers and a crew of five. It made its first flight last week.

The new engine is a 2000-horsepower "Duplex Cyclone"—500 horsepower more powerful than the "Cyclone 14," which has the highest power rating ever accorded an American-built, air-cooled radial engine by the civil aeronautics authority.

The army already has tried out the engine with success on long-range bombers, and it may soon become standard for some categories of military planes.

Johnson said the engine had been developed by the Wright Aeronautical Corp., Paterson, N. J., with the assistance of the Army Air corps. Information in army circles is that a considerable amount of work of designing was done by the experimental experts of the Army Air corps at Wright field, Dayton, O.

BREWSTER PLANS TO BUILD FLEETS

BREWSTER Aeronautical Corporation on April 14 signed an agreement with Consolidated Aircraft Corporation, of San Diego, Calif., whereby Brewster will acquire all the design rights, design information, jigs and fixtures on nine types of Army and Navy training and observation planes manufactured up to this time by Consolidated.

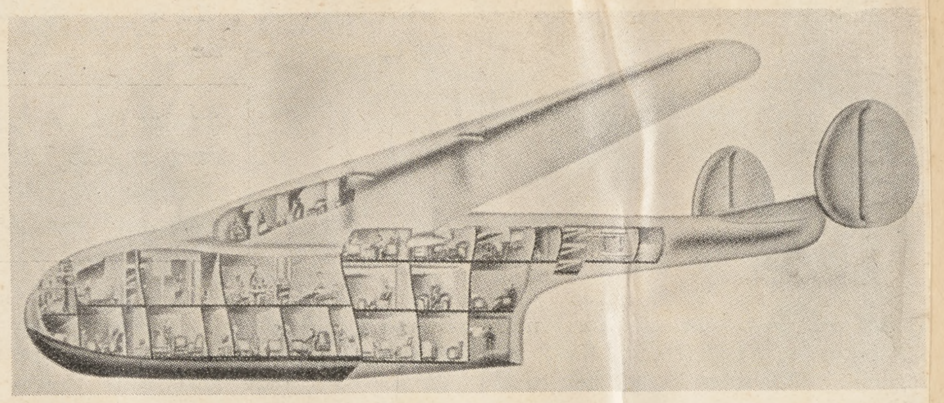
Western Flying May 1939

Cutting from the March 1939 issue of the Danish magazine "FLYV".

FLYVEMASKINER TIL 100 PASSAGERER

(Shell Aviation News)

Flyvemaskinen til 100 Passagerer er ikke længere Fantasi. Amerikanske Fabriker har nu givet ganske nøjagtige Planer og Beregninger for en saadan Type. Vi bringer nedenfor de forskellige Fabrikers Konstruktioner.

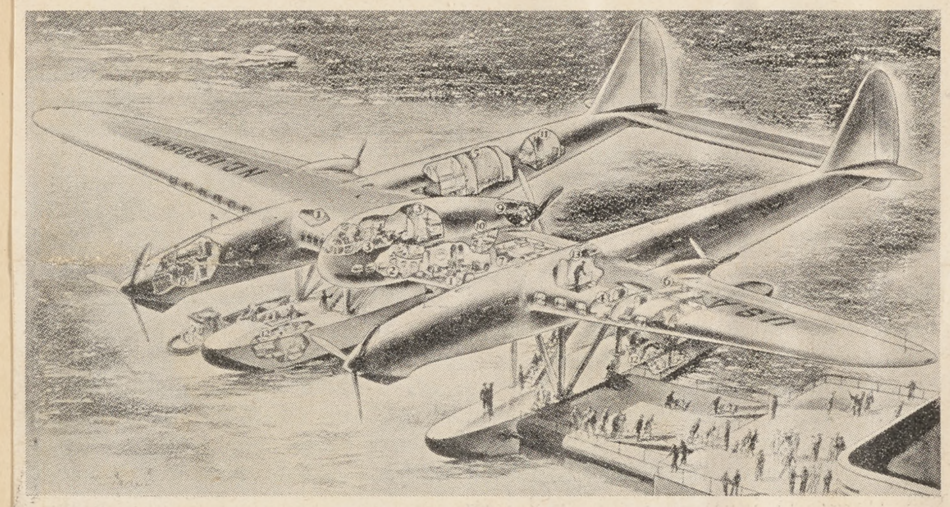


Consolidated Flyvebaad.

FOR et Aars Tid siden sendte Pan American Airways et enslydende Brev til otte Flyvemaskinefabriker, hvori man bad dem om at fremkomme med Forslag til Bygning af Trafikflyvemaskiner, der kunde medføre 100 Passagerer over en Distance paa 8000 km med en største Hastighed paa 480 km/T og en Marchhastighed paa ikke under 320 km/T. Der foreligger nu nærmere Konstruktionsplaner fra fem Fabriker: Douglas, Sikorsky, Consolidated og Boeing, og et Fællestræk hos alle fem Typer er dette, at Motorerne er anbragt paa en saadan Maade, at de er tilgængelige under Flyvning. Boeing, Douglas og Sikorsky anvender seks Motorer, medens Consolidated har fire og Sikorsky otte. Douglas er det eneste Landluffartøj mellem de nye Typer. De er alle udstyret med den størst mulige Komfort for Passagererne. Detaillerede Oplysninger om Kæmpeluftlinerne vil ikke blive offentliggjort, førend Pan American Airways har truffet sin Bestemmelse med Hensyn til Valg af Type, men i det efterfølgende gives en kort Oversigt over de forskellige Typer.

Consolidated Aircraft Corp.

Consolidated er fremkommet med Planer til en Flyvebaad, udstyret med fire vædskekølede Motorer med Luftfortætter, hvis Ydelse ved Jorden er 4×2,150 HK. De anbringes i Bæreplanets forreste Kant, og Propellerne monteres paa de forlængede Krumtapaksler. Firmaet hævder, at Anvendelsen af fire Motorer i Stedet for seks, vil give et bedre Resultat. Udkastet omfatter et Luftfartøj med tre Dæk, idet 36 af de 100 Passagerer vil faa Plads i det meget tykke Bæreplan. De øvrige 64 Passagerer faar Plads i en Række smaa Kabiner til to eller fire Mand. Paa det midterste Dæk er indrettet en Spisesalon, med Plads til 18 Personer, og paa det øverste Dæk findes en rummelig Salon. I den bageste Del af Kroppen er der Opholdsrum for syv Mænd af Besætningen, og helt forude er der Plads til to andre. Der findes tre Post- og Fragtrum; et i Kroppens Næse under Førerrummet, et øverst i Planets Forkant, og et tredje bagude i Kroppen. Hele Kroppens forreste Del af øverste Dæk optages af Arbejdsrum for Flyveren, Næstkommanderende, Flyveingeniør, Radiotelegrafist og Navigatør.



Seversky »Supper Clipper«.

Seversky Aircraft Corp.

Dette Firma var oprindelig ikke iblandt de otte, som Pan-American Airways henvendte sig til, men paa et senere Tidspunkt blev man enige om ogsaa at modtage Tilbud fra Seversky. Super-Clipper er konstrueret til at kunne medføre en betalende Last paa 20.000 kg over en Strækning af 8000 km ved en Mindstehastighed paa 400 km/T. Den skal medføre 120 Passagerer, der faar alle Bekvemmeligheder til Disposition, som findes i en moderne Atlanterhavsdamper. Luftfartøjet er i Virkeligheden en flyvende Vinge, og byder Passagererne nogle meget store Rum. Der vil blive indrettet Spisesalon og en Bar samt et Promenadedæk med rigelig Plads til 60 Personer. I Spisealonen kan der sidde 50 Personer paa een Gang. Det indvendige af Supper-Clipper'en kan gøres tryklufttæt saaledes, at der i 6500 Meters Højde kan vedligeholdes et Tryk, der svarer til 2500 m. Besætningen skal bestaa af 15 Mand.

Planet har en Spændvidde paa 75 m, og Luftfartøjet har to Kroppe, hver udstyret med en Ponton, der kan trækkes ind i Kroppen. Man mener paa denne Maade at kunne kombinere et Søluftfartøjs Fordele med en Landflyvemaskines Ydeevne. Der er otte vædskekølede Motorer, hver paa 2000/2300HK. I Forenden af hver af de to Kroppe vil der blive installeret to Motorer, som trækker een Propel, og et tredje Par Motorer bliver indbygget i den bageste Del af »Førerhuset«, der er anbragt paa Bæreplanets Midterstykke, og som tillige rummer Førerrum, Radiorum, Navigationsrum m. m. Motor Nummer syv og otte anbringes i Bæreplanets Bagkant. Alle Motorerne anbrin-

Flyvemaskiner til 100 Passagerer.

(Fortsat fra Side 75)

ges i Motorhuse, der har Opholdsrum for to Mekanikere, og som bygges tryklufttætte, ligesom Kabiner og Førerrum er det.

Boeing Aircraft Co.

Boeings Udkast bestaar af en Flyvebaad med seks Motorer, anbragt i Planet. Propelanordningen er den samme som Douglas anvender. Af Udseende ligner den nye Boeing Flyvebaad Typen Boeing 314. Kroppen er indrettet med to Dæk.

Douglas Aircraft Co.

I Stedet for en Flyvebaad er Douglas fremkommet med Planer til Bygning af en Landflyvemaskine, et lavvinget Monoplan med seks Motorer anbragt i Planets forreste Kant. I Lighed med Boeing- og Consolidated-Typerne anvender Douglas en selvregulerende Propel med fuldt vendbare Blade, og den er anbragt paa en temmelig lang Aksel. Kroppen er bygget vandtæt, og der hævdes, at den kan holde hele Luftfartøjet flydende i Tilfælde af tvungen Landing paa Søen. Halepartiet bestaar af en enkelt Halefinne og Haleplan med tilhørende Side- og Højderor. Understellet kan trækkes ind. Det formodes, at Landingsstellet bestaar af tre Hjul ligesom paa DC-4.

Sikorsky Aircraft.

I Lighed med Boeings Konstruktion gaar Sikorsky's Projektet ud paa at bygge en Flyvebaad med eet højtliggende Bæreplan, udstyret med seks Motorer. Kroppen er omtrent ens for begge Projekters Vedkommende, omend Sikorsky anvender en Krop af noget større Dimensioner. Halepartiet er derimod forskelligt, idet Sikorsky anvender dobbelt Halefinne og Sideror.

Western Flying Bulletin May 16, 1939

SAN DIEGO
CONSOLIDATED AIRCRAFT CORP'S MODEL 31, POWERED WITH TWO 2000 HP WRIGHT CYCLONES IS ABOUT READY FOR FLIGHT TESTING. REPORTS ARE: 50,000 LBS GROSS WEIGHT; CRUISING RANGE OF 10,000 MILES BETWEEN 200 AND 250 MPH; WING EMBODYING ENTIRELY NEW AIR FOIL; RESEMBLES YACHT; WING LOADING, 50 LBS PER SQ FT; POWER LOADING, 12½ LBS; ACCOMMODATIONS FOR 40 PASSENGERS; ADAPTABLE AS BOMBER OR MILITARY TRANSPORT. RUMORED THAT AUSTRALIA CONTEMPLATES PURCHASE OF 10 MODEL 28'S, THE COMMERCIAL VERSION OF PBY.

U. S. Air Services - May 1939

Record $50,000,000 Air Corps Order

Army Buys 571 Airplanes Within an Hour After the President Approves Bill
First Order on Projected 6,000-Plane Goal

IN AN ACTION UNPRECEDENTED FOR SPEED and size of order involved, the War Department within one hour after President Roosevelt signed the appropriation bill for 1940 placed in a single order contracts for 571 airplanes and accessories totaling about $50,000,000. Announcement of this award was made late on April 26th, and at noon the following day it was supplemented with word that the order would be divided among five plants, as follows:

Curtiss-Wright Corporation, New York, $12,872,398 for pursuit planes, type P-40.

Consolidated Aircraft Corporation, San Diego, Calif., $2,880,000 for heavy 4-engined bombers, type B-24.

Lockheed Aircraft Corporation, Burbank, Calif., $2,180,728 for pursuit interceptor, 2-engined planes, type YP-38.

Bell Aircraft Corporation, Buffalo, N. Y., $1,073,445 for pursuit interceptor planes, single-engined, type XP-39.

Beech Aircraft Corporation, Wichita, Kans., $528,749, for photographic airplanes, type F-2.

The total in these contracts is $19,535,320; the remainder of the $50,000,000 will be devoted to purchase of engines, propellers, instruments and other accessories, in quantity lots. Contracts under this phase of the order are to be announced shortly.

AT THE SAME TIME the President requested a new appropriation of $31,621,000 to begin immediate construction of the chain of naval aviation bases as recently recommended by the Hepburn Board, including sites from Alaska, through the Pacific, around to Puerto Rico and the Atlantic Coast.

The speed of the action, from approval by the President to award of the contracts, resulted in announcement of this tremendous armament step parallel with action of Great Britain in adopting conscription, and as it happened, just two days before Hitler was scheduled to make his reply to the President's virtual demands for longtime peace guarantees from Germany.

Nobody in authority would admit that these developments were in any way related, or that the sequence of events, so far as the United States was concerned, was anything more than coincidence. Nevertheless, Washington observers commented on the significance of the moves in the light of world events, and the fact is there.

America is putting its defense machine into high gear.

The 571 airplanes ordered represent the first instalment of the projected aerial expansion to a possible 6,000-plane force for the Army. It was further indicated, as noted elsewhere in this issue, that the President will shortly outline the actual distribution of the remaining $250,000,000 of the total of $300,000,000 which was asked for the aviation program.

Assistant Secretary of War Louis Johnson said War Department plans were made, and will be submitted to Congress at an early date. Meanwhile, further purchase of other types of aircraft, including training, cargo, etc., will be made when additional funds become available July 1, it was said.

IN ADDITION TO CONTRACTS ANNOUNCED, the War Department will, within a few days of this announcement, place orders totaling $19,000,000 for a number of attack bombers, for which design competitions recently have been held at Wright Field, Dayton, Ohio.

The Consolidated Aircraft Corporation, designated to produce the heavy 4-engined bombers in the order just announced, has been making this type for the Navy, and manufactured the heavy patrol bombers which made mass flights from Norfolk, Va., to San Diego, Calif., in 1935, from San Diego to Hawaii in 1937, and have performed similar feats repeatedly in naval service.

The Curtiss ships are described elsewhere in this issue. The interceptor pursuit type is a recent development designed particularly to attack heavily armed bombers. They develop speeds considerably in excess of 350 miles and are Allison-engine powered, with tricycle landing gear.

The total War Department bill, $549,000,000, is the largest since the World War, just as the plane order was the largest single order of record. Placement of orders now, it was stated, probably will result in important economies as compared with waiting until the new fiscal year.

CONSOLIDATED $200,000 FLYING BOAT FOR AMERICAN EXPORT AIRLINES

Undergoing Final Test for Its Inaugural Flight Across the Atlantic. The Consolidated Ship Was Released by the Navy From Its Production Line, and is the Commercial Version of Its Predecessors Which Have Successfully Completed Many Notable Overwater Flights. Equipped With Two Pratt & Whitney "Wasp" Engines, of 1200 H-p. Each, It Has a Top Speed of 202 m.p.h. It Will Fly a Direct Route to Horta in the Azores, Thence to Biscarrosse, France's New Transatlantic Air Base Southwest of Paris, and on to Marseilles. Following the Survey Flights, American Export Airlines Plans to Acquire a Sufficient Number of Flying Boats to Operate Two Round Trips a Week, Carrying Mail and Express. The Ship Will Be in Command of P. J. Byrne, Who Has Been Lent to the Air Line by the Navy

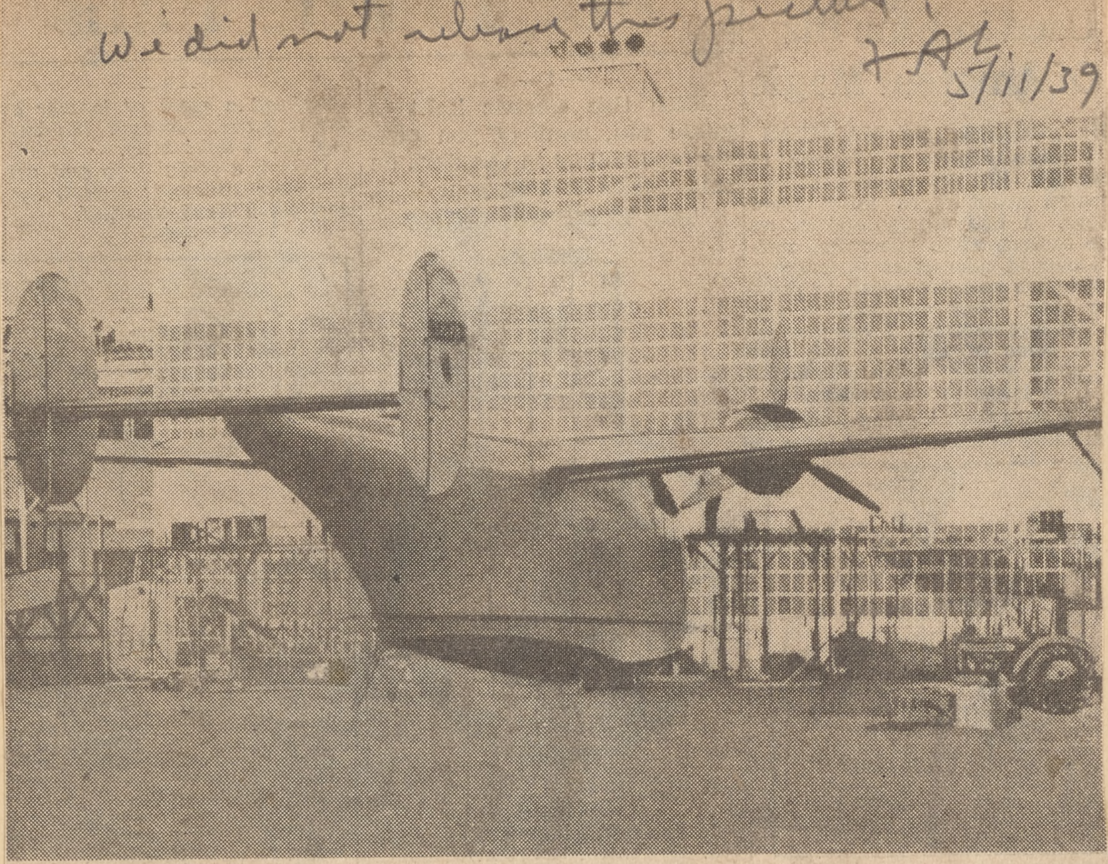
FAL 5/11/39



NAVY'S NEW "PERFECT WING" PLANE.—This new Navy plane, being tested at San Diego, Cal., has what the designer, David R. Davis, calls "the perfect wing." It is said to have an airfoil so aerodynamically clean that it will increase a plane's efficiency 20 per cent. Mr. Davis claims that fighting planes which today move at 400 m. p. h. with his wing would increase to almost 500.

WINGS OF THE NAVY

Nieuwe Amerikaansche vliegfilm samengesteld met de hulp van marinevliegers.

Warner Bros brengen binnenkort hier te lande de Amerikaansche vliegfilm „Wings of the Navy", een film, welke is samengesteld met de hulp van den Amerikaanschen marinevliegdienst; dat wat er aan vliegerij in deze film voorkomt is dan ook van zeer bijzonder gehalte. Wij zijn in de gelegenheid gesteld om deze werkelijk zeer goede film gisteravond en petit comité te bewonderen; kapt. ter zee Rost van Tonningen benevens eenige subalterne zee-officieren waren er eveneens getuigen van.

De draad die door deze film loopt is natuurlijk een romantische: een documentaire film is dit dus geenszins, wel een — en een vaak buitengemeen spannend — kijkspel.

Opvallend goed is het vliegen in formatie, uiterst spannend de duikvlucht, waarbij de reacties op den vlieger zoo goed mogelijk zijn weergegeven. Het zal wel een film zijn, waarvan het in het algemeen vrij air-minded publiek zonder twijfel zal weten te genieten.

De Nederlandsche bewerking van de tusschenschriften is in hoofdzaak van den heer Smits, den publiciteitschef der Fokkerfabriek. Dat is een goede gedachte van Warner Bros geweest, want nu staan er geen gekke dingen tusschen, wat zoo vaak bij dergelijke films den totaal-indruk heeft bedorven.

De Ver. Staten wijden veel aandacht aan de luchtstrijdkrachten van hun leger en hun vloot. Het zeer uitgestrekte land is als het ware voorbeschikt om de vliegerij zoowel commercieel als militair tot een zoo hoog mogelijken graad van ontwikkeling op te voeren. Aan de opleiding van hen, die zich geroepen voelen om zich te stellen au service des ailes wordt dan ook de grootste zorg besteed.

Een indruk van de wijze, waarop de instructie wat betreft de marinevliegers geschiedt, geeft de film Wings of the Navy, welke geproduceerd is door Warner Brothers en binnenkort onder den naam van Luchtduivels van de Marine haar rondgang door de Nederlandsche bioscooptheaters zal aanvangen.

De organisatie van de vliegschool is, blijkens de film, voortreffelijk. Een fiksche hijschkraan takelt de vliegtuigen, wanneer de oefening is afgeloopen, uit het water en zet de ranke toestellen met een zwaai op het wagentje waarmee zij naar de loodsen worden gereden. Op eigen kracht rijden (op wagentjes) de vliegtuigen de helling af naar de baai, waar geoefend wordt. Natuurlijk ontbreekt bij de opleiding de vroolijke noot niet. Deze mankeert op geen enkele recrutenschool ter wereld.

Na het brevet te hebben verworven gaan de marinevliegers naar San Diego, de voornaamste luchtvaartbasis der Amerikaansche marine aan de Westkust. Daar wacht hun grooter werk: de vliegbooten, waarvan het tweemotorige type Consolidated P.B. Y wel het voornaamste deel vormt. Zwermen vliegbooten, in formatie vliegend, trokken aan ons oog voorbij. Gevechtsoefeningen worden den toeschouwer getoond, zooals dit bij de U.S. Navy,

Gisteravond heeft deze film voor een klein aantal genoodigden in het theater Tuschinski te Amsterdam gedraaid. De film behoort zonder twijfel tot het beste, wat wij op dit gebied hebben gezien, al laat zij slechts een deel van de Amerikaansche luchtstrijdkrachten, nml. die der vloot, zien.

Bij den aanvang wordt hulde gebracht aan de nagedachtenis van den Amerikaanschen marine-vlieger Harrington, die in den oertijd der vliegerij baanbrekend werk voor den Amerikaanschen marinevliegdienst heeft verricht.

Te Pensacola (Florida) is de opleiding van de marinevliegers gevestigd, die, gelijk elders, „getest" worden op landvliegtuigen en later routine dienen te verwerven op drijver-vliegtuigen, waartoe een-drijver-vliegtuigen, type Curtiss meenen wij, van een verouderd type worden gebezigd. Het leven in deze opleidingsschool is niet ongezellig en het gunstige klimaat is een waarborg, dat de opleiding zonder eenige onderbreking kan worden voortgezet. Ook het formatie-vliegen wordt te Pensacola beoefend en de film laat daarvan verbluffende staaltjes zien, evenals van acrobatiek, die de adspirant marine-vliegers terdege beoefenen.

welke haar volledige medewerking aan de totstandkoming van deze film heeft verleend, pleegt te geschieden. Het vertrek voor een vlucht in formatie van eenige tientallen Consolidated-vliegbooten naar Honoloeloe, waar de commandant „over 20 uur een afspraak heeft" en dus op tijd moet arriveeren, vormt het indtrukwekkende slot.

Tusschen de bedrijven door worden eenige bijzonder belangwekkende tafreelen vertoond met betrekking tot het invliegen van een nieuw type vliegtuig waartoe met een Grumman-jachtvliegtuig wordt gedemonstreerd dat duikvluchten uitvoerd als viel het gelijk een steen uit de lucht.

Om al dit gezoem en gesnor is een petite histoire geweven, waarin George Brent, John Payne en Olivia de Havilland — wier naam overigens een uitstekend figuur in een vliegfilm moet maken — de hoofdrollen vervullen. Maar de mooie oogen van Olivia en de ranke gestalte van John Payne rechtvaardigen ditmaal niet alleen het aanschouwen van de geslaagde Amerikaansche vliegfilm, die ongetwijfeld propagandistische waarde heeft, in het bijzonder voor den marine-luchtvaartdienst der Ver. Staten.

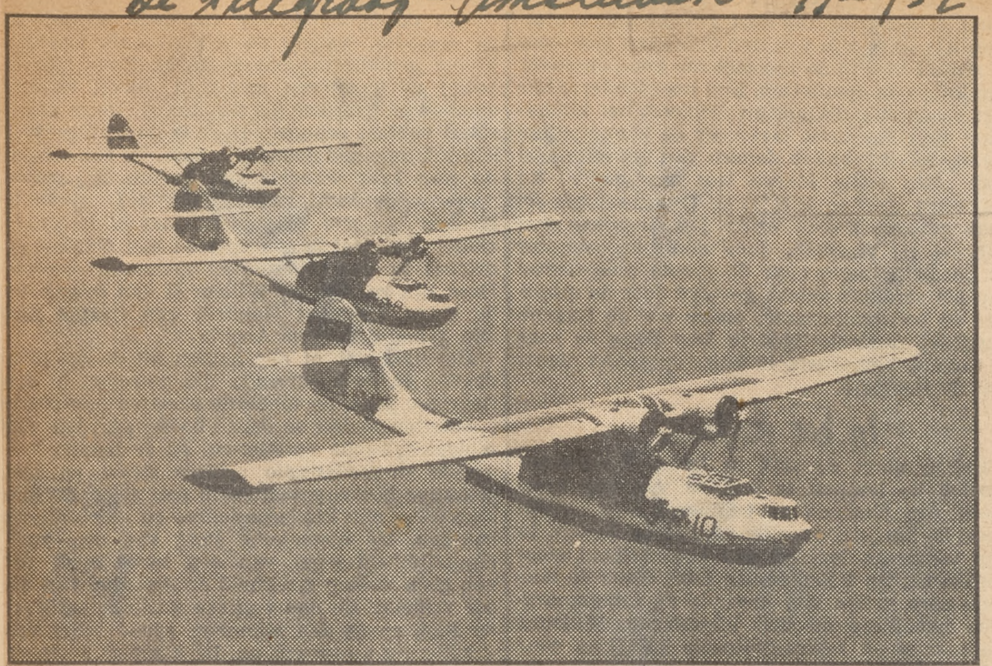
Luchtvaart

DE AMERIKAANSCHE MARINE-LUCHTSTRIJDKRACHTEN

Een aantal Consolidated verkenningsvliegbooten in de luchtvaartbasis der Amerikaansche marine te San Diego.

VLEUGELS VAN AMERIKA'S MARINE.

"De Telegraaf" Amsterdam 7/22/39



Twintig duizend piloten noodig.

Propaganda voor de U. S. Navy.

AMERIKA heeft twintig duizend vliegers noodig. Wat beteekent dat minstens tweehonderdduizend jongelui zich beschikbaar moeten stellen, gezien de scherpe selectie, die wordt toegepast en het onvermijdelijke aantal afvallers tijdens de opleiding. Om dat te bereiken, is een grootscheepsche propaganda noodig. Dat men daarbij van de film heeft gebruik gemaakt, spreekt vanzelf.

Warner Bros vervaardigde derhalve de film „Wings of the Navy", waarbij men de volledige medewerking kreeg van den Amerikaanschen Marine Luchtvaartdienst. Voor de entourage beschikte men daardoor over een onbeperkt aantal medewerkers, de nieuwste jachtvliegtuigen, bommenwerpers en marine-vliegbooten. Om het op zijn Amerikaansch te zeggen: op een gegeven moment ziet men voor een waarde van vijftien millioen dollar in de lucht.

De film toont de opleiding der jonge piloten, hun doopvlucht, de emotie der eerste solovlucht, de instructie in de lucht, het examen. De nieuwste vliegboot-bommenwerpers worden van binnen en buiten bezichtigd. De commandant legt op den bok, in den start, tijdens de vlucht en bij de landing, alles uit. De toeschouwer ervaart hoe de eerste-bestuurder van zulk een vliegend schip, als een kapitein op de brug zijn mannen aanvoert.

En dan zijn er angstig-natuurgetrouwe opnamen van den test-piloot in actie, die met een snelheid van 700 kilometer naar omlaag suist, waarbij men niet weet wat meer te bewonderen, de acteurs, die zich voor deze proeven leenen of de operateur, die er in slaagde alle momenten zoo vast te leggen, dat men inderdaad met de grootste spanning de huiveringwekkende evoluties volgt.

Het is een film, waar de mannen van het vak waardeering voor hebben, waar de jongeren, die droomen van heldendaden in de lucht, van smullen. Want het brengt hun alles wat hun hart begeert en zelfs meer dan dat. Het is de beste propaganda, die er bestaat. De gevaren worden nòch verdoezeld, nòch aangedikt. Men beleeft eenige minder geslaagde manoeuvres van jeugdige onervaren vliegers, waarbij de waarschuwende sirene angstig loeit en de hulp-expedities van alle zijden toesnellen.

Geslaagd mag ook heeten de vlucht van een blindvlieger, die zonder het te weten, geheel alleen, op zijn instrumenten een tocht maakt, soms onderstboven vliegt, herhaaldelijk onwetend een „narrow escape" heeft, om ten slotte, tot opluchting der toeschouwers, behouden te landen.

Typeerend is ook de korte zakelijkheid, waarmee de jongelui geïnstrueerd worden, de hartelijke verhouding tusschen instructeurs en leerlingen en de kordate wijze, waarop zij aangepakt worden.

Het zou geen Amerikaansche film zijn, wanneer men er als een lossen draad geen liefdesgeschiedenis doorheen had geweven. Maar die neemt men graag op den koop toe.

Deze propaganda voor den marine-vliegdienst kan dan ook dienstbaar gemaakt worden aan de opwekking tot deelname aan de luchtvaart in andere landen. Vandaar, dat onze marine-autoriteiten belangstelling toonden voor dit Amerikaansche product. Bij de vertooning in de projectiezaal van Tuschinski bevonden zich naast verschillende luchtvaart-autoriteiten, ook kapitein-ter-zee N. A. Rost van Tonningen, onder-commandant der Marine te Amsterdam, met zijn staf, die met groote belangstelling deze Warner Bros-creatie aanschouwden.

Voor de toelichting had men zich de medewerking verzekerd van den heer J. Smits, chef der afdeeling Publiciteit van Fokker, die op vakkundige wijze de Nederlandsche versie verzorgde.

ARCHBOLD ENDS MUSEUM WORK

'Guba' To Make Survey Hop For Australia

S.D. SUN 5/10/39

Adventure

The American Museum of Natural History's expedition into the jungle country of Netherlands New Guinea, led by Richard Archbold and his San Diego-built Consolidated airboat Guba, today officially came to an end.

The last group of scientists was removed from the island river camp by the Guba and brought to the seacoast base at Hollandia, according to short wave reports received by Barney F. Boyd, San Diego amateur operator.

SURVEY FLIGHT

Tomorrow, the Guba, without Mr. Archbold, will be flown by its regular flight crew to Sydney, Australia, via Port Moresby, British New Guinea, to prepare for an unprecedented survey flight across the Indian Ocean to Africa for the Australian government. Mr. Archbold will leave by steamer for Batavia to wind up affairs of the expedition with the Dutch colonial government there.

Hundreds of rare specimens of plant, animal and bird life were obtained by the expedition during its 11 months' stay in New Guinea. They have been shipped to the Museum in New York City, and Mr. Archbold expects to continue this work late in 1940.

STARTED LAST JUNE

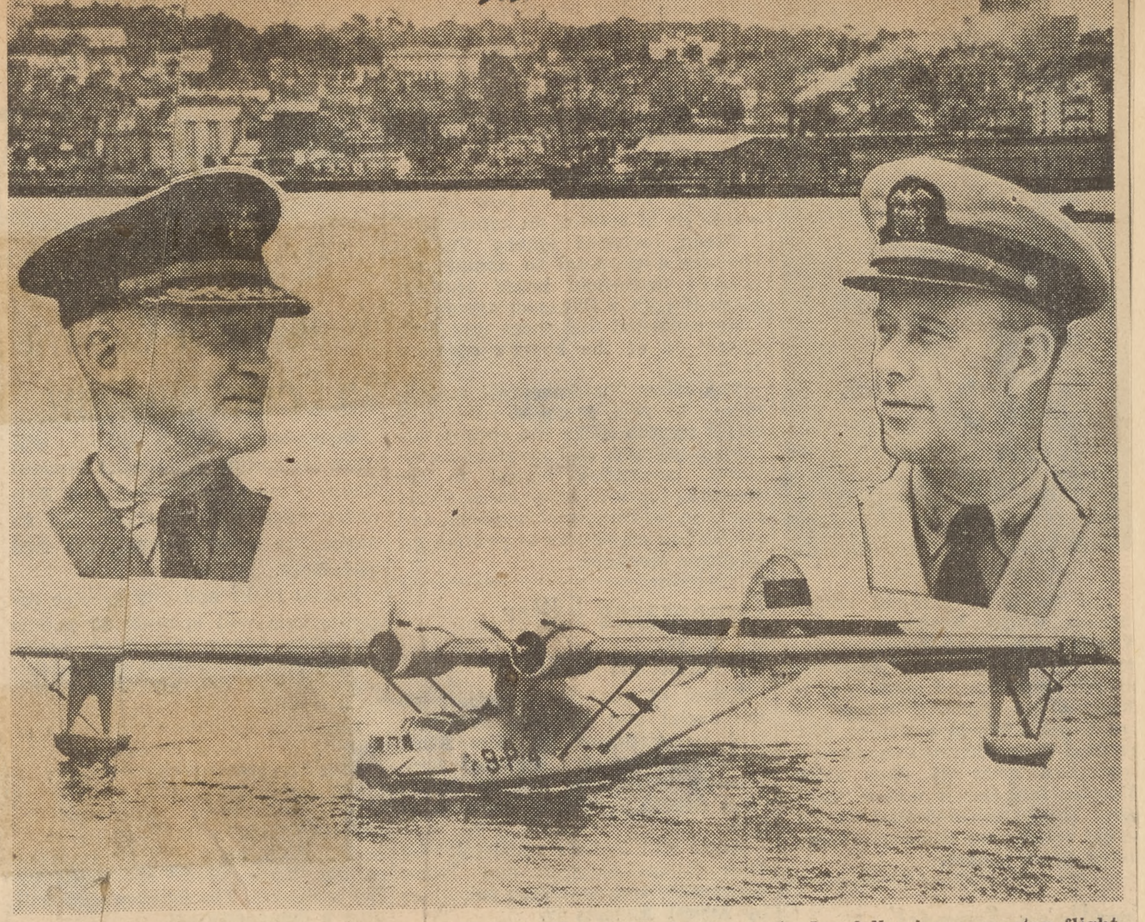
The Guba, which has flown more than 100,000 miles in delivery hops from the coast to the inaccessible interior with supplies and personnel, was piloted by Mr. Archbold to New Guinea from San Diego last June.

On completion of the Indian Ocean flight in July, the Guba will be taken across Africa in easy stages, then vault the Atlantic to St. Thomas, Virgin Islands, and to the New York World's Fair for a short stay before continuing to San Diego. The airboat is due here late in July for overhaul at Consolidated.

Mr. Archbold expects to rejoin his crew in Sydney after his Batavia visit about June 1, and the Guba will leave June 15 for Mombasa, Africa, via three Indian Ocean island stops.

NAVY AIR CRUISERS ALIGHT ON SAN DIEGO BAY

S.D. UNION – MAY 11, 1939



One of the huge bombers of squadron VP-9 landing in the harbor yesterday following a nonstop flight from the Gulf of Fonseca. Inset, left, Capt. March A. Mitscher, commander, Patrol Wing 1, and right, Comdr. B. L. Braun, VP-9 squadron.

20 Big Bombers Arrive After 2100-Mile Hop

Return From Navy 'War' in Caribbean; Will Remain Here

Four months almost to the hour that 48 long-range patrol bombers of Fleet Patrol Wing 1 left San Diego for war exercises in the Atlantic-Caribbean area, 20 of the great air cruisers came winging out of the clouds yesterday morning after a 2100-mile nonstop flight from the Gulf of Fonseca.

Of the four squadrons of 48 planes, VP-11 and VP-12 have been assigned permanently to Hampton Roads. Two planes of squadrons VP-9 and VP-7 were left at Coco Solo, although their crews of 14 officers and men were brought north on other airboats of the two squadrons.

TWO ARRIVING LATE

Ill-luck befell Lt. Thomas Hamilton, piloting plane 10, and Lt. R. E. Coombs, pilot of plane 11 of squadron 9. Because of engine trouble they failed to get their heavily laden planes into the air when squadrons 7 and 9 left the rough waters of the gulf for San Diego at 2 p.m., Tuesday. They took off from the gulf at 5 a.m. yesterday, landed in the afternoon at Magdalena bay and will leave this morning for San Diego, arriving about noon.

In his flagplane, Capt. Marc A. Mitscher was the first of the 20 airmen to land on the bay. He arrived at 8:29 a.m., exactly 19 hours and 30 minutes from the time of take-off in the Gulf of Fonseca. The other planes came in from the sea singly and in groups of three, the last ship reporting in at 9:45. So swiftly did the huge bombers speed up the coast few of the wives and sweethearts were on hand to greet the returning fliers, most of whom came in nearly 90 minutes ahead of schedule.

PERFECT NIGHT FLIGHTS

Capt. Mitscher, veteran flier, described the night flight up the west coast of Central America and Mexico as one of the finest he ever has ever undertaken. Perfect flying conditions prevailed until the two squadrons, breezing along at 8500 feet and logging 120 miles an hour, ran into clouds near Cedros islands.

The planes rode atop the clouds until in the vicinity of Rosarita beach when down through a cloudhole plunged Capt. Mitscher's flagplane. Other bombers discovered cloud holes and all came down to the 2000-foot level and then streaked for home. Once they were hauled up on the ramp, customs and "bug" men inspected the planes and baggage of officers and men.

Although details of the part played by the big bombers in Fleet Problem 20 were guarded, it was

(Continued on Page 2, Col. 1)

learned that the airboats flew more than a 1,000,000 miles in the Caribbean and South Atlantic while acting as "eyes" of the two combatant forces. Not a single plane was damaged in these extended air maneuvers in all kinds of weather, a feat that has added another brilliant chapter to American naval aviation history.

WILL GO TO CAPITAL

This is Capt. Mitscher's last long-distance flight as commander of Patrol Wing 1. He will leave next month for Washington for duty in the navy department, his successor being Comdr. Charles P. Mason, executive officer of the carrier Yorktown, which with the Enterprise is due to arrive at dawn tomorrow from the Atlantic coast.

Capt. Mitscher reported planes of Patrol Wing 1 have no orders to cruise to Alaskian or north Pacific waters and probably will remain based at North Island the rest of the year.

Squadron 1, a 15-plane unit, is scheduled to take off from San Diego June 28 for Pearl Harbor, Hawaii. The squadron is commanded by Comdr. Sam La Hache, Squadron 16, from Pearl Harbor, has replaced squadron 12 in the wing.

Four vessels that have been acting as plane guards on the flight of the patrol wing from Hampton Roads to San Diego, the cruisers Memphis, tender Wright and destroyers Childs and Williamson, are now heading homeward. The Childs and Williamson are expected Sunday, the Wright Monday and the Memphis Tuesday.

EXPEDITION QUITS JUNGLE

By North American Newspaper Alliance.

HOLLANDIA, Netherlands New Guinea, May 12.—The American Museum of Natural History expedition has folded its tents and is moving out of the New Guinea jungles after 11 months' successful exploration for rare and interesting specimens of plant, animal and bird life. Members of the expedition will fly to Sydney, Australia, via Port Moresby, British New Guinea.

Flight Crew Is Sought To Transport San Diego Airboat To England

S.D. SUN 5/14/39

Great Britain is interested in the purchase of a Consolidated airboat similar to the U. S. Navy PBY patrol bombers which have made spectacular non-stop mass flights to Honolulu, the Canal Zone, and over the West Indies in the recent Caribbean war games.

This was reported here yesterday as officials of the English government and Consolidated sought to organize a flight crew for the delivery hop to the British Isles this summer.

Aviation observers saw behind the negotiations between England and the San Diego concern the following possibilities:

1. England, which is not particularly deficient in airboat development, wishes to augment its own overtaxed factory facilities in the current European armament race through the procurement of these long range seaplanes from the United States. Heretofore, virtually all foreign plane orders placed in this country have been for land aircraft.

2. Great Britain is anxious to build a fleet of efficient flying boats less bulky than the giant craft of Imperial Airways, designed for trans-Atlantic travel. Such a fleet would tend to weld more closely the widely scattered units of the Empire.

In either case, purchase of a plane from Consolidated may prove the forerunner of a large production order, it was pointed out.

S.D. UNION 5/19/39

Consolidated Gets $37,000 Pact for Plane Wings

A contract for $37,395 of aircraft wings was awarded to Consolidated Aircraft Corp. yesterday by the navy department, The Associated Press reported. While no details were given in the dispatch, it was assumed the wings were repair parts for Consolidated airboats now owned by the navy.

---

19 Bombers Home; Two Expected Today From East War Games

S.D. SUN 5/11/39

Nineteen Navy patrol bombers, which arrived at North Island yesterday after a 2100-mile nonstop flight from the Gulf of Fonseca, today were joined by two sister planes at 9:50 a. m. after a 750-mile hop from Magdalena Bay. The disabled third was en route aboard the tender Wright, due Tuesday.

The Consolidated seaplanes had completed scouting operations over the Caribbean and Atlantic of unprecedented scope, which were said to have clinched their utility as the advance "eyes" of the Fleet in warfare. Hundreds of thousands of miles were logged during Fleet Problem 20 and subsequent maneuvers without serious mishap.

GAS LOAD REDUCED

Because of a reduced gasoline load, Lieut. Tom Hamilton, former coach of the Naval Academy football team, and Lieut. R. E. Coombs of Patrol Squadron 9 had to land at Magdalena Bay yesterday. They refueled from the destroyers Childs and Williamson and early today took off for San Diego.

The third plane suffered engine trouble at the Gulf of Fonseca and was taken aboard the Wright.

Two other airboats of the original 24-plane group remained at Coco Solo, Canal Zone, for permanent duty, and will be replaced here by a pair of ships held in reserve.

Capt. Marc A. Mitscher, Patrol Wing 1 commander, who led the 19 bombers into San Diego yesterday, soon will leave for Washington, where he is slated to become assistant chief of the Bureau of Aeronautics.

NEW MASS FLIGHT

Meanwhile, preparations continued for a mass flight of 15 airboats of Patrol Squadron 1 from San Diego to Pearl Harbor, June 28. Unless another squadron is assigned to San Diego, North Island will have only three patrol units—one less than before the war games.

Patrol Squadrons 11 and 12 have been based permanently in Norfolk. Only one of these has been replaced—by Patrol Squadron 18, formerly of Hawaii, and originally due to ferry its planes to Pearl Harbor from the Naval Air Station.

S.D. UNION 5/15/39

24 Squadrons Of Navy Planes Based at S. D.

Twenty-four squadrons of naval aircraft, totaling 408 planes, are based at Naval Air station. The planes are to remain here during the summer and autumn for training and tactical exercises.

Sixteen of the squadrons are attached to the aircraft carriers Saratoga, Lexington, Yorktown and Enterprise, four squadrons are with the Fleet Patrol Wing and four are Marine corps units.

Naval air authorities said the only planes that will make the cruise north this summer with the combatant units will be aircraft attached to the cruiser divisions.

Rear Adm. W. F. Halsey, commander of Carrier Division 1, will sail aboard the carrier Yorktown for Mare Island today.

OFFICERS INSPECT S. D. AIR PLANTS

S.D. SUN 5/16/39

Having completed an inspection of factory production methods in the Consolidated, Ryan and Solar plants here, 17 Army, Coast Guard and Marine Corps aviation officers left San Diego for Los Angeles today to continue their nation-wide tour of aircraft factories and maintenance bases.

The contingent, including 12 Army men, three from the Coast Guard, one of the Marine Corps, and one foreign student of the Philippine Army, arrived Sunday from Chanute Field, Rantoul, Ill., where they are enrolled in the engineering course of the Army Air Corps Technical School. The inspection is part of their training.

They will visit plants in the Los Angeles area before proceeding to Cheyenne, Wyo., and Kansas City, Mo., to observe maintenance methods of transcontinental air-lines. The officers are being transported in two of the latest Douglas Army bombers piloted by Capts. W. E. Sloan and Don W. Morrow.

S.D. TRIBUNE

Fleet on Board Of State Chamber

Maj. Reuben H. Fleet, San Diego aircraft manufacturer, was elected a director of the state chamber of commerce yesterday and Hal G. elected a director, The Associated Press reported.

Results of the election were announced by the state chamber after state-wide balloting. Besides Fleet other new directors are A. C. Mattei, San Francisco oil executive; D. P. Boothe, Modesto packer, and George G. Hoberg, Lake county resort owner.

5/9/39

NORWAY ROYALTY ARRIVES IN L. A.; IN S. D. TOMORROW

S.D. UNION 5/15/39

Crown Prince Olav and Crown Princess Martha of Norway, who will be entertained by the local Norwegian colony and chamber of commerce officials tomorrow, arrived in Los Angeles yesterday, The Associated Press reported.

The prince re-emphasized, in answer to interviewers' questions, that northern countries of Europe traditionally have tried to keep out of war and "we certainly hope to retain that policy as long as possible."

Civic dignitaries and others, including Sonja Henie, actress, greeted the royal couple upon their arrival at Los Angeles on their 70-day American tour. After luncheon, the party went to Sycamore grove, where the crown prince addressed in native tongue the Los Angeles organization of Sons of Norway.

After a round of entertainment, Prince Olav and his wife will motor to San Diego tomorrow, arriving at U. S. Grant hotel at noon. Roy Hegg, Norwegian vice consul, heads the local committee which will entertain them at luncheon at 1 p.m. in Casa del Rey Moro.

The royal party will visit the House of Pacific Relations and Consolidated Aircraft plant before taking a train at 4:15 for San Francisco.

Australia-to-Africa Flight Planned by Archbold

By North American Newspaper Alliance.

HOLLANDIA, New Guinea, May 8.—While England rearms for any emergency one of the great links of her empire, the commonwealth of Australia, is quietly preparing to survey an air route to Africa which would be a reserve protection for Great Britain's communications in case of war. This was disclosed as the twin-engined flying boat Guba, owned by the millionaire aviator-scientist of the American Museum of Natural History, Richard Archbold, was made ready to leave here for Sydney for a final check-up before attempting, in June, to span the Indian Ocean—still unconquered by air.

The Reserve Route Flight

THE PROPOSED SURVEY of the Imperial Reserve Route across the Indian ocean, already referred to briefly in THE AEROPLANE by cable, is scheduled to take place between June 1 and August 1. It will be an Australian-American effort inasmuch as Captain P. G. Taylor will represent Australia. We learn from Australia that everything else about the expedition will be American, and serve us right, except the "official newspaper correspondent," a Mr. J. Percival, Junr., who has been working for Captain Taylor for a time but has also been publicity manager for the Marcus Show, a denuded American revue, and aviation correspondent for the *Sydney Morning Herald*. In Australia he is regarded as anti-British and as preferring anything Dutch or American. Apart from that it is a good expedition.

The personnel will be:—

Richard Archbold, American multi-millionaire owner of the flying-boat *Guba*, who has been researching in New Guinea on behalf of the American Museum of Natural History.

P. G. Taylor, in charge of the survey, who has done many excellent things in aviation and some crazy things—such as flying the Pacific with the late Sir Charles Kingsford Smith in a single-motor Lockheed.

Capn. L. A. Yancey, navigator, who like Captain Taylor has done much meritorious flying and much crazy flying, as when he flew a single-motor Ballanca non-stop from New York to Spain. He made a good job of the *Guba's* trans-Pacific flight from the United States to New Guinea.

R. Rogers will be first pilot. He was one of the trans-Pacific crew of the *Guba*, and a veteran U.S. boat pilot. R. Booth[illegible] will be radio operator. G. Brown and S. Berrinka will be mechanics. Mr. Brown flew near the North Pole with Sir Hubert Wilkins. ↔Booth also.

The *Guba* is a Consolidated P.B.Y. flying-boat with two 1,000 h.p. Pratt and Whitney motors. It cost Dr. Richard Archbold £62,000, and is equipped in the most luxurious style. It has six comfortable full-length bunks, a kitchen range, ice-box and home comforts almost like an Empire boat.

Capn. Yancey, in describing the preparations, said that the pioneer crossing of the Indian Ocean would represent something entirely new in aerial exploration. "Instead of a cramped overloaded 'plane in which the crew is surrounded by petrol tanks unable to move or sneeze without risk of wrecking it, we shall have comparatively speaking a flying hotel." Everyone will be able to get normal sleep and food, and so far as the ship itself is concerned the crew will stand watches exactly as on board ship. There will be two pilots, a navigator and a mechanic on duty all the time. The rest of the crew will eat or sleep.

He added that the navigator has a chart deck as big as that on any ship, and the full-length bunks are as comfortable as human ingenuity can make them. He adds that Dr. Archbold is a magnificent cook, who specialises in aerial flapjacks and syrup. He believes that the duty pilots will have very little work to do as the automatic pilot does most of the flying.

The radio equipment is the most powerful set in any aircraft in the World, according to the owner's claims, which are justified by the fact that throughout the Pacific flight and all the time the machine has been in New Guinea the crew have maintained direct communication with the United States,—a depressing thought.

Immediate arrangements include fitting two new Pratt and Whitney motors in New Guinea, which will be run in on the flight to Western Australia. This will be by way of Brisbane and then non-stop to Carnarvon (West Australia)—a considerable portion of the journey over land. A chartered steamer will deliver petrol and oil to the intermediate ports.—2,500 gallons will be unloaded at each.

The *Guba* in its present trim has a non-stop range of 4,000 miles. The actual flight will start probably from Onslow in West Australia and stage distances will be: Onslow to Cocos Island, 1,230 miles.—Cocos to Diego Garcia, 1,472 miles.—Diego Garcia to Seychelles, 1,022 miles.—Seychelles to Mombassa, 950 miles.—Total approximately 4,674 miles.

The 'plane is to remain at Cocos, Diego Garcia and the Seychelles at least a week so that Dr. Archbold can make investigations whilst Capt. Taylor will spy out the land for suitable boat bases. Captain Taylor and Mr. Percival will leave the 'plane at Mombassa and return to Australia by boat—whether flying or surface has not so far been decided.

Dr. Archbold and his crew will then proceed across Africa to Boma, to Bathurst then to the Azores, Bermuda and New York. The *Guba* will then only have to fly across the States to complete its circuit of the World.

Financial arrangements have not been fully revealed but the fact has been made known that neither Capt. Taylor nor Dr. Archbold will get any pay. Fuel and the wages of the crew will be paid by the Commonwealth Government, as also will be the charter costs of the special steamer which will convey the fuel to the islands in the Indian Ocean.

Our correspondent learns that Dr. Archbold is not making any charge for the use of the boat.—A fine sporting act which ought to make Imperial Airways and our Air Ministry feel quite small.

So far no definite arrangements have been made for the carriage of mail but probably philatelists will be given a chance of helping the Australian Government to pay its share of the flight and mail will be accepted to the limit of the available loading.

The flight is the culmination of years of effort by Captain Taylor backed by much opinion and no practical effort. The last hope was that the Empire boat *Centaurus* would have made the flight when it had finished its trans-Tasman survey at the end of 1937 but nothing was done.

In a candid discussion on the prospects of the flight Captain Taylor told our correspondent that the idea came to him following a suicidal thought that he might attempt a non-stop flight from Western Australia to Cape Town on the Great Circle course.

"That suicidal idea left me," said Captain Taylor, "when I realised that to succeed would mean nothing commercially and be little more than an advertisement for the aeroplane builder and a hollow personal triumph. On the other hand to have failed would have meant damage to the cause of aviation in general.

"Then I started looking around for a sensible crossing of the Indian Ocean for three reasons (1) the need for an alternative or reserve Empire route in the event of trouble in the Far East (2) an additional route which though not possibly justified for passenger traffic might be valuable for fast mail-carrying flying-boats (3) the fact that the Indian Ocean is the only important ocean in the World which has never been crossed by aircraft."

For years Captain Taylor has been endeavouring to obtain a suitable boat. His only disappointment in the present arrangements is the fact that it is not an All-British effort.

Proposals have been considered at various times by the Air Ministry and Imperial Airways and information was received in Australia early this year that Imperial Airways might undertake the survey with one of the C class Empire boats while waiting for the trans-Tasman service to open. The objection appeared to be more to Captain Taylor than to the survey.

Capt. Taylor seems never to have been in Imperial's good books since he made some outspoken criticism of the machines which he had been engaged to fly for Qantas Empire Airways. He did not take up his appointment and it seems that Imperials have not been anxious to further any plan outlined by Capt. Taylor since then. In fact our correspondent learned that on occasions they have even failed to answer correspondence and cables.—An old English custom.

Efforts to make the survey flight as one of the spectacular sidelines of Sydney's 150th Anniversary Celebrations were made at the beginning of last year and Capt. Taylor then visited England and America in the hope of being able to get support for the plan. Economics as usual came into the picture. Manufacturers had too much work to do to be bothered about the advertising potentialities of what was described as a stunt flight—and air line operators were faced with the problems of maintaining enough equipment to operate existing routes without bothering about new ones.

The present arrangements seem to be the best possible and an Australian-American alliance is perhaps the next best thing to an all-British effort. But some people in England certainly have missed a great opportunity for an exploratory flight of first-class importance. It should have been an essentially British enterprise and flown with British equipment but nobody, now that the opportunity has been lost, will fail to wish the crew good luck and good fortune in their exploration of a route which may well become a vital Empire life-line.

The reforming influence in the Commonwealth Government which made possible the official interest was the Treasurer, Major Casey, himself an able private pilot, who persuaded his cabinet colleagues that the flight was necessary. The ready co-operation of Dr. Archbold made the rest easy.

New Consair Ship

S.D. UNION 5/24/39

To Get Final Test

Under supervision of civil aeronautics authority inspectors, final tests of Consolidated Aircraft Corp.'s new commercial flying boat will be held next week.

The tests were delayed several days pending changes in fuel dumping facilities required by the government on all commercial passenger planes and which were a direct result of the fatal accident to Capt. Ed Musick, veteran Pan-American Airway pilot, when his clipper plane caught fire near Pago Pago, Samoa.

Following completion of the tests, the plane will be flown nonstop to New York, where it is to be used by American Export lines in transatlantic survey flights this summer. Capt. P. J. Byrne will be at the controls.

S.D. TRIBUNE 5/15/39

LARGEST ENGINE, WORD ON U. S. ARMY AIR MONSTER

WASHINGTON, May 15 (A.P.)—The war department today announced development of "the world's largest and most powerful air-cooled aircraft engine"—a 2000-horsepower, 18-cylinder monster.

The engine is the creation of the Wright Aeronautical Corp. of Paterson, N. J., assisted by the army air corps.

With two rows of nine cylinders each [illegible]e engine, said Louis Johnson, assi[illegible]nt secretary of war, "is 500 horsepower more powerful than the 1500 horsepower double-row cylinder 14 which has the highest power rating ever acocrded an American-built air-cooled radial engine by the civil earonautics authority."

The new engine, known as the duplex cyclone, has been under development for the last two years. Its first commercial application has been made in a long-range flying boat which carries 52 passengers and a crew of five. The plane, flown for the first time last week, is powered by two of the new duplex-cyclones.

Developed from the double-row cyclone 14, the new engine will be displayed publicly May 20 in the army air corps exhibit at the New York world's fair.

The plane which made the flight, according to International News Service, was the new long-range flying boat developed by Consolidated Aircraft Corp., carrying 52 passengers and crew of five. The plane made its first flight May 5.

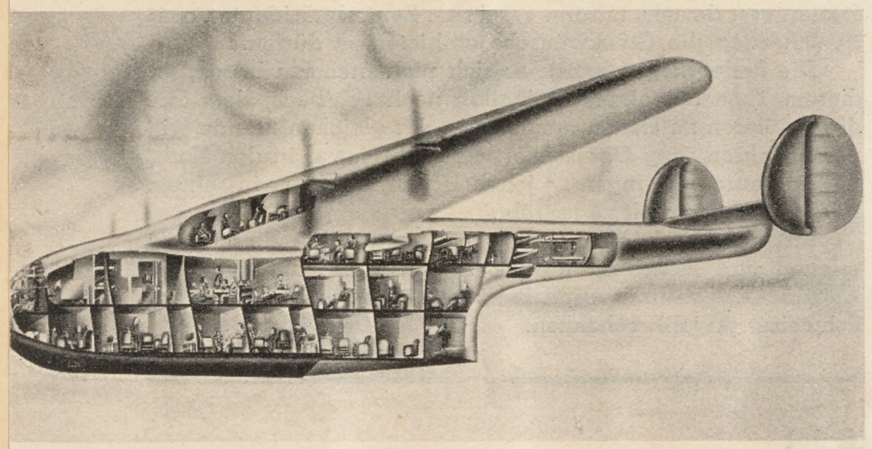
VERKEHRSFLUGWESEN · AVIATION COMMERCIALE

Ein Preisausschreiben für ein Hundert-Passagierflugzeug.

Von Willy Ley.

Im Dezember 1937 versandte die grosse amerikanische Luftverkehrsgesellschaft Pan American Airways System an die acht grössten Flugzeugfabriken der Vereinigten Staaten ein Rundschreiben, welches gewissermassen ein Preisausschreiben darstellte. Pan American Airways bat die Flugzeugfabriken um Angebote für drei, sechs oder auch ein volles Dutzend Riesenflugzeuge. Die Bedingungen hätten noch vor fünf Jahren einfach phantastisch geklungen, einhundert Passagiere, sechzehn Mann Besatzung, Nutzlast 11,500 Kilogramm, Mindestgeschwindigkeit 325 Kilometer pro Stunde und Flugweite mindestens 8000 Kilometer bei dieser Geschwindigkeit.

Es wurde dabei erwähnt, dass die Angebote an Charles A. Lindbergh eingereicht werden müssten und dass diese Flugzeuge für regelmässigen Dienst über grosse Strecken offenen Wassers bestimmt seien. Also kurz: für einen regelmässigen Transatlantikdienst.



Durchschnitt durch den Entwurf der Consolidated. ● Coupe du projet de la Consolidated.
Weitere Bilder siehe Tiefdruck.

Von den angefragten Firmen antworteten vier, Sikorsky, dessen Fabrik an der Ostküste der Vereinigten Staaten sich befindet; Boeing, dessen Sitz in Seattle im Staate Washington an der Pazifischen Küste ist und Douglas Aircraft und Consolidated Aircraft, die beide in Kalifornien ansässig sind. Alle vier Firmen haben bereits erfolgreich Riesenflugzeuge gebaut und also Spezialerfahrung, trotzdem ist dieser Auftrag selbst für sie eine ganz besondere Aufgabe. Trotz allen amerikanischen Getöses um die « China Clippers » ist das grösste bisher jemals gebaute Flugschiff immer noch der Do-X. Die Bedingungen der Pan American Airways machen dagegen ein Flugzeug von mindestens der doppelten Grösse des Do-X nötig.

Man kann an den eingereichten Entwürfen durchaus den Stil ihrer Firmen sehen. Der Entwurf der Consolidated ist in der Hauptsache eine sinngemässe Vergrösserung ihres berühmten Flugbootes XPB 2 Y, welches als Probeauftrag für die amerikanische Marine geliefert wurde. Wie dieses, ist auch der Entwurf des neuen Riesenflugzeuges viermotorig, nebenbei bemerkt der einzige viermotorige Entwurf, alle andern sind sechsmotorig.

Allen Entwürfen ist gemeinsam, dass es sich um Ganzmetallhochdecker handelt, bei denen die Motoren in die Flügel eingebaut sind, so dass sie während des Fluges leicht erreicht, direkt beaufsichtigt und nötigenfalls repariert werden können. Alle Entwürfe sehen auch luftdichte Kabinen vor, so dass der Innendruck etwa einer Flughöhe von 2000 Metern entspricht, während die Maschine in Wirklichkeit etwa 4000 oder 5000 Meter hoch fliegt.

Der Entwurf von Boeing ist besonders interessant in seiner Linienführung, weil diese eine Kombination von zwei berühmten Boeing-Typen darstellt. Boeing baut hauptsächlich Landflugzeuge, hat sich aber auch mit grossen Flugbooten, kürzlich z. B. mit dem sogenannten Pan-American-Clipper, einen Namen gemacht. Während nun das 100-Passagierflugzeug von Boeing als Flugboot gebaut werden soll, hat es doch vollkommen die Linienführung des sogenannten « Stratoliners » (siehe Artikel in « Aero-Revue » Nr. 16, Seite 352), eines Landflugzeuges für Verkehr in sehr grossen Höhen, welches jetzt endgültig seiner Fertigstellung entgegensieht.

Der Entwurf der Firma Douglas ist der einzige, der ein Landflugzeug vorsieht, trotzdem Ozeanstrecken damit geflogen werden sollen. Da aber auch diese Maschine für verhältnismässig grosse Flughöhen gedacht ist, wird durch die geschlossene luftdichte Kabine ein Treiben auf dem Wasser sichergestellt, welches ermöglicht, auch bei stürmischer See auszuharren, bis Hilfe gebracht wird.

In amerikanischen Fachkreisen ist man sehr gespannt, welcher Firma schliesslich der Auftrag, das Flugzeug auch wirklich zu bauen, zufallen wird. Für das Reisepublikum aber bedeutet allein die Tatsache eines solchen sehr geschäftsmässigen Preisausschreibens, dass der regelmässige Transatlantikverkehr mit Riesenflugbooten in spätestens zwei bis drei Jahren Tatsache sein wird.

WESTERN FLYING'S *Review of the* FLYING WORLD

May 1939

U. S. GREATEST AIR FORCE IS STARTED BY FIVE BIG ORDERS

FOR weeks the manufacturers, the purveyors of material and equipment, and the procurement division of the Army Air Corps have been cleaning up the details preliminary to a mass production of airplanes. Even before the appropriation bills authorizing the expansion of the Air Corps were passed by Congress, the supply men had their instructions, and the manufacturers of materials were clearing the decks, so that actual manufacturing of aircraft would not be held up for lack of supplies.

On April 25, Congress finally passed a measure appropriating $549,000,000 for the War Department, with $50,000,000 available for immediate purchase of aircraft. On April 26 the President signed the bill, and on that same day the Army awarded contracts for 571 military planes, at a total cost of about $20,000,000. The production departments of the five companies to whom contracts were awarded immediately swung into action, and the country was forthwith on its way to fulfillment of the 6,000-plane complement of the Army Air Corps.

Contracts were awarded as follows: Curtiss-Wright Corporation, $12,872,398 for single-engined pursuits; Consolidated Aircraft Corporation, $2,880,000 for heavy bombers; Lockheed Aircraft Corporation, $2,180,728 for twin-engined pursuits; Bell Aircraft Corporation, $1,073,445 for twin-engined pursuits; Beech Aircraft Corporation, $528,749 for photographic planes. The number of planes to be built by each company was not announced, but the total was given as 571.

The Consolidated order was for a four-motored bomber, said to be bigger than the Boeing B-15. So far it is a drawing-board airplane, and has never been built. It is said to be based on the big flying boat which Consolidated developed for the Navy, and for which an order for $4,699,057 was awarded Consolidated on March 22. It is believed that the Navy order was for six ships, and, on that basis, the Army order is for about three.

Lockheed's order is for the twin-engined single-seater which Lieut. Ben Kelsey flew to New York last February, and which crashed on arrival. It is powered with two Allisons, and is the flying wing type, with the empennage surfaces on the end of a pair of booms. It carries six heavy machine guns, and is supposed to have a speed of over 400 m.p.h. It is impossible to guess how many of these were provided for in the order.

The Curtiss-Wright order is for the new Curtiss P-40—a single-engined, one-place, all-metal pursuit, with retractable landing gear and tailwheel developed for high speed, high altitude operations. It carries oxygen equipment.

Bell's order is for the "Airacuda," with its two Allisons installed to spin-pusher propellers. The Beech order is the first to be received by that company from the Army.

Within the next few days the Army is expected to place orders for approximately $19,000,000 worth of bombers. Bids have been received from 11 different manufacturers on bombing types in the past month, and it is supposed that the forthcoming contracts will be divided among several of these companies.

On March 17 the Army opened bids on a twin-engined bomber from North American, which bid $456,000 for one plane or $51,000 in lots of 700 to 2000; Glenn L. Martin, which bid $993,500 on one ship or $56,000 in lots of 2000; and Stearman Aircraft Corporation, which bid $435,000 for one, or $70,686 to $83,280 in lots of 300.

On April 18 the Army opened bids for attack bombers from the following manufacturers: Consolidated Aircraft Company, San Diego, Calif., $585,000 and $48,951; Curtiss-Wright Corporation, Buffalo, N. Y., $878,385 and $89,940; Glenn L. Martin Company, Baltimore, $950,000 and $64,000; Bell Aircraft Company, Buffalo, $504,000 and $78,000; Lockheed Aircraft Company, of Burbank, Calif., $1,225,000 and $75,540; North American Aviation Corporation, of Inglewood, Calif., $760,000 and $58,190; Douglas Aircraft Corporation, El Segundo, Calif., $742,000 and $55,623, and Douglas, Santa Monica division, Santa Monica, Calif., $207,500 and $56,000.

A week previous to opening the bids the North American entry was destroyed on its final test flight, but it is understood that the Army already had obtained practically all the information it required, so that it was not eliminated from the competition by the disaster.

■

LARGEST PLANE ENGINE TESTED

War Department Ends 2-Year Secret Job

S.D. SUN 5/18/39

Aeronautics

The War Department today formally announced completion of two years' secret experimental construction of the world's largest air-cooled aeronautical engine—the 2000-horsepower Wright Cyclone, which was given a preview to San Diego naval and aviation observers May 5 at the launching of Consolidated Aircraft Corp.'s "mystery" Model 31.

The Consair plane, whose top speed will approach 300 miles per hour and whose non-stop cruising range will be 10,000 miles, is powered with two of the engines.

2 MILLION CONTRACT

It is believed they may be used in the four-motored bombardment plane for which the San Diego firm has been awarded a $2,000,000 contract by the Army for construction of an experimental prototype and a small number of service test-craft. They generate double the power in each of the four engines now used in the Boeing "flying fortress," the Army's largest plane.

Assistant Secretary of War Louis Johnson in Washington, described the 18-cylinder engine as a development of the 14-cylinder Wright Cyclone now being used on some of the Army's newest planes.

VIRTUALLY TWO ENGINES

It operates virtually as two nine-cylinder engines, he said, and is built with a single crankcase and shaft.

His announcement had awaited successful completion of the first test flights of the Consolidated airboat, it was believed here.

The motor will be exhibited at the New York World's Fair. Experts say it is a big step toward attaining a flying speed of 500 miles per hour and that it may insure successful operation of combat ships at the dizzy altitude of 35,000 feet.

Maj. Gen. H. H. Arnold, chief of the Army Air Corps, recently told a closed Congressional committee hearing that such speeds and altitudes are imperative if the United States is to regain supremacy in the air.

"A 1000-horsepower engine used to be a big one," Gen. Arnold said. "Everybody was satisfied to think in terms of 1000 horsepower. But today it is not a drop in the bucket. We went to 2000 recently.

"We should have one of 3000 on the drawing boards available for dynamometer tests next year. The only way to do it is with money. We do not know much yet about speed in excess of 400 miles per hour."

G-Men Mum On Consair Investigation

5/23/39

S.D. UNION TRIBUNE

Federal bureau of investigation agents have begun an investigation of charges that sabotage was responsible for wrecking of planes being built by factories in southern California, including the Consolidated Aircraft Corp. plant at San Diego, The Associated Press reported from San Francisco.

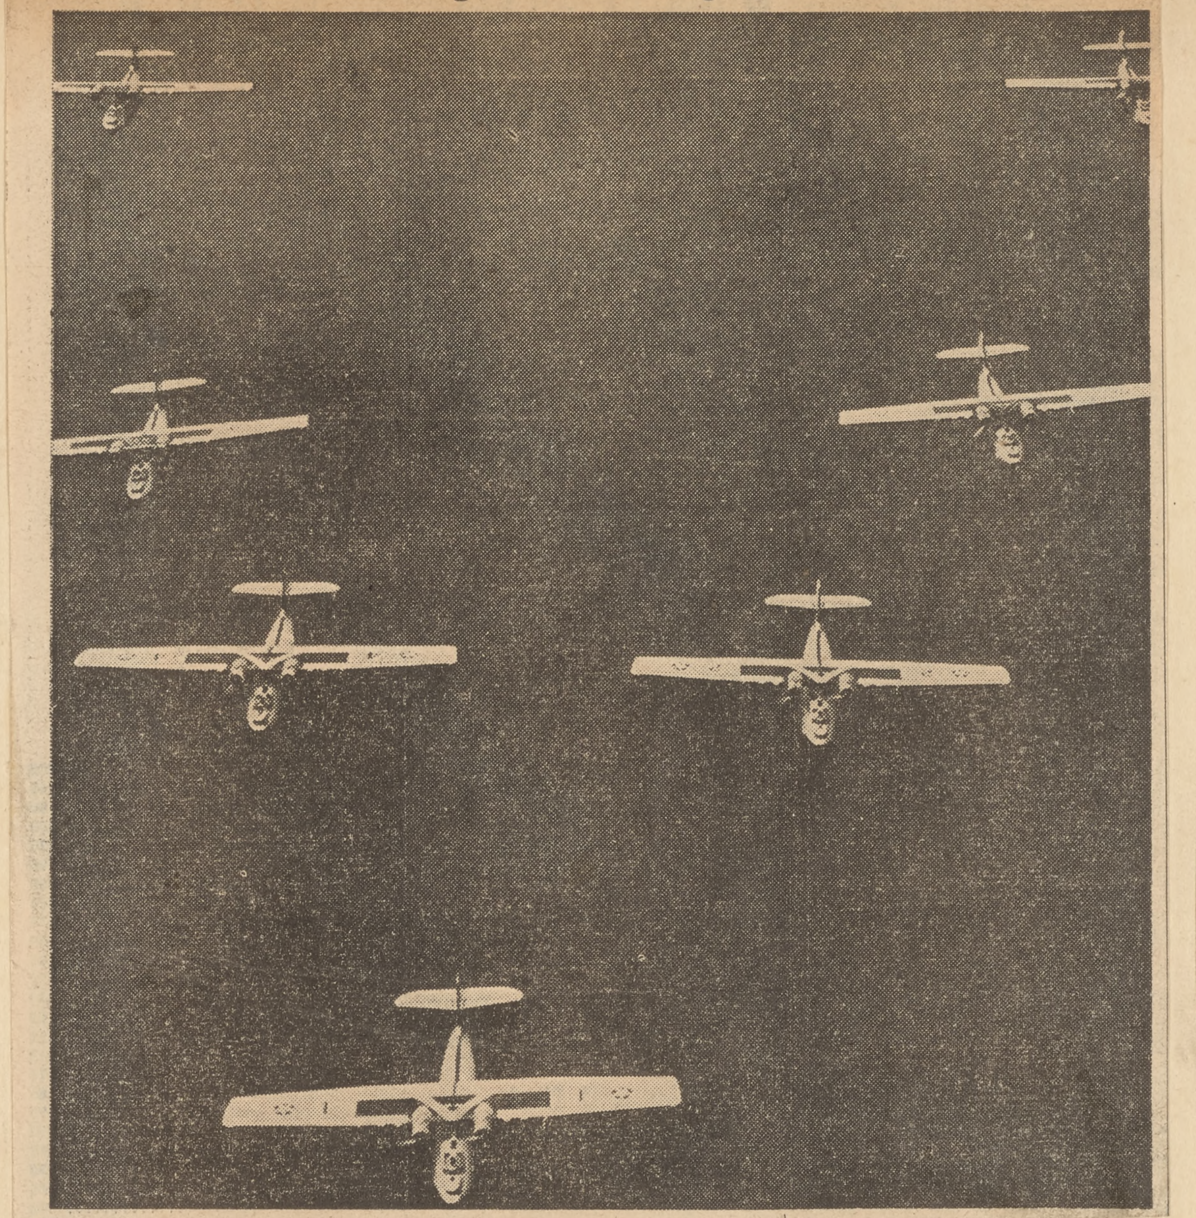
F.B.I. agents declined to talk about the investigation or say what caused it to be launched.

Harry Bridges, West Coast C.I.O. director, charged last January that Nazi agents were sabotaging planes in the Consolidated plant here. The charge was denied at the time by executives of the company and naval intelligence officers.

Bridges asked President Roosevelt for an investigation by the department of justice and claimed planes being constructed for the government in the Consolidated plant and the North American Aviation Co. plant at Los Angeles had been damaged by sabotage. He cited the 1938 accidents to "approximately 12 navy bombers manufactured by Consolidated."

Giant Bombers Practicing for Mass Flight, S. D. to Honolulu

S.D. TRIBUNE 5/16/39



Preparing for a mass flight this summer from San Diego to Honolulu, seven big two-motored navy patrol bombers of the 12-ship VP-1 squadron are shown, upper, in a practice formation flight over the Pacific after taking off from here. Leading the group is the plane of Lt. Comdr. Sam La Hache, commander of the squadron. Lower, La Hache, right, and Lt. Herschel House are shown in front of one of the planes conferring on plans for the flight.

MYSTERY AIRBOAT TRIES WINGS AGAIN

S.D. SUN 5/18/39

Consolidated Aircraft Corporation's half-million dollar twin-motored "mystery" airboat was taken aloft today in another series of test flights. The government is interested in the tests, as the 52-passenger ship represents new departures in construction.

Piloting the plane today was William B. Wheatley; George Newman Jr., co-pilot; Jack Kline, flight engineer, and Robert Tibbs, assistant flight engineer.

Consolidated officials said the flight was "routine," but it was understood pilots were instructed to test the ship for speed and endurance.

Air Commerce Bill Opposed

S. D. UNION

5/28/39

Further hearings on an assembly bill designed to place intrastate air operations under control of the state railroad commission will be held by the senate committee on aviation and aircraft Thursday afternoon, Sen. John D. Foley, committee chairman, notified the San Diego chamber of commerce last night. Taking the position that a "multitude of regulations" tend to retard commercial aviation, chamber directors voted 21 to 2 to oppose the measure pending in Sacramento.

Sen. Ed Fletcher, San Diego, member of the senate aviation and aircraft committee, notified the chamber that American Air Lines, Transcontinental and Western Air, Federated Trades and Labor council, Aircraft lodge 1125, International Assoclaiton of Machinists, Ryan Aeronautical Corp., Solar Aircraft Corp., San Diego harbor commission and "many other organizations and individuals" have voiced opposition to the bill.

Chamber directors held that for the present, control of commercial air operations, as vested in the civil aeronautics authority, created by the last congress, is adequate.

Maj. R. H. Fleet, Consolidated Aircraft Corp. president, informed the directors that approval of the measure, A. B. 2701, would tend to "destroy competition in commercial intrastate air operations, and would tend to create a monopoly in favor of existing lines."

PLANELY SPEAKING

By Major Al Williams

Westbrook Pegler is on his annual four-weeks vacation. While he is away, Major Al Williams, noted aeronautics authority and Scripps-Howard Aviation Editor, conducts a column in this space. —The Editor.

S. D. SUN

New Game Of Waiting For That Fellow To Drop His Other Shoe

FROM WHAT I can gather from the War College boys these days, surface fleets at sea are having a tough time cooking up plans for defense against air attack.

For instance: There's a hostile battleship and cruiser fleet loose, somewhere within a thousand square miles of ocean. Shore-based flying boats are out on a scouting mission to locate that fleet. The old Navy way to locate that enemy fleet would have been to send light, fast scouting cruisers and destroyers out.

Scouting Plans

Centuries of naval warfare developed a dozen or more cute little scouting plans. No naval commander would dare to split his strength, and was therefore forced to shape his fleet's position in line with what he thought the enemy wanted to do.

The modern air setup follows the basic plan of naval search. The long-range flying boats are all radio-equipped, and, spreading fan shape, they can comb an ocean in jig time.

Aerial observers enjoy a great advantage since they see the surface vessels long before they themselves are sighted or detected. They use this advantage by hanging in the low-lying cloud formations, or just far enough away from the surface fleet to maintain contact, but remain undiscovered.

They Congregate

Meanwhile, they radio the other searching aircraft, and in a short time these vultures congregate.

The fleet they are waiting to pounce upon has, of course, its aircraft carriers, with hundreds of little fast fighters on board. These little wasps could make it pretty hot for the big flying boats—if they knew they were near; and if near, where.

Modern long-range flying boats can remain aloft for 20-odd hours, and at some time during that period they will find visibility most suitable for attack and most disadvantageous for the defense.

The bad light just before sunrise, or the shading of sunset—plus cloud protection—gives all the surprise factors to the air attack. Hanging on in the distance, just waiting for the kill, the flying boats are generally in and out again before the surface fleet can get its guns manned and its aircraft carrier planes into the air.

First Attack

The first attack is launched against the aircraft carriers, the most vital elements of a fleet, and, at the same time, the most vulnerable. One 500-pound bomb on the landing deck, and an aircraft carrier is out of commission. And no matter how rabid the admirals may be about the superiority of steel-sided fleets, none dare maintain that such a fleet has a ghost of a chance against an enemy when stripped of all its fighting aircraft. This is one point they don't argue about.

And so the headache problem of naval strategists today is to be ever and always ready to ward off an air attack without demoralizing the crews of the surface vessels. Only a few minutes intervenes between the just-out-of-sight position of the bombers and the first bomb drop. During these few minutes guns must be manned, ammunition hoists in operation, range finders and keepers in the mast tops on the job, and squadrons warmed-up and launched from the carrier's decks.

Scared 'Em

Peacetime war games at sea have scared the wits out of the old seadogs, and they have learned from experience that the surprise attack is aviation's most deadly and unpredictable feature. They know the dread of bombers gathering in the distance—holding off for the bad light and flying for the kill.

It's a greatly expanded version of waiting for the fellow upstairs to drop the other shoe.

Most Powerful Plane Engine Goes to Army

Air-cooled radial develops 2,000 horsepower; only two needed for flying boat

Washington, D. C., May 15 (AP)—A step forward for the United States in the world race for air supremacy was disclosed today when the army announced the development of "the world's largest and most powerful air-cooled aircraft engine."

It is a 2,000 horsepower "duplex cyclone"—500 horsepower more powerful than the "cyclone 14" which has the highest power rating ever accorded an American-built air-cooled radial engine by the Civil Aeronautics Authority.

Its strength is indicated by an announcement from Louis Johnson, assistant secretary of war, that only two of them were required to fly the long-range consolidated flying boat which carries 52 passengers and a crew of five. It made its first flight last week.

The army already has tried out the engine with success on long-range bombers, and it may soon become standard for some categories of military planes.

Johnson said the engine had been developed by the Wright Aeronautical Corporation, Paterson, N. J., with the assistance of the Army Air Corps. Information in army circles is that a considerable amount of work of designing was done by the experimental experts of the Army Air Corps at Wright Field, Dayton, O.

The new engine is a double-row, air-cooled radial, with eighteen cylinders arranged in two rows of nine cylinders each. Johnson said it was "virtually two nine-cylinder engines built on one crankcase with a common crankshaft."

Two years were spent in developing it, Johnson said. It is based on the double-row "cyclone 14" engine of 1,500 horsepower but has four more cylinders.

The public will get its first glimpse of the new engine when the Army Air Corps puts it on display May 20th in the Aviation Building at the New York World's Fair.

"The Dope on Paint" — Continuation

May 1939

May 1939

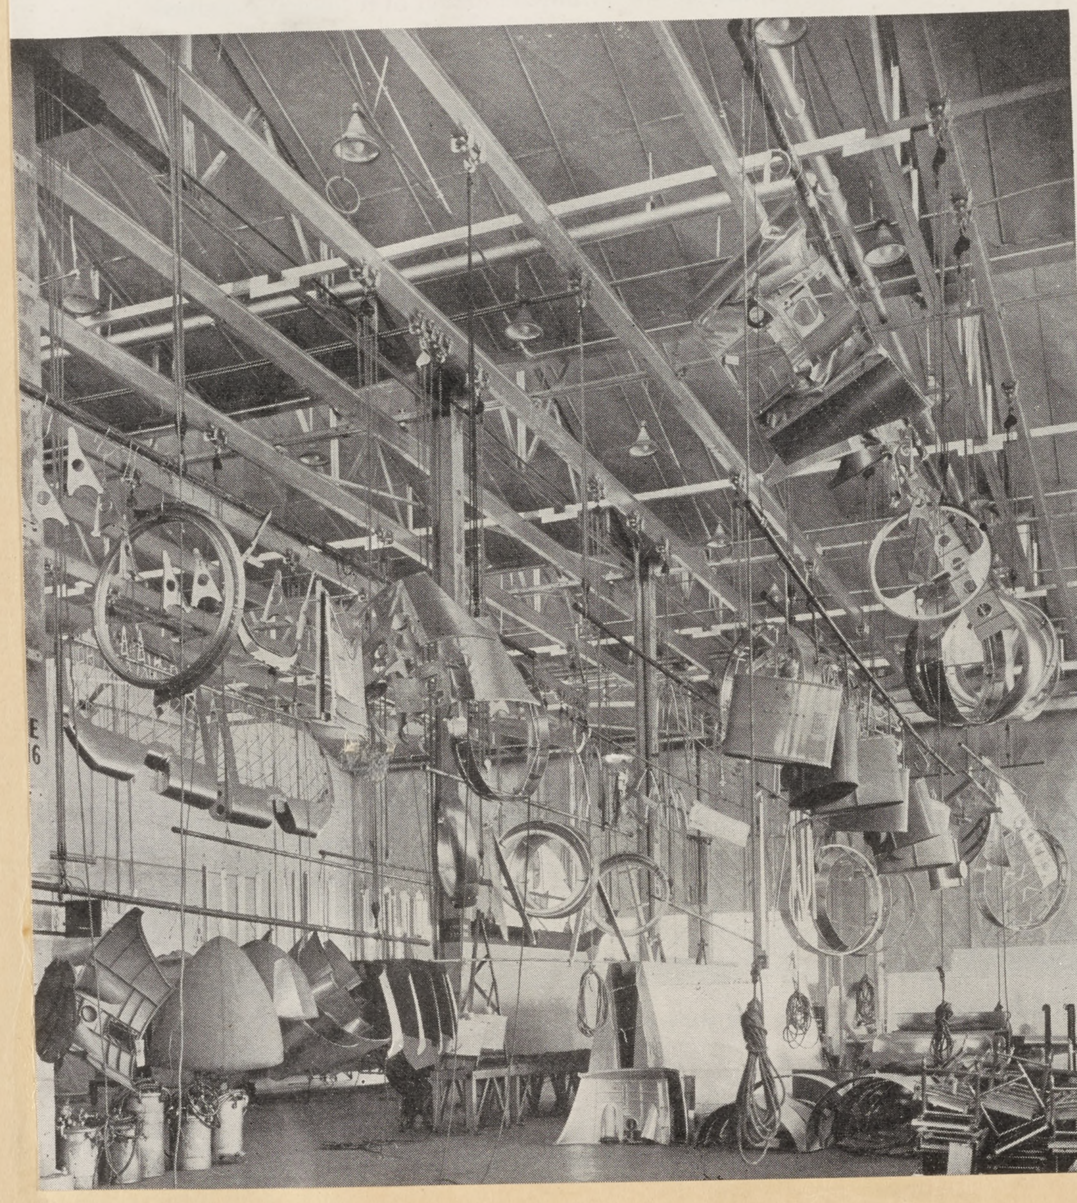
Western Flying

except by the long process of test and elimination of organic coatings available. As the aircraft industry increased in size and the synthetic resin suppliers and the paint manufacturers increased their technical staffs, organic protective coatings were made available to fit peculiar problems. The result today is that the larger users of coating materials have technical men well versed on organic protective coatings which fit their particular needs.

The first step in filling a peculiar need for a protective coating for aircraft was the use of a cellulose material on fabric to obtain a taut surface. Cellulose as we know it constitutes the principal material of the cell walls in plants, but when treated with sulphuric and nitric acids produces a film-forming material soluble in esters and alcohol, which we know as dope and lacquer solvents. The selection of proper solvents and plasticizers in nitrocellulose makes up the nitrated dope as used in the aircraft industry today. The most important point in the manufacture of dope is the control of nitrocellulose to plasticizer ratio, in a properly balanced solvent. Acetate dopes have been tried many times to replace the conventional nitrate dope system in the hope of overcoming the extreme fire hazard which goes with a nitrate dope. It is now generally agreed that the only cellulose material suitable for use on fabric in aircraft operation must be more or less of a non-thermal plastic nature.

In the early days of the production of aircraft the principal materials used in construction were steel, wood, fabric, and some aluminum. The aeronautical engineer's principal problem was making an airplane that would fly at the highest speed and maintain the highest pay load possible for his airplane and, of course, have a good margin of safety. These requirements make it necessary to use only the lightest gauges of aluminum alloy which in turn require a satisfactory protective coating for these metals. The many variables in the paint industry itself could offer very little technical information on organic coatings that would be of value to an aircraft designer without investigation.

The paint shop at Consolidated Aircraft Corporation showing the method of hanging finished parts from the monorail overhead.

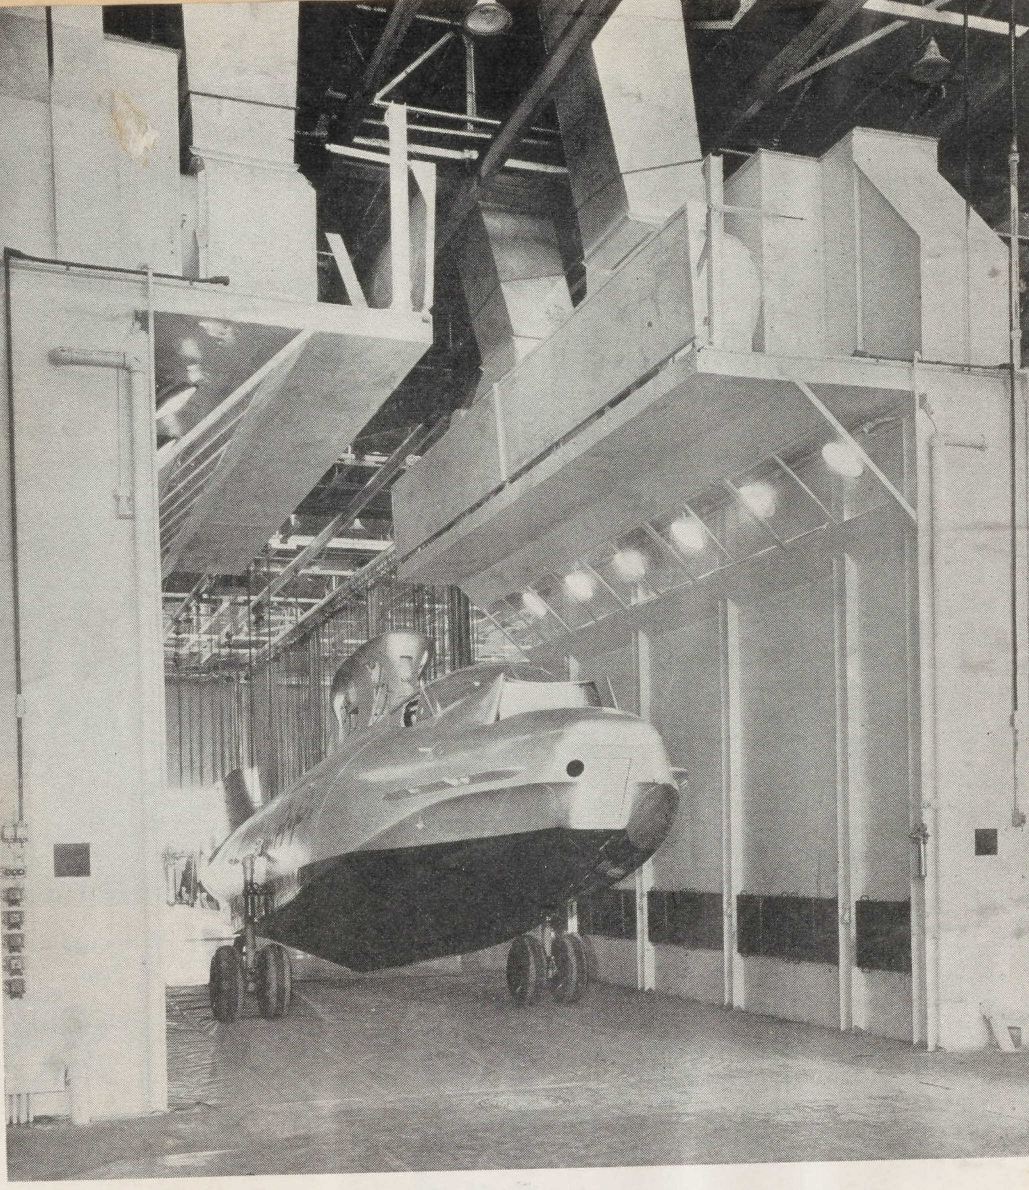


The first finish coatings commonly used 10 years ago were the oleoresinous type of enamel commonly known as the "four-hour enamel." The primer was of the iron oxide type but other types were used, such as pyroxylin or lacquer base. In those days the finishing systems seemed to always change with every new model and each aircraft manufacturer worked out the finishing system that he found most practical.

The Army and the Navy air services were compelled to work out a finishing system which would fit the peculiar needs of military aircraft. At the same time, such rigid specifications were drawn up as to enable the procurement of these products from any responsible paint manufacturer, because the government cannot purchase proprietory products on the open market. After many sad experiences with organic coatings on aircraft, the Army and the Navy air services, in cooperation with some of the larger aircraft manufacturers and aircraft operators, set up quite an extensive program to investigate the most suitable finishing systems for aircraft.

The results of this extensive investigation were tabulated more or less in a roundabout way, but they bring out some very interesting facts. Probably the most important discovery was that zinc chromate pigment was the only pigment available which had corrosion-inhibiting properties when used on aircraft metals. These tests were repeated many times with the same corrosion-inhibiting results. It was concluded that these corrosion-inhibiting properties were derived from the electrolytic depolarizing of the chromate ions liberated due to the slight water-soluble nature of this pigment. In 1934 the first steps were taken to incorporate this pigment into a proper synthetic base that would be suitable for use as a primer on aircraft metals. This was accomplished by blending pure glycerol phthalate resins with a special type of Bakelite resins, with the result that this primer today is a standard aircraft primer in the United States for all types of aircraft metal finishes.

The investigation for the most suitable finish coat produced a somewhat different reaction in the aircraft industry. Some of the people concerned were in favor of continuing use of the four-hour enamel as a finish coat. Others felt that the synthetic glycerol phthalate type would be much more suitable because these resins had better flexibility, gloss, and color retention when compared with the four-hour enamel type. Then a third group preferred a lacquer finish because of the fast-drying characteristics which would be a big advantage under production conditions and at repair stations. This condition continued for a long while, but every effort was made to come to some kind of an agreement.



A spray booth at Consolidated Aircraft Corporation, where an entire flying boat hull may be finished.

The operation of Naval aircraft was considered the most important from a protective standpoint because of the serious corrosion trouble which had to be considered in the development of a standard aircraft finish coat. It was agreed that a finish coat with lacquer drying characteristics which would yet maintain a gloss and color retention, with adhesion and flexibility of the glycerol phthalate enamels would be the ideal aircraft finish coating. From this information efforts were made to draw up synthetic lacquer specifications to produce a protective coating with the characteristics outlined. Today, these lacquers have a remarkable degree of flexibility, gloss, and color retention, yet dry to handle in about 30 minutes, are ready for masking in one hour, and in many respects are superior to the glycerol phthalate enamels.

With these new coatings which were especially developed for use on aircraft, a finishing schedule was finally worked out which is very simplified, giving a very practical and economical system with the maximum protective properties, and a saving in weight as far as finish coatings are concerned. This standard finish is using the zinc chromate primer for all interior surfaces and on exterior surfaces where finish coatings are specified. On interior surfaces a second coat is applied with this primer — plus a small amount of aluminum paste with a touch of black, so as to give the finish a soft, dull green tint. In many instances this scheme is followed through on the interior of cargo ships, crew quarters, etc. This finishing system works out to be not only the most durable finish obtainable, but also the lightest in weight.

In many cases the use of zinc chromate primer is also recommended for the inside of integral gasoline tanks, providing, however, about 10 days are allowed for air drying so as to completely oxidize the film. For the finishing of the inside of the pilot's cockpit the tendency is to finish in a dark, flat green rather than use the black as was the common practice. A study made on colors for pilot's cockpit indicates that green is preferable because the human eye adjusts itself more quickly from green to outside light than from black to outside light. Another study is being conducted concerning color with the lowest fatigue value for the finishing of interiors of long-range transports or flying boats. It appears that on long-range flying boats a pastel shade of blue-green, on the blue side, has the lowest fatigue value, and on long-range transport airplanes a pastel shade of blue-green, on the green side, has the lowest fatigue value.

The present accepted finishing system for fabric-covered airplanes is still the conventional nitrate dope which requires from seven to fourteen coats, depending upon the type of finish desired. One of the military air services requires a cadmium semi-pigmented dope, without the use of any clear dope. It has been found that cadmium pigment is very desirable to reduce fabric fires, as this pigment does prevent smouldering around any burns that might be made in the fabric finish from hot exhaust carbon or cigarette burns. However, this system will sustain combustion. Another trend to obtain fireproofing on fabric finishes and reduce fabric fire hazards is to obtain the required tautness with the conventional nitrate dope, but to finish with a pigmented fire-resisting acetate dope.

Some of the new products that may soon be introduced in the aircraft industry to serve some peculiar aircraft need will include synthetic organic plastics which are non-drying and non-hydroscopic formulated in such a way as to produce an ideal sealing compound for integral gasoline tanks, watertighting flying boat hulls, watertighting the wings, stratosphere sealing, and the insulating of dissimilar metals. The use of these compounds indicates that it will reduce engineering time and production costs probably 40 per cent over any other material on the market today.

STATE AIRLINE CONTROL HIT

C. of C. Opposes Assembly Bill

S. D. SUN 5/13/39

State Legislature

Growing opposition to an Assembly bill designed to place intra-state commercial airline operations under the control of the State Railroad Commission was indicated today in reports reaching the Chamber of Commerce from Sacramento.

Meanwhile the Senate Commission on aviation and aircraft Thursday afternoon will conduct further hearings on the measure, Sen. John D. Foley, committee chairman, notified the chamber.

By a vote of 21 to 2 chamber directors voted to oppose the bill, holding that "a multitude of regulations tends to retard commercial aviation."

Sen. Ed Fletcher, member of the Senate aviation and aircraft committee, notified the chamber that the American Air Lines, Transcontinental and Western Air, Federated Trades and Labor Council, Aircraft Lodge 1125, International Association of machinists, Ryan Aeronautical Corp., Solar Aircraft Corp., San Diego Harbor Commission and "many other organizations and individuals" already have voiced opposition to the bill.

CAA 'ADEQUATE'

Chamber directors held that for the present, control of commercial air operations, as vested in the Civil Aeronautics Authority, is adequate.

Maj. R. H. Fleet, Consolidated Aircraft Corp. president, informed the directors that approval of the measure, A. B. 2701, would tend to "destroy competition in commercial intra-state air operations, and would tend to create a monopoly in favor of existing lines."

BRITISH INTEREST IN U.S. FLYING BOAT

BOMBER WITH DUAL USE

By Group Capt. L. G. S. Payne

According to a B.U.P. message, officials of the Consolidated Aircraft Corporation of San Diego, California, declared yesterday that Great Britain was now interested in purchasing 'planes similar to the Consolidated PBY long-range flying boat.

This can be employed either for reconnaissance or bombing, and is used by the United States Navy.

It is said that the first indication of British interest in these machines was afforded when the company's officials and English experts began to seek men for a crew to fly an experimental machine across the Atlantic this summer.

When equipped with two Wright Cyclone engines, the PBY boat has a top speed of 204 m.p.h. and a maximum range of 4,000 miles.

SAN DIEGO NORWEGIAN COLONY AND CHAMBER HOSTS TO PRINCE AND PRINCESS

S.D. UNION 5/17/39

The local Norwegian colony and chamber of commerce were hosts to their royal highnesses, Olav and Martha, during their San Diego visit and here they are with D. E. Hanson, chamber president, and Roy Hegg, Norwegian representative.

Military cooperation has been extended from coast to coast in making their American tour pleasant for Prince Olav and Princess Martha. Shown with them are, left to right, Vice Adm. E. J. King, Rear Adm. Sinclair Gannon, Maj. Gen. Louis McC. Little and Col. R. E. Guthrie.

Royal Visitors Smile on S.D.

S.D. UNION 5/17/39

'Beautiful—Kind, Say Olav, Martha

By RUTH TAUNTON

Out of the land of brave Norse legend came Crown Prince Olav and Crown Princess Martha yesterday to make us feel anew what a wonderful thing is international friendship and the brotherhood of man.

Without the slightest sign of pose or snobbery, the democratic heir to the throne of Norway stepped from an automobile in front of U. S. Grant hotel at 12:30 yesterday afternoon and lent a strong arm to his princess before turning to the cheering crowd.

Appealing in his sincere naturalness, his greetings to the welcoming committee at the hotel, to the press in a close, small bedroom, to civic and military officials in Sala de Oro, to 150 guests at Casa del Rey moro luncheon, to the public in the House of Pacific Relations and to those who took his party on a tour of Consolidated Aircraft factory included expressions of gratitude for the hospitality of Americans on his 70-day tour of the United States.

"THANK YOU, THANK YOU"

Likewise, his last words at Santa Fe station where the royal party took the streamliner for San Francisco at 4:15 were: "Thank you, thank you, thank you! San Diego is so beautiful and her people are so kind. The princess and I never will forget. I hope—sincerely hope—we may meet again."

Tall, broad shouldered, with sea-blue eyes and thinning blond hair, Prince Olav has the tenor-pitch voice that comes as such a surprise from one of his athletic build and prowess. And there was more sunshine in his smile than all southern California was able to muster for their trip into our southland, although there was blue sky overhead when Olav and Martha walked beside the pansy beds from the House of Hospitality to Norway cottage in the Park's international colony.

Roy Hegg, Norwegian vice consul; John Johnson, Norwegian cottage president, and Dr. H. V. Sverdrup, Norwegian-born scientist, welcomed the prince and princess at U. S. Grant hotel and Hegg was official host for all entertainment of the afternoon.

POSE FOR PICTURES

After they had rested in their suite for only 10 minutes, Prince Olav, wearing a gun-metal gray suit and black tie, entered the room where reporters and photographers were waiting. With him was Princess Martha, her black costume reminding one that the court at Norway still is in semi-mourning for the English-born Queen Maud, mother of Olav.

Urbane and seemingly unwearied by continuous rounds of entertainment provided for them since their arrival in New York April 27, they posed for pictures and then looked expectantly at the battery of interviewers.

Asked if he could pass on to the United States the secret that has kept Norway out of war for 100 years, the prince's answer implied that it might be because his country has no designs on what belongs to another—and that Norway, happy and prosperous as a small country, yet has little to stir envious designs in the hearts of aggressors.

"We have only one neighbor," he said, "and we are at peace with her. We do not go afield looking for trouble."

The prince, speaking of modern social progress in Norway, said that men and women have complete equality before the law. Both he and his princess raised their eyebrows in surprise when they were told that such is not the case in the United States.

"But why?" asked the prince. "You are one of the most industrially modern nations in the world."

SPEAKS IN NORWEGIAN

Speaking briefly at the luncheon, the prince said that, unlike the '49ers, he and his princess did not come to California to seek gold or to speculate in oil.

"We came to America," he said, "just because we wanted to know you and to see the land in which you live. What we hear of California, land of sunshine and plenty, conjures up visions you could hardly imagine in those of us who live in faraway northlands."

In the House of Pacific Relations, where representatives of many nationalities greeted the royal visitors, Martha stood by the side of her prince while he addressed the throng first in Norwegian and then in English, pleading that "every individual in the world work for a just peace of cooperation and progress."

Then came an experience new to the Crown Prince and Crown Princess from Oslo, judging from their expressions of mingled interest and utter bewilderment. They viewed a Navajo sand painting. They met Chief At-sidda Begay of New Mexico. Confused, but irreproachably polite, the royal couple received the blessings of Chief Albanes, San Diego county Mission Indian in full native dress, after Dr. C. E. Nelson has explained that the prince was to be an honorary chief. And every inch the perfect guests, they gave undivided attention to tribal songs as each chief presented his solo.

SHAKE CHIEFS' HANDS

"Because we were the first Americans," said the Mission Indian chief, "and because California originally was our own, I came down from Palomar mountain to welcome the prince and princess of Norway. My ancestors, too, were rulers.

"Thank you very much," said Olav—and Martha extended a black-gloved hand to each chief.

From the House of Pacific Relations the party was taken to the Consolidated Aircraft factory where Major Reuben H. Fleet personally conducted them on a tour of the plant.

Gifts to the royal couple included a corsage of lilies of the valley (national flower of Norway) and orchids from the House of Norway club to the princess; red roses from Our Savior's Lutheran church; a tinted picture of the House of Norway in a silver frame, and a beautiful floral flag of Norway (red, white and blue flowers) from Sons of Norway lodge. The flag decorated the table at which the prince and princess sat at luncheon.

The civic and military reception for the visitors was held in Sala de Oro preceding the luncheon, when they were welcomed by Mayor Percy J. Benbough; D. E. Hanson, chamber of commerce head; Vice Adm. E. J. King, Rear Adm. Sinclair Gannon, Maj. Gen. Louis McC. Little, Col. R. E. Guthrie and other dignitaries.

The police motorcycle escort, on duty from the time the seven-car caravan entered the city limits until the departure of the royal couple by train, led the way across Cabrillo bridge and in the main plaza of the park the prince and princess received a military salute and the marine band played "Fa, Vi Elske" ("Yes, We Love Our Country"), the Norwegian national anthem. Marine musicians played from the balcony throughout the luncheon and they contributed to the House of Pacific Relations program.

It was the prince himself who provided the occasion for the band to play our own national anthem when, at the luncheon, he lifted a glass of water and proposed a toast to the President of the United States.

A San Diego Bid For Role in Air

May 22 1939

Special to The Christian Science Monitor

SAN DIEGO, Calif.—San Diego makes its bid for a role in the trans-Atlantic air drama with the Consolidated Aircraft Company's new 25-ton flying boat.

The air liner can carry 28 passengers across the Atlantic, and 52 passengers on shorter trips, according to officials of Consolidated. The plane has a wing span of 110 feet, is 73 feet long, 22 feet high, and has a maximum wing chord of 14 feet.

Two full decks, one above the other, provide for a flight control room and eight compartments for passengers.

The ship is powered with two 18-cylinder twin-row radial engines, each capable of generating 2,000 horsepower at the take-off. They are said by the War Department to be the world's largest and most powerful air-cooled aircraft engines.

Construction is of aluminum-coated aluminum alloy skin internally reinforced with longitudinal stiffeners and transverse bulkheads and frames.

Ten months were required for design and construction of the craft, and the Navy Department was in touch with the Company during the construction period. The ship is designed to operate with a crew of five—pilot, co-pilot, flight engineer, radio operator, and navigator.

Test flights of the new craft were successfully completed shortly after it was hauled from the factory.

ARCHBOLD STARTS 20,000-MILE FLIGHT TODAY IN RETURN FROM AUSTRALIA

S.D. UNION 6/2/39

Richard H. Archbold, associate director, American Museum of Natural History, will take off from Sydney this afternoon for a 20,000-mile return flight to San Diego via Africa, the West Indies and Miami.

Piloting the $250,000 Consolidated built "flying laboratory" with which which he completed a successful scientific expedition in Netherlands New Guinea, Archbold first will attempt to span Australia on a 2200-mile non-stop flight.

BLAZE AIR ROUTE

From Port Hedland on the east coast of the land of the southern cross, Archbold will head out over the Indian ocean to Mombassa, Africa. From Mombassa he will fly to Lake Victoria, thence to Dakar, St. Thomas and Miami. He is expected to arrive at San Diego July 1.

Archbold will blaze a new air route of almost 5000 miles over the Indian Ocean to East Africa.

The flight is sponsored by Capt. Percy G. Taylor of Sydney, who proposed it five years ago, urging the route as an alternative for the England-Australia airmail service in time of war, The Associated Press reports.

BONUSES FOR CREW

Taylor has been prominent in Australian aviation for many years. He was the late Sir Charles Kingsford-Smith's navigator on flights from Australia to New Zealand in the "Southern Cross" in 1933 and 1934 and second pilot on the flight from Brisbane to California in the "Lady Southern Cross" in 1934.

Archbold will receive no payment from Australia as owner of the Guba, but the crew of the flying boat will receive bonuses.

Lewis A. Yancey, American aviator who flew the Atlantic to Rome in 1929, will be navigator, and Russell Rogers, veteran American flying boat pilot, will be first pilot.

Archbold Maps Hazardous Flight Across Australia In Airboat Guba

The Consolidated airboat Guba, owned by Richard Archbold, scientist-aviator, will take off from Sydney at 10 p. m. (PST) tomorrow, (weather permitting) in an attempt to span Australia non-stop on a 2200-mile flight, it was learned today.

With Mr. Archbold and Russell Rogers as co-pilots, the San Diego-built plane will set as its goal, Port Hedland, on the east coast of the continent, after a hazardous crossing over an area where large water bodies are scarce.

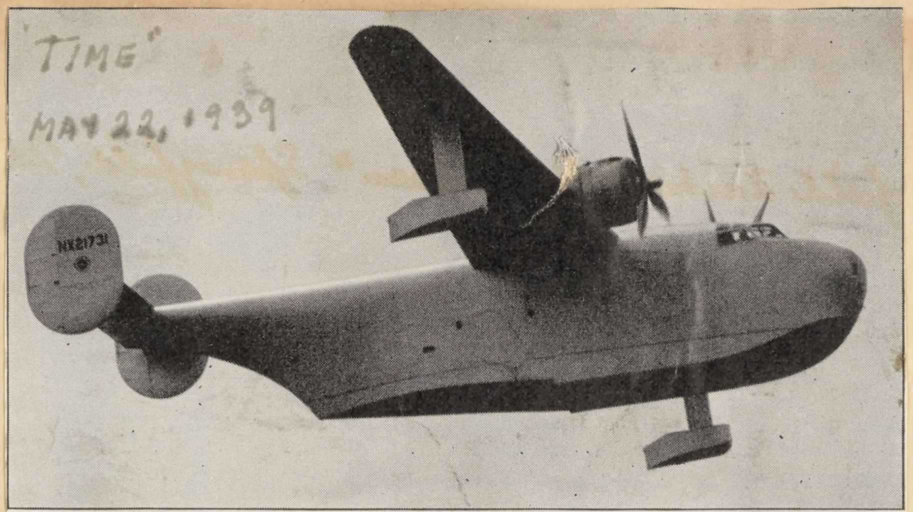
SURVEY FLIGHT

From Portland, the Guba will fly across the Indian Ocean to Mombasa, Africa, on a survey flight for the Australian government to establish an air route over friendly territory to be used as a reserve line for Great Britain's communications with Australia in event of war.

Three island groups will serve as stops on the Indian Ocean in a 5400-mile hop. From Mombasa, the Guba will head for Lake Victoria, in the African interior, and on to Dakar, on the east coast, before proceeding across the Atlantic to St. Thomas, Virgin Islands. From here, the seaplane will fly either to Miami or New York and then to San Diego, where it is expected about July 1.

EXPLORATION TRIP

Accompanying the Guba on the first crossing by airplane of the Indian Ocean will be Capt. P. G. Taylor, noted Australian trans-oceanic aviator. The plane has been used for the last year in transporting personnel and equipment into The Netherlands New Guinea jungles for an American Museum of Natural History expedition, headed by Mr. Archbold. Exactly one year ago tomorrow, the Guba left San Diego on a 7500-mile flight to New Guinea, via Honolulu and Wake Island. It has flown more than 100,000 miles since. S.D. SUN 6/1/39



"TIME" MAY 22, 1939

Associated Press

CONSOLIDATED'S MODEL 31
Her wing and range attracted the Navy's nose.

Perfect Wing

From the sprawling Consolidated Aircraft Corp. factory on Lindbergh Field a huge flying boat waddled down to land-locked San Diego Bay one day last week. In the bright California sun her slim wing looked absurdly frail, her huge hull with its upswept stern grotesquely fat. Nevertheless, her little band of professional observers knew they were watching a plane designed to be the last aerodynamic word of 1939.

With her two 2,000-h.p. Wright Cyclones rumbling, she taxied out to open water, swung into the wind and poised for flight. Spindrift ripping from her slim stern, she was up on the step. Then she was in the air.

From the beach, factory executives in shirt sleeves, mechanics in overalls watched the new 52-passenger ship as she swung out past Point Loma. Among them, none watched more intently than Engineer David Richard Davis, because none had a bigger stake in her than he. For David Davis had designed her slim 110-foot wing, had calculated on the drawing board and in the wind tunnel that it was close to perfection.

What Pilot Bill Wheatley had to say when he landed confirmed Designer Davis' calculations. Consolidated's new 25-ton Model 31 had a high speed of 275 m.p.h. (75 miles faster than Boeing's four-motored *314* clipper), handled nicely in the air. Gasoline consumption showed that she had a range of 10,000 miles with a light passenger load, that she could lug 28 passengers in Pullman accommodations across the Atlantic at a speed unprecedented for commercial flying boats.

Designer Davis' wing, flush-riveted and smooth of contour, had justified his prediction that it would be 20% more efficient than any in the air today. The product of ten years of work, it had been tried in Caltech's aeronautical laboratories and in test rigs of its designer's own devising. Whether he had achieved a smooth flow of air over virtually its entire surface as National Advisory Committee for Aeronautics has done with its new wing curve (TIME, May 15), David Davis modestly declined to say.

With the Davis "perfect wing" as a starter, Consolidated in ten months built its new boat from the ground up without help from Army or Navy. Long before the ship had flown, however, the news of its spectacular 10,000-mile cruising range was out, and the Navy, one of Consolidated's best customers, poked in its nose. At week's end it appeared likely that Model 31's first assignment will be as a patrol bomber for the fleet.

S. D. AIRPLANT SPIES HUNTED

S.D. SUN 5/23/39

G-Men Probe Charges Made By Bridges

The Federal Bureau of Investigation has started an investigation of charges that Nazi spies are active in San Diego's Consolidated Aircraft Corp. and the North American Aviation Co. of Los Angeles, the United Press reported today from San Francisco.

Three Federal agents, it was disclosed, have been making a quiet inquiry of sabotage charges contained in a telegram from Harry Bridges, West Coast CIO director, to President Roosevelt last Jan. 23.

Mr. Bridges was reported to have offered Federal authorities additional alleged material to support charges of sabotage in plants making planes for the Army and Navy. Mr. Bridges has been in Washington this week and was due to return to San Francisco tonight.

SABOTAGE CHARGED

In his telegram to the President Mr. Bridges charged that Nazi spies, in the guise of employes, had entered the San Diego and Los Angeles aircraft companies, and had sabotaged airplanes under construction.

He charged further that government and company officials had declined to make an investigation. Mr. Bridges appealed to the President to place the inquiry in the hands of "some Federal agency, free of employer coercion."

NAVY CRITICIZED

Mr. Bridges also said that "all the Navy has done" about recent crashes of its airplanes "is to hold short inquiries to determine whether investigations are necessary.

The CIO director also declared that "Nazi agents and Bund members" served the two-fold purpose of acting as "labor spies and union disrupters, while deliberately sabotaging planes."

AIRBOAT READY FOR HOP TO N. Y.

Consolidated Plane To Take Off Tuesday

S.D. SUN JUNE 2, 1939

Aviation

With Civil Aeronautics Authority officials completing their inspections, the plane is ready for commercial air service, the Consolidated airboat of American Export Airlines is being groomed today for a transcontinental hop to New York soon, it was announced at the plant today. The ship will be used on three transatlantic survey flights this summer.

The plane is scheduled to make a round-trip "shakedown flight," to Boulder Dam possibly next week, and at daybreak the following morning the craft, with a six-man crew, will take off from the bay for Galveston, Tex., where she will be refuelled before proceeding either non-stop to New York or via Norfolk, Va., according to Capt. P. J. Byrne, commanding officer.

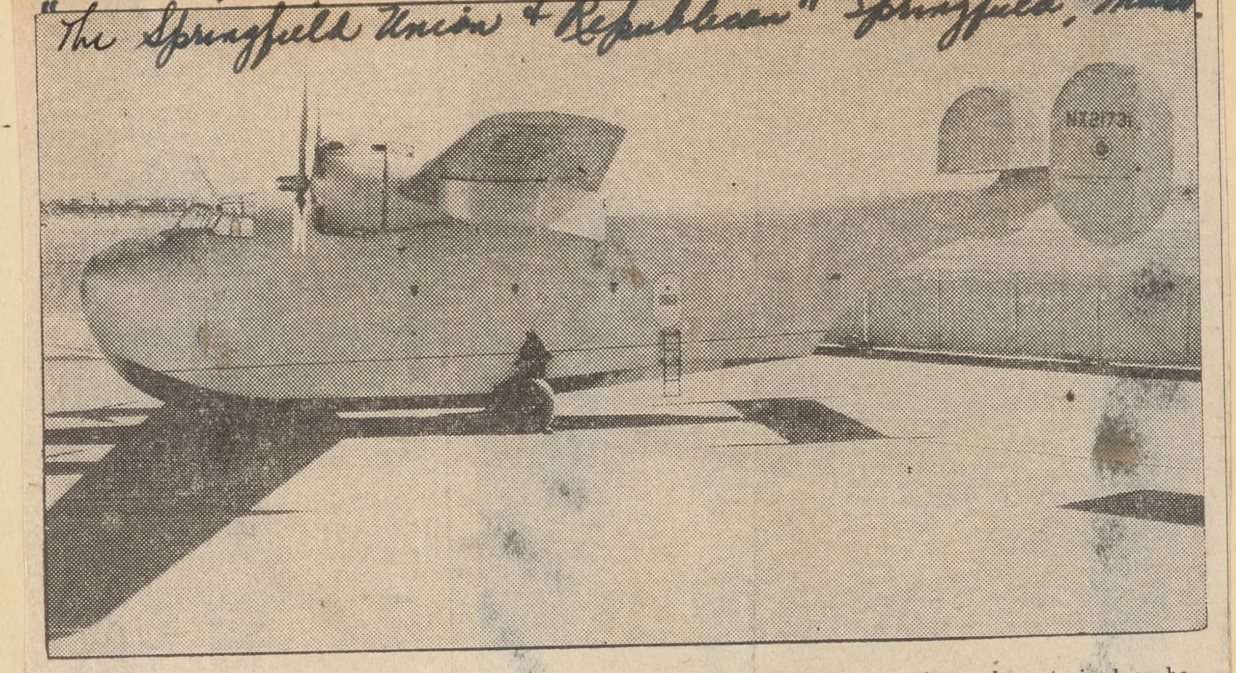
Flight tests which failed to satisfy CAA inspectors have delayed the plane's departure since mid-March.

Included in the crew, in addition to Capt. Byrne, will be T. S. Terrill, first officer; M. J. Doyle and R. V. Carlson, engineering officer, and W. W. Ehmer and E. L. Stuhrman, radio officers.

Consolidated's Latest Bid

May 7, 1939

"The Springfield Union & Republican" Springfield, Mass.



What makes this 25-ton flying boat of special interest is the fact that it has been characterized as being capable of flying nonstop from the West coast to Asia and back as far as Wake island, at a speed of little less than 300 m. p. h. Although the company denies these predictions, information about the plane points to tremendously improved performance over present flying boats.

Take a look at this flying boat which Consolidated Aircraft corporation of San Diego, Cal., first showed to the public Friday. It has been constructed under strictest secrecy and was the subject of a yarn by Jim Bassett, West Coast aviation writer credited with knowing his aviation. Bassett's story predicted the craft could fly nonstop to China, from the California coast, and back as far as Wake island. Not only this, but it would be able to cruise at a speed of between 285 to 300 miles per hour.

While the company officially denied the story in all detail, aviation experts and observers throughout the country declared such performance was impossible, and then, after a second thought, began to wonder just how such potentialities would change the nation's defense picture. Possessors of a number of such flying boats could bomb the East coast, with a start and return in Europe.

"Greatly Exceeds PBY"

The company, in announcing its new craft, fails to indicate performance figures, but contents itself with saying "the model 31 greatly exceeds the PBY in speed, range and load capacity." The PBY had a top speed of 190 m. p. h. at 10,500 feet; a range of 4000 miles, and cargo capacity of slightly more than 4½ tons.

In gross weight, the model 31 is nearly twice as big as the PBY, scores of which are in navy service as patrol bombers. Approximate gross weight of the new craft is 50,000 pounds, as compared to 27,080 pounds for the PBY.

New twin-row 18-cylinder radial engines developed by Wright will develop a maximum of 2000 horsepower apiece for takeoff. This is 500 horsepower more, per engine, than the Wrights installed in the Boeing Clippers. Two engines on the Consolidated job will turn up 66 2-3 per cent the power capacity of the four power plants of the Boeing giant. Hamilton Standard hydromatic propellers 16 feet in diameter are used.

Vital statistics include: Wing span, 110 feet; overall length, 73 feet; hight, 22 feet, and maximum wing chord, 14 feet. The flying boat is built of aluminum-coated aluminum allow skin, internally reinforced with longitudinal stiffeners and transverse bulkheads and frames. Wings, tail surfaces and the planing surface of the hull bottom are flush-riveted.

A new method of handling wing floats has been devised. Whereas the wing tips of the PBY were so constructed as to serve as wing floats, the wing tips of the model 31 are too small, comparatively, to permit retraction at the tip. The wing is full cantilever, with integral fuel tanks in the center section. The outboard floats retract to the under side of the wing panel.

The hull has two full decks, as in the Boeing, with the upper deck for flight control work, with eight additional compartments available for crew, cargo, etc.

Not Guided by Government

Concerning its new craft, Consolidated's spokesman wrote:—

"Unlike previous experimental flying boats which were constructed by the Consolidated Aircraft corporation under government contract, the model 31 is the corporation's private venture. While the navy department was cognizant of the construction, the development has not been financed by the government nor subjected to the ordinary procurement routine which adds materially to the cost and time for construction. Only 10 months were required for the design and construction of the airplane, whereas development of types of similar magnitude has required from two to three years heretofore.

"The flight compartment has been completely soundproofed and furnished with all latest type instruments and equipment. As a commercial airliner, the model 31 has a maximum capacity of 52 passengers for day operations and 28 passengers (sleeper) for night operations. For transatlantic flights, the airplane has accommodations for 28 passengers."

FINAL AIRBOAT TESTS SLATED

CAA Men To Observe Consolidated Plane

S.D. SUN 5/23/39

Aviation

Final tests to satisfy Civil Aeronautics Authority officials as to the airworthiness of the craft will be conducted here this week on the Consolidated airboat "Model 28," a replica of the Navy's PBY bombers to be used by American Export Airlines for several trans-Atlantic survey flights this summer.

Latest in several delays on acceptance of the big seaplane by the CAA, has been occasioned by modifications of fuel-dumping apparatus, required by the government on all commercial flying boats.

LAST DEMONSTRATION

The last mid-air fuel-disposal demonstration was scheduled for this afternoon. If CAA inspectors approve of the operation, the ship will be prepared for a takeoff possibly late this week on a nonstop flight along a mid-continent route to New York.

With trans-Atlantic service already inaugurated by Pan American Airways, American Export Airlines is anxious to finish its survey flights and begin regular passenger and mail schedules in competition.

Meanwhile, the firm, which spent about $200,000 for its plane in San Diego, has filed with the CAA in Washington, D. C., an application for a permanent certificate of convenience and necessity covering routes between New York, or Baltimore and Charleston across the Atlantic via Botwood, Newfoundland, to Foynes, Ireland; Horta, Azores, Biscarosse and Marseilles, France.

AIDED BY SHIPS

Helping the airboat on its survey flights will be a fleet of 18 surface ships of American Export Lines, Inc., the airline's parent concern. From five to eight of these vessels are nominally at sea at all times between New York and Gibraltar and will radio complete weather and direction finding information along the flight routes.

Immediately after the proving flights, the concern proposes to purchase enough airboats to operate two round-trips a week with mail and express. Following this experience, American Export plans to acquire long range craft capable of carrying 40 or more passengers in addition to mail and express next year.

NEW MODEL LURES

Officials of the company have expressed interest in the new Consolidated twin-engined "Model 31," which can fly 10,000 miles non-stop and has a capacity of 52 passengers.

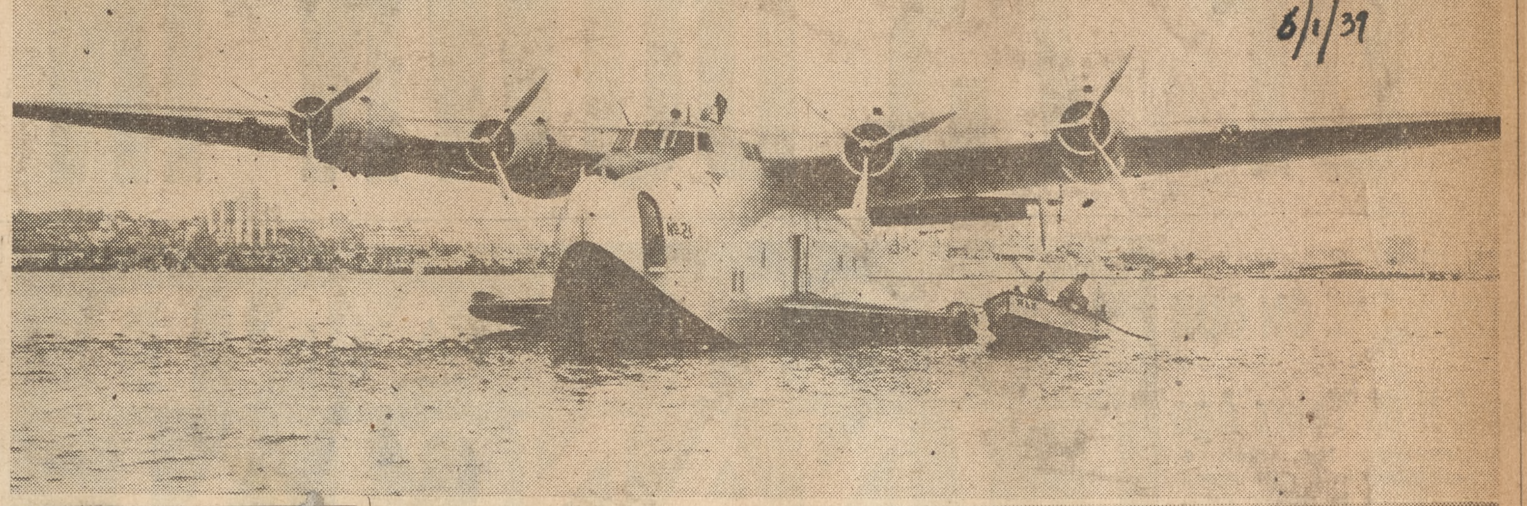
A gloomy financial picture was given by the firm in its application for the trans-Atlantic route certificate. It predicted a gross revenue of $37,500 the first year, increasing to $250,000 the fifth year, as against a net loss, without compensation for mail carriage, of from $2,065,000 the first year to $2,108,000 the third year.

The "Model 28" will be piloted by an experienced six-man flight crew led by Capt. P. J. Byrne.

New Transatlantic Clipper Spends Night on San Diego Bay on Long Hop

~~S.D.TIME~~

S.D.TRIBUNE 6/1/39



The Pan American Airways' huge clipper, which arrived here yesterday from San Francisco, is shown on San Diego bay. The plane, piloted by Capt. R. O. D. Sullivan, took off at 5:30 a.m. today for Baltimore, from where it will be operated with the line's Yankee Clipper in transatlantic service. Lower: Comdr. Andrew Crinkly, U.S.N., pilot of the navy's Consolidated-built XPB2Y-1 four-motored plane, left, welcomes Sullivan.

S.D.SUN ~~NEWS~~

S. D. SAIL PLANERS WIN TOP HONORS

JUNE 5, 1939

Three San Diego sailplane pilots won top honors in the opening day's competition of the second annual southwestern soaring contest at Wichita Falls, Tex., it was reported here today.

John Robinson, who has broken the national altitude record unofficially three times in flights from Clark Dry Lake, Borego Valley, flew his streamlined craft "Robin" 165 miles from Wichita Falls, staying in the air six hours, 15 minutes. Although approximately 50 miles short of his goal, Amarillo, the 24-year-old pilot was awarded a $100 prize for his performance.

On another long-distance attempt, Woodbridge Brown of La Jolla landed six miles from Chillicothe, Tex. Alan Essery, in a two-place sailplane with Lucretia Boxton of Lennox, Cal., as passenger, won the first goal-to-goal flight for craft of that class by landing at Electra, 27 miles from Wichita Falls. The three are planning to continue to Elmira, N. Y., on completion of the Texas meet next Sunday to seek national laurels.

S.D. SUN 5/31/39

S. D. EXECUTIVE NEW CHAMBER DIRECTOR . . . A. J. MacFadden (center), re-elected to presidency of the California State Chamber of Commerce, welcomes Reuben H. Fleet, executive of the Consolidated Aircraft Corporation of San Diego (left), and George G. Hoberg, of Lake county, recently elected Chamber directors.

ARCHBOLD TO START 2200-MILE HOP TODAY

Richard Archbold and the flight crew of the San Diego-built airboat Guba, accompanied by Capt. P. G. Taylor, Australian transoceanic aviator, were scheduled to take off at 11 p. m. (PST) today from Sydney on a non-stop 2200-mile hop to Port Hedland, on the east coast.

ARCHBOLD ON SECOND LEG OF HOP; FLIES NEW ROUTE FROM AUSTRALIA

S.D. UNION 6/5/39

The San Diego-built flying boat Guba, carrying Richard H. Archbold, research director of American Museum of Natural History, took off from Port Hedland, Australia, yesterday on the second leg of a 20,000-mile flight from Sydney to San Diego via Africa, the west Indies and Miami, The Associated Press reported.

Archbold's destination is the island of Cocos, which became a British possession in 1857. From Cocos, the new airway-blazing flight will be to the island of Diego Garcia in the Chagos islands group which also belongs to Britain.

After a brief stop here, the Guba will wing its way to the Seychelles group of islands, thence to Mombassa, Africa. From there the route will be to famed Lake Victoria in mid-Africa, to Dakar on the African west coast, St. Thomas, D.W.I., Miami and home to San Diego.

Archbold left Sydney for Port Hedland Saturday and made the 2000-mile nonstop flight in less than 18 hours.

Lewis A. Yancey, American aviator who flew the Atlantic to Rome in 1929, is naviagtor of the Guba and Russell Rogers is first pilot.

The flight from Sydney to Mombassa over a hitherto uncharted airway of the Indian ocean is sponsored by the Australian government.

The American Museum of Natural History's scientific expeditionary base at Hollandia, Netherlands New Guinea, is to be abandoned this week when two members of the expedition, William Richardson and Dr. Bass, sail for the U. S.

S. D. Soaring Pilots Win Texas Honors

S.D. UNION 6/5/39

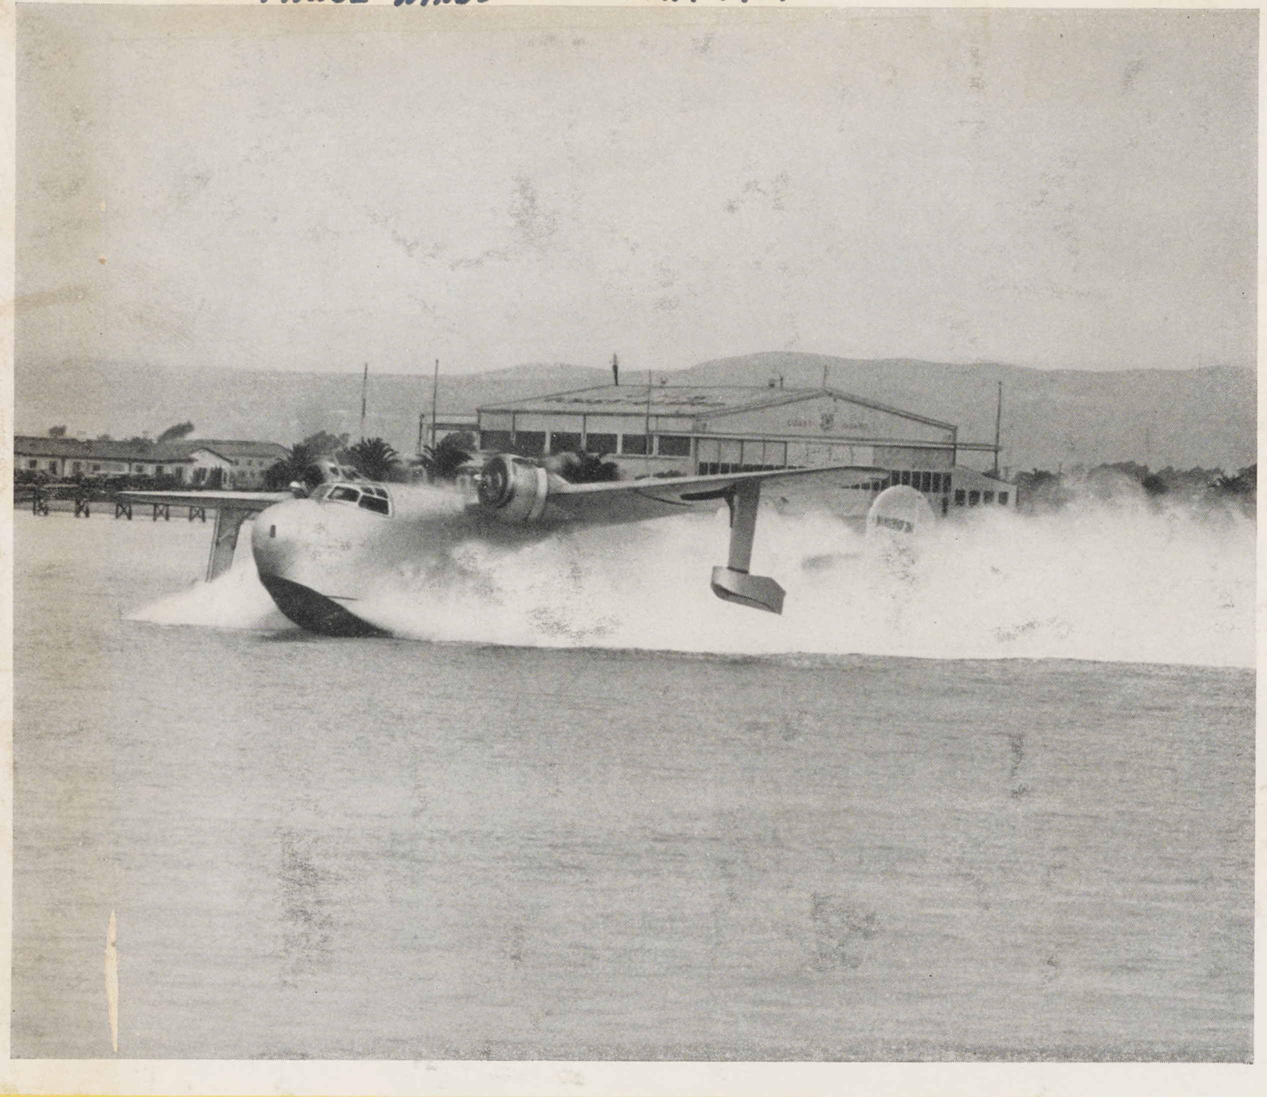
San Diego sailplane pilots scored heavily in the opening day events of the second annual southwest soaring meet at Wichita Falls, Tex., yesterday, The Associated Press reported.

John Robinson took first honors when he remained aloft 6 hours and 15 minutes but he failed in his projected hop from Wichita Falls to Amarillo, 210 miles airline. His actual flight distance was 165 miles. He received a $100 prize.

Woodbridge Brown, La Jolla, landed six miles from Chillicothe after being in the air three hours.

Dick Essery, another San Diego pilot, and Miss Lucretia Buxton, Lennox, Calif., won the first goal flight to Electra, a distance of 27 miles from Wichita Falls.

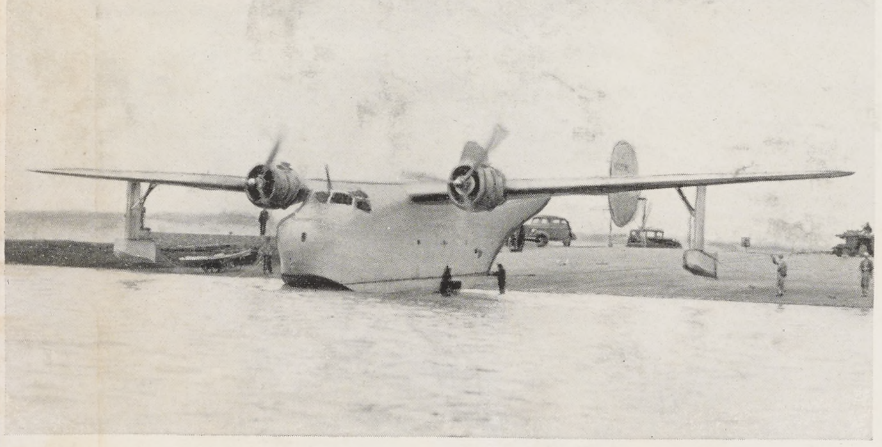
"TRADE WINDS" MAY 1939



"Two Duplex-Cyclones Make a Consolidated Announcement."

New Consolidated 52-Passenger Flying Boat Powered by Two 2000 H. P. Duplex-Cyclones

"TRADE WINDS" MAY 1939



Consolidated Aircraft's new 52-passenger long-range flying boat enters the water for the first time. Powered by two 2000 h.p. Wright Duplex-Cyclones, the most powerful radial, aircooled, aircraft engines in the world, it incorporates many distinctive new features which give it remarkable performance. Among these is the so-called "perfect wing," a flush-riveted structure with improved aerodynamic qualities.

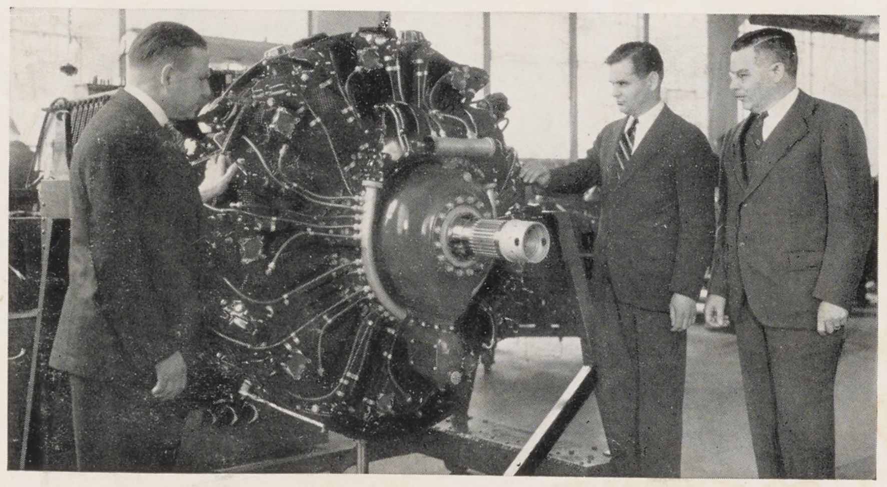
FROM the waters of San Diego Bay, one day early this month, there rose on its maiden test flight a gigantic flying boat pulled aloft by the tremendous power developed by 36 Wright Cyclone cylinders. The 4,000 h.p. which virtually catapulted the latest development of the Consolidated Aircraft Corporation into the air, however, was not the output of four 1000 h.p. Cyclones but the power developed by the largest pair of radial air-cooled aircraft engines which ever have lifted an airplane off the ground or the water — two Wright Duplex-Cyclones — 18 cylinder, double-row engines each rated at 2,000 h.p.

Duplex-Cyclone

Close upon the heels of the announcement of the successful test flight of the new Consolidated commercial boat designed to carry 52 passengers and a crew of five over long distances, came an official dispatch from Washington that the Duplex-Cyclone with which the ship is powered was the development of the Wright Aeronautical Corporation and the Army Air Corps engineers. Assistant Secretary of War Louis Johnson, who made the War Department announcement, characterized the new engine as the most powerful aircraft engine of its type in the world, stating further that "it is 500 h.p. more powerful than the 1500 h.p. Wright Double-Row Cyclone 14 which has the highest power rating ever accorded an American-built air-cooled radial engine by the Civil Aeronautics Authority."

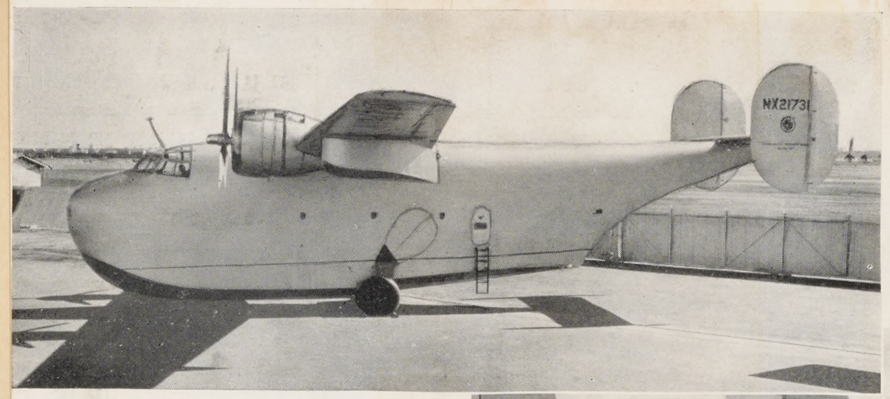
18-Cylinders

The name Duplex-Cyclone, selected by the Wright company for the new power plant, is particularly apt. The 2000 h.p. engine is, as its name implies, two nine cylinder Cyclones built on one crankshaft. The two rows of cylinders are staggered in construction as is customary in double-row radial engine design, i.e., the cylinders in the rear row are arranged on the crankcase to fill in the gaps between the cylinders of the front row, providing an adequate flow of cooling air over cylinders of both front and rear banks.



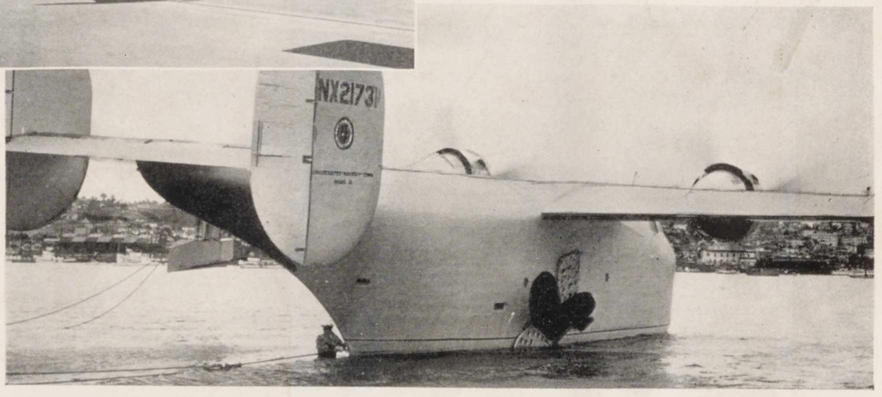
Officials of the Wright Aeronautical Corporation examine a 2000 h.p. Duplex-Cyclone which is now on exhibition at the New York World's Fair by the U. S. Army. Shown left to right are George Chapline, vice-president of sales; P. B. Taylor, chief engineer; and M. B. Gordon, vice-president and general manager. Other views of the engine on a pedestal-type stand are shown on the following page.

TRADE WINDS MAY 1939



A new type of retractable beaching gear is featured in the Consolidated Model 31 flying boat. When retracted the gear is fully enclosed in the bottom and sides of the hull. The gear may also be removed if desired.

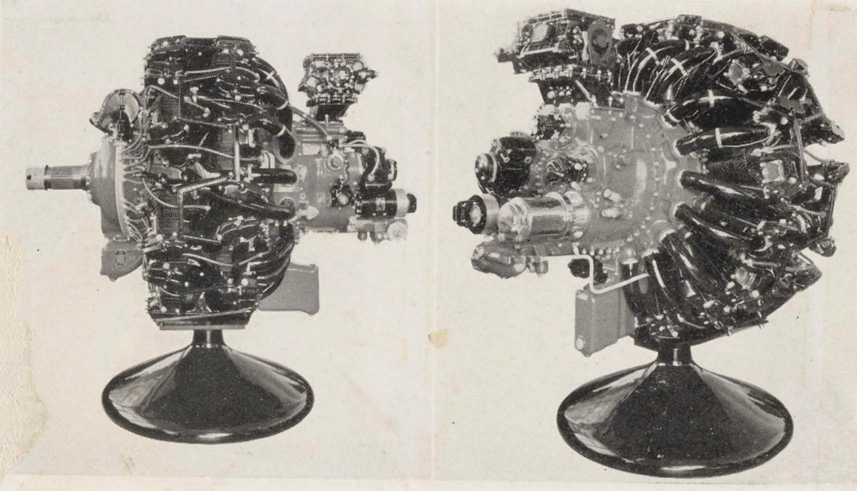
Operation of the retractable beaching gear is demonstrated as the ship enters the water. Wheels fold into compartments in the side and are closed in by doors.



As new as the 2000 h.p. Duplex-Cyclones with which it is powered is the Consolidated flying boat. The latest commercial product of an aircraft manufacturer who has designed and built some of the world's finest naval and commercial flying boats, the huge new craft was designed and completely constructed in the comparatively short space of 10 months. Development of types of similar size, the manufacturer pointed out, usually required two to three years.

Weighs 25 Tons

With a gross weight of approximately 50,000 pounds (25 tons), the new long range Consolidated ship, designated the Model 31, will have a maximum capacity of 52 passengers for day operations and 28 passengers as a sleeper for night flight. If used for trans-Atlantic operations, it will accomodate 28 passengers in spacious, comfortable quarters. The 22 foot high by 73 foot long fuselage contains two full decks, one above the other, providing a large flight control cabin and eight large passenger compartments.



Side and three-quarter rear views of the 2000 h.p. Wright Duplex-Cyclone which is being exhibited by the U. S. Army Air Corps at the New York World's Fair. This engine develops 500 horsepower more than the Double Row Cyclone 14 which has the highest power rating ever accorded an air cooled radial engine by the Civil Aeronautics Authority.

The monoplane wing which mounts the two 2000 h.p. Duplex-Cyclones of the Model 31 has a span of 110 feet and a maximum chord of 14 feet. The wing is of full cantilever construction with fuel tanks built integral with the center section, following standard Consolidated practice. Hydraulically operated Fowler flaps extend from the inboard side of the ailerons to the hull.

Retractable Floats

The outboard floats, also a Consolidated development which eliminate the necessity of sponsons or stub wings attached to the hull near the water line for stability, retract to the underside of the outer wing panel instead of to the tip of the wing as in the famous Consolidated PBY series of flying boats. Ailerons and flaps are fabric covered. Tail surfaces consist of a full cantilever stabilizer with twin fins and rudders. Rudders and elevators are fabric covered.

The fuselage or hull is constructed of aluminum coated aluminum alloy skin internally reinforced with longitudinal stiff[illegible] and transverse bulkheads and frames. The wings, tail surfaces and planing surface of the hull bottom are flush-riveted.

Beaching Gear

A unique feature of the Consolidated Model 31 is its hydraulically operated retractable tricycle beaching gear. Standard practice on flying boats is merely to provide fittings for the attachment of equipment of this type. On the Model 31 a nose wheel, housed in a well in the bottom of the hull, and twin main wheels, which swing upward into the sides of the hull, are provided. The side wheels are removable as well as retractable. All three wheels are completely enclosed within the hull by doors leaving no projections from the hull to interfere with maximum efficiency in flight.

CONSOLIDATED.

THE CONSOLIDATED AIRCRAFT CORPORATION.

HEAD OFFICE AND WORKS: LINDBERGH FIELD, SAN DIEGO, CAL.
Incorporated: May, 1923.
President and General Manager: R. H. Fleet.
Vice-President and Chief Engineer: I. M. Laddon.
Vice-President [illegible] Factory Manager: C. A. Van Dusen.
Secretary: [illegible]anberry.
Treasurer: W. M. Shanahan.

During 1937-38 the Consolidated Aircraft Corporation continued the engineering and research work which it has carried on in recent years in high-performance military aeroplanes. Orders for the PBY-1, PBY-2 and PBY-3 were completed and the completion of orders for the PBY-4 was expected early in 1939, making an aggregate production of 250 PBY boats for the U.S. Navy alone.

In addition to normal production the Company built the PB2Y-1 four-engined patrol flying-boat for the U.S. Navy. Full tests of this flying-boat were expected to be completed at the end of 1938.

THE CONSOLIDATED PBY SERIES.

TYPE.—Twin-engined all-metal long-range patrol-bombing flying-boat.

WINGS.—Semi-cantilever high-wing monoplane. Wing in three sections, the centre-section supported above the hull by a streamline superstructure and braced by two pairs of parallel streamline struts to the sides of the hull. Wing structure is of the beam bulkhead and stressed-skin type, the skin being reinforced with "Z" section extruded stiffeners. The trailing-edge section consists of aluminium alloy ribs cantilevered from the main beam and covered with fabric. Aluminium-alloy-framed balanced ailerons covered with fabric. An adjustable camber device is installed on the upper surface of the ailerons.

HULL.—Two-step semi-circular topped hull, of all-metal construction. Aluminium-alloy bulkheads, framing stringers and skin. All-metal retractable wing-tip floats. When the floats are retracted they form tips to the wings and the float struts and bracing structure are recessed flush with the lower surface of the wings. Electrical and mechanically-operated retracting mechanism. Automatic locks and warning lights.

TAIL UNIT.—Monoplane cantilever type. Lower fin built integral with the hull. Tail-plane and upper section of fin covered with smooth metal sheet reinforced with extruded sections. Elevators and rudder are aluminium-alloy structures with fabric covering. Trimming-tabs in elevators and rudder.

POWER PLANT.—Two 1,000 h.p. Pratt & Whitney "Twin-Wasp" R-1830-S3C3G or Wright "Cyclone" GR-1820-G103A radial air-cooled engines on welded steel-tube mountings in the leading-edge of the centre-section. N.A.C.A. cowlings. Hamilton-Standard constant-speed airscrews. Fuel tanks (1,750 U.S. gallons) are integral with the structure of the centre-section.

ACCOMMODATION.—Bow compartment for mooring gear, etc. Enclosed pilot's compartment seating two side-by-side with dual controls. Engineer's station in hull below centre-section. Details of military equipment not available.

The Consolidated PBY Patrol Flying-boat (two 1,000 h.p. Pratt & Whitney "Twin-Wasp" engines).

ARCHBOLD SAFE IN EAST INDIES

Scientist-Aviator Lost Six Hours

S.D. SUN JUNE 5, 1939

Aviation

Lost for six hours on a 1350-mile flight from Port Hedland, western Australia, to Cocos Island in the Indian ocean, Richard Archbold, millionaire scientist-aviator, and six-man crew in the Consolidated airboat Guba landed at Batavia, Netherlnds East Indies, today as a search was being organized for them, the United Press reported.

The plane had taken off from Port Hedland at 12:30 a. m. Sunday, San Diego time (6:30 p. m. Sunday, Australia time), only six and a half hours after completing a 20-hour flight from Sydney 2200 miles non-stop across the Australian continent.

BEARINGS LOST

Six hours overdue at Cocos Islands, Mr. Archbold radioed that he had lost his bearings and was flying back to Batavia, with his fuel running out. He had circled the ocean, he reported, apparently only about 100 miles from Cocos Island, but was unable to contact a ship which could give him radio cross bearings.

As the hours passed, anxiety increased and Prime Minister R. G. Menzies of Australia wirelessed the British representative in Batavia to start a search for the airboat.

UNPRECEDENTED HOP

Mr. Archbold was on the first leg of an unprecedented survey flight to Africa for the Australian government, over a route never before attempted by plane. In the crew of his San Diego-built plane were Lewis Yancey, navigator; Russell Rogers, co-pilot; Gerald Brown, flight engineer; Raymond Booth, radio operator; Stephen Barrinka, assistant engineer; and Capt. P. G. Taylor, noted transoceanic navigator representing the Australian government.

The Guba is expected back in San Diego about July 1.

S.D. SUN 6/8/39

Guba Reaches Famed Cocos

Archbold To Return To S. D. July 1

A second attempt to reach Cocos Island in the Indian Ocean had been successful today for the Consolidated airboat Guba, commanded by Richard Archbold, millionaire research associate of the American Museum of Natural History.

The San Diego-built plane flew from Batavia, Netherlands East Indies, where it had landed early this week after the crew lost its bearings on a flight from Port Hedland, on the west coast of Australia, to Cocos Island. Total distance of the journey from Batavia—first lap in a survey jaunt across the Indian Ocean to Africa for the Australian government—was approximately 1000 miles. About three days will be spent in Cocos Island, which gained international attention during the World War, when the notorious German raider Emden was wrecked on its shores after a battle with an Australian battleship.

Two more island stops—at Diego Garcia and Mahe—are scheduled in the Indian Ocean before the Guba lands at Mombasa, Kenya Colony, Africa. From there the local plane, which was used to transport material and personnel in a Netherlands New Guinea expedition during the past year, will continue across Africa and the Atlantic to San Diego, arriving here about July 1.

Consair Plane Hops East for Atlantic Test

S.D. UNION 6/8/39

San Diego's entry in the race for commercial air supremacy over the Atlantic ocean, the Consolidated model 28-4, a development of the famous PBY navy plane, left yesterday morning at 4:35 for France, via Galveston and New York.

The plane landed at Galveston at 3 p.m. San Diego time yesterday afternoon, The Associated Press reported, and is to start this morning on the next leg of its flight.

Consolidated officials reported the craft has been purchased by American Export lines to survey an Atlantic route which the line expects to develop in competition with Pan-American, now operating an Atlantic service with clipper planes.

After servicing and checking in New York the plane is to begin its transatlantic flight about June 21, according to reports received here.

Aboard the big ship when it roared off the bay a few minutes before sunrise were Capt. P. J. Bryne, T. S. Terrill, first officer; W. W. Ehmer, radio officer; Michael J. Doyle, engineering officer; R. V. Carlson, assistant engineering officer, and George Newman, Consolidated test pilot. All the others are Export line airmen.

The ship has a wingspread of 104 feet and is 67 feet over-all. The gross weight is 30,500 pounds and it is powered with two 1200-horsepower twin row engines swinging 12-foot propellers. Its number is NC-18997.

FIVE GLIDERS IN AIR FOR RECORD TRIES; THREE FROM S. D.

WICHITA FALLS, Tex., June 8 (A.P.)—Tulsa this afternoon was the goal of four southwestern soaring meet pilots carried northward on a strong tail wind while a two-seater transport plane headed for Oklahoma City.

The five ships left municipal airport between 11:40 a.m. and 12:15 p.m.

Woody Brown, of San Diego, who set a new American distance record Tuesday with his flight to Wichita, Kan.; John Robinson, of San Diego, No. 2 man of the meet; Harvey Stephens, Los Angeles movie actor, and Delbert Booth, of Lafayette, Ind., soared aloft for Tulsa.

Dick Essery, of San Diego, was piloting the transport with Jack Begley, of Wichita Falls, as navigator. S.D. TRIBUNE 6/9/39

New York Next Goal Of Consair Plane

S.D. TRIBUNE 6/8/39

A Consolidated-built plane, recently purchased by American Export lines to survey an Atlantic air route, was expected to arrive at New York today after a one-stop flight from San Diego which began yesterday. The plane was at Galveston, Tex., last night, and took off from there for New York at 3:18 a.m. (PST). The plane is expected to start its Atlantic survey work June 21.

Another Consolidated-built plane, the Guba, $250,000 flying boat owned by Richard Archbold, research associate for the American Museum of Natural History, is at Cocos island, in the Indian ocean, on a survey flight across that ocean for the Australian government. Archbold is expected to depart Saturday for Diego Garcia, in the Chagos islands group, where, after a stay of a few days, he will proceed to the Seychelles islands, and then to Kenya colony, from where he plans to span Africa and the Atlantic, bound for San Diego. Archbald left here a year ago this month in the Guba for New Guinea to carry on a scientific expedition for the museum.

ARCHBOLD LANDS AT COCOS; AFRICAN EAST COAST NEXT.

S.D. UNION 6/8/39

San Diegans following the progress of Richard Archbold's flying boat Guba on its westward flight to San Diego from the far east are finding the job of converting antipodes time to local time rather confusing.

F. A. Learman of Consolidated Aircraft, where the Guba was built, got a message yesterday that the ship had arrived at Cocos island at 4 p. m. Australian time Tuesday.

But it seems that Australian Tuesdays are San Diego Wednesdays, so the ship didn't land at Cocos until Wednesday morning around 2 o'clock, as nearly as Learman could figure.

The Cocos island mentioned is not the famous one of that name off South America, but lies about 1500 miles from Australia and 800 west of Java. The Guba, which flew from San Diego to the far east is going on around the world.

Archbold expected to stay three days on Cocos before leaving for Mombassa, British East Africa, he notified Barney Boyd, local radio amateur.

S. D. 'SOARERS' SMASH MARKS

S.D. SUN 6/9/39

'Big Three' Pilots In Wichita Falls Meet

Sailplane

San Diego's "big three" of soaring—Woody Brown, John Robinson and Dick Essery—continued to smash national records in phenomenal sailplane performances at the southwestern gliding meet in Wichita Falls, Tex.

Mr. Essery, with Jack Begley of Wichta Falls as passenger, flew to Oklahoma City yesterday, 109 miles, to crack the distance record for two-place sailplanes.

ALMOST DOUBLED

This almost doubled his own previous mark, set Tuesday, when he flew with a passenger from Wichita Falls to Lawton, Okla., 64 miles.

Woody Brown piloted his motorless craft to Shawnee, 80 miles short of his predetermined goal, Tulsa, completing a 155-mile flight in four hours, 17 minutes. Last Tuesday he set a national distance record of 280 miles and national altitude mark of 7600 feet on a flight from Wichita Falls to Wichita, Kan.

182 MILES

John Robinson, unofficial holder of the U. S. record at 11,000 feet, maneuvered his sailplane 182 miles to five miles north of Bristow, Okla., yesterday.

The San Diegans have monopolized all honors at Wichita Falls, and will depart at conclusion of the meet Sunday for Elmira, N. Y., to compete for the national soaring championship.

S.D. UNION 6/14/39

Archbold Spans Sea Stretch in Latest Hop

Richard Archbold, flying his $250,000 Consolidated flying boat Guba on a 1717-mile flight from Cocos Island, was believed to have landed yesterday at the Diego Garcia islands about 1000 miles south of Ceylon.

Word of the take-off from Cocos island at 5 a. m. (P.S.T.) yesterday was received here by Barney Boyd, radio amateur. No further word of the plane's progress was received. Radio contact with the ship has been irregular, however, Boyd reported, and he expected to receive word of the Guba's safe arrival at the Diego Garcia isles early today.

ARCHBOLD WORKS ON 1800-MILE HOP

S.D. SUN 6/9/39

HONOLULU, T. H.—As casually as he might face a trip across the street, Richard Archbold, young Standard Oil heir, tinkered with his $250,000 plane on remote Cocos Island today, preparing for an 1800-mile hop across open water to Diego Garcia Island, a tiny spot in the Chagos archipelago, lying almost due south of India's tip.

Archbold and his six companions flew to Cocos Island Wednesday from Batavia, in the Dutch East Indies, by way of Christmas Island, according to belated word received by Amateur Radio Operator Harold Smith. As is his custom, he did not announce his departure and made no attempt to keep in touch with radio operators during his flight.

HAROLD RAMM GLAD TO BE BACK IN S. D.

S.D. SUN 6/13/39

Glad to be home after 14 months in the Netherlands New Guinea wilderness, Harold Ramm, radioman of the American Museum of Natural History Expedition led by Richard Archbold, was enjoying well-earned rest here today, while awaiting orrders from his "boss," which may carry him to another strange destination.

Mr. Ramm returned from Hollandia, New Guinea, being met at the dock in Wilmington by his wife, who has not seen him since he left their former residence in Denver Febuary, 1938.

He was with the first group of scientists to arrive in New Guinea, and established the powerful short-wave station PK6XX, which kept in direct contact with San Diego, 7500 miles away, as well as the interior auxiliary stations in the New Guinea jungles. First of the expedition to return from the tropics, Mr. Ramm will rest in San Diego until arrival of the Archbold airboat, Guba—now flying the Indian Ocean—about July 1.

The Consolidated PBY Patrol Flying-boat. This view shows the beaching chassis and the lowered wing-tip floats.

DIMENSIONS.—Span 104 ft. (31.72 m.), Length 65 ft. 1 in. (19.83 m.), Height 18 ft. 6 in. (5.64 m.).

WEIGHTS AND LOADINGS (Pratt & Whitney "Twin-Wasp" engines).—Weight empty 14,240 lbs. (6,465 kg.), Weight loaded 27,080 lbs. (12,295 kg.), Wing loading 19.13 lbs./sq. ft. (93.35 kg./sq. m.), Power loading 13.4 lbs./h.p. (6.08 kg./h.p.).

WEIGHTS AND LOADINGS (Wright "Cyclone" engines).—Weight empty 14,538 lbs. (6,600 kg.), Weight loaded 27,080 lbs. (12,295 kg.), Wing loading 19.35 lbs./sq. ft. (94.42 kg./sq. m.), Power loading 12.31 lbs./h.p. (5.58 kg./h.p.).

PERFORMANCE (Pratt & Whitney "Twin-Wasp" engines).—Maximum speed at 10,500 ft. (3,200 m.) 190 m.p.h. (304 km.h.), Stalling speed at sea level 61.5 m.p.h. (98.4 km.h.), Climb to 5,000 ft. (1,525 m.) 4.5 mins., Climb to 15,000 ft. (4,575 m.) 15 mins., Service ceiling 25,200 ft. (7,686 m.), Maximum range (1,750 U.S. gallons of fuel) at critical altitude 4,000 miles (6,400 km.).

PERFORMANCE (Wright "Cyclone" engines).—Maximum speed at 14,300 ft. (4,360 m.) 206 m.p.h. (330 km.h.), Stalling speed at sea level 61.9 m.p.h. (99 km.h.), Climb to 5,000 ft. (1,525 m.) 4 mins., Climb to 15,000 ft. (4,575 m.) 12.9 mins., Service ceiling 29,700 ft. (9,060 m.), Maximum range (1,750 U.S. gallons of fuel) at critical altitude 4,000 miles (6,400 km.).

THE CONSOLIDATED XPB2Y-1.

TYPE.—Four-engined Patrol flying-boat.

WINGS.—High-wing cantilever monoplane. Wings mounted direct to top of hull and taper in chord and thickness, with a swept-back leading-edge and a straight trailing-edge. All-metal structure with stressed aluminium-alloy skin. Entire trailing-edge hinged, the outer portions acting as ailerons and inner portions between ailerons and hull as flaps. Ailerons and flaps have metal frames with fabric covering. Stabilising floats retract and form wing-tips when the boat is in the air.

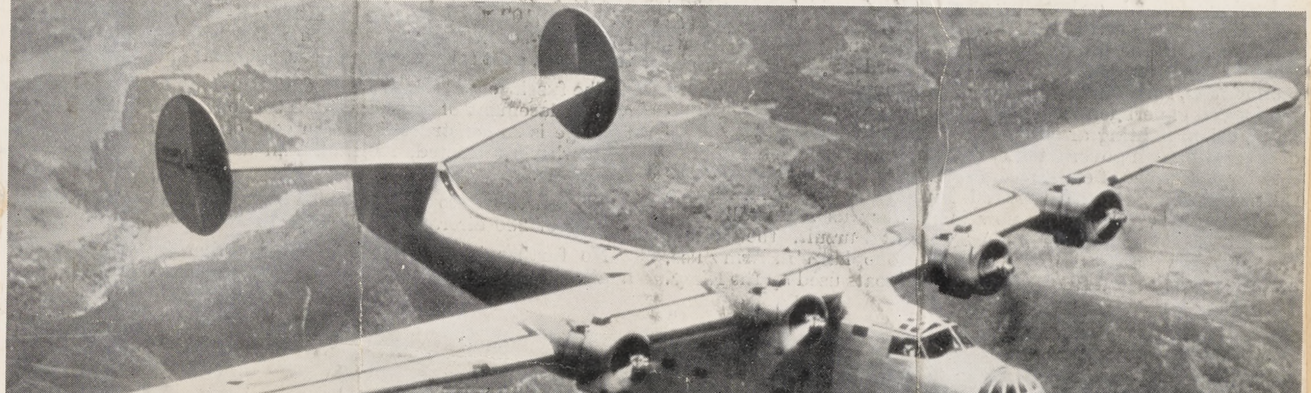
HULL.—Two-step semi-circular topped hull of all-metal construction. The after step terminates in a vertical knife-edge. Hull treated inside and out with anti-corrosion finishes, the exterior finish being an aluminium-pigmented paint. Stabilising floats retract to form wing-tips, the supporting struts being recessed flush with the underside of the wings.

TAIL UNIT.—Cantilever monoplane type with twin fins and rudders. All-metal structure with fabric-covered elevators and rudders. Statically and aerodynamically-balanced movable surfaces, which are also fitted with trimming-tabs.

POWER PLANT.—Four 1,050 h.p. Pratt & Whitney "Twin-Wasp" radial air-cooled engines in line along the leading-edge of the wings. N.A.C.A. cowlings. Three-bladed Hamilton-Standard airscrews.

ACCOMMODATION.—Details of internal arrangement unknown. Pilot's compartment in front of leading-edge of wings, gunner's turrets in nose and stern and navigation turret amidships over trailing-edge of wing. For sustained cruises the hull is provided with commodious sleeping and living quarters, galley with electric range and refrigerator, workshop, independent electric generating system to supply A.C. current throughout the boat, complete inter-position telephone system, etc. Equipment includes beaching-gear, lifting slings for engines, etc. Fully soundproofed and provided with heating and ventilating systems.

DIMENSIONS, WEIGHTS AND PERFORMANCE.—No data available.



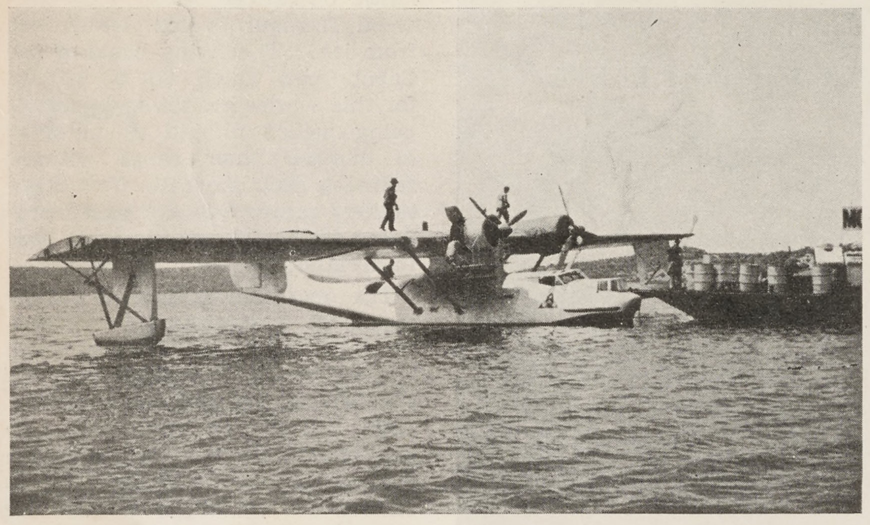
The Consolidated XPB2Y-1 Patrol Flying-boat (four 1,050 h.p. Pratt & Whitney "Twin-Wasp" engines).

"The Air-Log" (Australia) May, 1939

Indian Ocean Survey Flight

Most Important Project.

Of supreme importance to Australia is the survey flight, which is planned to commence about the middle of next month, from West Australia to Africa.



Richard Archbold's Consolidated PBY-2 Flying-Boat, "Guba," which will carry the trans-Indian Ocean survey party from West Australia to Africa, via the Cocos Islands, Chagos Islands and Seychelles Islands, in June. It is seen refuelling in Rose Bay, Sydney. *("Air-Log" photo.)*

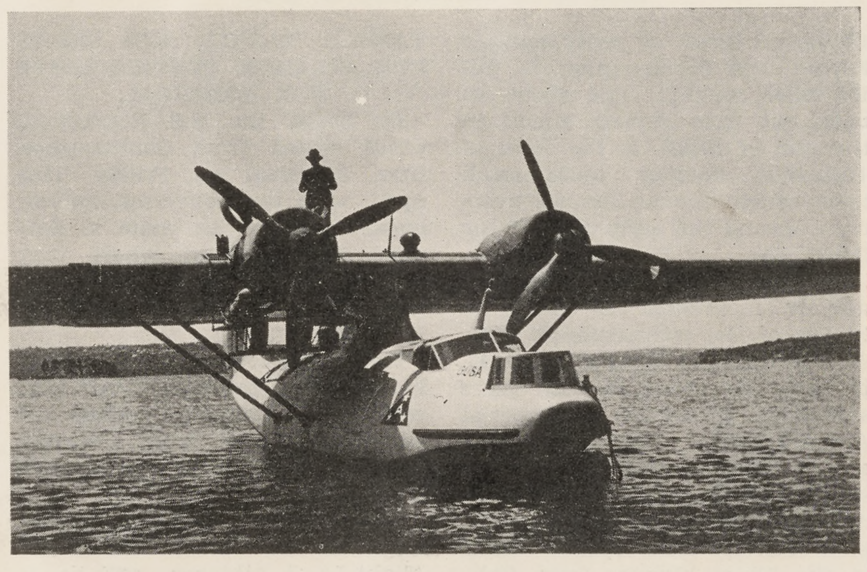
Variously referred to as "The Reserve Route" and in other fashions, it might well become, under exigencies of circumstance, the ONLY aerial route open between England and Australia for link communication by aircraft, so it should be regarded as a much more important piece of work than the "Reserve" title suggests. Though it is not the only possible All-Red aerial route (we could travel via Canada) seasonal severity in the North Atlantic make that crossing a definitely inferior one from the ease-of-operations point of view to that which could link England with Australia via the west coast of Africa—trans-Africa—trans-Indian Ocean route.

By arrangement with the Commonwealth Government, the well-known American millionaire, Mr. Richard Archbold, research associate of the American Museum of National History, has made his Consolidated PBY-2 flying-boat,

Australia's Vital Interest

"Guba," available for the survey.

This very fine product of aircraftsmanship received its name from a type of tropical storm common to New Guinea, where Mr. Archbold's first expedition, about three years ago, lost the Fairchild Amphibian with which they were preparing to make exploratory excursions as the result of one of these tropical willy-willies turning up at an inappropriate moment.



Close-up of the "Guba". Note engineers sitting in frame seats working on starboard engine. Everything on the "Guba" "breathes" comfort. *("Air-Log" photo)*

Ordinarily, the Consolidated PBY-2 is a twin-engined 14-place flying boat, with a wing span of 104 feet, length of 67 feet 1 inch, gross weight of 27,000 lbs., and a maximum payload of 9,250 lbs. Its engines are twin-row Pratt and Whitney radials of 900 h.p. each, and it has a cruising range of 4,000 miles and a cruising speed of 170 m.p.h. The "Guba" is, indeed, a most luxurious craft.

On the projected flight the personnel will be:—

Mr. Richard Archbold, owner of the "Guba," reputedly one of the wealthiest of citizens of the U.S.A.;

Captain P. G. Taylor, who will be in charge of the survey. Mr. Taylor holds one of the only two first-class aircraft navigators' licences in force in Australia;

Captain Lewis A. Yancey, navigator to the Archbold Expedition and also on this flight;

Mr. R. Rogers, Chief Pilot;

Mr. R. Boothe[illegible] Radio Operator;

Mr. G. Brown, Chief Engineer;

Mr. S. Berrinka, Second Engineer; and a

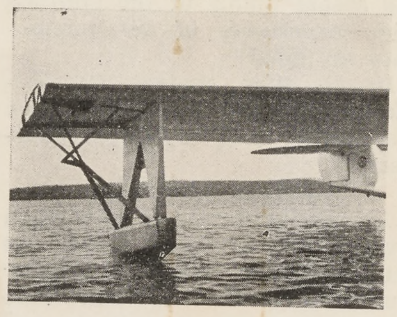
Mr. J. Percival, in charge of mail.

The route to be flown will be from the West Australian coast (probable point of departure, Port Hedland) to Cocos Islands, about 1,230 nautical miles (1,416 statute miles); Cocos Island to Diego Garcia, Chagos Islands, 1,472 nau-

(Continued on next page.)

tical miles (1,680 statute miles); Chagos Island to Seychelles Is., 1,022 nautical miles (1,184 statute miles), and Seychelles Is. to Mombasa (Kenya) 950 nautical miles (1,083 statute miles)—a total of 4,674 nautical (or 5,363 statute) miles. (The nautical mile in British usage is 6,080 feet).

A special Air-mail stamp with a face value of 5/- is to be printed.



The unusual and efficient wing-tip float of a Consolidated PBY-2 Flying-Boat. It folds into and forms the wing-tip in flight.

~~S.D. UNION~~ S.D. TRIBUNE 6/14/39

Archbold at Chagos After 1700-Mile Hop

Completing a 1700-mile leg of his survey flight for the Australian government, from Hollandia, New Guinea, Richard Archbold, scientist-explorer, today was believed to have landed at Diego Garcia island, in the Chagos group, 1000 miles south of Ceylon in the Indian ocean.

Archbold took off from Cocos island, where he had stopped several days, yesterday at 2 a.m. (Pacific time).

Barney Boyd, local radio amateur, contacted a Sydney, Australia, radio station at 9:30 p.m. (Pacific time) yesterday which relayed the information that the big Consolidated plane was 160 miles from its destination. The plane was reportedly performing smoothly and was in constant radio touch with the steamer City of Manchester.

Boyd was unable to contact the Guba direct but said today he would attempt to establish communication with Archbold again tonight.

CONSOLIDATED EXPANSION DUE

Sulphur Refinery May Be Built In S. D.

S.D. SUN 6/8/39

Large-scale industrial expansion in San Diego, involving possible enlargement of the Consolidated Aircraft Corp. plant, and establishment of a new sulphur refinery here, was studied by the Harbor Commission today.

The aircraft concern has applied for additional space on Lindbergh Field to enable it to expand the entire 2200-feet length of its present property and 200 feet west into the municipal airport, it was disclosed.

The extra space, which would add approximately 66 per cent to the land now occupied by the plant (2200 feet by 300 feet), is required in anticipation of airplane orders that may overtax the present productive capacity.

REFINERY INDICATED

At the same time, it was revealed that negotiations are under way to build a sulphur refinery either in Calexico or San Diego, with a payroll of 200 to 300 persons and a productive capacity of 25,000 tons per month. To be known as the Gulf-California Co. and backed by the American Smelter and Refinery Co., the concern has sought information from the Harbor Commission on the cost of purchasing or leasing tidelands in San Diego. Further plans include construction of a dock and dredging to sufficient channel depth to accommodate large ocean-going vessels.

Port Director Joe Brennan pointed out that, regardless of where the plant eventually is located, San Diego will benefit by export of the refined sulphur through the port. The raw supply would originate at a veritable "mountain of sulphur" situated 20 miles below Mexicali, whose ownership is shared by certain San Diegans.

BIG MARKET EXISTS

Officials who have contacted the Harbor Department declared that Australian interests are willing to contract for the export of 10,000 tons of sulphur per month for 10 years. A large market also exists in the auto tire industry in and around Los Angeles, it was said. Mr. Brennan commented that the best location for such a plant probably would be in the Chula Vista-National City south bay area.

The Consolidated expansion would require approval, not only of the Harbor Commission, but of the Civil Aeronautics Authority, due to a necessary realignment of Lindbergh Field's north-south runway. Arthur Ayres, regional airport engineer for the CAA, notified the Harbor Commission today that he would attempt to visit here late this month to consider the plan.

Consolidated Aircraft Corporation is still testing the **American Export Corporation's** twin engined flying boat which was due for delivery a couple of months ago. A group of Australian Royal Air Force officers have been inspecting the boat with the possibility in mind of placing an order for ten of them. Western Flying 6/39

LOCAL PILOT MAKES DISTANCE FLIGHT

DICK ESSERY S.D. UNION

. . . with record-smashing sailplane.

6/9/39

S. D. Flier Breaks Sailplane Mark

Takes Passenger On 109-Mile Hop

OKLAHOMA CITY, June 8 (AP.)—Dick Essery of San Diego landed his sailplane late today on a vacant tract southwest of the Oklahoma capitol and claimed a new record for motorless distance flight with a passenger.

Excited state employes telephoned the capitol press room "a big red airplane has crashed." But the few persons who saw the plane touch ground marvelled at the skill with which the glider was wafted down.

Essery took off at 1 p.m. from Wichita Falls, Tex., where the Southwest Soaring meet is in progress. He landed here at 4:20 p.m. and nonchalantly climbed out with his passenger, Jack Begley of Wichita Falls.

The distance from Wichita Falls to the municipal airport here is 109 miles, but Essery figured he had covered between 126 and 127 miles in his flight.

SECOND RECORD IN WEEK

The record was the second passenger-carrying distance mark Essery has broken this week. Tuesday he flew a passenger from Wichita Falls, to a point north of Lawton, Okla., 64 miles.

Begley said the sailplane reached a maximum altitude of 6200 feet. The glider will be dismantled and taken back on a trailer.

Woody Brown, of La Jolla, another entrant in the soaring meet, came down at Shawnee today, about

(Continued on Page 3, Col. 4)

80 miles short of his announced destination, Tulsa.

Brown was one of four glider pilots who left Wichita Falls on an "objective" flight to Tulsa this afternoon. He ended his 155-mile trip at 4:17 p.m., 4 hours and 17 minutes after his departure.

John Robinson, San Diego sailplane pilot, landed five miles north of Bristow, Okla., late today after riding the wind approximately 182 miles from Wichita Falls.

Actor Crashes Ship

PAWNEE, Okla., June 8 (A.P.)—Harvey Stephens, Los Angeles film star, wrecked his sailplane but escaped injury in landing near here at 4:45 p.m. today in an attempt to glide from Wichita Falls, Tex., to Tulsa.

Wrecking of the glider probably will prevent his competing in an Elmira, N. Y., contest, he said.

S. D. Glider Pilots Set Sights On National Meet In New York

S.D. SUN 6/13/39

Three San Diego glider pilots who won practically every trophy and cash prize offered at the southwest soaring contest in Wichita Falls, Texas, just completed, today set their sights on the national competition at Elmira, N. Y., June 24 to July 9.

Because of his remarkably accurate goal-to-goal and long distance hops in the only two-place sailplane entered in the meet, Dick Essery received the largest number of awards. He set a national distance record for two-place sailplanes by flying from Wichita Falls to Oklahoma City, 109 miles.

Closely behind Mr. Essery in honors won were Woody Brown of La Jolla, who broke the national distance record by soaring 280 miles from Wichita Falls to Wichita, Kan., and set a new altitude mark of 7600 feet on this flight; and John Robinson, who flew more miles than any other contestant, falling short by only a few miles on his final attempt Sunday to equal Mr. Brown's distance feat.

In addition to trophies and aeronautical instruments, $650 in cash awards were presented at a banquet honoring the contestants last night.

WEATHER DELAYS ARCHBOLD FLIGHT

Takeoff of Richard Archbold's airboat Guba on the second lap of an Australia to Africa survey flight was postponed 24 hours and the plane today was still at Cocos Island, in the Indian Ocean, apparently awaiting better weather before leaving on a 1500-mile hop to Diego Garcia.

This information was received today by Barney Boyd, operator of Mr. Archbold's local base station. Diego Garcia, a British-owned island in the Chagos archipelago, lies 1000 miles south of Ceylon, India. From there, the Guba will fly to Mahe, in the Seychelles group of islands, and then to Mombasa, Kenya Colony, on the east coast of Africa, goal of the survey mission for the Australian government.

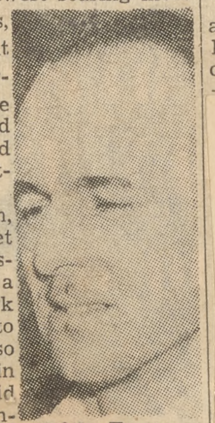
S. D. PILOTS LEADING PRIZE WINNERS IN TEXAS SOARING COMPETITION

S.D. UNION 6/13/39

Dick Essery, San Diego seaplane pilot who flew the only two-place ship in the southwest soaring meet at Wichita Falls, Tex., last night collected the largest share of the cups, trophies and cash prizes posted for the contestants.



Dick Essery

Woody Brown, La Jolla, who set an American distance record and a new altitude mark in a flight to Wichita, Kan., also shared heavily in the spoils as did John Robinson another San Diego flier. Robinson flew more miles and achieved more goal flights than any contestant, although he failed by a few miles equaling Brown's 280-mile jauunt, The Associated Press reported.

Essery set two transport distance records and a spot landing record besides succeeding on several goal flights.

A total of $650 and numerous cups and aeronautical instruments were handed out in a dinner honoring contestants.

Testing Consair Bomber; Built for Britain

S.D. TRIBUNE 6/14/39

With William B. Wheatley test pilot, at the controls, a giant patrol-bombing seaplane built by Consolidated Aircraft Corp. for the British air ministry, today took off from the bay here on its first "shake-down" flight.

The airboat, designated as Model 28-5 and developed from the familiar U. S. navy's PBY series, will be flown to England early in July. Flight personnel and the route have not been announced.

After completion of its shake-down flights, the big plane will be put through a rigid test-flight series. The craft bears the military markings of the royal air force. It was ordered from the local plant during the recent visit of air ministry officials.

The new Consolidated XPB2Y-1 patrol bomber. A fleet of these are being built for "the Navy."

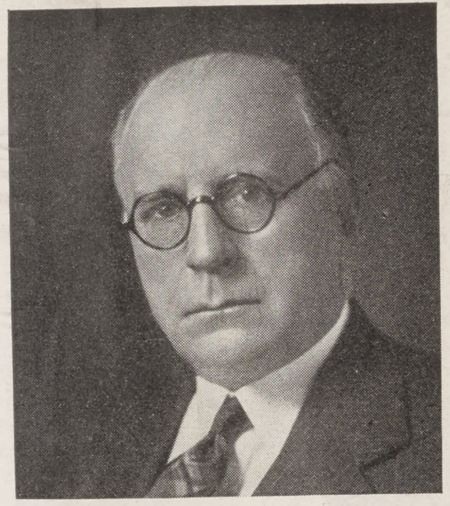
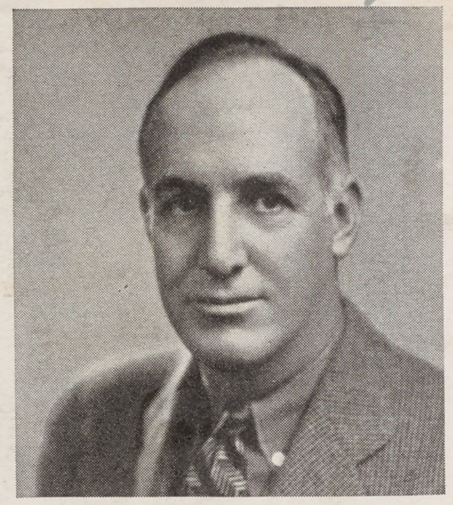
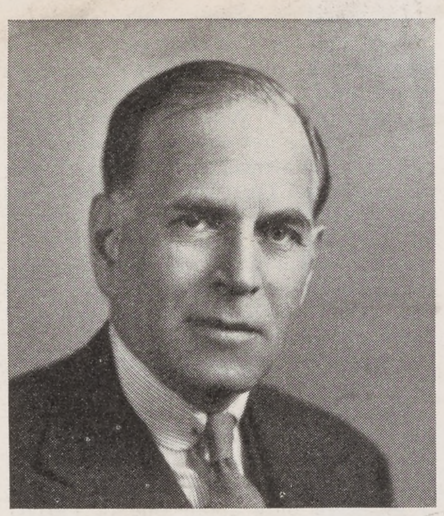
"Popular Aviation" July 1939



William H. Coverdale is the self-made millionaire who heads American Export.



It's up to Durston Richardson to set up Export's airline and make it run safely.



Jim Eaton, who knows his ocean airline business. is executive vice-president.

TRANSATLANTIC NEWCOMER

by SPENCER GREGG

Three tough, air-minded business men with plenty of cash have started an airline well worth watching

★

IF you plopped Durston G. Richardson down in the middle of a Guatemalan jungle armed with nothing but a pocket knife and some usable profanity that he could lay a practiced tongue to, he would emerge a few weeks later, freshly shaven, carrying a deed to the country.

That is information only incidental to our story, but it serves to show what kind of a man has become top hand in the only airline in the history of aviation which proposes to start from scratch and fling an operation across 3,000 miles of open ocean.

Richardson looks rather silly sitting there behind a highly polished desk in the heart of the nation's biggest city, doing things with pencils and sheets of paper which presently should materialize into a transoceanic transport line. He looks silly because he is a hard-fisted hombre who started his kindergarten work in flying back in the days when a World War instructor thought nothing of denting a student's skull with a wrench if the fool jammed his foot against right rudder in the midst of a port bank. Richardson sits there with his pencils and paper, flanked by a comely secretary, itching for the day when he can go out to Floyd Bennett Field on Long Island and bellow to the skipper of an American Export Airlines flying boat: "All right, get that big piece of tin out of here—and don't go making eyes at any of those native wenches in the Azores!"

Richardson is operations manager for a company which proposes to bridge the Atlantic to France and fly far into the Mediterranean, with great metal wings marked "Made in America." This is the story of that venture. . .

More years ago than he cares to remember a youngster named Willie Coverdale was born in modest circumstances in a little Canadian community on the banks of the St. Lawrence. If Willie was not born with a silver spoon in his mouth, he had the makings of one. More than that, he had a Midas touch. Engineer and business man, William H. Coverdale had made a fortune—and lost it—at a time in his life when most young men are trying to figure out a career.

One of the favorite stories about him impinges on the hard times of the year 1907 when he walked the streets of New York, fingering a thin dime in his pants pocket.

"How much?" he asked a street peddler, pointing to a sack of peanuts and an apple.

"A dime," replied the peddler.

Coverdale handed it over. He was broke but he had his dinner.

Two years later he was drawing $100,000 a year.

This same Coverdale, a director in numerous corporations, coiner of fortunes for himself and others, president of a transatlantic steamship line, now proposes to establish an airline to Europe which eventually expects to offer nonstop service from the American mainland to cities of the Old World.

There has been some jeering, but you can't jeer assets of several million dollars without making yourself look foolish. Coverdale has a lot to learn about flying, but he knows business and he knows men. He picked Jerome C. Hunsaker, head of the department of mechanical engineering at Massachusetts Institute of Technology and one of the country's outstanding research scientists, as aeronautical consultant to American Export Airlines. He picked James M. Eaton, one-time head of Ludington Airlines and former general traffic manager for Pan American Airways, as a vice president. And of course, on the recommendation of Eaton, he picked Durston Richardson who has taught flying, dusted cotton and for ten years held down one of the toughest assignments in aviation—managing operations in Pan American Airways' western division where the jungles are interminable and every cloud hides a mountain as hard as flint.

American Export Airlines, a subsidiary of American Export Steamship Lines, is starting from scratch. Just about 30 months ago Tommy Hitchcock, the wartime flyer, business man and polo player, approached Eaton.

"What about starting an airline over the Atlantic?" asked Hitchcock quizzically.

Eaton nodded. "Airplanes can be built for it," he said.

An electrical engineer and graduate of the University of Maine, Eaton had taken his first flight in 1912. A year later, with Tony Janis, he started what he calls the first commercial airline in the world. It was in Florida. Its lone piece of equipment, a Benoist flying boat, sported an engine in the hull which whirled a wooden prop by a chain drive. The tariff was four cents a pound for each passenger on the hoof and the Benoist faithfully churned the air between Tampa and St. Petersburg once each morning and afternoon.

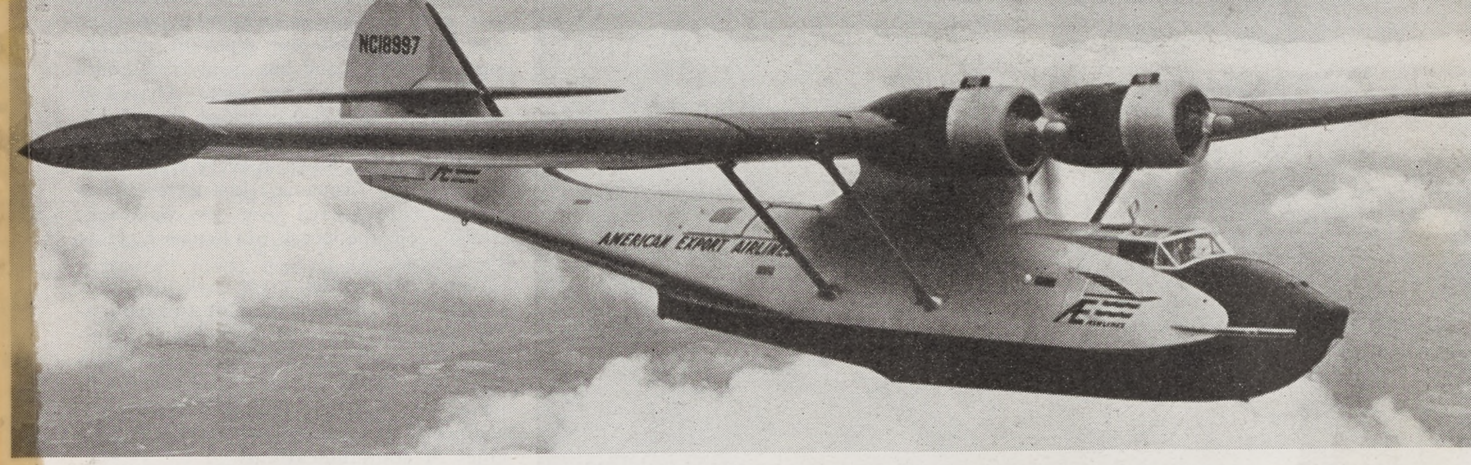
Eaton worked at that for a year. Fourteen years were to elapse before he again got his fingers into flying. A specialist in engineering management, he had charge of purchasing all the materials for the American Ordnance Base Depot in France during the war. Returning to the United States, he took charge of materials purchasing for the Hog Island shipyards.

And—an interesting sidelight—14 of the freighters now being used by American Export Steamship Lines were built at that time at Hog Island.

Eaton's work for Pan American is a well-worn story. He laid out an organization chart and suggested expansions when Panair was shuttling back and forth over that 90 miles separating Key West from Havana. He knew the Caribbean and he knew the kind of equipment that was needed to push that puny operation to Nassau, Jamaica, Haiti, Santo Domingo, Puerto Rico and Panama. In four years he watched Panair's route mileage jump to 19,000.

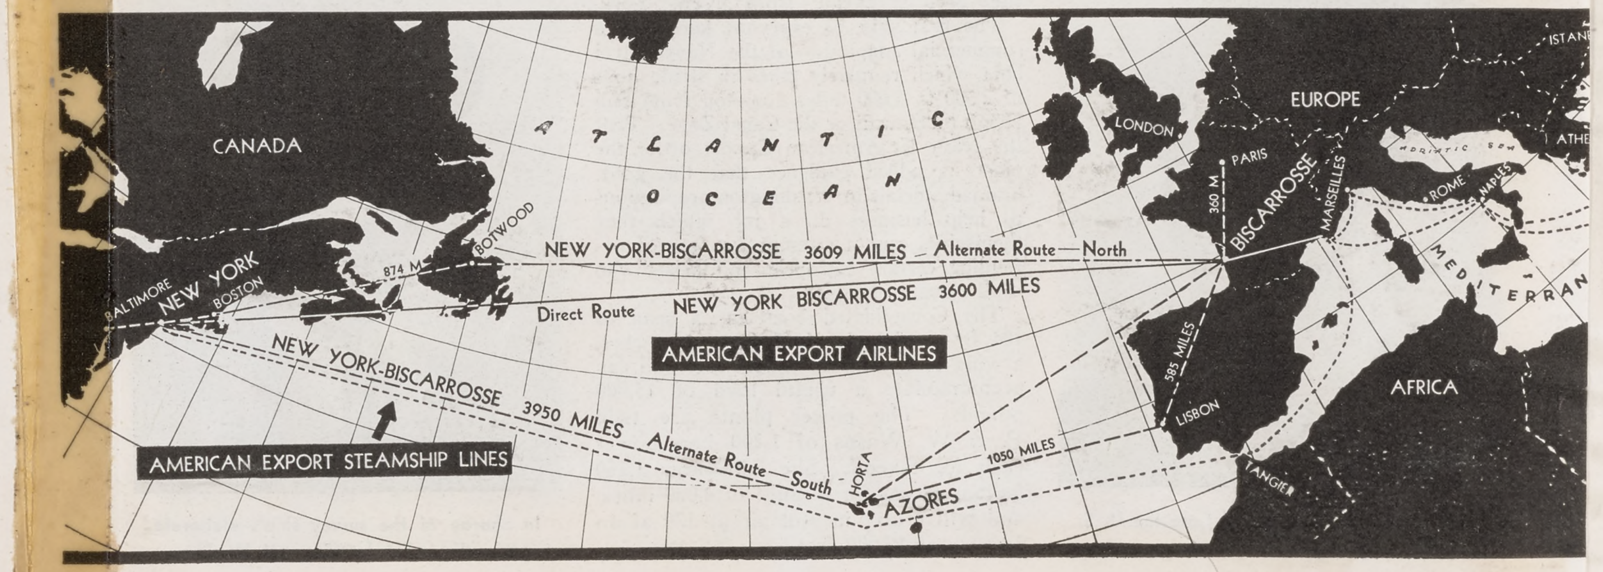
The Ludington venture was a success for everybody except the man who rang the cash register. Its New York-Washington merry-go-round reached a peak load of 300 passengers a day, but Eaton concluded it was an unsound business without a mail contract. He sold it.

When Hitchock rapped on his door, Eaton was ready for him. He had devoted himself to a study of airplanes for transportation. His argument was that a plane had to be built for a given job. He took Coverdale to the Glenn L. Martin plant at Baltimore. There the engineering and financial genius of dozens



Survey flights between the United States and the Mediterranean countries will start soon with this Consolidated boat. A commercial version of a Navy patrol bomber, American Export's ship cost $200,000.

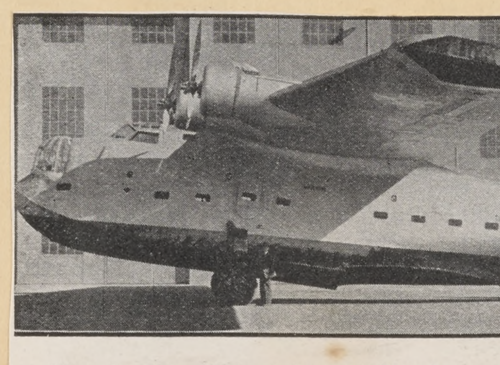
The lowest dotted line on the map below shows AE's ship routes. Routes above that are the airline's.



THE Man UNDER THE Hood

POPULAR AVIATION 7/39

MOST secret of all new Air Corps battleplanes is the **Consolidated** four-engined B-24 bomber . . . it's supposedly the next step ahead of the Boeing B-17s . . . it's a landplane with a tricycle landing gear, a particularly excellent high speed and range—and a cruising speed said to be in the vicinity of 200 m.p.h. . . . the company has a contract to build five, we hear . . . for a total of $2,880,000 . . . this ship may be flying by the time you read this . . . surprise in all this is the fact that **Consolidated** has been concentrating for the last five years on Navy business.



Navy buying will stress big patrol-bombers. Above, the Consolidated XPB2Y-1

Gott Completes Work In N. Y.; Begins At Consair On Return

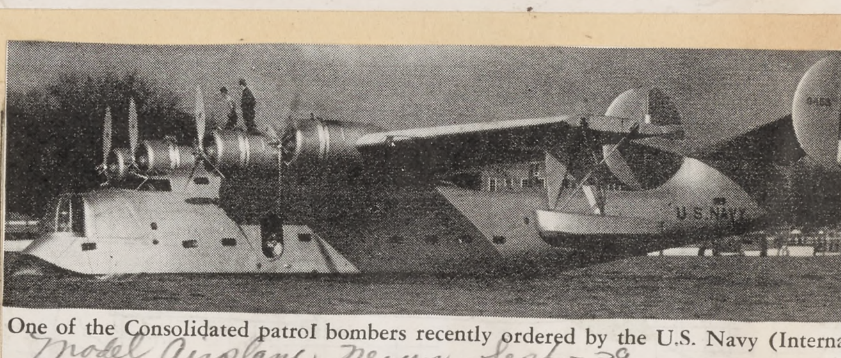
S.D. SUN 6/16/39

Vice President Edgar N. Gott of Consolidated Aircraft Corp., today completed his special duties as assistant to John H. Jouett, president of the Aeronautical Chamber of Commerce of America, in reorganizing and revitalizing the aircraft manufacturing industry's trade association.

He has been assisting Mr. Jouett at the New York headquarters since last February and will resume his work with Consolidated immediately.

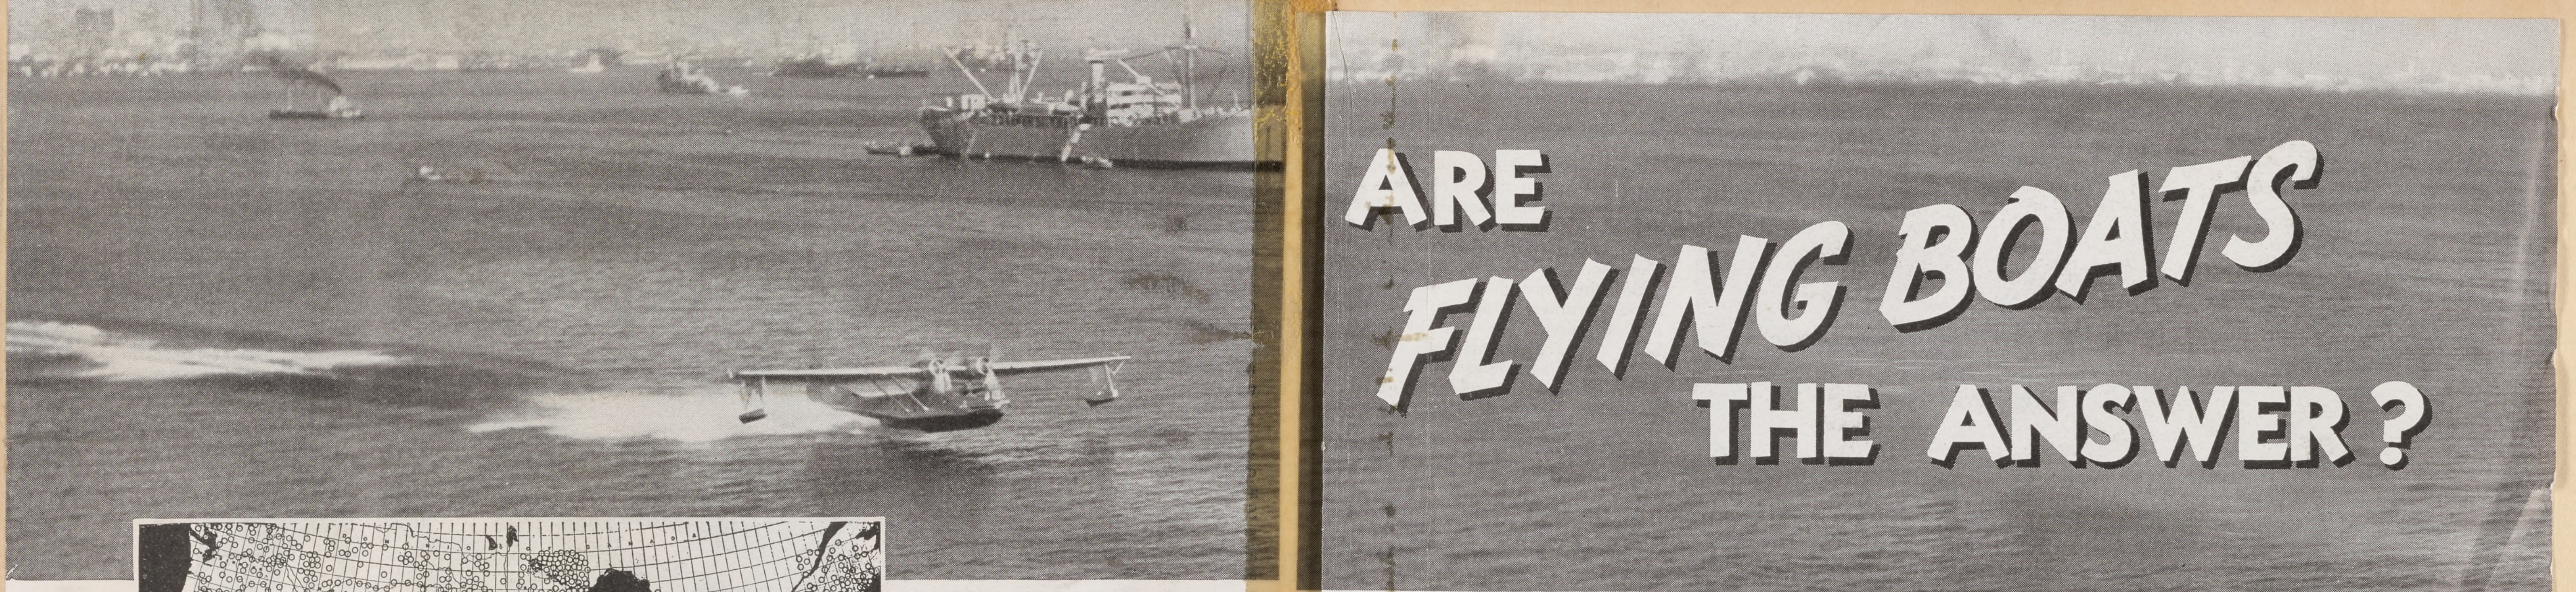
Mr. Gott possesses an impressive background in the aviation industry. A graduate of the University of Michigan in 1909 with a Bachelor of Science degree, he was one of the original incorporators of the Boeing Airplane Co., at Seattle, serving as vice president and general manager until 1922, when he was elected president.

In 1925, Mr. Gott became vice president of Fokker Aircraft Corp., Hasbrouck Heights, N. J., and in 1926 went to the Keystone Aircraft Corp,. at Bristol, Pa., as president and chairman of the board, where he remained until 1932. He joined Consolidated in San Diego four years ago. Mr. Gott is expected back home early next month.

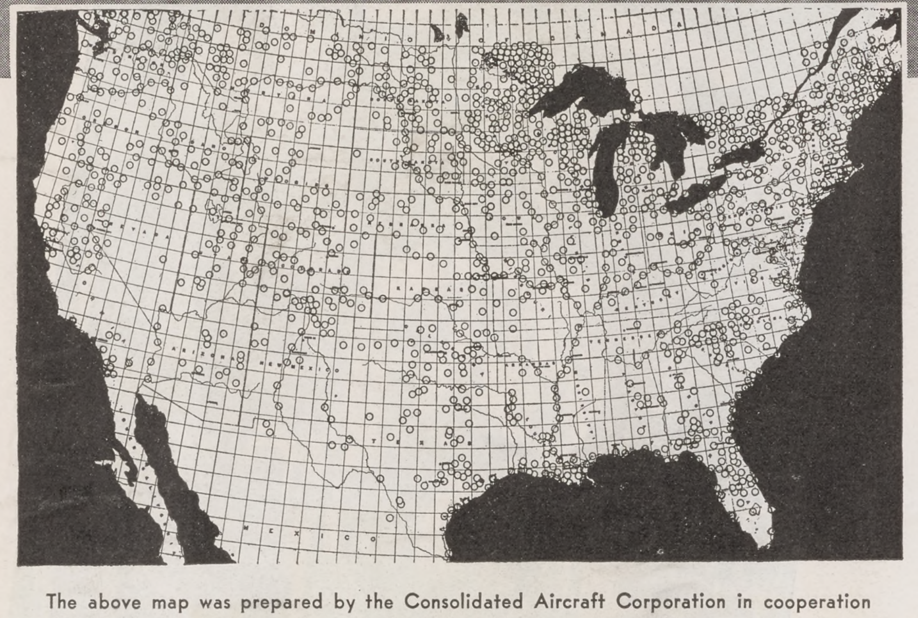


One of the Consolidated patrol bombers recently ordered by the U.S. Navy (Internat'l)

Model Airplane News Sept-39



ARE FLYING BOATS THE ANSWER?



The above map was prepared by the Consolidated Aircraft Corporation in cooperation with the Federal Government. Each circle indicates water facilities capable of caring for large passenger-carrying flying boats. It can readily be seen that transcontinental routes are feasible. In winter the southern, ice-free route would be used.

As airliners get larger, airports grow smaller. Instead of spending unlimited millions on enlarging present-day fields, the airlines might well consider using the limitless water facilities of the nation.

by

EUGENE P. LYLE III

THE scene opens a few years in the future. Perhaps five years from today; not over 10 at the most.

Several big trans-Pacific airboats are moored at the public ramps and floats at Treasure Island. This is a man-made island in San Francisco Bay, built for the 1939 exposition, and afterwards developed as an airboat terminal. Next to the Pacific clippers is berthed a little airboat belonging to the Southern Express. This latter is barely larger than the Boeing "314" of 1939.

Its freight has been stowed, its crew of eight and its 90-odd passengers are aboard. The hatches have been sealed and the six motors are idling. The clearance call comes from the control tower. Six propellers beat the air to a din, but to the passengers inside the airtight, insulated hull, the sound is only a muffled hum. They feel a slight vibration, and glancing out the double-glass windows, see the shoreline spin around in dizzy circles as the pilot warms the engines by taxying. Then the ship straightens out, heads down the bay a way, and swings round into the wind for the take-off. The ship takes the air, and the hum of the motors quiets to a steady purr. The airboat rises over the Golden Gate Bridge, then dips its port wing and heads south, following the broken coast line.

First stop is San Pedro Harbor, on the outskirts of Los Angeles. Here additional passengers come aboard and the plane takes off again, heading eastward across the continent. It wings over the Salton Sea, over Parker Lake on the Colorado River, to Roosevelt Reservoir in Arizona. Some passengers stop over at the resort while others are shuttled to Phoenix and Tucson by "tiny" 30-passenger amphibians or by bus.

Coolidge Lake in Arizona and Elephant Butte reservoir in New Mexico can be seen on the next leg of the trip, which ends with a landing on an artificial lake on the outskirts of El Paso, Texas. This is a lake created especially for cross-country airboats, fed by the Rio Grande and developed into an attractive civic park. A half hour before the plane's arral sirens warned bathers and canoers c of the water. An airport speedboat bught in laggers 15 minutes before aival.

rom El Paso the flight continues to Lke Worth on the outskirts of Fort Vorth. From here amphibians shuttle psengers to Lake Brownwood at Bownwood, Texas, to Whiterock Reservr at Dallas, to Galveston on the Gulf al about any place else within a 500-me radius where passengers and freight oers. At Fort Worth fuel is pumped ino the wing tanks—sufficient to carry th plane over 2,500 miles, so that even inbad weather it has plenty of reserve rage to reach waterways far off its reular course.

he next hop ends at McAlester Lake at Little Rock, Ark. More passengers diembark to be whisked by amphibian to Cross Lake at Shreveport, La., to New Oeans, to Memphis on the Mississippi Rier. Then the express continues on to Nshville's Skyport Lake, fed by the Cmberland River, especially created as wa the lake at El Paso.

Vinston-Salem, N. C., comes next, where a lake has been created by dammig the Yadkin River. Very soon now the ship is working its way into the thikly populated eastern seaboard where the waterways are almost within gliding disance of one another. A landing is mae on the Potomac River at Washington, D. C., and feeder lines branch out in ll directions. Then one more short hop for the express, a neat landing on Nev York's Upper Bay, a quick taxi to the Midtown Skyport, and the cross-coninental journay is over. At New York the really large trans-Atlantic clippers await European-bound passengers and express.

. . . .

Now we're back in 1939 again. We still reg the Boeing "314" and the DC-4 as e planes. Has this prophecy of a tra continental airboat service sounded fan tic? It was not intended to. Some of t most conservative engineers in the wo today are thinking along those line

Present-day cross-country commercial flight is faced with a serious problem, that of building fields large enough to accommodate projected giant landplanes.

Quizzed by Los Angeles reporters, Jack Frye, president of TWA, made this statement the other day:

"Los Angeles must build up its municipal airport if it wishes to continue to rank as a Class A-1-A city among major American air centers . . . Expenditure of $8,000,000 there would give the city a field comparable to New York's $37,000,000 North Beach port now being completed."

Mr. Frye might have included most of the terminals and intermediate fields in the United States in the inadequate class. There are only about four which are thoroughly suitable from the pilot's point-of-view.

Eight million dollars is a lot of money to spend improving an already costly field. Thirty-seven million dollars, the total cost of the New York terminal, would buy a right fancy railroad station. And airplanes do not have the traffic

Giant boats like Pan America's transatlantic clippers might well be use for the longer transcontinental airlines. Shortest coast-to-coast route is 2,57 miles.

Popular Aviation July 1939

S.D. UNION 6/20/39

Report that Richard Archbold's flying scientific expedition is safe on the Isle of Paradise in the Scychelles islands was received here yesterday by Bernard F. Boyd, radio contact man for the flight. Previous reports stated Archbold had flown his giant San Diego-built flying boat, Guba, to Mombasa, Kenya colony, East Africa.

Boyd said he contacted the Hollandia, New Guinea, base of the expedition yesterday for the first time in three days and learned that Archbold had been making short trips through the island group.

Hollandia radio operators told him Archbold plans to take off tomorrow morning (tonight, Pacific standard time) for Mombasa.

"Modern Transport" – 6/3/39

New American Flying-boat.

A new passenger flying-boat has been built by the Consolidated Aircraft Corporation, and first test flights were conducted recently. The machine has been styled Consolidated Model 31, and has been designed and constructed as a private venture. Passenger accommodation is for 52 persons, and the designers state that accommodation on transatlantic services would be for 28 passengers. This suggests that the flying-boat may be taken up by American Export Lines for their projected service. It has an all-up weight of 50,000 lb. The span is 110 ft. and length 73 ft. Power is derived from two Wright engines of a new type. These are Wright Duplex-Cyclones, and are two-row, air-cooled, 18-cylinder radials rated at 2,000 h.p. each. This new engine is a development of the 1,500 h.p. two-row, 14-cylinder Cyclone, and is being shown at the World's Fair in New York. The Consolidated Model 31 will have three-bladed Hamilton fully feathering airscrews. To facilitate beaching there is a retracting nose-wheel and two side wheels, the latter being removable. The high wing is equipped with partly retractable outboard floats and hydraulically operated Fowler flaps. There are two decks, and the crew is accommodated on the upper one. No performance figures have so far been released, but claims are understood to have been made for a speed in excess of 250 m.p.h.

NEW FLYING-BOAT TO BE TESTED

30/5/39 (England)

U.S. MACHINE WITH 3,000 MILES RANGE

By Major C. C. TURNER

Flight delivery to Felixstowe Marine Aircraft Experimental Station of a Consolidated Military PBY flying-boat—a picture of which appeared in THE DAILY TELEGRAPH on Saturday—will take place early in July. There it will undergo Air Ministry tests.

The flying-boat will leave San Diego, California, and will pass over Kansas City, Chicago, Detroit, Toronto, Ottawa, Montreal, and Quebec, to Botwood, Newfoundland (British Transatlantic service base), and thence cross the Atlantic, passing Cardigan Bay on its way to Felixstowe.

The total distance to be flown is 5,750 miles.

The PBY is extensively used by the U.S. Navy for long-range reconnaissance, and frequently transfers from base to base 3,000 miles apart.

FOUR MACHINE-GUNS

A commercial version of the same machine, Model 28, known as the "Guba" (Sudden Squall), will next month make an exploratory route flight from Perth, Australia, to Mombasa, Africa, crossing the Indian Ocean, with a view to developing, for strategical reasons, an alternative route between Australia and Great Britain. This flight has the financial backing of the British Government.

The flying-boat has an all-up weight of 12¼ tons. With twin Wright engines, it has a top speed, at 14,000 feet, of 206 miles an hour, and cruises at its economical speed at 150 m.p.h.

The military type is armed with four machine-guns, all movable, and placed for defence in all directions.

Are Flying Boats . . .

(Continued from page 70)

more of these before long.

But the greatest drawback is the cost of changing over to airboats, or of making the initial step in opening new lines for them. Airlines are already equipped with fleets of landplanes and the personnel trained to operate them. They have spent years and much money educating the public to their services. And, most important of all, no manufacturer is building commercial airboats on a production basis at the present time.

How would airboats compare in cost with landplanes? The only airboat manufactured in quantities is the Navy's PBY long-range patrol-bomber. It costs, completely equipped except for armament, from $110,000 to $115,000. The DC-3, slightly smaller than the PBY, faster and with better performance but less range and payload capacity, costs the airlines about $100,000. This is the closest comparison that can be made between airboats and landplanes. It is not altogether a fair comparison. The DC-3 is outfitted much more luxuriously than is the military plane, but does not need as complex equipment for navigation and radio. The PBY was first produced in 1932, the DC-3 in 1937, so that the latter has the benefit of five years more experience in design. Then too, the PBY would cost less if manufactured in quantities for commercial lines, because when built for the navy government inspections and red tape slows production.

It is probable that large airboats would cost less than comparable landplanes in commercial production. The hull of the airboat is more costly to build than the fuselage of the landplane, but the landing gear of the latter more than offsets the difference.

When a special landplane is developed the first model might cost as much as $2,000,000, as has the DC-4. Subsequent editions of the DC-4 will get down to a reasonable figure. Boeing contracted to build six of the "314s" at $500,000 each and is said to be losing money at that price. Now that the dies and tools are set up and production of this particular ship is organized, future "314s" should drop considerably in cost.

Last November Igor Sikorsky, lecturing in Berlin before the Lilienthal Society for Aeronautical Research, made aerodynamic comparisons of airboats and landplanes. At no place within known gross weight limits does the airboat possess the *aerodynamic* efficiency of the landplane, Mr. Sikorsky's figures show. In the very small sizes, around 2,000 lb., the airboat requires nearly twice the horsepower. Aerodynamic efficiency of each type of plane increases as the size is increased. *But*—from around 20,000 lb. to 200,000 lb. the airboat's efficiency increases at a much greater rate than that of the landplane. In the 22,000 lb. class the airboat requires 75.5 h.p. per ton (metric) of gross weight and the landplane 49.2 h.p. per ton. In the 110,000 lb. class the airboat rates 28.5 h.p. to the landplane's 22.8. The planes we have discussed fall between these figures, the PBY (commercial) weighing 28,000 lb. gross, the DC-4 65,000 lb. gross, and the "314" 84,000 lb. gross. But when still larger ships come, see how the aerodynamic comparison grows close. In the 551,000 lb. class the airboat requires 14.4 h.p. to the landplane's 12.7! Beyond this size the comparison is any man's guess, though it is reasonable to believe that the airboat, in sizes not yet conceived, will equal if not surpass the aerodynamic efficiency of the landplane. In the large sizes the landplane still has the edge in speed and climbing ability, the airboat in range and payload capacity.

The reason for these differences is due mainly to the shape of the airboat's hull, and to the landing gear of the landplane. In the small sizes the airboat must have a cabin higher than is necessary for crew and passengers, or else a superstructure, in order to keep the propellers above the spray level. Where the superstructure is used it takes several forms in different types of airboats. In the PBY it is a streamlined member housing the engineers' cabaña that raises the wing above the hull. Both the Martin and Sikorsky clippers have somewhat similar streamlined members to raise the wing. The Douglas *Dolphin* has its propellers raised above the wing. In either case a drag is caused. But the spray level remains nearly constant. Therefore if the airboat is large enough it may be designed aerodynamically perfect except for the bottom of the hull, and its propellers will be naturally placed high enough to clear the spray. No superstructure to raise them is needed. Examples of such large airboats are the Boeing "314", the Sikorsky XPBS-1, and the Consolidated XPB2Y-1. Landplanes, on the other hand, require a relatively more complicated and heavier landing gear as they increase in size.

So you have here a summary of some of the problems caused by increasing airport costs and landplane sizes. They inevitably bring up the question, "Will airboats be the answer?"

The Guba Starts Air Trail From Australia

From among those shown with the flying laboratory plane on a previous flight are several participants in the Australia-Africa hop. Left to right: Stephen Barinka, an engineer; Raymond Booth, radio operator; Lewis A. Yancey, navigator on the present flight; Russell Rogers, pilot on the present flight; Richard Archbold, owner who has loaned the ship for the journey, and Gerald Brown, engineer.

The inset shows, in dotted lines, the water route the Guba will survey after the journey from Sydney to Western Australia. The solid line shows the present Empire air route from Europe to Australia.

Australia-Africa Air Trail Tried By Flying Boat

SYDNEY, New South Wales, June 5 (AP)—The flying boat Guba took off June 3 on the first leg of an attempt to blaze a new Australia-Africa air trail.

Lewis A. Yancey, American aviator who flew the Atlantic to Rome in 1929, is navigator, and Russell Rogers, American flying boat pilot, is first pilot. Mombasa, Kenya, 5,000 miles over the Indian Ocean, is the ultimate objective.

The Guba was lent by Richard Archbold, a wealthy young American, for the flight sponsored by Capt. Percy G. Taylor of Sydney, who proposed it five years ago, urging the route as an alternative for the England-Australia airmail service in time of war.

Captain Taylor has been prominent in Australian aviation for many years. He was navigator for the late Sir Charles Kingsford-Smith on flights from Australia to New Zealand in the Southern Cross in 1933 and 1934, and second pilot on the flight from Brisbane to California in the Lady Southern Cross in 1934.

He enlisted the co-operation of Mr. Archbold, who led an American Museum of Natural History scientific expedition at Moresby, Papua.

Archbold Bound for Chagos Isles In Flight Across Indian Ocean

S.D. TRIBUNE
6/13/39

Speeding across the Indian ocean on a survey flight for the Australian government, Richard Archbold's $250,000 Consolidated-built flying boat, the Guba, today was en route from the Cocos islands group to Diego Garcia, in the Chagos islands, which lie about 1000 miles south of Ceylon. Archbold, research associate of the American Museum of Natural History, and his flight companions took off from Cocos islands at 2 a.m. (PST), and at 5 a.m. still had 1500 miles to go on the 1717-mile distance between the two island groups.

Word of the take-off was received here in a direct short-wave radio contact between Ray Booth, radioman aboard the Guba, and Barney F. Boyd, 4635 Fifty-sixth st., radio amateur, who has maintained radio communication with the Archbold expedition ever since the Guba left San Diego June 2, 1938, for New Guinea, where Archbold carried on scientific work for the American Museum of Natural History for nearly a year.

Four Contacts Made

Jubilant because today was the first time he has made direct contacts with the plane since the flying boat left the New Guinea base camp at Hollandia several weeks ago, Boyd said he made four contacts with the plane from 4:35 a.m. to 6 a.m. The last position report was latitude 10 degrees, 46 minutes south; longitude 89 degrees, 20 minutes east.

After leaving New Guinea the Guba was flown to Australia to be made ready for the flight across the Indian ocean and pick up Capt. P. G. Taylor, Australian government representative. The plane left Sydney June 3 and flew 2000 miles across Australia to Port Hedland, on the west coast, in less than 18 hours. It left the Australian mainland for the Cocos islands a week ago yesterday.

"Archbold reported he plans to spend several days at Diego Garcia," said Boyd. Weather conditions for the flight today were described as good, and Boyd said Booth reported from the plane that "everything is going along nicely."

No More Until Tonight

An interesting feature of the contacts made between Boyd and the Guba today was the fact that Boyd was in contact both with the Guba, flying over the Indian ocean more than 10,000 miles from San Diego, and with a radio operator remaining at the base camp in New Guinea, 7178 miles from here, but the base camp radio operator could not hear the radio messages from the plane. Those on the plane, Boyd said, could hear the base camp operator, but he couldn't hear them, although he could hear Boyd.

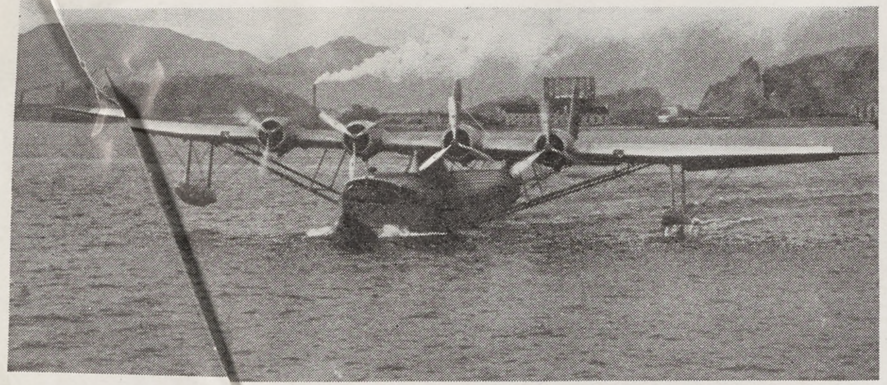
The 6 a.m. radio contact with the Guba was the last Boyd will hear until tonight, he said.

Boyd yesterday visited with Harold Ramm, radioman who was with the Archbold expedition in New Guinea, who turned to San Diego by steamer. Ramm, who went to New Guinea by steamer from New York early in 1938, said details of the accomplishments of the expedition are to be released by Archbold and the museum.

"We had the best of radio equipment in New Guinea, and I don't recall a day when we were not in communication with some part of the United States," said Ramm. Commenting on the weather in New Guinea, Ramm said, "when Barney would call for the weather I'd tell him 'sun shining in the west, cloudy in the east, temperature 86' almost every day." Ramm was welcomed by Mrs. Ramm when he left the liner at San Pedro. He plans to be here to welcome Archbold when the Guba returns to San Diego after a flight across Africa and the Atlantic ocean about July 1.

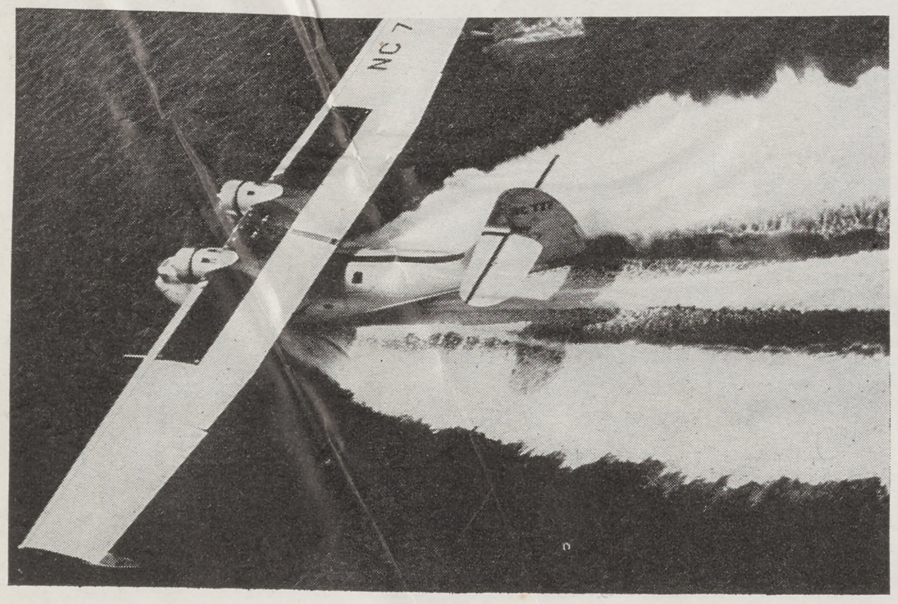
The Chagos islands, the Guba's goal on today's flight, belong to Great Britain. The total land area is about 76 square miles. Most of the population, about 500, are Negroes, who live on Diego Garcia, which is the largest of the islands, being 13 miles in length and six miles wide. Diego Garcia has a large lagoon, where the Guba is expected to alight.

Richard Archbold has spanned the continent five times in his first and second Consolidated flying boats ('Guba II' above). Such flights are as safe as with landplanes.



Flying boats have access to hundreds of lakes, rivers, bays and harbors. Practically every major city in the U. S. has some water facilities adaptable to these ships.

With large ships water take-offs are, by comparison, much safer than with landplanes in case of engine failure. The boat pilot simply lets his craft settle onto the water.



railroads have. Then, too, in many case there is no more land available for en larging existing fields, and growing citie are crowding them. New routes will b opened to accommodate future demand Will these routes be as castly to buil and maintain as existing ones? Probabl more so.

So—the demand for a solution to th airport problem is opening a brand ne field to pioneering—that of using air boats for cross-country work. Most o the pioneering along this line so fa has been incidental to other objects. Th Navy and Coast Guard have made prac tical demonstrations in coastal flying Twice in 1938 Naval patrol-bomber spanned the continent non-stop. Th object was to demonstrate that such bi airboats could be based on either coas and be transferred quickly to the othe coast. Richard Archbold, noted ex plorer, has five times spanned the con tinent in his PBY airboats. Three c these trips were non-stop. At preser Archbold's ship, the *Guba,* makes almos daily flights from Hollandia on the coas of New Guinea Netherlands to Lak Habemma, 12,000 feet high in the dee interior of the island. These fligh transport food and scientists and nati workers over jungles and mountains t camps that would be impossible to reac by any other means.

Such feats, routine to the men wh perform them, demonstrate the pract cality of using airboats on commerci overland routes. Commercial interes are just beginning to investigate seriou ly the possibilities. It is known th Pan American has men busy at pap work on the problem, and that Conso dated Aircraft in San Diego is unde taking a considerable research. Rumo whisper that several other airlines a manufacturers are playing with the ide

Airboats flying across the contine at first thought, sounds as dangerous landplanes flying the Atlantic. But isn't, really. Glance at the map. The are thousands of lakes, rivers and ha bors in the United States suitable f the heaviest airboat to take off fro Many rivers and lakes form continuo landing areas for hundreds of mil Besides these, there are thousands other bodies of water, smaller, thou quite large enough for emergency lan ings. An airboat can land in about h the distance a landplane requires becau of the braking effect of the water. making a slightly zigzag course acr a southern route, for instance, the av age distance between water is 60 mil No distance is greater than a hundr miles.

But what would happen if an airb had to make a forced landing wh there was no water? That's a go question, and there's a good answer it, because it has already happened number of times. A few years ago passenger disembarking from o American's Consolidated Co stood on the landing float lookin ship.

"You know," he said to the p was in a plane just like this th

(*Continued on page* 70)

Are Flying Boats . . .

(*Continued from page* 26)

day when it made a forced landing in the interior of Cuba. No one was hurt and it didn't seem to do any damage."

The pilot laughed. "Yes, I remember that," he replied. "This is the same ship that made the ploughed-field landing, and I'm the same pilot!"

He didn't explain how the ship was moved to the nearest water. That, of course, must have been a feat. But, in an emergency, it is comforting to passengers to realize that an airboat can sit down anywhere a landplane can, and many more places besides.

The U. S. Army and other organizations have had experience with amphibians landing on an airport with the wheels retracted because the pilot forgot to lower them—a fairly common occurrance a few years ago. Seldom has serious damage been done in such landings. The hulls of amphibians and airboats are built to withstand high impact loads. A landplane alighting on anything except a smooth field would have its wheels retracted anyway, to avoid nosing over or ground looping. Though passengers and crew might escape injury in such landings, certainly the plane's belly, wings and propeller would be damaged. The airboats wings and propellers, built high to clear the water, would be more likely to avoid damage in an emergency ground landing.

Of course a landing in mountainous terrain would be disastrous to either type of plane. But then again, the airboat flying cross-country would be safer if it lost its way, because there are always alternative bodies of water in all directions scattered over the country. The landplane off an established airway is helpless until it finds another airway with its line of emergency fields and airports, and these usually are hundreds of miles apart. The same applies when a different route must be taken because of a sudden storm.

Because water landing areas often are unlimited, it is safer to land an airboat in poor visibility than a landplane, which must find a comparatively small target. Water take-offs also are safer in case of engine failure. The airboat has merely to settle back in the water, while the landplane is off its level runway and must crash.

If we concede the safety of airboats in cross-country flying, why, then, are they not used commercially in that work? At first glance the economics involved appears to favor the airboat. Probably the greatest saving would be in terminals and emergency fields. Water costs little if anything to maintain. In places where it does not already exist in convenient locations, dams might be built or basins flooded. These might serve also as recreation lakes, or as storage and power reservoirs. The Civil Aeronautics Authority has requested $37,000,000 for modernization of airways. A small part of this sum would provide a cross-continental airway for the big boats.

Passengers likely would prefer airboats, especially when great speed and a direct route are not essential. For one thing the necessarily high wings offer an unobstructed view of the ground. And then waterways, with their shipping and vegetation, are always more interesting than straight land. Certainly resorts would develop at some of the more picturesque stopping places.

Along the coasts, from Maine to Florida, from San Diego to Alaska, there exists almost continuous landing areas of harbors, esturaries, rivers and lakes. The Coast Guard and the Navy have used these daily for years in routine patrols and maneuvers. Yet the possibilities have barely been scratched by commercial operators.

The trans-ocean lines probably will not bother with the coast trade, any more than trans-ocean steamers find it worth while to compete with coastal steamers. Coastal steamers act as feeders for their big sisters. It seems logical that coastal airboats should play the same part in relation to trans-ocean airboats. The necessary equipment would actually be cheaper per passenger mile than that used by steamship companies. There would be less initial expenditure and less operating cost.

Now let's examine the drawbacks which, at present, are serious. One is the fact that some inland cities do not have convenient bodies of water. A way of overcoming this would be to use amphibians. They can be built as large as any landplane, and the cities on the route away from water would then have to accommodate them with landing fields of sufficient size. Amphibians, however, because of weight and drag, are less efficient than either landplanes or airboats. And yet, if the demand was great enough, engineers would find means for increasing their efficiency. Another means of serving cities off the waterways would be to develop artificial lakes. Very little depth would be needed—a landing channel six feet deep would do.

Another, though lesser problem, is that of pilots. The airboat pilot must be a good sailor as well. This was demonstrated several years ago when General Italo Balbo brought a squadron of Italian Savoia-Marchetti airboats on a trans-Atlantic tour. The pilots were all Army fliers, as was their commander. In preparation for the tour they were given what was then thought an extensive course in airboat work. It was not enough. They were still soldiers. Numerous disasters befell them, all during surface maneuvers and all due to poor seamanship. Commercial airboat pilots must be given special training.

The Civil Aeronautics Authority inherited a regulation prohibiting public carrier airboats from flying over land, though landplanes carrying passengers are permitted to fly over water. This is a foolish regulation and is almost certain to be cancelled soon. The CAA is now making a thorough investigation of three projected cross-continental routes for airboats and will probably be asking for an appropriation to develop one or

S.D. UNION 6/20/39

Report that Richard Archbold's flying scientific expedition is safe on the Isle of Paradise in the Scychelles islands was received here yesterday by Bernard F. Boyd, radio contact man for the flight. Previous reports stated Archbold had flown his giant San Diego-built flying boat, Guba, to Mombasa, Kenya colony, East Africa.

Boyd said he contacted the Hollandia, New Guinea, base of the expedition yesterday for the first time in three days and learned that Archbold had been making short trips through the island group.

Hollandia radio operators told him Archbold plans to take off tomorrow morning (tonight, Pacific standard time) for Mombasa.

"Modern Transport" - 6/3/39

New American Flying-boat.

A new passenger flying-boat has been built by the Consolidated Aircraft Corporation, and first test flights were conducted recently. The machine has been styled Consolidated Model 31, and has been designed and constructed as a private venture. Passenger accommodation is for 52 persons, and the designers state that accommodation on transatlantic services would be for 28 passengers. This suggests that the flying-boat may be taken up by American Export Lines for their projected service. It has an all-up weight of 50,000 lb. The span is 110 ft. and length 73 ft. Power is derived from two Wright engines of a new type. These are Wright Duplex-Cyclones, and are two-row, air-cooled, 18-cylinder radials rated at 2,000 h.p. each. This new engine is a development of the 1,500 h.p. two-row, 14-cylinder Cyclone, and is being shown at the World's Fair in New York. The Consolidated Model 31 will have three-bladed Hamilton fully feathering airscrews. To facilitate beaching there is a retracting nose-wheel and two side wheels, the latter being removable. The high wing is equipped with partly retractable outboard floats and hydraulically operated Fowler flaps. There are two decks, and the crew is accommodated on the upper one. No performance figures have so far been released, but claims are understood to have been made for a speed in excess of 250 m.p.h.

NEW FLYING-BOAT TO BE TESTED

30/5/39 (England)

U.S. MACHINE WITH 3,000 MILES RANGE

By Major C. C. TURNER

Flight delivery to Felixstowe Marine Aircraft Experimental Station of a Consolidated Military PBY flying-boat—a picture of which appeared in THE DAILY TELEGRAPH on Saturday—will take place early in July. There it will undergo Air Ministry tests.

The flying-boat will leave San Diego, California, and will pass over Kansas City, Chicago, Detroit, Toronto, Ottawa, Montreal, and Quebec, to Botwood, Newfoundland (British Transatlantic service base), and thence cross the Atlantic, passing Cardigan Bay on its way to Felixstowe.

The total distance to be flown is 5,750 miles.

The PBY is extensively used by the U.S. Navy for long-range reconnaissance, and frequently transfers from base to base 3,000 miles apart.

FOUR MACHINE-GUNS

A commercial version of the same machine, Model 28, known as the "Guba" (Sudden Squall), will next month make an exploratory route flight from Perth, Australia, to Mombasa, Africa, crossing the Indian Ocean, with a view to developing, for strategical reasons, an alternative route between Australia and Great Britain. This flight has the financial backing of the British Government.

The flying-boat has an all-up weight of 12¼ tons. With twin Wright engines, it has a top speed, at 14,000 feet, of 206 miles an hour, and cruises at its economical speed at 150 m.p.h.

The military type is armed with four machine-guns, all movable, and placed for defence in all directions.

Are Flying Boats . . .

(*Continued from page* 70)

more of these before long.

But the greatest drawback is the cost of changing over to airboats, or of making the initial step in opening new lines for them. Airlines are already equipped with fleets of landplanes and the personnel trained to operate them. They have spent years and much money educating the public to their services. And, most important of all, no manufacturer is building commercial airboats on a production basis at the present time.

How would airboats compare in cost with landplanes? The only airboat manufactured in quantities is the Navy's PBY long-range patrol-bomber. It costs, completely equipped except for armament, from $110,000 to $115,000. The DC-3, slightly smaller than the PBY, faster and with better performance but less range and payload capacity, costs the airlines about $100,000. This is the closest comparison that can be made between airboats and landplanes. It is not altogether a fair comparison. The DC-3 is outfitted much more luxuriously than is the military plane, but does not need as complex equipment for navigation and radio. The PBY was first produced in 1932, the DC-3 in 1937, so that the latter has the benefit of five years more experience in design. Then too, the PBY would cost less if manufactured in quantities for commercial lines, because when built for the navy government inspections and red tape slows production.

It is probable that large airboats would cost less than comparable landplanes in commercial production. The hull of the airboat is more costly to build than the fuselage of the landplane, but the landing gear of the latter more than offsets the difference.

When a special landplane is developed the first model might cost as much as $2,000,000, as has the DC-4. Subsequent editions of the DC-4 will get down to a reasonable figure. Boeing contracted to build six of the "314s" at $500,000 each and is said to be losing money at that price. Now that the dies and tools are set up and production of this particular ship is organized, future "314s" should drop considerably in cost.

Last November Igor Sikorsky, lecturing in Berlin before the Lilienthal Society for Aeronautical Research, made aerodynamic comparisons of airboats and landplanes. At no place within known gross weight limits does the airboat possess the *aerodynamic* efficiency of the landplane, Mr. Sikorsky's figures show. In the very small sizes, around 2,000 lb., the airboat requires nearly twice the horsepower. Aerodynamic efficiency of each type of plane increases as the size is increased. *But*—from around 20,000 lb. to 200,000 lb. the airboat's efficiency increases at a much greater rate than that of the landplane. In the 22,000 lb. class the airboat requires 75.5 h.p. per ton (metric) of gross weight and the landplane 49.2 h.p. per ton. In the 110,000 lb. class the airboat rates 28.5 h.p. to the landplane's 22.8. The planes we have discussed fall between these figures, the PBY (commercial) weighing 28,000 lb. gross, the DC-4 65,000 lb. gross, and the "314" 84,000 lb. gross. But when still larger ships come, see how the aerodynamic comparison grows close. In the 551,000 lb. class the airboat requires 14.4 h.p. to the landplane's 12.7! Beyond this size the comparison is any man's guess, though it is reasonable to believe that the airboat, in sizes not yet conceived, will equal if not surpass the aerodynamic efficiency of the landplane. In the large sizes the landplane still has the edge in speed and climbing ability, the airboat in range and payload capacity.

The reason for these differences is due mainly to the shape of the airboat's hull, and to the landing gear of the landplane. In the small sizes the airboat must have a cabin higher than is necessary for crew and passengers, or else a superstructure, in order to keep the propellers above the spray level. Where the superstructure is used it takes several forms in different types of airboats. In the PBY it is a streamlined member housing the engineers' cabaña that raises the wing above the hull. Both the Martin and Sikorsky clippers have somewhat similar streamlined members to raise the wing. The Douglas *Dolphin* has its propellers raised above the wing. In either case a drag is caused. But the spray level remains nearly constant. Therefore if the airboat is large enough it may be designed aerodynamically perfect except for the bottom of the hull, and its propellers will be naturally placed high enough to clear the spray. No superstructure to raise them is needed. Examples of such large airboats are the Boeing "314", the Sikorsky XPBS-1, and the Consolidated XPB2Y-1. Landplanes, on the other hand, require a relatively more complicated and heavier landing gear as they increase in size.

So you have here a summary of some of the problems caused by increasing airport costs and landplane sizes. They inevitably bring up the question, "Will airboats be the answer?"

Wide World

The Guba Starts Air Trail From Australia

From among those shown with the flying laboratory plane on a previous flight are several participants in the Australia-Africa hop. Left to right: Stephen Barinka, an engineer; Raymond Booth, radio operator; Lewis A. Yancey, navigator on the present flight; Russell Rogers, pilot on the present flight; Richard Archbold, owner who has loaned the ship for the journey, and Gerald Brown, engineer.

The inset shows, in dotted lines, the water route the Guba will survey after the journey from Sydney to Western Australia. The solid line shows the present Empire air route from Europe to Australia.

Australia-Africa Air Trail Tried By Flying Boat

SYDNEY, New South Wales, June 5 (AP)—The flying boat Guba took off June 3 on the first leg of an attempt to blaze a new Australia-Africa air trail.

Lewis A. Yancey, American aviator who flew the Atlantic to Rome in 1929, is navigator, and Russell Rogers, American flying boat pilot, is first pilot. Mombasa, Kenya, 5,000 miles over the Indian Ocean, is the ultimate objective.

The Guba was lent by Richard Archbold, a wealthy young American, for the flight sponsored by Capt. Percy G. Taylor of Sydney, who proposed it five years ago, urging the route as an alternative for the England-Australia airmail service in time of war.

Captain Taylor has been prominent in Australian aviation for many years. He was navigator for the late Sir Charles Kingsford-Smith on flights from Australia to New Zealand in the Southern Cross in 1933 and 1934, and second pilot on the flight from Brisbane to California in the Lady Southern Cross in 1934.

He enlisted the co-operation of Mr. Archbold, who led an American Museum of Natural History scientific expedition at Moresby, Papua.

Archbold Bound for Chagos Isles In Flight Across Indian Ocean

S.D. TRIBUNE 6/13/39

Speeding across the Indian ocean on a survey flight for the Australian government, Richard Archbold's $250,000 Consolidated-built flying boat, the Guba, today was en route from the Cocos islands group to Diego Garcia, in the Chagos islands, which lie about 1000 miles south of Ceylon. Archbold, research associate of the American Museum of Natural History, and his flight companions took off from Cocos islands at 2 a.m. (PST), and at 5 a.m. still had 1500 miles to go on the 1717-mile distance between the two island groups.

Word of the take-off was received here in a direct short-wave radio contact between Ray Booth, radioman aboard the Guba, and Barney F. Boyd, 4635 Fifty-sixth st., radio amateur, who has maintained radio communication with the Archbold expedition ever since the Guba left San Diego June 2, 1938, for New Guinea, where Archbold carried on scientific work for the American Museum of Natural History for nearly a year.

Four Contacts Made

Jubilant because today was the first time he has made direct contacts with the plane since the flying boat left the New Guinea base camp at Hollandia several weeks ago, Boyd said he made four contacts with the plane from 4:35 a.m. to 6 a.m. The last position report was latitude 10 degrees, 46 minutes south; longitude 89 degrees, 20 minutes east.

After leaving New Guinea the Guba was flown to Australia to be made ready for the flight across the Indian ocean and pick up Capt. P. G. Taylor, Australian government representative. The plane left Sydney June 3 and flew 2000 miles across Australia to Port Hedland, on the west coast, in less than 18 hours. It left the Australian mainland for the Cocos islands a week ago yesterday.

"Archbold reported he plans to spend several days at Diego Garcia," said Boyd. Weather conditions for the flight today were described as good, and Boyd said Booth reported from the plane that "everything is going along nicely."

No More Until Tonight

An interesting feature of the contacts made between Boyd and the Guba today was the fact that Boyd was in contact both with the Guba, flying over the Indian ocean more than 10,000 miles from San Diego, and with a radio operator remaining at the base camp in New Guinea, 7178 miles from here, but the base camp radio operator could not hear the radio messages from the plane. Those on the plane, Boyd said, could hear the base camp operator, but he couldn't hear them, although he could hear Boyd.

The 6 a.m. radio contact with the Guba was the last Boyd will hear until tonight, he said.

Boyd yesterday visited with Harold Ramm, radioman who was with the Archbold expedition in New Guinea, who turned to San Diego by steamer. Ramm, who went to New Guinea by steamer from New York early in 1938, said details of the accomplishments of the expedition are to be released by Archbold and the museum.

"We had the best of radio equipment in New Guinea, and I don't recall a day when we were not in communication with some part of the United States," said Ramm. Commenting on the weather in New Guinea, Ramm said, "when Barney would call for the weather I'd tell him 'sun shining in the west, cloudy in the east, temperature 86' almost every day." Ramm was welcomed by Mrs. Ramm when he left the liner at San Pedro. He plans to be here to welcome Archbold when the Guba returns to San Diego after a flight across Africa and the Atlantic ocean about July 1.

The Chagos islands, the Guba's goal on today's flight, belong to Great Britain. The total land area is about 76 square miles. Most of the population, about 500, are Negroes, who live on Diego Garcia, which is the largest of the islands, being 13 miles in length and six miles wide. Diego Garcia has a large lagoon, where the Guba is expected to alight.

Archbold Radioman Returns to S.D.

★ ★ ★ ★ ★ ★

HAROLD RAMM REVIEWS SCIENCE TRIP

"It was a great experience—but San Diego never looked better to me."

This is the way Harold G. Ramm, radioman with the Richard Archbold Hollandia scientific expedition, put it yesterday when he returned after almost 16 months away from the United States.

"I wished a number of times that I had gone along, too," said vivacious Mrs. Ramm, who met her husband when his ship docked at Wilmington yesterday morning. They were busy unpacking in their quarters in Arista apartments, 433 Nutmeg st., when they were interviewed.

'WHERE'S THE GUBA?'

"Where's the Guba?" Ramm asked, referring to Archbold's big San Diego-built ship in which he went from Hollandia, New Guinea, to Sydney, Australia, to catch a steamer for the United States.

"That reminds me," he said. "I'm supposed to go out and see Barney Boyd. I talked with him almost every day for the last 14 months and it will be good to see him again."

Ramm's job in Hollandia was to run the base communication system for the Archbold expedition,

(Continued on Page 2, Col. 3)

Richard Archbold, flying scientist, was to take off today at 2 a. m., Pacific standard time, from Cocos island, on a 1400-mile flight to Diego Garcia island in the Indian ocean, on the next leg of his air journey from Hollandia, New Guinea. The take-off, originally scheduled for yesterday, was delayed, according to information received from the Hollandia base camp by Barney Boyd, local short-wave amateur.

2 Lose Lives, 11 Hurt In $100,000 S. F. Fire

SAN FRANCISCO, June 12 (A.P.)—A $100,000 fire brought death to two Japanese, injured 11 firemen and destroyed the Japanese American News building near here today.

Michi Kugenuma, 21, was burned to death when, police said, he stopped to pack a suitcase. H. Tanaka, 41, a printer who was among those carried from the four-story building by firemen, died of burns in a hospital.

None of the 11 firemen injured during the three hour fight against the flames was badly hurt.

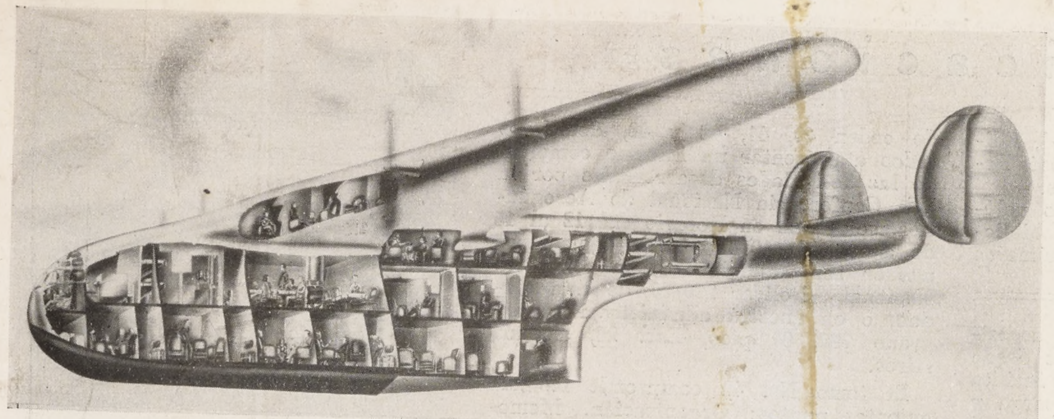
AVIA

El Hidroavión proyectado por la Consolidated Aircraft Corporation para el transporte trans-atlántico de 100 pasajeros



Sección longitudinal ideal del hidroavión proyectado por la Consolidated para el transporte de 100 pasajeros sobre las rutas del Atlántico. Nótese las cabinas situadas en el ala y la forma no común de la parte posteroinferior del casco, que lo asemeja al Handley-Page «Hampden». Sus cuatro motores estarán alojados en el interior de la célula.

El hidroavión Consolidated para 100 pasajeros, diseñado para llenar los requisitos exigidos por la Pan American Airways en su concurso para la adquisición de aviones para el servicio transatlántico, es un aparato no sólo veloz y económico, sino también confortable y conveniente para los pasajeros. Los requisitos esenciales para este avión de pasajeros eran: carga comercial, cerca de 11.500 Kg.; 16 tripulantes; radio de acción, 8000 Km. y cabina preferiblemente sobrecargada, para volar a 6.000 m. con una presión interior de la cabina equivalente a 2.450 m.

Como resultado de estudios previos, se llegó a la conclusión de que con los motores obtenibles actualmente o en un futuro cercano, el hidroavión proyectado debería ser propulsado por seis grupos motopropulsores, lo que daría por resultado un peso total, con carga completa, de más de 90 toneladas, a menos que se hallase el medio de aumentar la eficiencia del diseño y permitir una reducción material en el tamaño de la concepción original. Tal reducción traería automáticamente aparejados muchos refinamientos, tales como la eliminación de las ineficiencias resultantes del mayor número de motores. Este nuevo avión, diseñado de acuerdo a las tendencias de la Consolidated, incorpora características tales como elevada relación de alargamiento alar y carga por unidad de superficie sustentadora, remaches exteriores a nivel con el revestimiento, en toda la superficie, y flotadores auxiliares escamoteables en el intradós del ala.

Se desprende de inmediato que esta reducción de tamaño comprometía directamente y en razón directa el alojamiento de los 100 pasajeros y 16 tripulantes y sus facilidades de habitación. Un estudio detallado de este aspecto del proyecto reveló que con sólo un ligero aumento del espesor alar y un consecuente aumento de resistencia muy pequeño, sería posible que 36 de los 100 pasajeros fuesen alojados en el ala, así como también los motores, lo que mejoraría enormemente el rendimiento.

El problema principal que se planteó para acomodar los pasajeros en el ala fué que las cabinas serían atravesadas por las costillas. Esta dificultad fué allanada colocando costillas principales a los costados de cada compartimiento, en forma de tabiques y fijando entre cada una de ellas costillas auxiliares formando arcada, de manera de no reducir la altura efectiva de la cabina. El diseño del ala para llenar esta finalidad demostró tener otra ventaja importante. El revestimiento usado para resistir las cargas de flexión del ala sería amplio, sin otros refuerzos, para soportar las cargas de presión que se presentan en el vuelo subestratosférico.

El diseño del hidroavión Consolidated quedó por lo tanto establecido. Este aparato con cabinas sobrecargadas estaba en condiciones de llenar los requisitos de la Pan American, con un peso total, cargado, de 77.000 Kg. desarrollando un promedio mínimo de velocidad de crucero de 386 Km/h. para un radio de acción de más de 8000 Km. Los cuatro motores enfriados por líquido, de 2[illegible]0 C.V. cada uno están alojados en el ala, entre las costillas, con árboles de extensión que accionan las hélices tractoras. Estos motores serán accesibles en vuelo, para su mantenimiento y reparaciones menores.

El interior de la aeronave ha sido dispuesto con 36 pasajeros en el ala y el resto, o sea 64, en el fuselaje, con cabinas de 2 ó 4 plazas. Sillones giratorios de descanso, de tipo ajustable y confortablemente tapizados, serán provistos para los vuelos diurnos. Durante la noche, estos sillones son rápidamente convertibles en cómodas camas inferiores, mientras que las superiores se forman extrayéndolas de la pared, al estilo de los pullman ferroviarios. Ambas camas tienen suficiente espacio en alto para permitir sentarse en posición erguida en ellas, sin tocar la de arriba o el techo de la cabina. Todas las cabinas de dos plazas tienen la conveniencia de haber sido dotadas de un lavatorio combinado con tocador, plegadizos, mientras que las cabinas para cuatro personas están provistas de 12 tocadores, diseminados por todo el avión.

Cada cabina, además de estar hermosamente tapizada y decorada, está completamente aislada contra los ruidos y posee aire acondicionado, con un difusor a presión, sin corrientes de aire. La temperatura, grado de humedad y presión en todo el avión, son reguladas desde un tablero central de control.

El salón comedor, situado en el centro con todos los pasadizos y corredores desembocando directamente en él, acomoda a 18 personas por vez. El viajero, mientras paladea su merienda, tiene al mismo tiempo una vista clara y sin obstrucciones del panorama, a través de la ventana que tiene a su lado. El confort del pasajero es aun aumentado mediante comodidades para el descanso, para escribir y para pasearse.

La tripulación se acomoda en dos cabinas separadas. La mayor de las dos está en la parte posterior del avión y tiene comodidades para siete personas. Además de las siete grandes literas, hay en esta cabina un tocador y un lavatorio, como también gavetas para los objetos personales de la tripulación. La otra cabina de tripulantes, con literas y gavetas para dos personas, se encuentra en la parte anterior del avión.

La cocina y despensa se hallan adyacentes y delante del salón comedor, lo que permite un servicio conveniente. El equipo de la cocina incluye tanques de agua, horno, refrigerador, depósito de desperdicios y una abundante cantidad de gavetas y cajones para los alimentos y utensilios. El equipo ha sido distribuído de la manera más conveniente y no habrá posibilidades de confusión entre el personal de cocina.

Todo el equipaje de mano será instalado en la cabina que ocupará su poseedor. El equipaje más pesado, como ser baúles, será alojado en los compartimientos de carga y correo. En este avión habrá tres de estos compartimientos, uno de ellos en la proa, inmediatamente debajo de la cabina de pilotaje, otro en el borde de ataque del ala y sobre la cocina y el tercero en la cola del fuselaje. Todos estos

The Consolidated trans-Atlantic survey plane above the clouds. (Morrison)

WRIGHT DUPLEX CYCLONE IS ANNOUNCED; RATED AT 2000 H.P.

DEVELOPMENT of the world's largest and most powerful air-cooled aircraft engine by the **Wright Aeronautical Corporation,** of Paterson, N. J., with the assistance of U. S. Army Air Corps' engineers, was announced May 15th by Louis Johnson, Sec'y. of War.

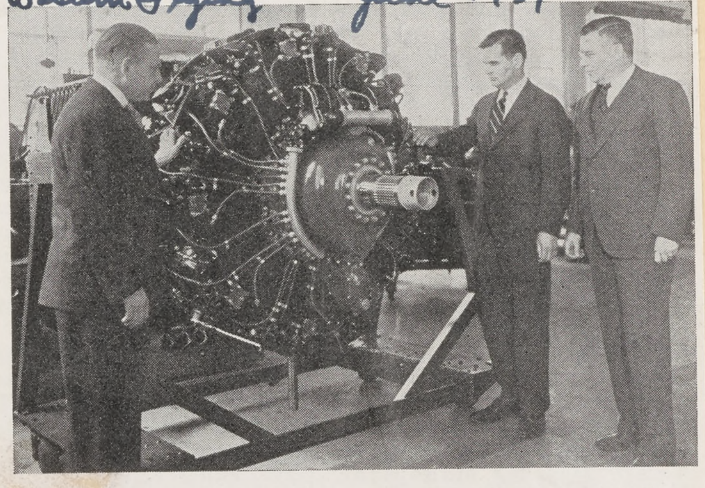
The new engine is the Wright Duplex-Cyclone and is a double-row, air-cooled, radial type with 18 cylinders arranged in two rows of 9 cylinders each and rated at 2000 h.p.

It is 500 h.p. more powerful than the 1500 h.p. Double-Row Cyclone 14 from which it was developed, and which has the highest power rating ever accorded an American-built air-cooled radial engine by the Civil Aeronautics Authority.

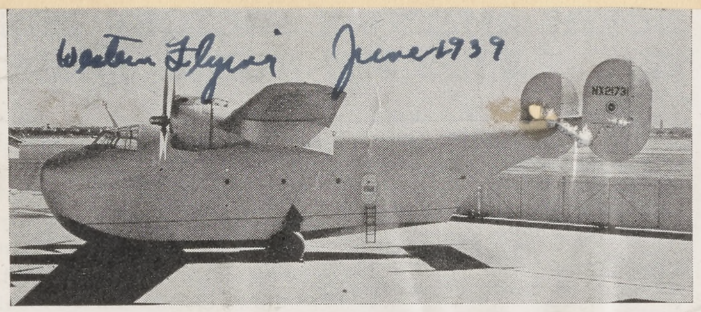
The new Duplex-Cyclone has four more cylinders than the Cyclone 14 however and as its name implies is virtually two 9-cylinder engines built on one crankcase and using a common crankshaft.

Two of these engines powered the new long range Consolidated Flying Boat which made its first flight in May with 52 passengers and a crew of five on the Pacific Coast.

Western Flying June 1939



The Duplex Cyclone is here being admired by (left to right) Vice-President George Chapline, Chief Engineer P. B. Taylor, and General Manager H. B. Gordon, of Wright Aeronautical Corporation.



Western Flying June 1939

Consolidated's new Model 31—a revolutionary flying boat.

NEW AIRFOIL, NEW ENGINES ARE FEATURES OF CONSOLIDATED 31

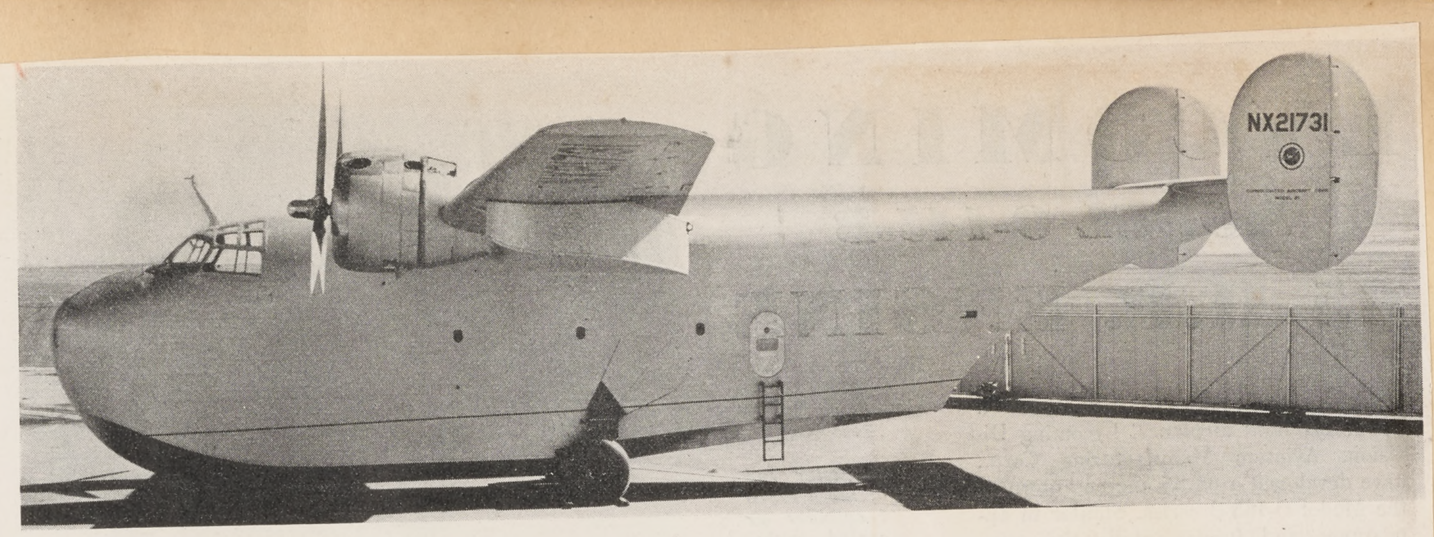
THE Consolidated 31 is still undergoing tests at San Diego and while it is the private project of **Consolidated Aircraft Corporation** it is being treated with as much secrecy as though it were being built for the Government. Consolidated points out that, after all, the Navy is the best prospective customer for this revolutionary type of flying boat and that in view of the possibility the Navy considers its purchase, it is following Navy policy insofar as publicity releases and photographs are concerned.

No specifications of the ship have been released. It is learned, however, that its two most significant features are the two 18-cylinder Wright Duplex Cyclones (GR3350-A-71) which supply it with a total of 4,000 h.p., and an entirely new air foil developed by David R. Davis. Few details of this new wing curve have been released, but it is noteworthy that the wing is small, considering the size of the airplane which it supports and that estimated wing loading is 50 lbs.

The hull is very deep, giving room for two decks, each with a head clearance of 6 ft. 6 in., and is so designed and shaped that practically all of its interior, with the exception of a few cubic feet in the tail of the ship, may be utilized.

In spite of its small wing, the ship is said to have displayed remarkable performance on its first test flight. The wing floats are said to have shown a tendency to plow, and this is being remedied by redesigning the nose of the floats. Unlike the conventional Consolidated float, which retracts into the end of the wing, the float on the 31 is located about midway of the span of the wing. In the extended position, the float projects down from the wing on the end of a strut, which, in the retracted position, folds up against the bottom of the wing and apparently is covered by the float itself.

The 31 has a wing span of 110 feet, an overall length of 73 feet, a height of 22 feet, and a maximum wing chord of 14 feet. These figures are approximate. Gross weight is 50,000 pounds. Wings, tail surfaces, and planing surface of the hull are flush riveted and control surfaces are fabric covered. Accommodations may be installed for 52 day passengers, or 28 sleeper passengers. The beaching gear is of the tricycle type, the nose-wheel retracting into the bottom of the hull, and the side wheel into the sides.



CONSOLIDATED 25-TON MODEL 31 FLYING BOAT

- Ten months after it was conceived, the 25-ton Model 31 flying boat made its initial flight over San Diego to bring to a successful culmination one of the few non-government projects undertaken by the Consolidated Aircraft Corp.

Adaptable either for commercial or military purposes, Model 31 also marked the initial public demonstration of Wright Aeronautical's new 18-cylinder double row engines rated 2000 hp for take-off, and about which no data is presently available. These engines are equipped with 16′ dia. Hamilton Standard hydromatic full-feathering propellers.

As a commercial transport, the new Consolidated can carry a maximum of 57 passengers for day operations, and has sleeper accommodations for 28 passengers for trans-oceanic flights. Provision is made for a flight crew of five—pilot, co-pilot, flight engineer, radio operator and navigator.

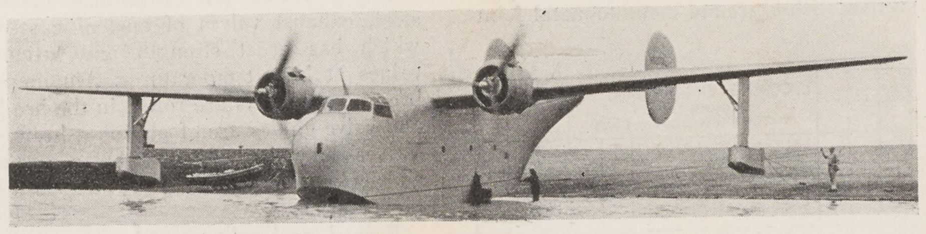
Wings have a span of about 110 ft. and a maximum chord of 14 ft. They are all-metal flush riveted full cantilever units employing three sections—two outer panels and the center section which incorporates integral fuel tanks. Fabric-covered Fowler trailing edge flaps are hydraulically actuated and extent inboard from the fabric-covered ailerons to the hull. Because of a tip section which is smaller than that on its PBY type, Consolidated has found it desirable to employ an outboard float which retracts into the underside of each outer wing panel instead of at the tip.

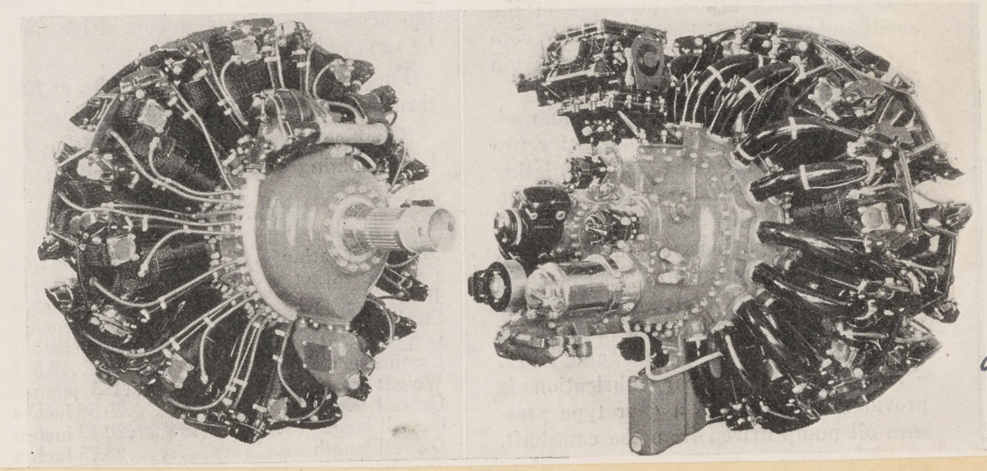
The hull is a single-step type of semi-monocoque structure internally reinforced by longitudinal stringers and transverse bulkheads and frames. Outer covering is aluminum-coated aluminum alloy, the planing surface of the bottom being flush riveted. The interior presents a double-deck arrangement—one over the other to provide a large soundproofed flight control compartment above, and eight large compartments below. Overall length of the boat is about 73 ft., overall height approximately 22 ft.

Fixed tail surfaces are also flush riveted metal and cantilevered; the moveable surfaces are fabric covered. Use is made of twin fins and rudders, the latter being provided with trimming tabs.

Equipment includes a hydraulically operated retractable tricycle beaching gear. Side wheels swing upward into wells in the hull sides where they are fully enclosed by doors which fit flush into the hull lines. The nose wheel is housed in a well in the hull bottom and is also closed in by a door which is flush with the bottom contours.

As a military airplane, Model 31 would augment the PBY type patrol bomber built by Consolidated for the U. S. Navy. While no performances data is available, Consolidated officials reported that the new flying boat embodies extensive advances over the PBY type in speed, range and load capacity.





Three-quarter front and rear views of the Wright double-row engine rated at 2000 hp for take-off. The view above shows the installation of two of these engines in the new Consolidated Model 31 flying boat being test flown at San Diego, California

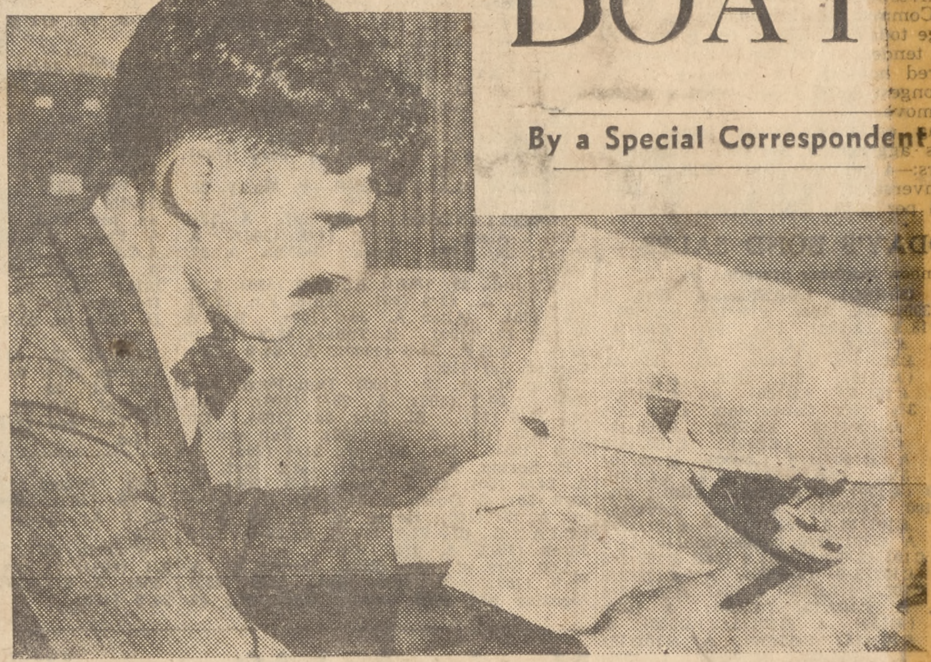
ACROSS THE INDIAN OCEAN BY FLYING BOAT

By a Special Correspondent

Australian pioneers of the air have conquered the Pacific and the Atlantic Oceans, and now a conspicuous figure among them, Captain P. G. Taylor, is to attack the Indian Ocean.

This article describes the route which the flying-boat Guba, chartered by the Commonwealth Government, will take on its survey flight, on which Captain Taylor will represent the Commonwealth and bear the responsibility of organisation.



Mr Richard Archbold, owner of the Guba, looking at a picture of the machine.

CAPTAIN TAYLOR'S projected flight, over 4000 miles from Onslow in Western Australia to Mombasa in Africa, is an enterprise comparable to his Pacific flights with Kingsford-Smith, and to the flights of the American clippers from San Francisco to China.

In one respect, in particular, the adventure of the Indian Ocean will resemble the Pacific flights—it will consist of a series of "hops," from one continent to another, with romantic little equatorial islands as resting places.

How appropriate it is that, in this official Australian enterprise of Empire, the first stop of the flying-boat should be at the Cocos Islands! For these islands, of course, are now famous in Australian history as the scene of our first distinctive sea-battle, the destruction of the German raider Emden by H.M.A.S. Sydney.

Early in the Great War the Emden had been carrying out a campaign of destruction in the Indian Ocean, and because of this Australian troopships had to be heavily guarded. The Sydney, sturdy battleship among the convoys, smashed the Emden at a distance of three miles, and left the raider a broken wreck on one of the islands.

Many Australians know the Cocos group at firsthand, because it is a port of call of certain mail steamers plying between this country and England. At least, the steamers stop in the vicinity, and the islanders sail or row out to get their mails, etc.

A low-lying, picturesque group, suggesting from a distance a mere expanse of palm-trees, the Cocos Islands—called also the Keeling Islands and sometimes the Cocos-Keeling Islands—have an interesting history.

The original name commemorates Captain William Keeling, who discovered the strangely isolated coral outcrops in 1609. He found them to be a group of 23 islands, with the whole atoll only about 10 miles wide, covered for the most part with tropical flora.

"King" Of Cocos

BECAUSE of their isolation the islands remained unclaimed for centuries; but in 1823, Alexander Hare, an English adventurer, settled on the southernmost island with a number of slaves. A few years later the Clunies Ross family settled on Direction Island, and for years there was a feud between the rival settlers. To this day the name of Clunies Ross is closely associated with Cocos.

Indeed, John Clunies Ross is by way of being the "monarch" of Cocos. But he does not, according to report, care for the title of "King"; he prefers to be known as "sole proprietor" of the islands.

Be that as it may, the Ross rule appears to be quite effective; there has not been a serious misdemeanor on the Cocos Islands for more than a quarter of a century.

The islands were declared a British possession [illegible] were placed under the control of Ceylon in 1878, and subsequently under the control of the Straits Settlements. In 1902, a station on the Cape-Australia cable route was established on Direction Island, in the north-eastern part of the group. This station was the subject of attack by the Emden in 1914.

The population of the Cocos Islands is approximately 1300. Life centres mainly on the cable station, but there are large coconut plantations and copra, oil, and nuts are exported.

Time slips by pleasantly enough on the islands, judging by the men who make their bow to the mail steamers. One young fellow who smiled up at a recent vessel was asked by a passenger why he affected a majestic beard.

"This," he shouted back, "is a sensible place——there's no need here to use a razor!"

One imagines, however, that the islands will be stirred out of their usual placidity when the flying-boat Guba drops down from the clouds. P. G. Taylor will probably be their most distinguished visitor since the days when Charles Darwin studied corals there

Diego Garcia

FROM Onslow to the Cocos Islands is little more than 1000 miles—a relatively brief hop for a man who has done his two and three thousand miles non-stop across the Pacific. The second "leg," however, is longer, being approximately 1500 miles from Cocos to Diego Garcia, in the Chagos Islands.

To most Australians, perhaps, the Chagos group is but a name, a speck on the wastes of the Indian Ocean. Actually, the islands are an interesting little archipelago, belonging to Great Britain, and administered by Mauritius. They lie about 1000 miles south of Ceylon, and are, therefore, well off the track of mail steamers.

The total land area in the Chagos group is approximately 76 square miles. Half a dozen islands of a coralline nature constitute the archipelago, but most of the population —only about 500, mostly negro laborers from Mauritius—live on Diego Garcia, which, the largest of the islands, is 13 miles long by 6 miles wide.

Diego Garcia has an excellent lagoon, typical of most of these coral atolls. It is there, presumably, that the Guba will rest. This lagoon has accommodated some large vessels from time to time.

The French occupied the islands in 1791 from Mauritius, and the oil industry (from which the group is sometimes called the Oil Islands) came into the hands of French Creoles. In 1814, Mauritius and its dependencies were ceded to England, and now comes a development never dreamed of in those days—the Chagos takes a place as an Empire airways link.

The Seychelles Group

THE last of the three island links in the new chain is the Seychelles group, some 900 miles due west of Diego Garcia. Here is a large and relatively important archipelago, since the islands have a total area of 156 square miles, and a population of nearly 30,000.

Lying about 600 miles north-east of Madagascar, and about 800 miles from the coast of Africa, the Seychelles consist of 10 islands, and a large number of coral banks. The largest and most central island, Mahe, is 17 miles long and about seven miles across at its widest point. It has a very good harbor, Port Victoria, and it is to this that Captain Taylor and his companions will bring their flying-boat.

Seychelles is a British Crown Colony administered by a governor, assisted by a nominated executive and legislative councils. Most of the population consists of negroes (descendants of slaves from Mauritius and Africa), Indians, and Chinese. The white residents number only about 1000.

The Seychelles have been known for at least 400 years; they are marked on Portuguese maps dated 1502. The first recorded visit, however appears to have been that of an English ship in 1609. Well over a hundred years later the islands were formally annexed by France, upon which the group was named after an important French official, Moreau de Sechelles, and the principal island after Mahe de la Bourdonnais, Governor of Mauritius.

The first permanent settlement was made about 1768, when the town of Mahe was founded. Spice plantations were secretly made (with the object of wresting this trade from the Dutch) but they were destroyed by fire by the French on the appearance in the harbor, in 1778, of a vessel flying the British flag. That was a bad mistake, for the ship proved to be merely a French slaver, which had hoisted the Union Jack in the belief that the British were in possession.

The islands were occupied in 1810 by the British, to whom they were ceded by the treaty of Paris in 1814. J. B. Queau de Quincy, governor under the Monarchy, the Republic, and the Empire, was appointed by the British to be agent-civil, and he acted until his death in 1827. In all, that remarkable official governed the Seychelles for 38 years.

MELBOURNE "HERALD", 29/3/39.

EMERGENCY INDIAN OCEAN ROUTE

Strategic Value Of Flight

ptain P. G. Taylor's Indian Ocean survey flight, to be made ne in the Archbold Expedition's flying-boat Guba, is re- d by strategists in both England and Australia as a vital in safeguarding the Empire's wartime communications.

importance of an alternative as impressed on the Common- Government during the Septem- s, when several Australia-bound oats were temporarily held in n case war broke out. lling by way of Lisbon to the ast of Africa, then across the t to Mombasa, the take-off point four ocean stages, boats using the Empire route" would avoid the ions of the existing route which rded as particularly vulnerable ime.

are the Mediterranean and the between Singapore and Australia.

LAST OCEAN

se of the existing emergency in the strategic aspect of the flight its interest as the crossing of ocean of the world to be con- by the aeroplane.

both points of view it is the tion of years of planning by Taylor, who has been attempt- ecure backing for the flight since en he first saw the possible weak- of the present Empire route and , at the same time, that an ian pilot should make the first Ocean crossing.

When he was in England at the be- of last year, he discussed the with British Air Ministry offi- ut found there was then no suit- ritish flying-boat available. He ent to the United States, where table boat was available for

PACIFIC CROSSING

is return, Captain Taylor placed ns before the Prime Minister (Mr secured the active support Federal Treasurer (Mr Casey). tiations with Mr Richard Archbold, the young millionaire American scientist, whose flying-boat Guba had already crossed the Pacific from California to New Guinea, were begun, and in December, Captain Taylor inspected the Guba at Williamstown and in Sydney.

Keenly interested in the proposal, Mr Archbold sent Captain Lewis Yancey, his navigator, to Sydney some weeks ago, and the agreement between Captain Taylor, Mr Archbold and the Commonwealth Government was completed at the week-end.

SHELTERED LAGOONS

Captain Taylor's data about the three island stopping-places, accumulated over years, show that all have sheltered harbors suitable for flying-boats. On his flight he will spend some days at each island taking soundings in lagoons and seeking both bying-boat and landplane aerodromes by air and ground surveys.

Distances of the four ocean stages are:

	Land miles.
Onslow (W.A.)—Cocos Is.	1435
Cocos Is.—Diego Garcia	1717
Diego Garcia—Seychelles	1192
Seychelles—Mombasa (Kenya)	1110

Because the longest of these stages is 500 miles shorter than the San Francisco-Hawaii air route which Pan-American Airways has been operating for three years, no doubts about the feasibility of the route are entertained.

LONG RANGE

The Guba, a standard American Navy patrol-boat, has a range of 4000 nautical miles as she is now equipped and, if necessary, she could carry enough extra fuel to enable her to fly the 4600 nautical miles from Onslow to Mombasa non-stop.

Preparations for the flight have been the best-kept secret in Australian aviation. Some weeks ago, to brush up his knowledge of modern flying technique and engines, Captain Taylor made a number of flights between Sydney and Melbourne in Australian National Airways Douglasses—a route he had often flown nine years ago when he was one of the select band of Fokker pilots employed by the original Australian National Airways.

Despite his unusual appearance as a supernumerary member of an airliner's crew, however, only a handful of men in Australia knew what he was planning.

PIONEER WORK

After Captain Taylor's flight, Australia will have the satisfaction of having pioneered the air trails across the two oceans that touch the Continent.

His close friends, the late Sir Charles Kingsford-Smith and Mr C. T. P. Ulm, made the first and so far only America-Australia flight in 1928, and, in 1934, Sir Charles and Captain Taylor made the only Australia-America flight.

By his splendid navigation on that flight, on several Tasman crossings in the Southern Cross and the Faith in Australia, and with the Faith in Australia on its fast flights from Australia to England and back, Captain Taylor has earned the title of the leading air navigator in Australia and one of the most famous in the world.

COST £3000

It was officially announced in Canberra today that the flight would cost the Commonwealth £3000.

The Commonwealth would bear the entire cost. Although Britain had been advised, the project was entirely Australian.

Asked if the route could feasibly be developed, officials refused to comment. They declined to state also how long it would take to establish a regular service; whether Australia would be responsible for the cost and upkeep of the bases if the service was established, and whether flying boats were available for an early start with the service.

On To Mombasa

THE most important industries of the Seychelles are fishing and agriculture. For many years these islands have been producing spices, cotton, coffee, tobacco, sugar, maize, rice, bananas, yams, coconut oil, timber, fish and tortoise-shell. Cocoa, too, has been extensively cultivated, and in recent years vanilla has been produced in large quantities. The medium of exchange is the Indian rupee, with the subsidiary coinage of Mauritius.

Early in the present century agriculture slumped badly in the Seychelles. During 1905-1910, however, successful efforts were made to broaden the economic resources of the colony.

Since that time direct telegraphic communication with Mauritius, Zanzibar, Aden, and Colombo has been established, and a Government wireless telephone service was opened in 1926 between Victoria and the Parslin Islands.

Captain Taylor's final stage, from the Seychelles to the African continent, will bring him to a country with older human contacts than any of his island ports, the ancient land of Kenya. It is a romantic spot for the conclusion of a journey by air across the Indian Ocean.

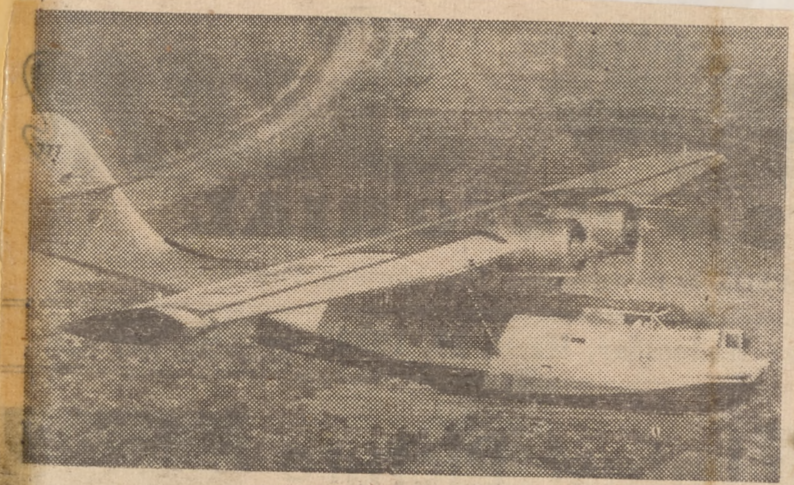
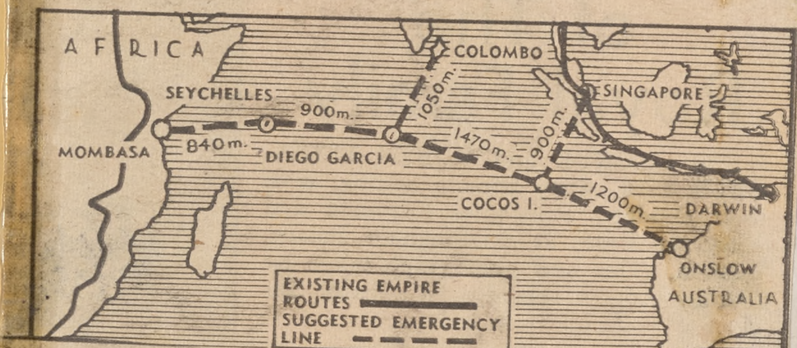
AUSTRALIA TO MOMBASA BY FLYING BOAT

The Sun News Pictorial

Captain P. G. Taylor Will Make Trip in Guba



THE FLYING BOAT GUBA



Captain P. G. Taylor

CANBERRA, Tuesday. — Capt. P. G. Taylor, colleague on several great ocean flights with the late Sir Charles Kingsford-Smith, and one of Australia's greatest aviators, is to pioneer another ocean air route.

Federal Cabinet decided today to sponsor a trans-Indian Ocean survey flight in June.

The long-range flying boat, Guba, will be used, and Capt. Taylor will be accompanied by Mr. J. Percival as official correspondent, and by Dr. Richard Archbold, owner of the Guba; Capt. L. A. Yancey, an Atlantic flyer, and Mr. Russell Rogers, an American test pilot.

THE survey flight will have great defence significance, as it will prove the practicability of the Indian Ocean route for civil and defence planes in the event of war.

The Minister for Civil Aviation (Mr. Thorby) announced tonight that the Guba would leave Onslow on the north-west coast of West Australia and would fly to Mombasa on the east coast of South Africa by Cocos Island, Diego Garcia in the Chagos Islands, and Victoria, Mahe in the Seychelles Islands.

At each of these points, Mr. Thorby said, conditions existed for the development of flying boat bases.

Data For Island Bases

CAPT. TAYLOR and his companions would make meteorological and other observations over the whole route and time would be spent at each island in the collection of data suitable for base establishment.

The Government, he added, had chartered the Guba from Dr. Richard Archbold, research associate of the American Museum of Natural History, the agreement having been completed with Capt. L. A. Yancey, acting on Dr. Archbold's behalf.

An agreement between the Government and Dr. Archbold stipulates that the flight shall be made between June 10 and August 1.

Flight Of 4000 Miles

THE distance from Onslow to Mombasa is about 4000 miles. It will be covered in the following stages: Onslow to Cocos Island (1000 miles), Cocos to Diego Garcia (1250 miles), Diego Garcia to Seychelles (850 miles), Seychelles to Mombasa (800 miles).

The longest stage is about 100 miles more than that from Sydney to Wellington (N.Z.).

Mr. Thorby said that the Australian expedition would be accompanied by Dr. Richard Archbold, who would make scientific investigations during the flight.

The Commonwealth would bear the whole cost of the flight. There would be no vessel to patrol the route in case of mishap.

Fuel Arrangements

A SPECIAL vessel has been chartered to carry 2500 gallons of fuel to each of the islands.

For more than four years Captain Taylor has advocated the survey of a reserve Empire air route across the Indian Ocean. Many critics believe the present route to be too vulnerable in the event of European hostilities.

The Indian Ocean route does not cross the country of any power other than those likely to be friendly. It is the only ocean that has not been crossed by a flying machine.

Will Carry Mail

CAPT. TAYLOR would represent the Government on the expedition and would be responsible for the whole organisation, including the provision of stores and fuel supplies and accommodation at all stopping places.

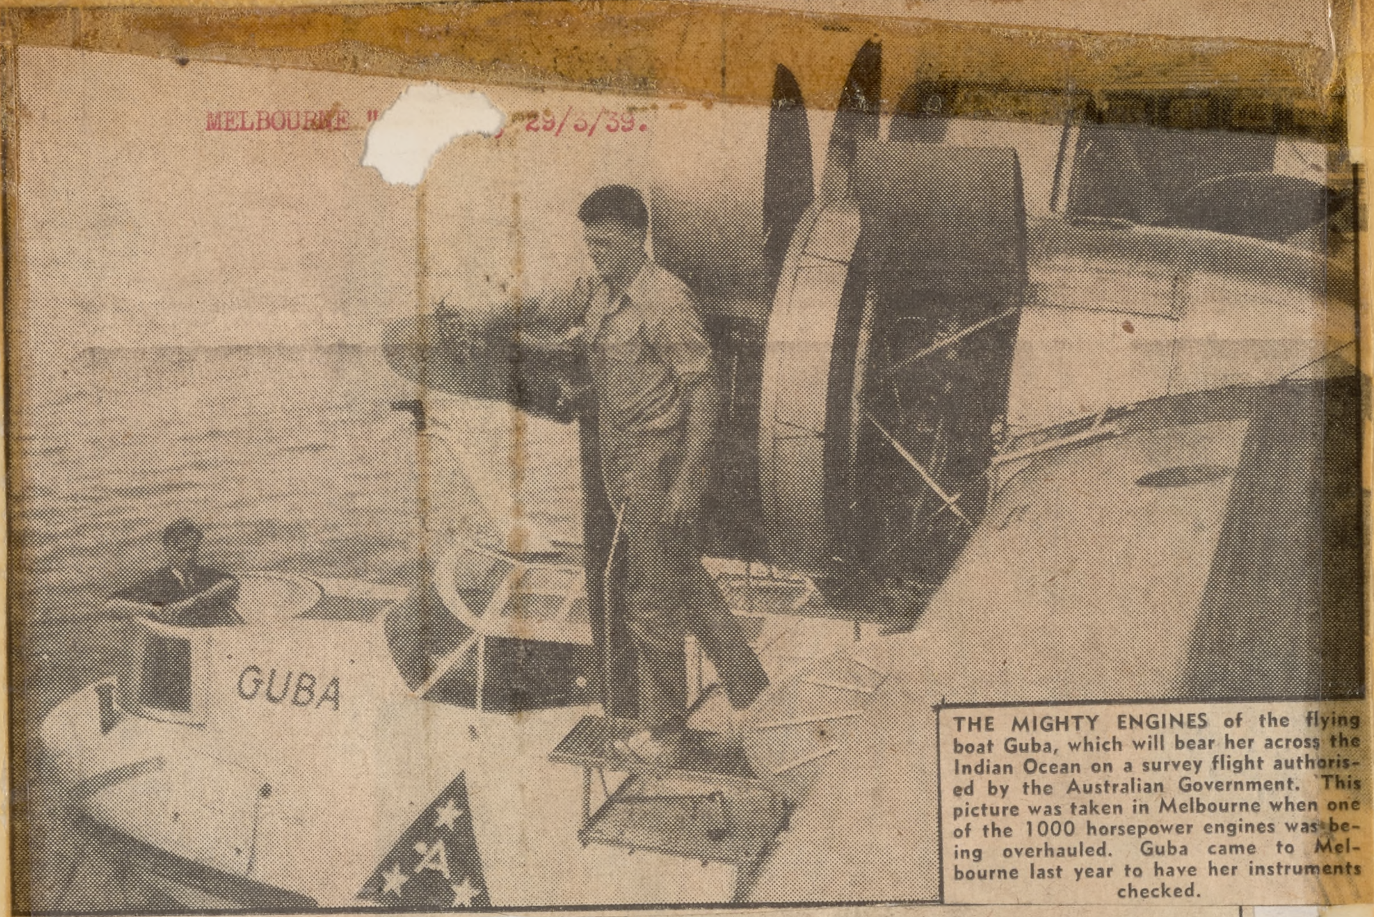
Mr. Percival would be subject only to Capt. Taylor's directions and would be in sole control of publicity, news, photographs, motion pictures and broadcasting.

The Guba, said Mr. Thorby, would be overhauled at Rose Bay, Sydney, before the flight and would carry 400lb. of mail.

DOOLITTLE DUE S. D.

Maj. Jimmy Doolittle, nationally famous flier, arrived at Lindbergh Field in a fast Seversky pursuit plane this afternoon for conferences with local aircraft officials, including Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp. Maj. Doolittle now is aviation adviser to an oil company. SDSUN 6/15/39

MELBOURNE " 29/5/39.



THE MIGHTY ENGINES of the flying boat Guba, which will bear her across the Indian Ocean on a survey flight authorised by the Australian Government. This picture was taken in Melbourne when one of the 1000 horsepower engines was being overhauled. Guba came to Melbourne last year to have her instruments checked.

SURVEY FLIGHT OF INDIAN OCEAN

THESE TWO MEN, Mr Russell Rodgers (left) and Captain L. A. Yancey, navigator and Atlantic flyer, will be in the Guba on her survey flight. They were photographed in Melbourne on the visit of the great flying boat.

CORRESPONDENT of Guba's flight will be Mr J. Percival (above) a Sydney journalist.

IN CHARGE of Guba and the flight will be Captain P. G. Taylor (above) famous navigator, seen here testing an instrument.

'Guba' Off Tonight For Kenya Colony

Richard Archbold's scientific expedition plane "Guba," after making several flights to various islands in the Seychelles island group in the Indian ocean, is expected to depart tonight for Mombasa, Kenya colony, Africa, according to a radio message received by B. F. Boyd, local radio amateur. The Guba, which is on a trail-blazing flight across the Indian ocean for the Australian government, has been in the Seychelles group for several days.

15 Planes To Hop For Hawaii June 28

S.D. TRIBUNE 6/20/39

Naval authorities here today announced a massed flight of navy patrol planes from San Diego to Honolulu is scheduled to start at 2 p.m. June 28. The 15-plane flight, under command of Lt. Comdr. Sam La Hache, commanding VP-1 squadron, will follow the direct route flown in previous flights by navy patrol planes.

Personnel who will be aboard the planes will be announced within the next few days by aircraft scouting force authorities.

Mariners are advised of the danger of collision between the planes and surface craft on the bay during the time of take-off, and naval authorities urged the utmost caution by surfcace craft, asking them to keep clear of the take-off area.

BOMBERS SET HAWAII HOP

15 Patrol Aircraft Takeoff In Week

S.D. SUN 6/21/39

Aviation

The crews of 15 patrol bombers — comprising approximately 90 officers and enlisted men—today were making final preparations at North Island for the takeoff on a mass flight to Hawaii one week from today, weather permitting.

Patrol Squadron One, which has been in training here for the nonstop trans-Pacific hop for several months, will make the flight to deliver the Consolidated PBY airboats for permanent duty in the Hawaiian Islands. The unit is commanded by Lt.-Comdr. Sam L. La Hache, veteran Navy seaplane pilot.

The aircraft tender Childs is en route from San Diego to new duty in Pearl Harbor with Patrol Wing Two, and is expected to serve as a plane guard for the squadron. Two other aircraft tenders, the Avocet and Pelican, will aid in guarding the flight while steaming from their former base in Pearl Harbor to San Diego. The Pelican is due here June 30 and the Avocet will arrive July 2.

S.D. UNION 6/22/39

Archbold Ship Hops For African West Coast

Richard Archbold's San Diego-built flying boat Guba, which recently surveyed a new air route over the Indian ocean from Australia to Africa, is on its way over Africa to Lagos, on Africa's south-western coast, according to a report received yesterday by Barney Boyd, local amateur radio operator. The plane left from Mombassa, Kenya colony, Africa, where it had completed in four hops the 4674-mile ocean survey flight.

Boyd said the report indicated that the ship would fly over Lake Victoria and Stanleyville, central Africa, then to Labos. The message did not state whether the flight would be non-stop.

BOMBER TAKES OFF

A Navy Consolidated patrol bomber, piloted by Lieut. George T. Mundorff Jr., and a six-man crew, took off at 4:15 a. m. today on a transcontinental nonstop flight to Pensacola, Fla., en route to Norfolk, Va., for permanent duty on the east coast. The airboat was over El Paso at 9 a. m., averaging 122 miles per hour, the Naval Air Station reported. S.D. SUN 6/22/39

S.D. Sun 6/22/39

ARCHBOLD ON WAY BACK TO SAN DIEGO

Having conquered the Indian Ocean the first time it has been traversed by an airplane, Richard Archbold's airboat Guba today was en route to San Diego to carry out orders for its crew to deliver a Consolidated patrol bomber to England early next month.

The Guba took off from Mombasa, Africa, a few hours after completing the final lap of the 5400-mile survey of a military and commercial air route from Australia, Barney Boyd, local amateur wireless operator, reported today. Its goal was Lagos, on Africa's Gold Coast, via Lake Victoria and Stanleyville, Belgian Congo, in an approximate 1800-mile hop. From Lagos the San Diego-built plane will proceed to Dakar, Senegal, extremest west point of Africa, before crossing the Atlantic to the United States via the Virgin Islands.

An attempt will be made to reach here July 1 to prepare for the flight to England in the airboat purchased by the Air Ministry. According to present plans, only one stop will be made en route to Felixstowe, marine aircraft experimental establishment on the North Sea. That will be at Botwood, Newfoundland, after a non-stop 3300-mile flight from San Diego.

In the crew will be Russell Rogers, pilot; Capt. Lewis Yancey, navigator; Gerald Brown, engineer; Ray Booth, radioman; Squadron Leader J. R. Adams of the Royal Air Force, and possibly a Consolidated representative. Whether Mr. Archbold will go is uncertain.

Aero Revue (Berne) May 1939

zahl, unabhängig von der Windgeschwindigkeit, somit die Möglichkeit, solche Windkraftwerke an die schon bestehenden Überlandsnetze anzuschliessen.

Zur Veranschaulichung der in den letzten Jahren erreichten Geschwindigkeitserhöhung durch Verbesserung der Flugzeuge und Flugmotoren sind zwei Flugzeugmodelle ausgestellt. Das eine Modell ist ein verspannter Doppeldecker mit nichteinziehbarem Fahrgestell, wie er in verschiedenen Ländern in den Jahren 1930 bis 1934 gebaut wurde. Das andere Modell ist ein Studienentwurf für einen modernen Jagdeinsitzer. Neben jedem Modell ist eine Scheibe aufgestellt, die denselben Luftwiderstand wie das zugehörige Modell hat. Die zwei Scheiben zeigen deutlich die in den letzten Jahren erreichte Herabsetzung des Luftwiderstandes. Die Widerstandsverminderung ist möglich geworden durch Vermeidung aller Streben und Verspannungen, durch Einziehen des Fahrgestelles, durch günstige Profilierung des Flügels, durch verfeinerte Rumpfform, sorgfältigen Kühlereinbau usw. Zusammen mit der gleichzeitig erreichten Leistungssteigerung der Flugmotoren, besonders für den Flug in grossen Höhen, ist eine Geschwindigkeitserhöhung von 320 km pro Stunde beim älteren Flugzeug auf 720 km pro Stunde beim modernen Flugzeug möglich geworden.

Interessant ist eine Gegenüberstellung der Widerstandsbeiträge der verschiedenen Teile an den zwei Flugzeugen im Schnellflug. Beim älteren Flugzeug bringt der sogenannte schädliche Widerstand des Fahrgestelles, der Streben und Verspannungen den Hauptanteil. Beim modernen Flugzeug dagegen besteht der Hauptanteil aus dem Profilwiderstand, dazu kommen Rumpf- und Leitwerkswiderstände. Der Kühlerwiderstand verschwindet im Schnellflug, infolge thermodynamischer Ausnützung der umgesetzten Wärme.

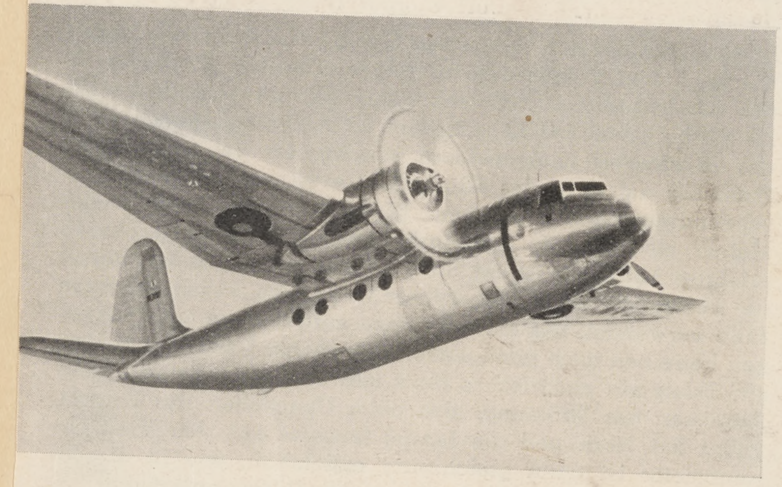
Den beiden Modellen sind die zugehörigen Polaren und die Kurve des Widerstandes in Abhängigkeit von der Fluggeschwindigkeit beigegeben, gemäss Messungen im ETH-Windkanal. Zur vollständigen Untersuchung eines Modelles gehören u. a. auch Messungen mit laufendem Propeller (Einfluss des Propellerstrahles). Dabei wird im Modellrumpf ein **Elektromotor** zum Antrieb des Propellers eingebaut. Im Institut für Aerodynamik werden kleine schnellaufende Drehstrommotoren verwendet, die durch Drehstrom mit Frequenzen bis zu 500 pro Sekunde angetrieben werden. Ein in der Institutswerkstätte hergestellter Drehstrommotor von 2,5 PS bei 15.000 Touren pro Minute ist ausgestellt.

Zu genauen Druckmessungen werden im Institut für Aerodynamik **Schwimmermanometer** Prinzip Betz verwendet. Am Schwimmer ist eine Glasskala befestigt, die auf eine Mattscheibe vergrössert projiziert wird und eine Ablesung auf $^1/_{20}$ mm Wassersäule genau gestattet. Der Messbereich beträgt 300 mm Wassersäule. Ein solches ebenfalls in eigener Werkstätte hergestelltes Manometer vervollständigt die ausgestellte Modellsammlung.

VERKEHRSFLUGWESEN · AVIATION COMMERCIALE

Der «Douglas DC-5».

Die Abteilung El Segundo der Douglas Aircraft Company in Santa Monica, Kalifornien, hat als neuestes Modell den « DC-5 » herausgebracht, der speziell für den Zubringerdienst von kleinen Flughäfen im Lande gedacht ist.



Das Flugzeug ist ein Ganzmetall-Hochdecker mit zwei Motoren und Dreirad-Landegestell, dessen drei Räder voneinander unabhängig (also ohne gemeinsame Achse) montiert und in die Tragflächen bzw. in die Rumpfspitze einklappbar sind. Als Motoren hat man für die Probeflüge G-2-Motoren eingebaut, die aber später durch G-102 A-Motoren ersetzt werden sollen.

Die Höchstgeschwindigkeit des Flugzeuges beträgt mit der augenblicklichen Motorenanlage 370 km/Std. Mit nur 50 % der höchstmöglichen Motorenleistung fliegt das Flugzeug in 3000 Meter Höhe immer noch 275 km/Std. Mit 75 % der Motorenleistung beträgt die Reisegeschwindigkeit 330 km/Std. Gipfelhöhe mit beiden Motoren ist 7400 m, mit einem Motor 3660 m. Der Anlauf ist recht kurz, nur 240 m, etwa die dreizehnfache Rumpflänge.

Die Spannweite des DC-5 ist 23,4 m, Rumpflänge einschliesslich des Leitwerkes 18,5 m und das Startgewicht 8200 kg. Der Rumpf ist mit besonders grossem Laderaum ausgestattet und hat in seiner Struktur einen regelrechten Kiel, um die Festigkeit zu vergrössern. Die drei Räder sind sehr gross gehalten und mit besonders kräftigen Bremsen versehen, um auch auf kleinen Flughäfen gut und sicher landen zu können.

Willy Ley.

Flugboot «Modell 31» der Consolidated Aircraft Corporation.

Seit Jahren schon sind die PBY-1-Flugboote der Consolidated Aircraft Corporation in San Diego in Kalifornien der besondere Stolz der U. S. Navy. Ihre ganz hervorragenden Flugeigenschaften haben naturgemäss dazu geführt, dass sowohl begüterte Privatleute als auch wissenschaftliche Gesellschaften immer wieder an die betreffenden Dienststellen mit dem Ersuchen herangetreten sind, die PBY-1-Flugboote zum Privatgebrauch freizugeben, entweder als schnelles und sicheres Beförderungsmittel für Expeditionen oder einfach als « Luftjacht ». Obwohl verschiedene Male in amerikanischen Tageszeitungen berichtet wurde, dass eine « Zivilausgabe » dieser Flugboote geplant sei, scheint man bei den zuständigen Stellen doch zu zögern.

Jetzt hat die Consolidated Aircraft Corporation aber ein neues Modell herausgebracht, welches ganz und gar dem Wunsch nach solcher Luftjacht gerecht wird. Dies « Modell 31 » wurde zwar mit Wissen der U. S. Navy, aber auf Kosten der Consolidated gebaut. Die ganze Entwicklungsperiode, von der ersten Konstruktionszeichnung bis zum fertigen Flugzeug betrug nur zehn Monate.

Das Modell 31 hat ein Startgewicht von etwa 22.700 kg, seine Spannweite beträgt 33,5 m, seine Höhe 6,7 m und seine Länge 22,2 m. Es hat zwei Wright-18-Zylinder-Doppelsternmotoren von je 2000 PS, die zwei dreiblättrige Hamilton-Standard-Metallpropeller von 4,8 m Durchmesser antreiben. Als Baumaterial hat durchwegs Aluminium Verwendung gefunden, nur die Verwindungsflächen und das Leitwerk sind mit Stoff bespannt. Der Rumpf ist in zwei übereinander liegende Decks unterteilt und bietet für Tagesflüge für 52 Fluggäste Raum, für Nachtflüge als Schlafflugzeug für 28 Fluggäste. Auch für transatlantische Flüge können 28 Passagiere an Bord genommen werden.

Die Brennstofftanks befinden sich in der mittleren Sektion der Tragfläche. Bei den beiden äussern Hilfsschwimmern nahe den Flügelenden ist man diesmal von der üblichen Bauweise abgewichen. Bei allen andern Consolidated-Flugbooten werden diese Hilfsschwimmer an die Enden der Tragflächen im Fluge angeklappt, so dass sie die Tragfläche etwas verlängern. Bei Modell 31 war die Tiefe der Tragfläche an ihrem Ende dafür nicht gross genug, so dass sie zum Anlegen an die Unterseite der Tragfläche eingerichtet werden mussten.

Die Flugleistungen des Modells 31 dürfen nicht bekanntgegeben werden, sie sind aber besser als die der PBY-1-Bomber, die eine normale Reisegeschwindigkeit von etwa 250 km/Std. und einen Aktionsradius von fast 6000 km haben.

Willy Ley.

Consolidated 31.

Après un premier vol du 5 mars, la Consolidated Aircraft soulève, par la publication d'un rapport, un coin du voile recouvrant son nouvel hydravion bimoteur désigné par **Consolidated 31.** Groupemoteur: **deux 18-cylindres en double-étoile Wright « Duplex Cyclone »,** homologué pour une puissance de 2000 HP au décollage. Hélices tripales Hamilton Hydromatic de 4,9 m de diamètre. Entièrement métallique (revêtement en tôle d'alliage en aluminium, aluminée). Aile, empennages et surface de glissement de la coque à rivets à tête noyée; volets d'aile, ailerons, gouvernails de profondeur et de direction entoilés. Aile cantilever; partie médiane constituant les réservoirs de carburant; volets Fowler à commande hydraulique; ballonnets relevables vers l'intrados des demi-ailes. Coque avec deux ponts, grande cabine de pilotage insonorisée et huit autres compartiments. Double dérive, cantilever comme le plan fixe. Train de roulement en tricycle, escamotable, à commande hydraulique; roues latérales démontables ou relevables vers l'extérieur dans des évidements des parois latérales de la coque. **Données** approximatives : envergure 33,5 m; longueur 22,2 m; hauteur 6,7 m; profondeur maximum de l'aile 4,3 m; poids total env. 22.700 kg. (voir photographies ci-dessus). Contrairement aux hydravions Consolidated précédents, le type 31 a été construit par la société à ses propres risques, sans aucune subvention du gouvernement. L'étude et la fabrication du prototype n'auraient pris que dix mois. Missions prévues: bombardier patrouilleur; avion de transport avec 52 places assises ou, pour services de nuit et transatlantiques avec 28 places (couchettes). Cinq hommes d'équipage (2 pilotes, mécanicien, navigateur, radio). La vitesse maximum dépasserait 400 km/h.; le rayon d'action serait de 6500 km avec 28 passagers. Extérieurement, l'hydravion rappelle nettement le type que Consolidated avait proposé aux Pan American Airways lors de la mise au concours d'un Clipper transatlantique pour 100 passagers. Le type 31 servira-t-il de maquette volante à cet autre appareil plus grand? En tout cas, il ne saurait entrer en ligne de compte pour le service de passagers sur des lignes transatlantiques parce qu'il est bimoteur, ce qui est contraire aux prescriptions américaines. D'autre part, il constitue une nouvelle preuve de ce que le genre quadrimoteur n'a été recherché et adopté en grande partie que comme une solution provisoire par suite du manque de moteurs de puissances suffisamment élevées.

-itav-

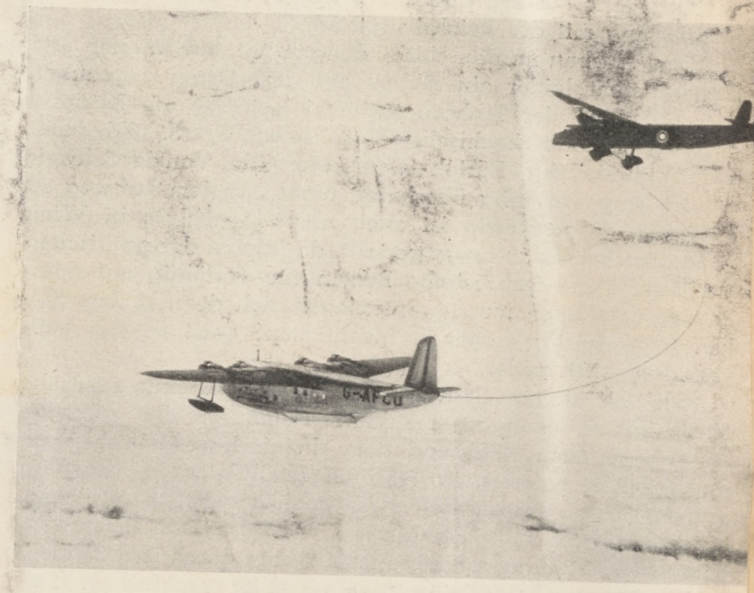
Brennstoffzufuhr in der Luft.

Die berühmte britische Luftverkehrsgesellschaft « Imperial Airways » wird diesen Sommer den regulären Luftpostverkehr über den Atlantischen Ozean mit vorläufig vier speziell für diesen Zweck konstruierten Wasserflugzeugen, aufnehmen. Diese werden jeweils beim Aufstieg von einem zweiten Flugzeug aus in der Luft mit zusätzlichem Benzin versehen.

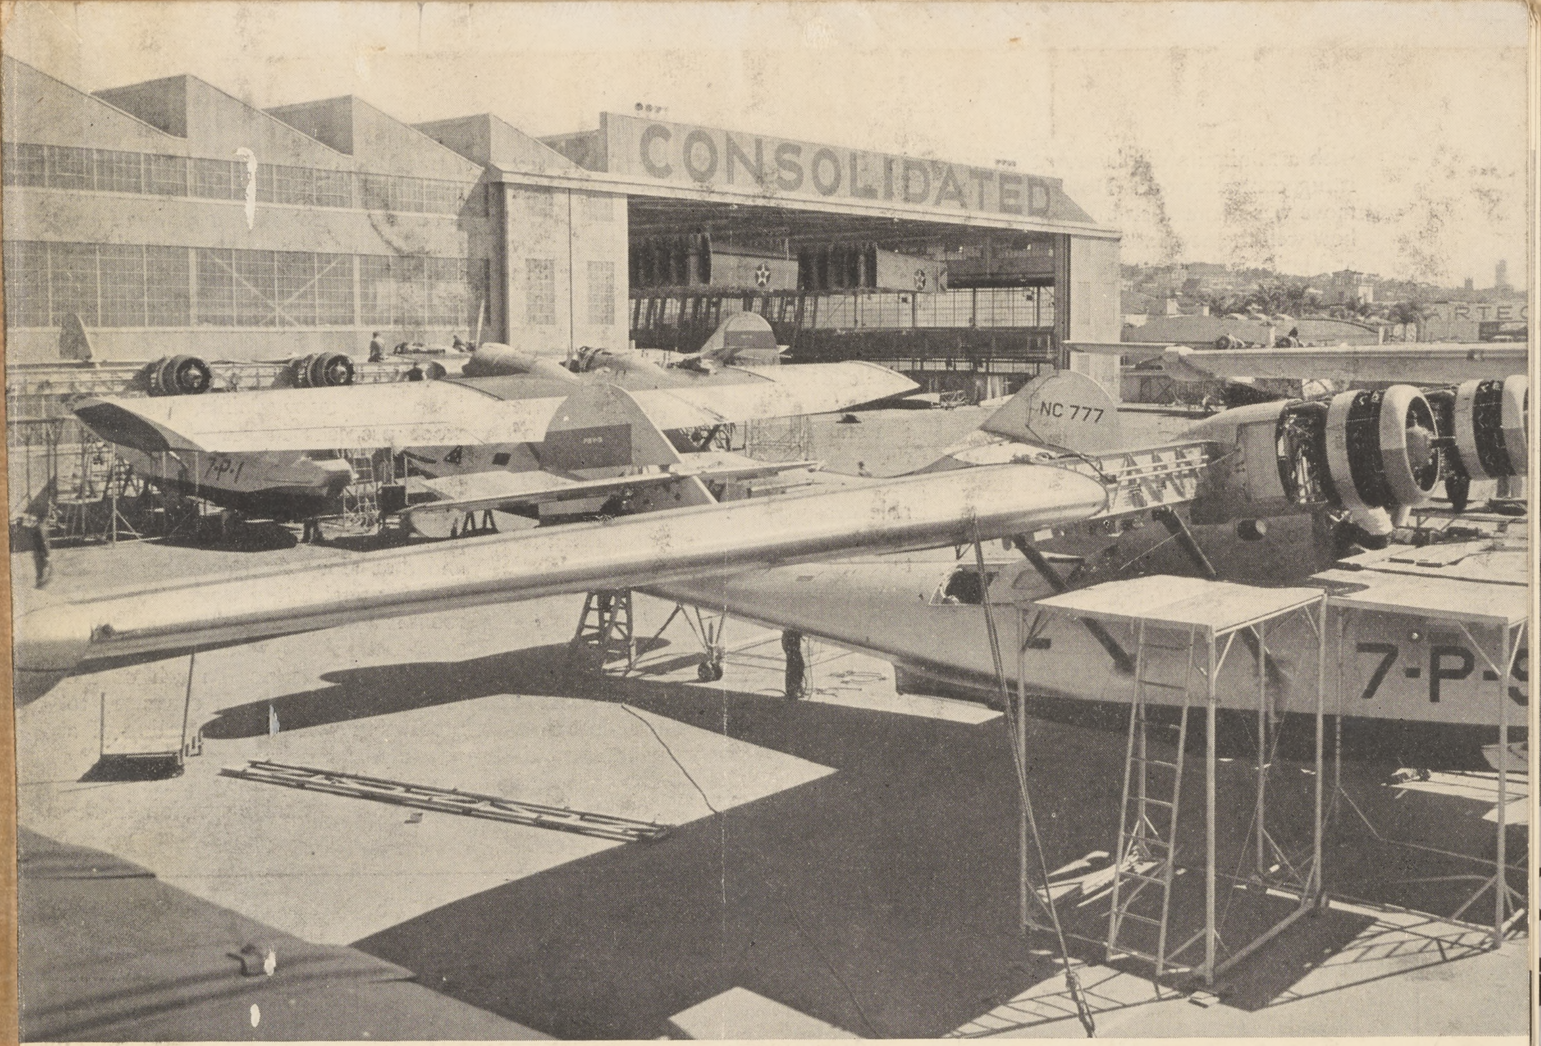
Das neue System der Luft-Brennstoffzufuhr wurde von dem berühmten Fliegerpionier Sir Alan Cobham entwickelt und vervollkommnet, und die ganze Operation nimmt nur zehn Minuten in Anspruch.

Diese Wasserflugzeuge, welche nur für den Transport von Post und Fracht bestimmt sind, wiegen bei voller Ladung je ungefähr 24 Tonnen. Sie führen 23.000 kg Benzin mit, wovon 3500 kg in der Luft zugeführt werden. Auf diese Art und Weise können sie eine bedeutend grössere Menge Brennstoff mitführen, als mit welcher sie imstande wären, sich vom Wasser zu erheben.

Die vier Flugboote, die für den transatlantischen Dienst bereitgestellt worden sind, heissen Cabot, Caribou, Connemara und Clyde. Fünf weitere Flugzeuge ähnlicher Konstruktion werden die Linien Bermuda – New York und Australien – Neuseeland bedienen. Ihre Durchschnittsgeschwindigkeit beträgt etwa 330 Stundenkilometer.



Brennstoffzufuhr in der Luft. Eines der neuen transatlantischen Imperial Airways Wasserflugzeuge, das in der Luft mit 3500 kg Benzin versehen wird. Die Brennstoffzufuhr geschieht von einem Handley Page Bomber aus und nimmt nur zehn Minuten in Anspruch. Der regelmässige Luftpostdienst über den atlantischen Ozean beginnt diesen Sommer.



Mild California climate and ample yard space make it possible to expand production greatly by performing assembly operations outdoors. Engines receive their check run-ins here

Flying Boats That Bomb

Consolidated Aircraft had the courage to uproot an older plant in favor of a location that has many advantages in natural facilities

Most spectacular flying done by the U. S. Navy in recent years has been that involving the Consolidated PBY patrol bomber flying boats manufactured in San Diego, Calif., by the Consolidated Aircraft Corporation. Official performance of the big twin-engine PBYs remains a Navy secret, but many of the outstanding flights made by squadrons of these planes during the past two years are a matter of public record.

Mass flights of the PBYs have involved as many as 48 planes carrying 336 men on one transocean hop. Routine delivery flights alone have totalled almost a half million airplane miles flown in tw years, the official figures being: 4 2,283 plane miles flown by 147 planes carrying a total of 1,022 crew members. These figures cover only mass delivery flights from the Consolidated factory in San Diego, and not the actual service operations which have followed such delivery flights. Altogether, Consolidated has built and delivered to the Navy more than 200 such planes, whose chief value is their ability to scout vast areas of open ocean for a hostile fleet. And these planes can also carry thousands of pounds of bombs for attack purposes once a hostile naval force has been located.

As should be expected, the Consolidated factory is as sensational in its way as are the planes that are built there, and so are the men in the organization that built the factory to build the planes. Consolidated Aircraft Corporation is sixteen years old in May, 1939.

Best example of the daring and resiliency of the Consolidated organization is the move of the entire plant from Buffalo, N. Y. to San Diego, Calif., in 1935. For while the company is sixteen years old, the San Diego plant is little more than three years old. The move to San Diego required selection of a site, planning and erecting of a building with some 246,841 sq. ft. of floor space, at a location almost three thousand miles away. It was necessary to move supplies, tools, and machinery, and some hundreds of workers to the new plant

WRIGHT *Aircraft* ENGINES

Archbold Due July 3 On Final Leg of Flight

S.D. Union 6/28/39

Richard Archbold, research director, American Museum of Natural history, en route to San Diego from Sydney, Australia, via Africa, the West Indies and New York, was expected to leave Dakar, West Africa, today on the final legs of his homeward bound flight. He is expected to arrive here July 3 in his San Diego built flying boat.

A New Boat with a New Wing

CHIEF FEATURE of interest in the new twin-motor Consolidated Model 31 flying-boat, which flew first early in May, is its Davis Wing. Its designer, David Richard Davis, was formerly with the Douglas Aircraft Company. His claims for his new section were confirmed by wind-tunnel tests at the California Institute of Technology (Calteck), but the authorities there were doubtful of the practical applications.

We know nothing of the section ourselves except that its designer claims for it a 20% reduction in drag compared with current designs. We assume that he has achieved this by moving the greatest depth back towards the middle from the more usual position somewhere about one-third of the chord back from the leading edge.

We also assume, in view of the doubts expressed at Calteck, that the section is very thin, or, in technical jargonese, has a low thickness-chord (t/c) ratio. This is borne out by the photographs of the new boat. Information from the United States confirms that the surface of the wing is flush-riveted.

So far there is no information about the relative efficiencies of the Davis Wing and the laminar-flow aerofoil developed by the National Advisory Committee for Aeronautics. So far there is no report that the new N.A.C.A. aerofoil has been flown.

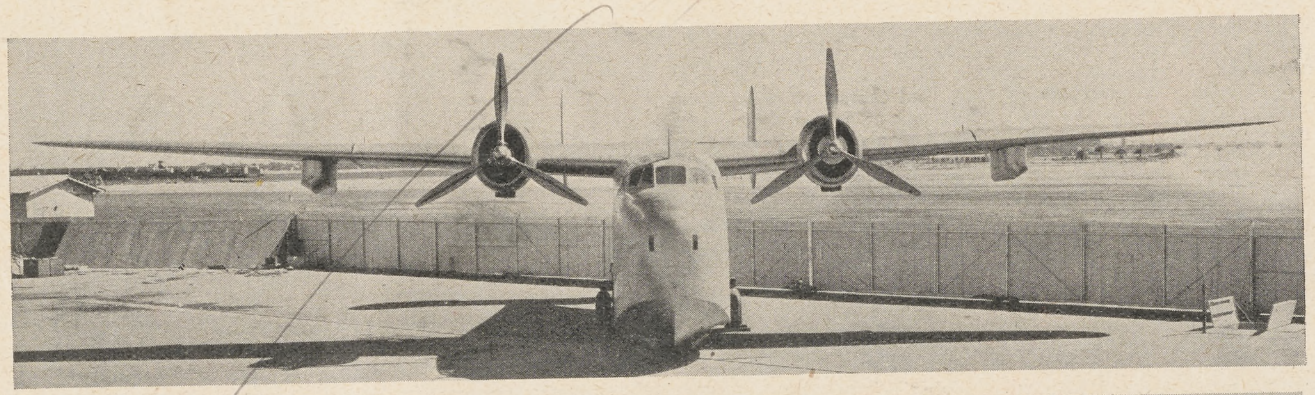
The Model 31 has been built as a Private Venture by the Consolidated Aircraft Corporation of San Diego, California, U.S.A., and, according to report, Reuben Fleet, President and General Manager of the Corporation, has contracted to pay a handsome royalty for every Davis Wing his corporation builds.

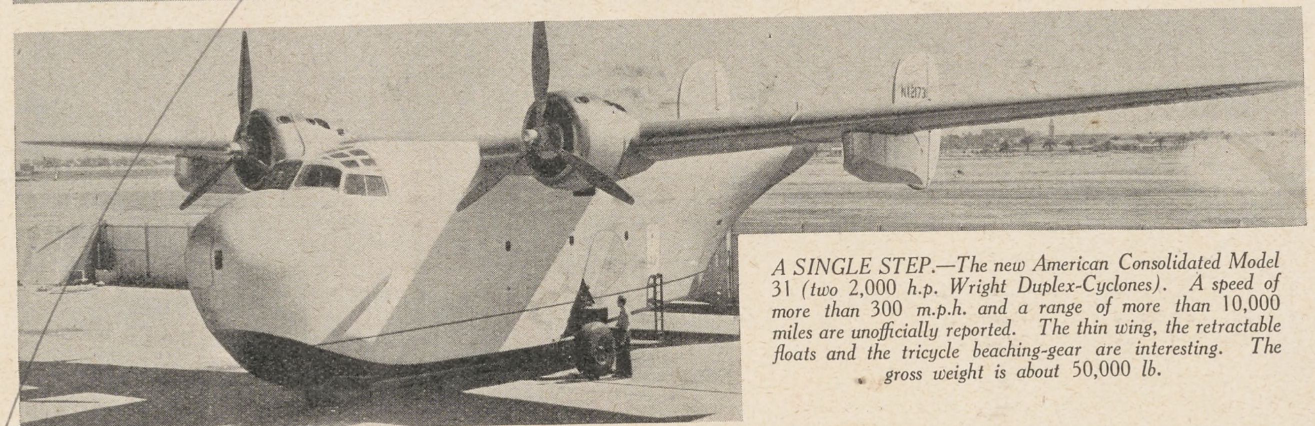
Aircraft construction in the United States seems to follow the same laws as here. We have been told that because the boat was built as a Private Venture, the design and construction, unhampered by Naval requirements, took only ten months, compared with the two or three years normally needed for an aeroplane of this size.

Although the Model 31 does not conform to any specification of the U.S. Navy, its makers believe that its extraordinary performance will probably cause its adoption for military work.

The Consolidated Model 31 high-wing cantilever monoplane has two 2,000 h.p. 18-cylinder Wright Duplex-Cyclone two-row radials. The gross weight is 50,000 lb. (22,660 kg.). The disposable load is supposed to be 1½ times the empty weight.

The maximum speed is quoted unofficially as more than 300 m.p.h. *Time* (New York) reports the "high speed" as 275 m.p.h.; this may mean the maximum cruising speed, which is the only speed of interest to commercial operators. If these figures are correct, the combination of load-carrying ability and speed is considerably better than that of any contemporary aeroplane.





A SINGLE STEP.—The new American Consolidated Model 31 (two 2,000 h.p. Wright Duplex-Cyclones). A speed of more than 300 m.p.h. and a range of more than 10,000 miles are unofficially reported. The thin wing, the retractable floats and the tricycle beaching-gear are interesting. The gross weight is about 50,000 lb.

In civil form the Model 31 can carry up to 52 passengers by day or 28 passengers in bunks at night. Twenty-eight passengers could be carried in comfort across the Atlantic.

Hydraulically operated Fowler flaps extend from the ailerons to the hull. The whole of the wing has stressed metal covering except for the ailerons and flaps which are fabric-covered.

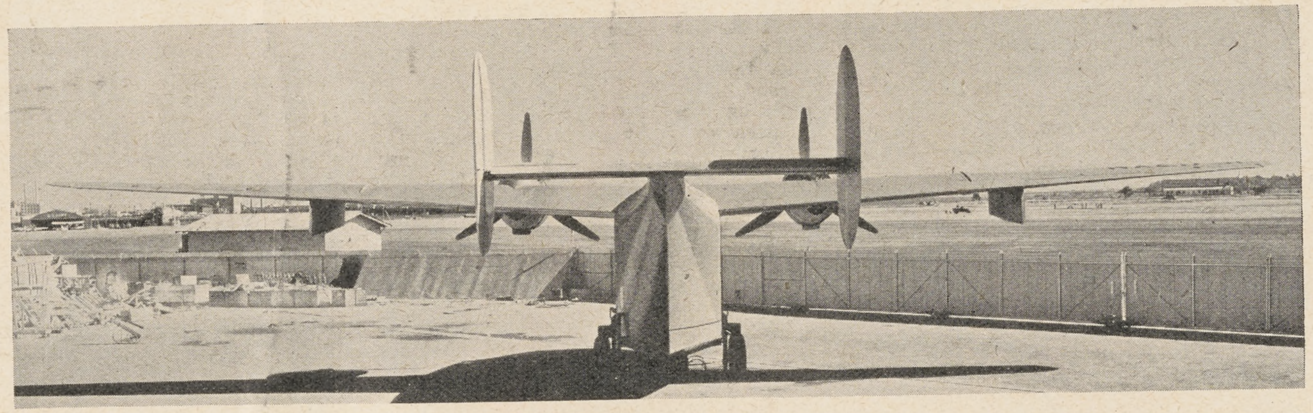
The outboard floats retract into the underside of each wing. The wing-tips of the Model 31 are too small for the sideways retraction of the floats as on the earlier Consolidated PBY.

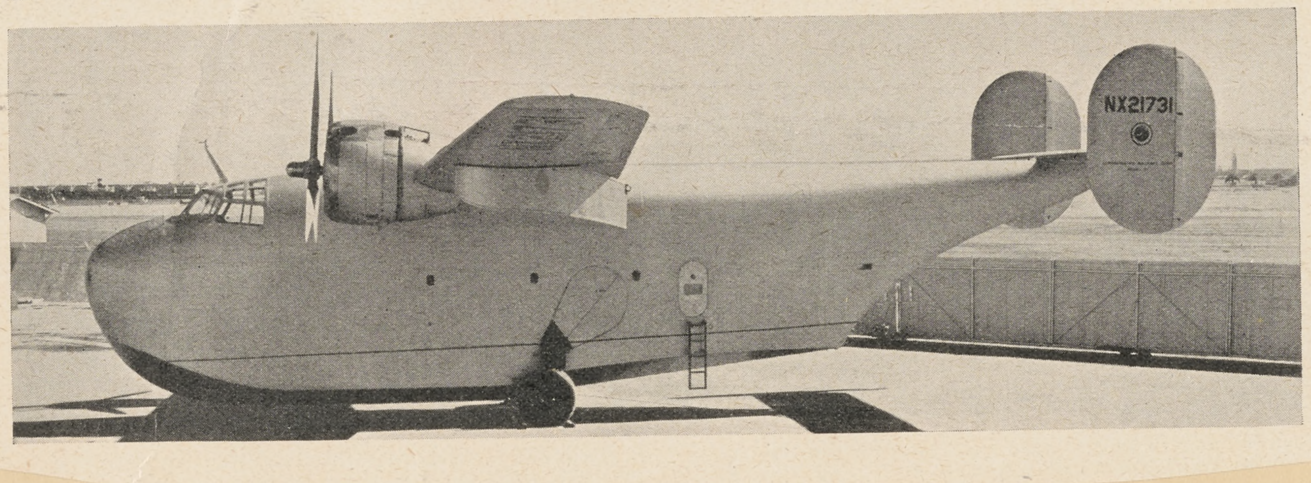
The fuel-tanks are built into the centre section in standard Consolidated fashion. The surfaces of the wing form the top and bottom of the tanks.

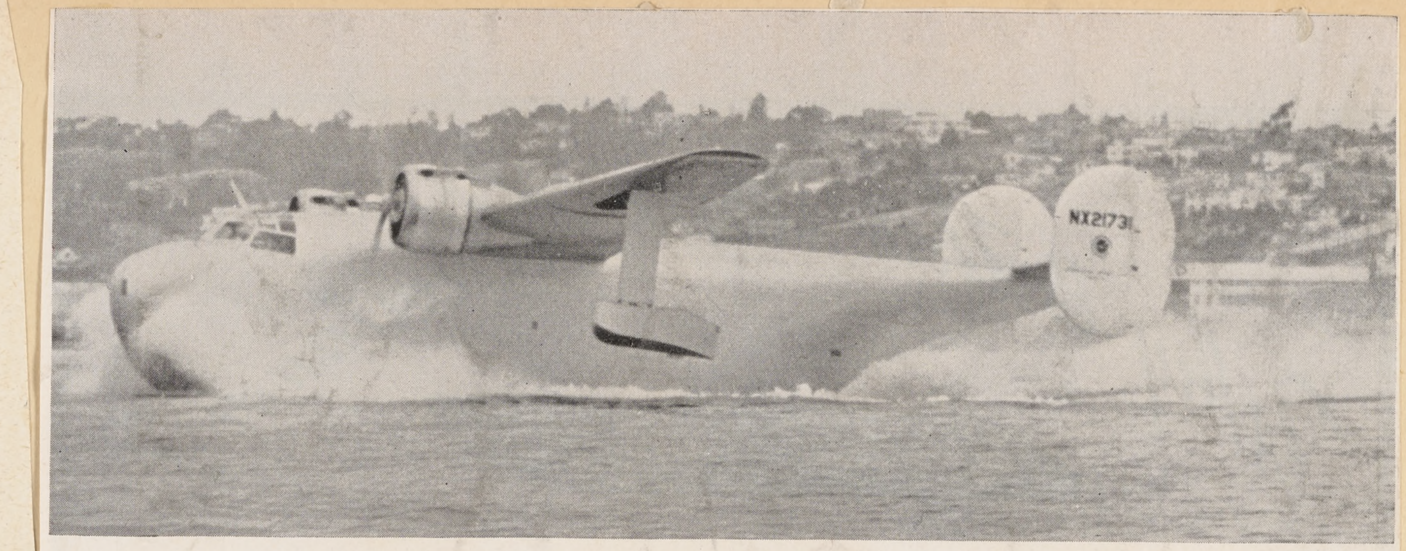
The motors are mounted on very small nacelles in front of the wing. They drive three-blade Hamilton Hydromatic constant-speed fully-feathering airscrews of 16 ft. (4.877 m.) diameter. The long-chord cowlings of the motors are oval in cross-section, perhaps because the carburetter intakes and oil coolers are encowled above and below the motors.

The existence of the new 18-cylinder Wright motors, rated at 2,000 h.p. each for take-off, had not been mentioned before.

The very deep hull of the Model 31 has two decks. The control cabin is above. Normally a crew of five is carried, two pilots, a flight engineer, a radio operator and a navigator. On the lower deck there are eight large compartments.







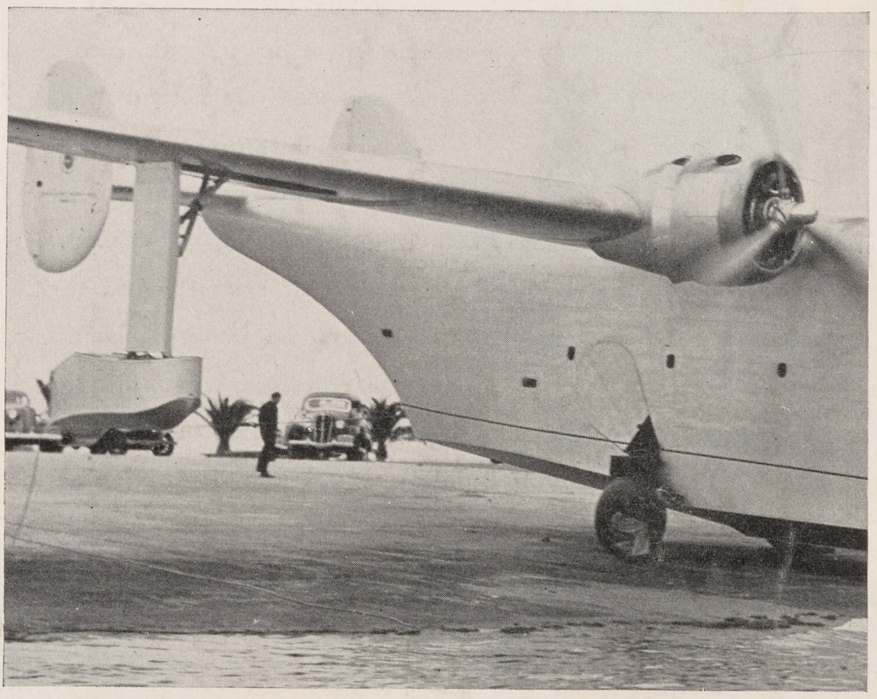
"Hush-Hush" Boat

Twin engined Consolidated combines high speed and long range

CONSOLIDATED'S "hush-hush" mystery plane, the Model 31 twin-engined flying boat, took to the air May 5th with William Wheatley at the controls. The new ship, a high-wing cantilever monoplane, of all metal construction, combines high speed, long range, and heavy striking power in a plane of relatively small size. It is powered with two Wright 18 cylinder twin-row engines rated 2,000 hp. for takeoff, driving 16′ dia. Hamilton-Standard 3 blade propellers.

Stability on the water is provided by outboard floats which retract against the under side of the wing in flight. The relatively high taper of the wing prevents tip retraction of the floats as on the PBY series. A tri-cycle beaching gear is permanently attached and is also fully retractable within hull wells. Although intended strictly as a beaching gear, it is believed rugged enough to withstand airport landings in an emergency.

Gross weight is approximately 50,000 lb., wing span 110 ft., over-all length 73 ft., height 22 ft., and maximum wing chord 14 ft. Although little detailed information is available, it is understood to have a wing with high taper ratio, an aspect ratio of approximately ten to one, and a maximum loading of more than 45 lb. per sq.ft. Gross wing area is reported at approximately 1100 sq.ft. Of particular interest is the use of a new type airfoil recently developed by David R. Davis, independent aeronautical engineer. The Davis airfoil is reported to possess a number of interesting characteristics, including low drag and low center of pressure travel. Hydraulically operated Fowler wing flaps assist landings and take-offs. Although no performance estimates have been released, engineers have estimated the plane to have a top speed ranging from 285 m.p.h. to upward of 300 m.p.h., and an all-out maximum range, if stripped for record purposes, of better than 10,000 miles.



Closeup of the Consolidated Model 31 showing the method of retracting the wing tip floats and the permanent retractable beaching gear.

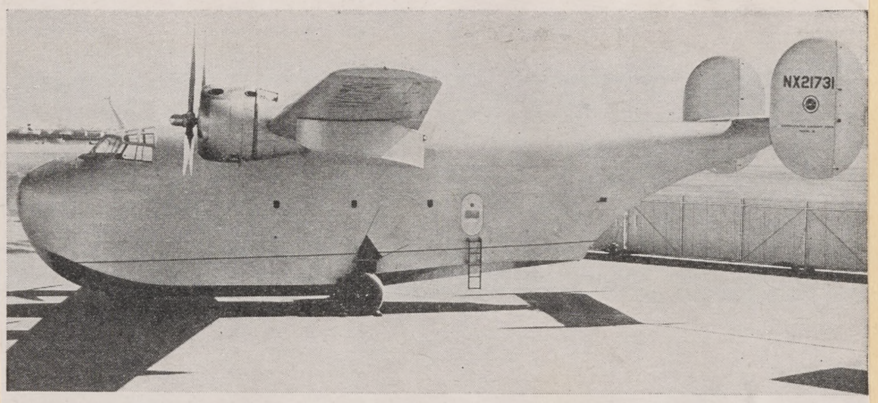
Reports of preliminary taxiing tests, and of the test flight which lasted approximately one hour, credited the plane with excellent stability on the water, quick take-off, and smooth landing. The hull is of unique design and is said to be the result of the newest testing technique in the Langley Field towing basin, where complete scale models are now being "flown" off the water instead of limiting test runs with a bare hull. The Model 31 differs materially from current hull design, having unusual depth of hull combined with a relatively narrow planing bottom, and a peculiarly stubby appearance aft.

In construction the Consolidated Model 31 is of conventional skin-stressed design. The wings, tail surfaces, and planing surface of the hull bottom are all flush riveted. Ailerons, flaps, rudders and elevators are fabric covered. The tail consists of a cantilever stabilizer with twin fins and rudders mounted at the ends.

Two flight decks are provided in the hull, one above the other, providing a large flight control compartment, and eight additional compartments for passengers and payload. As a commercial airliner the Model 31 has a day capacity of 52 passengers and a night capacity of 28 passengers, with sleeper accommodations. It is said to be capable of operating in trans-Atlantic service with a load of 28 passengers. Cruising speed on 50 per cent power has been unofficially estimater at better than 200 m.p.h. As a military airplane the Model 31 would augment the PBY series of twin-engine patrol bombers which it greatly exceeds in speed, range, and load carrying ability. However, the plane is a private venture on the part of Consolidated Aircraft Corp., not having been subject to the ordinary procurement routine which adds so materially to the cost and time for construction of prototype military aircraft. As a result the design was developed, built and test flown within a period of only ten months, instead of the two to three years required heretofore under normal procurement procedure.

Military men who have knowledge of the capabilities of the Model 31 base their high estimate of its naval effectiveness primarily on its ability to locate and destroy with relative ease all but the most heavily armed surface vessels. With its high speed, long range, and ability to carry a heavy bomb load, the Model 31 is believed capable of sweeping large areas of ocean entirely free of all enemy vessels except heavily protected fleets of heavy warships. It is pointed out that its high speed makes this plane nearly immune against attack by pursuit planes of current vintage, and materially reduces effectiveness of anti-aircraft fire against it. Yet the bomb carrying capacity is sufficient to cripple any ship afloat if hit but once by a bomb of the maximum size this plane can carry.

No further information on the plane is available as we go to press, but aviation people everywhere may well watch with interest for word of civil or military application of the Consolidated Model 31.



A distinctive feature of the Model 31 is the permanent beaching gear of the tricycle type which is fully retractable within wells in the hull. Although it is intended primarily for beaching, the gear is believed to be rugged enough to withstand airport landings in an emergency.

BOMBERS LEAVING FOR HAWAII TODAY

S.D. SUN 6/28/39

The non-stop, 2570-mile transpacific mass flight of 15 San Diego patrol bombers to Hawaii was to begin at 3 p. m. today, 24 hours ahead of the original schedule, to take advantage of favorable weather conditions en route, North Island officials announced.

A crew of 105 officers and enlisted men, commanded by Lieut.-Comdr. Sam L. La Hache, comprised the flight personnel. The Consolidated bombers will be delivered to Pearl Harbor and assigned to Patrol Squadron One in the eighth such ferry trip to distant air bases.

Nineteen hours will be required for the hop, Rear Adm. A. B. Cook, Aircraft Scouting Force commander, estimated.

Weather data has been furnished the squadron here during the past few days by the aircraft tenders Avocet, Pelican and Childs, the destroyers Dent and Waters, and Rear Adm. Cook's flagship Memphis, all stationed along the Great Circle route to Hawaii. They also will serve as guard ships during the flight.

with a minimum displacement of existing contract work. How well this move was planned and executed, and how well the new factory was planned and built, is demonstrated by the production of more than $20,000,000 worth of aircraft in San Diego since manufacturing operations commenced there in September, 1935. As a result of such planning the Consolidated factory could quadruple its normal peace-time production rate with a minimum of confusion and lost time.

In moving from the Great Lakes area to Southern California, Consolidated eliminated the problems connected with snow, ice and winter weather, which particularly plague the aircraft manufacturer. It was possible to build a factory that was "all windows and doors," of relatively light, long-span roof construction, and without a major heating problem. Weather in the San Diego area is such that planes can be tested almost every day of the year and, of equal importance, manufacturing operations can be conducted in the open yard area adjoining the plant. The area under roof at the Consolidated factory now totals 447,332 sq. ft., but there is an additional usable yard area of 212,462 sq. ft. This yard area is inclosed by a high fence and is provided with adequate facilities, such as electric power outlets and air supply.

Another advantage of the move to San Diego is the location of the factory adjacent to a protected harbor, permitting prompt launching of flying boats when completed. This proximity of water facilities aids materially in conducting extensive flight test programs where close liaison with factory personnel is necessary.

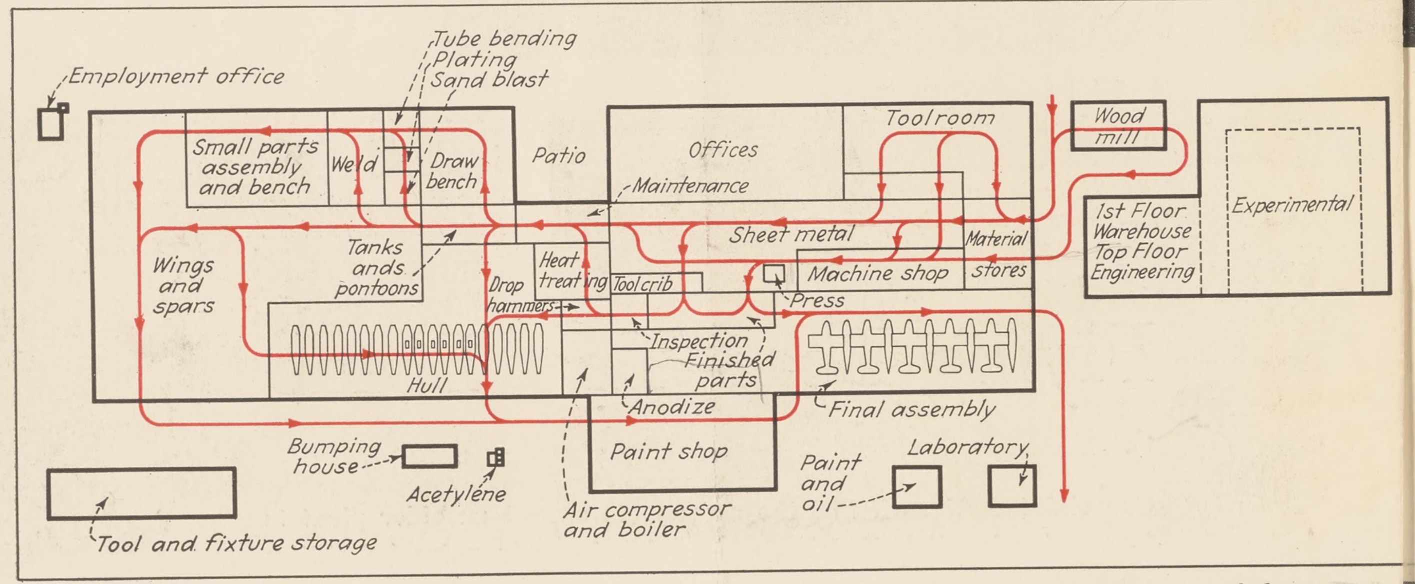
The Consolidated Aircraft factory is built on Lindbergh Field, the San Diego municipal airport which is adjacent to the business district. Although the Consolidated plant is on the land side of the airport, nearest railway and highway facilities, there is a seaplane ramp on the bay side of the field and dock facilities are close at hand. Thus the factory has available every type of transportation for the receipt of supplies and raw materials, or for the delivery of finished aircraft and parts for land or water service.

The plant is built on a 35-acre site, most of which has been reclaimed from bay tide-land. Investment in plant and equipment totals more than $2,000,000. This includes approximately $500,000 now being expended on modernizing the factory facilities in the light of aircraft production methods which have been developed since the factory was built in 1935. While it may sound fantastic to speak of "modernizing" a plant that is now less than four years old, this is exactly the case. One of the major items of new equipment is a battery of presses and drop hammers of large capacity to handle new sheet-metal production methods.

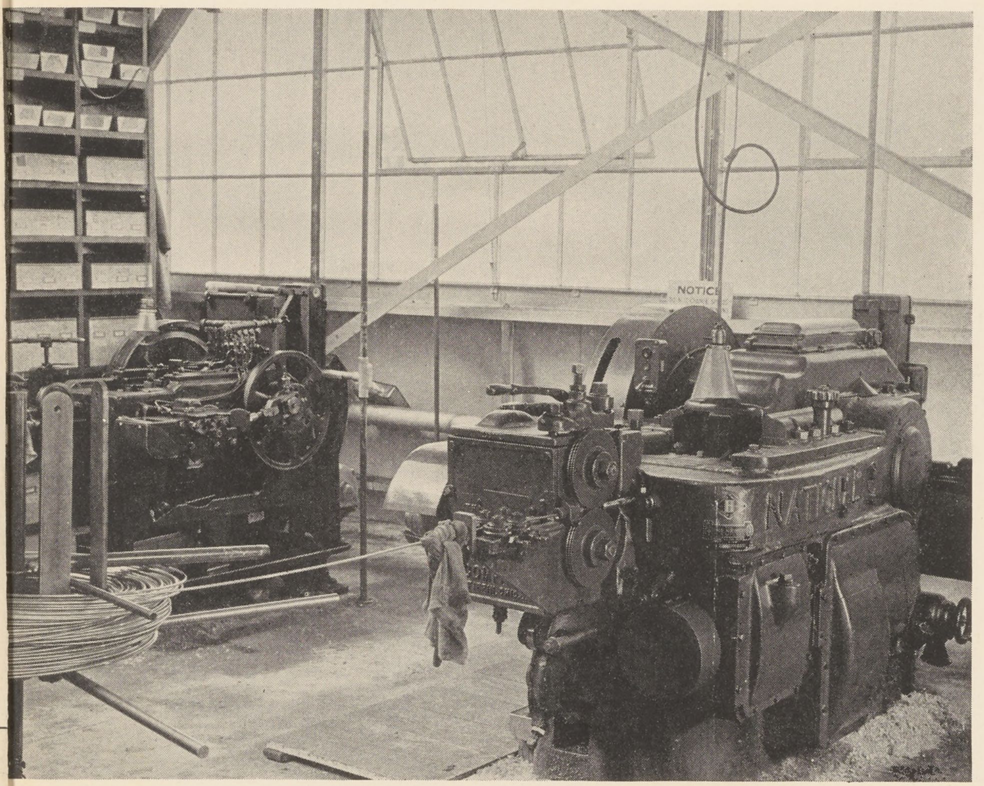
Layout within the main factory building has been planned for smooth flow of work from raw stock to final assembly. The offices are located at the center part of the front, or highway side, of the building. All production departments are arranged around and adjacent to the central office space. Production starts at the south end of the building, where raw materials flow in from the warehouse across the alley, or from the stock of purchased parts in the material store room located in the south end of the main building.

While production is necessarily broken at many points, the major work proceeds in straight-line flow progression up through the plant from raw stock and material stores, over into hull, or wing and spar departments, back into the paint shop, and then along final assembly to the yard for final fitting work. The toolroom is adjacent to both machine and sheet-metal shops, which promotes efficiency. Furthermore, much of the toolroom equipment is converted to production when initial tooling of a new model has been completed. By grouping the finishing parts stock, tool crib and final inspection in the center of the plant near the heat-treat, drop hammer, anodize tanks, paint shop, and plant maintenance shop, it is possible to reduce lost motion to a minimum on small parts handling. Parts and materials flow naturally from raw stores, material stores, and finished parts stores over in the small parts assembly and bench work department, and from that point into wing and spar, or hull assembly, which is but one step removed from final assembly. After final assembly the planes are moved out into the yard for installation of interior fittings and accessories.

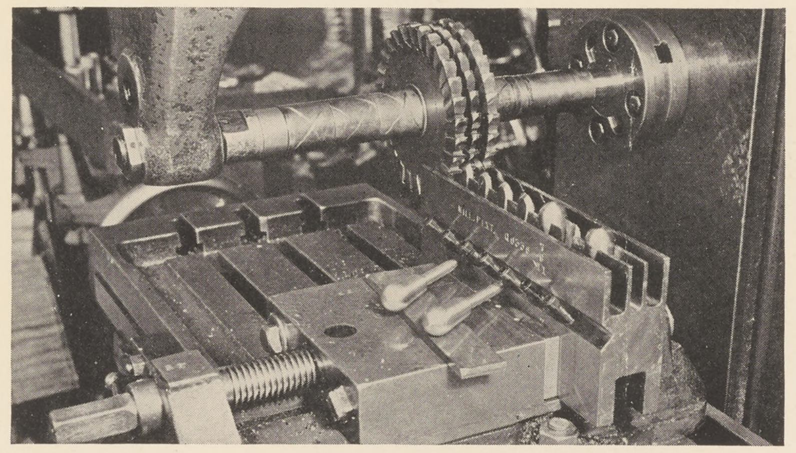
Extending through the entire plant is a complete overhead mono-



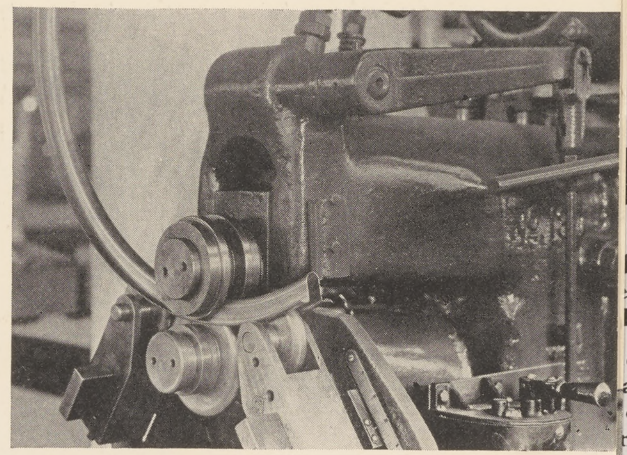
Consolidated factory layout is properly designed to arrange the various departments for efficient work flow



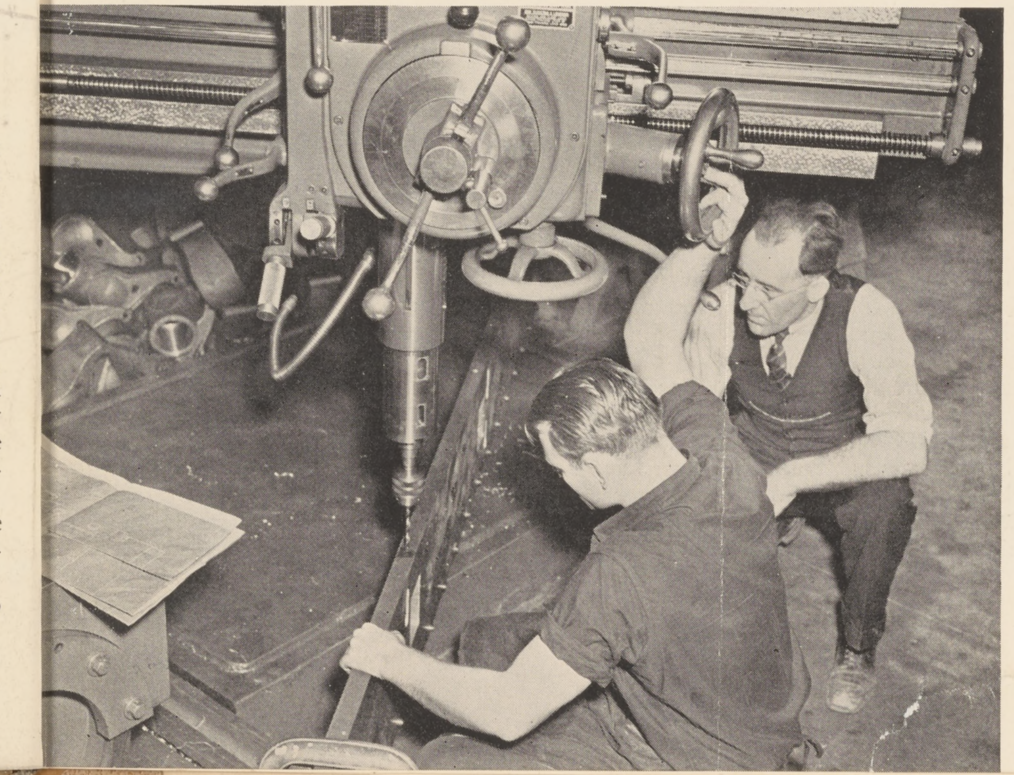
Rivets of many sizes and shapes to the tune of a million a week can be turned out on these two machines. They are then heat-treated and stored in electric refrigerators until ready for use



An airplane calls for a multitude of small machined parts. Here cable terminals are being straddle milled in a special fixture



The thin sections and curved contours of duralumin parts lend themselves to roll forming. The cold working of dural increases its strength



Machine tools employed for toolwork are turned to production operations as soon as the tools are completed. Here is a large radial drill employed in making a fixture part; it is also used for machining steel tube engine mounts

Archbold Due July 3 On Final Leg of Flight

S.D. Union 6/28/39

Richard Archbold, research director, American Museum of Natural history, en route to San Diego from Sydney, Australia, via Africa, the West Indies and New York, was expected to leave Dakar, West Africa, today on the final legs of his homeward bound flight. He is expected to arrive here July 3 in his San Diego built flying boat.

A New Boat with a New Wing

CHIEF FEATURE of interest in the new twin-motor Consolidated Model 31 flying-boat, which flew first early in May, is its Davis Wing. Its designer, David Richard Davis, was formerly with the Douglas Aircraft Company. His claims for his new section were confirmed by wind-tunnel tests at the California Institute of Technology (Calteck), but the authorities there were doubtful of the practical applications.

We know nothing of the section ourselves except that its designer claims for it a 20% reduction in drag compared with current designs. We assume that he has achieved this by moving the greatest depth back towards the middle from the more usual position somewhere about one-third of the chord back from the leading edge.

We also assume, in view of the doubts expressed at Calteck, that the section is very thin, or, in technical jargonese, has a low thickness-chord (t/c) ratio. This is borne out by the photographs of the new boat. Information from the United States confirms that the surface of the wing is flush-riveted.

So far there is no information about the relative efficiencies of the Davis Wing and the laminar-flow aerofoil developed by the National Advisory Committee for Aeronautics. So far there is no report that the new N.A.C.A. aerofoil has been flown.

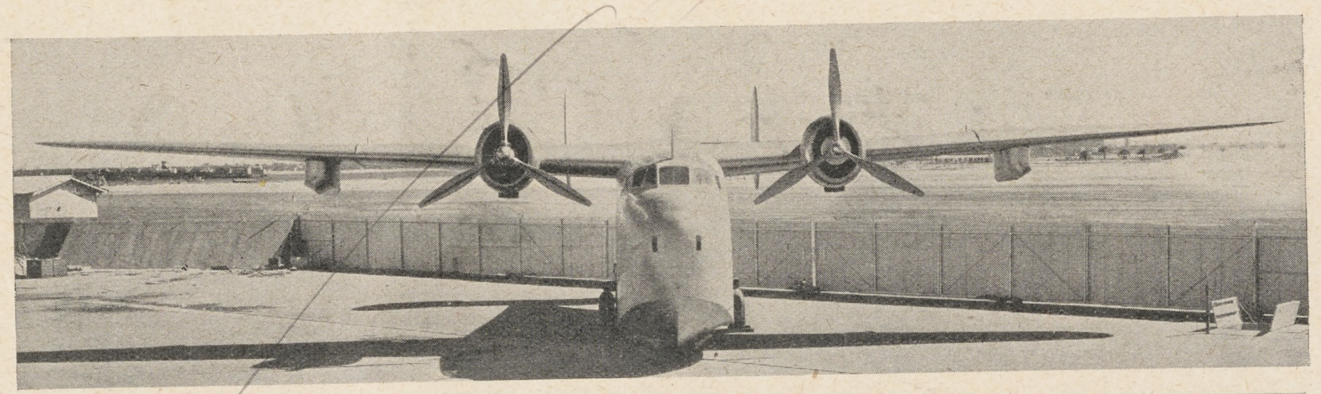
The Model 31 has been built as a Private Venture by the Consolidated Aircraft Corporation of San Diego, California, U.S.A., and, according to report, Reuben Fleet, President and General Manager of the Corporation, has contracted to pay a handsome royalty for every Davis Wing his corporation builds.

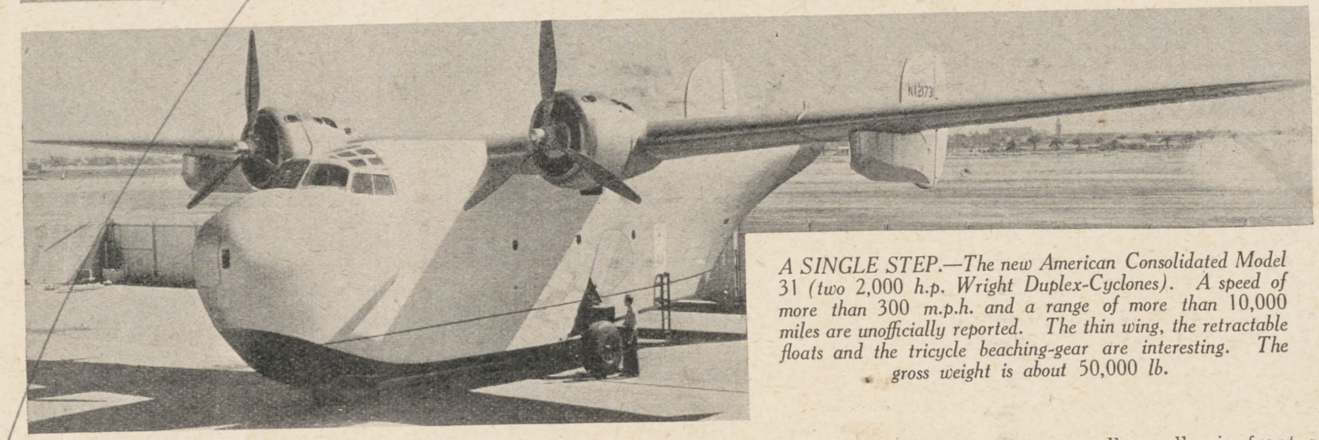
Aircraft construction in the United States seems to follow the same laws as here. We have been told that because the boat was built as a Private Venture, the design and construction, unhampered by Naval requirements, took only ten months, compared with the two or three years normally needed for an aeroplane of this size.

Although the Model 31 does not conform to any specification of the U.S. Navy, its makers believe that its extraordinary performance will probably cause its adoption for military work.

The Consolidated Model 31 high-wing cantilever monoplane has two 2,000 h.p. 18-cylinder Wright Duplex-Cyclone two-row radials. The gross weight is 50,000 lb. (22,660 kg.). The disposable load is supposed to be 1½ times the empty weight.

The maximum speed is quoted unofficially as more than 300 m.p.h. *Time* (New York) reports the "high speed" as 275 m.p.h.; this may mean the maximum cruising speed, which is the only speed of interest to commercial operators. If these figures are correct, the combination of load-carrying ability and speed is considerably better than that of any contemporary aeroplane.





A SINGLE STEP.—The new American Consolidated Model 31 (two 2,000 h.p. Wright Duplex-Cyclones). A speed of more than 300 m.p.h. and a range of more than 10,000 miles are unofficially reported. The thin wing, the retractable floats and the tricycle beaching-gear are interesting. The gross weight is about 50,000 lb.

In civil form the Model 31 can carry up to 52 passengers by day or 28 passengers in bunks at night. Twenty-eight passengers could be carried in comfort across the Atlantic.

Hydraulically operated Fowler flaps extend from the ailerons to the hull. The whole of the wing has stressed metal covering except for the ailerons and flaps which are fabric-covered.

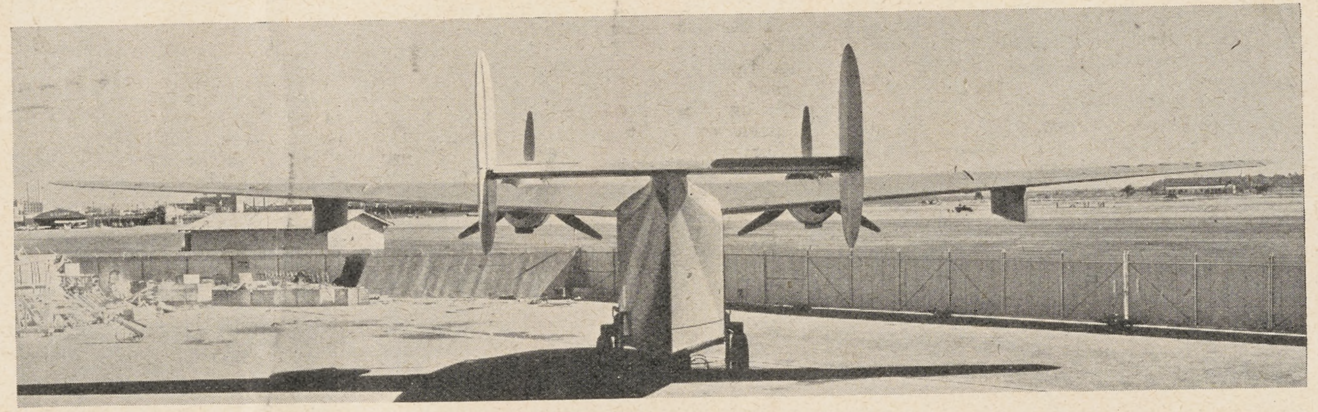
The outboard floats retract into the underside of each wing. The wing-tips of the Model 31 are too small for the sideways retraction of the floats as on the earlier Consolidated PBY.

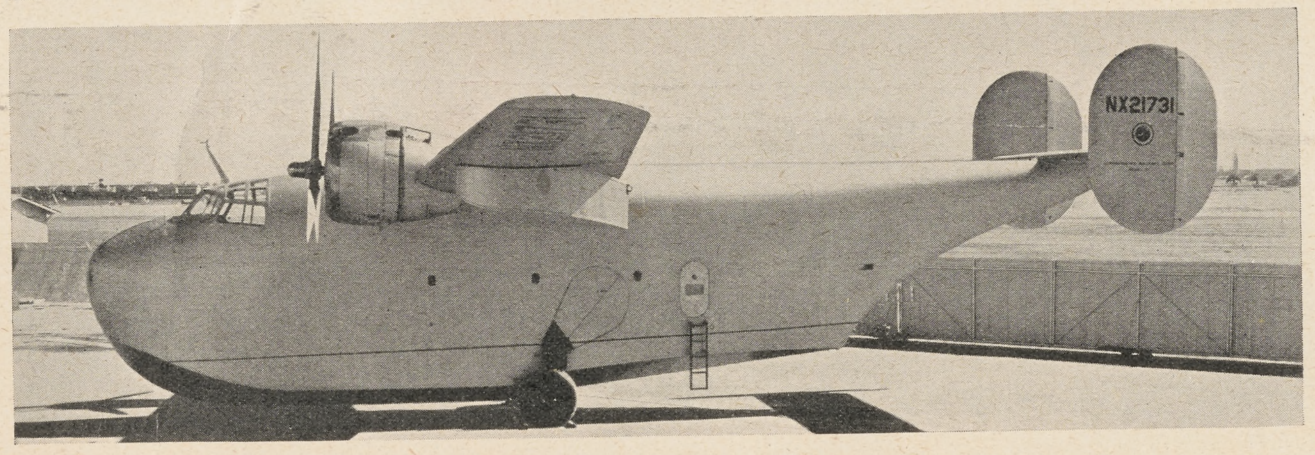
The fuel-tanks are built into the centre section in standard Consolidated fashion. The surfaces of the wing form the top and bottom of the tanks.

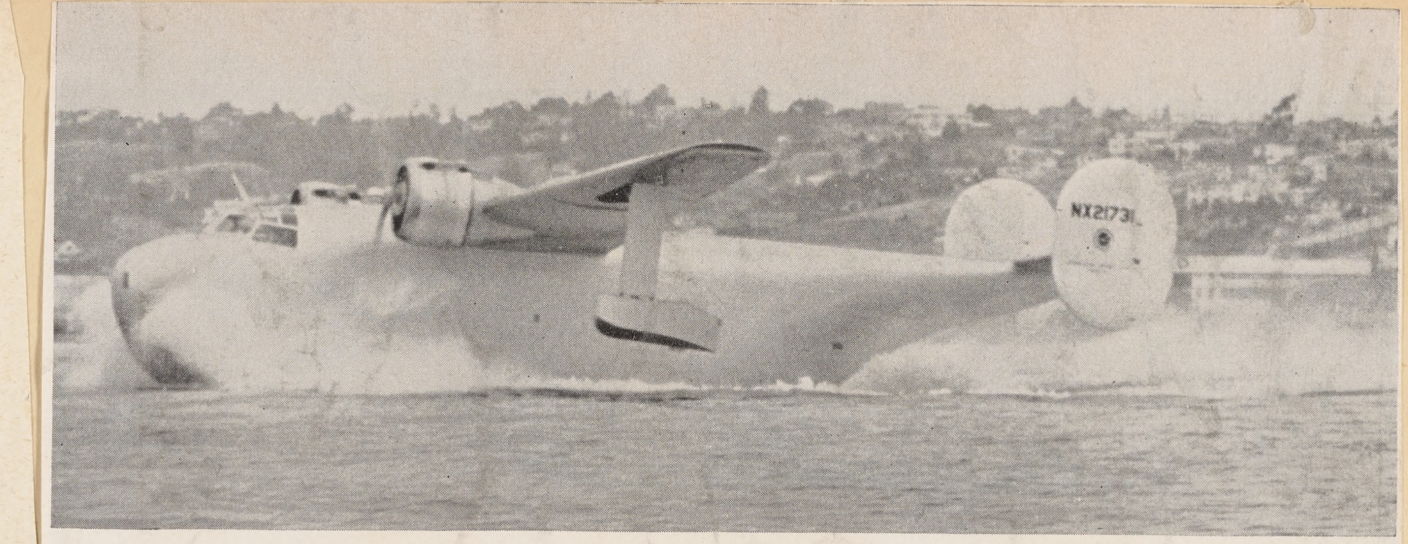
The motors are mounted on very small nacelles in front of the wing. They drive three-blade Hamilton Hydromatic constant-speed fully-feathering airscrews of 16 ft. (4.877 m.) diameter. The long-chord cowlings of the motors are oval in cross-section, perhaps because the carburetter intakes and oil coolers are encowled above and below the motors.

The existence of the new 18-cylinder Wright motors, rated at 2,000 h.p. each for take-off, had not been mentioned before.

The very deep hull of the Model 31 has two decks. The control cabin is above. Normally a crew of five is carried, two pilots, a flight engineer, a radio operator and a navigator. On the lower deck there are eight large compartments.







"Hush-Hush" Boat

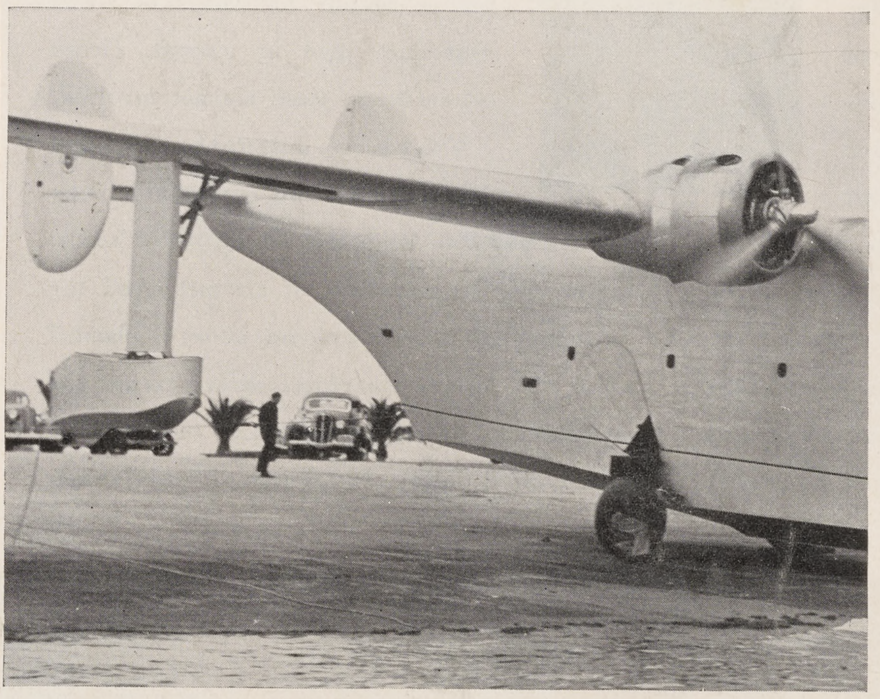
Twin engined Consolidated combines high speed and long range

CONSOLIDATED'S "hush-hush" mystery plane, the Model 31 twin-engined flying boat, took to the air May 5th with William Wheatley at the controls. The new ship, a high-wing cantilever monoplane, of all metal construction, combines high speed, long range, and heavy striking power in a plane of relatively small size. It is powered with two Wright 18 cylinder twin-row engines rated 2,000 hp. for takeoff, driving 16′ dia. Hamilton-Standard 3 blade propellers.

Stability on the water is provided by outboard floats which retract against the under side of the wing in flight. The relatively high taper of the wing prevents tip retraction of the floats as on the PBY series. A tri-cycle beaching gear is permanently attached and is also fully retractable within hull wells. Although intended strictly as a beaching gear, it is believed rugged enough to withstand airport landings in an emergency.

Gross weight is approximately 50,000 lb., wing span 110 ft., over-all length 73 ft., height 22 ft., and maximum wing chord 14 ft. Although little detailed information is available, it is understood to have a wing with high taper ratio, an aspect ratio of approximately ten to one, and a maximum loading of more than 45 lb. per sq.ft. Gross wing area is reported at approximately 1100 sq.ft. Of particular interest is the use of a new type airfoil recently developed by David R. Davis, independent aeronautical engineer. The Davis airfoil is reported to possess a number of interesting characteristics, including low drag and low center of pressure travel. Hydraulically operated Fowler wing flaps assist landings and take-offs. Although no performance estimates have been released, engineers have estimated the plane to have a top speed ranging from 285 m.p.h. to upward of 300 m.p.h., and an all-out maximum range, if stripped for record purposes, of better than 10,000 miles.

Reports of preliminary taxiing tests, and of the test flight which lasted approximately one hour, credited the plane with excellent stability on the water, quick take-off, and smooth landing. The hull is of unique design and is said to be the result of the newest testing technique in the Langley Field towing basin, where complete scale models are now being "flown" off the water instead of limiting test runs with a bare hull. The Model 31 differs materially from current hull design, having unusual depth of hull combined with a relatively narrow planing bottom, and a peculiarly stubby appearance aft.



Closeup of the Consolidated Model 31 showing the method of retracting the wing tip floats and the permanent retractable beaching gear.

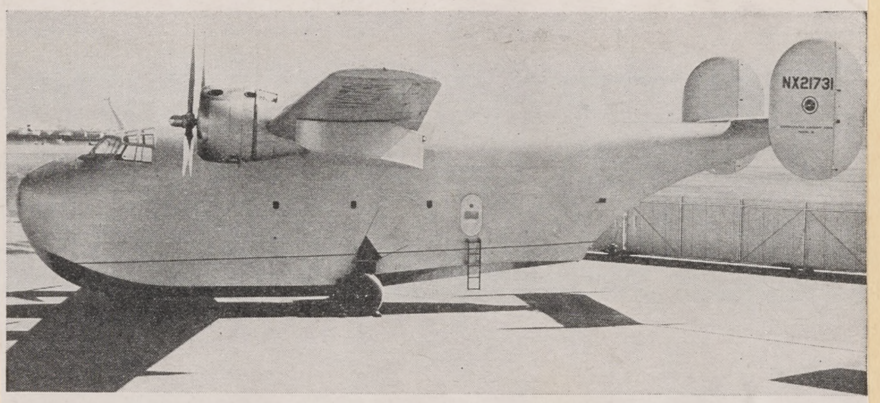
AVIATION
June, 1939

In construction the Consolidated Model 31 is of conventional skin-stressed design. The wings, tail surfaces, and planing surface of the hull bottom are all flush riveted. Ailerons, flaps, rudders and elevators are fabric covered. The tail consists of a cantilever stabilizer with twin fins and rudders mounted at the ends.

Two flight decks are provided in the hull, one above the other, providing a large flight control compartment, and eight additional compartments for passengers and payload. As a commercial airliner the Model 31 has a day capacity of 52 passengers and a night capacity of 28 passengers, with sleeper accommodations. It is said to be capable of operating in trans-Atlantic service with a load of 28 passengers. Cruising speed on 50 per cent power has been unofficially estimater at better than 200 m.p.h. As a military airplane the Model 31 would augment the PBY series of twin-engine patrol bombers which it greatly exceeds in speed, range, and load carrying ability. However, the plane is a private venture on the part of Consolidated Aircraft Corp., not having been subject to the ordinary procurement routine which adds so materially to the cost and time for construction of prototype military aircraft. As a result the design was developed, built and test flown within a period of only ten months, instead of the two to three years required heretofore under normal procurement procedure.

Military men who have knowledge of the capabilities of the Model 31 base their high estimate of its naval effectiveness primarily on its ability to locate and destroy with relative ease all but the most heavily armed surface vessels. With its high speed, long range, and ability to carry a heavy bomb load, the Model 31 is believed capable of sweeping large areas of ocean entirely free of all enemy vessels except heavily protected fleets of heavy warships. It is pointed out that its high speed makes this plane nearly immune against attack by pursuit planes of current vintage, and materially reduces effectiveness of anti-aircraft fire against it. Yet the bomb carrying capacity is sufficient to cripple any ship afloat if hit but once by a bomb of the maximum size this plane can carry.

No further information on the plane is available as we go to press, but aviation people everywhere may well watch with interest for word of civil or military application of the Consolidated Model 31.



A distinctive feature of the Model 31 is the permanent beaching gear of the tricycle type which is fully retractable within wells in the hull. Although it is intended primarily for beaching, the gear is believed to be rugged enough to withstand airport landings in an emergency.

BOMBERS LEAVING FOR HAWAII TODAY

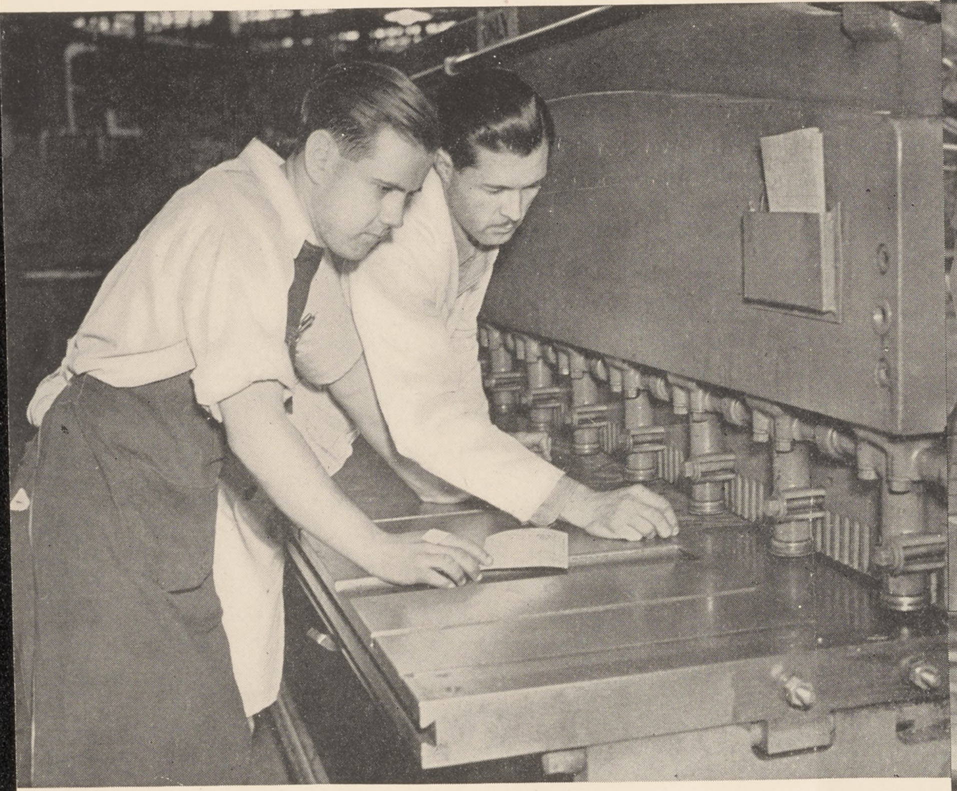
S.D. SUN 6/28/39

The non-stop, 2570-mile transpacific mass flight of 15 San Diego patrol bombers to Hawaii was to begin at 3 p. m. today, 24 hours ahead of the original schedule, to take advantage of favorable weather conditions en route, North Island officials announced.

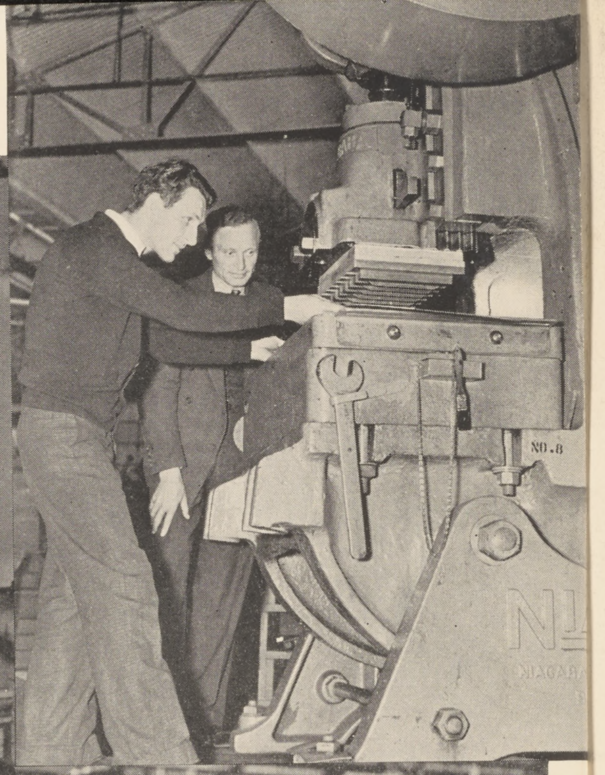
A crew of 105 officers and enlisted men, commanded by Lieut.-Comdr. Sam L. La Hache, comprised the flight personnel. The Consolidated bombers will be delivered to Pearl Harbor and assigned to Patrol Squadron One in the eighth such ferry trip to distant air bases.

Nineteen hours will be required for the hop, Rear Adm. A. B. Cook, Aircraft Scouting Force commander, estimated.

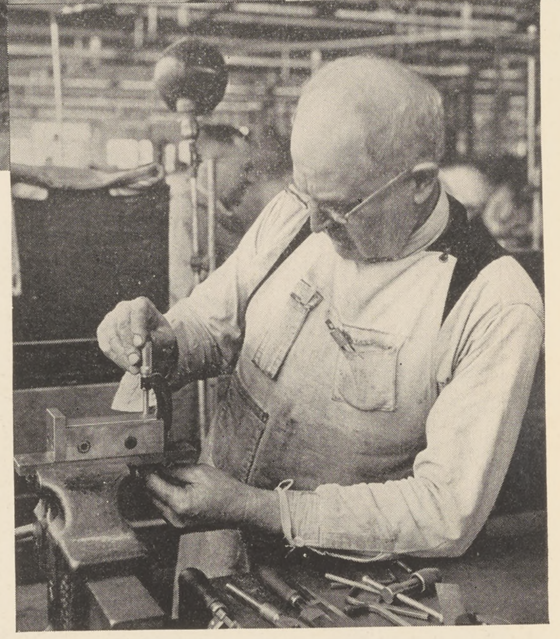
Weather data has been furnished the squadron here during the past few days by the aircraft tenders Avocet, Pelican and Childs, the destroyers Dent and Waters, and Rear Adm. Cook's flagship Memphis, all stationed along the Great Circle route to Hawaii. They also will serve as guard ships during the flight.



Sheet metal operations play an important part. A 14-ft. Cincinnati shear is shown being set up in the department devoted to this work



The initial set-up of a special louver die calls for special care. Other punch presses handle a multitude of blanking, forming, drawing, notching, perforating, crimping, slotting and burnishing operations, and even some small shear work



Skilled toolmakers play an important part in aircraft production; they build the foundation work for the accuracy that must go into the finished product

rail system with a total length exceeding 7500 ft. The monorail system is most complete in the paint shop, where parts are routed along a dozen different parallel tracks, with hundreds of ropes used to suspend parts ranging from small pieces of sheet metal to entire wing panels. Almost the entire back of the factory building, and both ends of the paint shop, is made up of doors. These can be opened at any point. In conjunction with the monorail system this makes it practicable to shift hulls, wing or semi-finished planes from point to point without disturbing the balance of the production line.

Emergency expansion of production can be accomplished quickly by moving all final assembly out into the open yard, and by erecting temporary buildings just east of the main plant, across the boulevard, to house small parts assembly. Further plant facilities could then be provided, if needed, on land available to the north of the present main building. None of this would materially affect the smooth flow of production in the existing plant.

As the company neared the end of its current production contract on the PBY type planes recently, a major program of maintenance work and new equipment installation was undertaken in connection with heavier production requirements of work to be undertaken in the near future. A $500,000 equipment program included three Brown & Sharp automatic screw machines, two Cleveland screw machines, a Cincinnati centerless grinder and a LeBlond gap lathe to swing 50 in.

For the drop hammer die foundry two James H. Knapp gas-fired tilting type melting furnaces were installed, each with a capacity of 8,300 lb. of zinc alloy, or 12,000 lb. of lead. To supply the power for the new air operated drop hammers a new Worthington 20 x 12 x 14-in. horizontal two-stage compressor was added. It is of interest to note than a standby system is provided to supply butane gas to the boilers, heat-treating equipment and furnaces in the event of failure of the natural gas supply, piped from Los Angeles. Some 10,000 gals. of butane fuel are stored at the plant, enough to meet normal needs for a a full ten-day period.

Included in the machinery purchases have been a 4500-ton hydraulic press, a Hamilton double-crank 1000-ton press, four Chambersburg air-operated drop hammers, and four new rope lift type drop hammers designed and manufactured in the Consolidated shops. The 4500-ton hydraulic press is built by the Birdsboro Steel Foundry and Machinery Company in conjunction with the Hydraulic Press Manufacturing Company. The double-crank Hamilton press is a single-action blanking press of 1000-ton capacity, manufactured by the Hooven-Owens-Rentschler Division of General Machine Corporation. The two presses are being installed in the center of the sheet-metal department. The four air-operated drop hammers are all of Chambersburg manufacture. Two smaller Chambersburg hammers are also being installed, each with a stroke of 42 in., and a platen area 41 by 36 in.

The drop hammer installations are new, such work having formerly been contracted to outside manufacturers. It is notable that the drop hammers are being installed in the center of the main factory, immediately adjacent to the machine shop and close to the offices. Drop hammer installations have always been a source of concern due to the heavy vibrations imparted to their foundations, and through the soil to buildings and equipment in the vicinity. It is of interest then, to note the installation of unusually large hammers right in the heart of the plant; and the installation has been further complicatetd by the fact that the entire factory is built on reclaimed soil filled over tidelands, with a bearing value of only 1,250 lb. per sq. ft. So it was necessary for the engineers to solve simultaneously load bearing and vibration transmission problems. The load bearing problem was solved by driving H-type steel piles to a depth of 60 ft. to serve as a sub-foundation. As the roof clearance was only 30 ft. it was necessary to drive the piles in short sections, welding additional increments in place as the driving progressed. Shocks have been kept within the foundations (subject to working demonstration) by mounting the drop hammers each on a heavy inertia block which is, in turn, suspended in a foundation box by means of heavy coil springs. The heavy concrete foundation box rests directly on the steel piles driven in the sub-soil. The inertia block is floated in this box from steel beams at the top resting on Korfund coil springs supported on the foundation proper. It is estimated that the maximum deflection of these springs on the largest of the Chambersburg hammers will not exceed ½ in. In order to save foundation space it was found necessary to make the inertia blocks of something with a specific gravity heavier than concrete. This was done by using steel punchings and scrap as aggregate in mixing the concrete for each of the inertia blocks. The inertia block is heavily reinforced with steel to keep it from disintegrating under the pounding of the hammer.

An aircraft design has called for metal construction to a constantly greater degree, the importance of the machine shop to airplane production has increased. But many metal-work-

Construction of large production fixtures requires some good sized machine tools in the toolroom as exemplified by this open-side planer

BOMBERS LEAVING FOR HAWAII TODAY

S.D. SUN 6/28/39

The non-stop, 2570-mile transpacific mass flight of 15 San Diego patrol bombers to Hawaii was to begin at 3 p. m. today, 24 hours ahead of the original schedule, to take advantage of favorable weather conditions en route, North Island officials announced.

A crew of 105 officers and enlisted men, commanded by Lieut.-Comdr. Sam L. La Hache, comprised the flight personnel. The Consolidated bombers will be delivered to Pearl Harbor and assigned to Patrol Squadron One in the eighth such ferry trip to distant air bases.

Nineteen hours will be required for the hop, Rear Adm. A. B. Cook, Aircraft Scouting Force commander, estimated.

Weather data has been furnished the squadron here during the past few days by the aircraft tenders Avocet, Pelican and Childs, the destroyers Dent and Waters, and Rear Adm. Cook's flagship Memphis, all stationed along the Great Circle route to Hawaii. They also will serve as guard ships during the flight.

ing processes not a part of the machine shop proper have also been required increasingly. Wood has been eliminated so completely from the PBY type that the only place it is used is for the top of the navigator's table, and small pieces in the pilot's seat arm rests. Future designs will probably continue this reliance on metal and will call for more efficient metal-working equipment. Nor is the metal all of a kind, for many different alloys, and structural forms, go to make up the completed PBY. There is extensive use of riveted sheet aluminum alloy in the skin of hull and wing. Welded steel tubing is used in the engine mount. Liberal use of forged dural parts is made throughout the plane, and these must all be machined. Spot-welded dural and stainless steel sheet parts are also employed. And dural tubes and extruded sections are used at many points.

This means that metal-working methods have had to be applied and developed to fit the particular needs of PYB production. Outside the machine shop there are the metal shears and brakes, the heat-treating furnaces, the plating and anodizing equipment, welding shops, tube bending, cable terminal, swaging machine, presses, drop hammers, draw bench, hand and machine riveters, and miscellaneous other such equipment. To keep all this metal-working machinery going a highly efficient tool-crib system has been worked out by which one master tool-crib distributes supplies to eight cribs located in or near eight separate departments.

Some conception of the bulk of metal parts handled in the manufacture of large aircraft is provided by the size of the anodizing pits, which are 20 ft. long and 15 ft. deep. Here aluminum alloy parts or assemblies are given a protective coating of aluminum oxide prior to painting. The same emphasis on size is found in the paint shop. Here facilities have been completely revamped through installation of new spray booths of the water wash type to take the paint residue out of the exhaust air.

To keep pace with the ever increasing size of parts a new salt bath furnace is being installed in the heat-treating department, with a capacity to heat-treat 2,000 lbs. of aluminum alloy parts per hour in a salt pot 21 ft. long, and requiring approximately 18,000 lbs. of potassium nitrate and the same quantity of sodium nitrate for its initial charge.

In the sheet-metal shop we note a Cincinnati brake with a 10 ft. throat which is extended to 15 ft. by end brackets for light aluminum alloy work. And a Cincinnati shear with a 14 ft. throat is used for trimming large sheet metal parts. A battery of Niagara punch presses handles a multitude of blanking, forming, drawing, joggling, notching, perforating, nipping, dimpling, crimping, slotting and burnishing operations, and even some small shear work. As with all metal-working machinery in an aircraft plant, each machine is required to handle a wide range of work, and every operator must be versatile in handling a number of operations satisfactorily.

In order to get the maximum use from the punch presses a complete system of dies has been worked out, including spring die sets, magnetic die holders, notching and slotting dies held in special die sets, and a fascinating technique in handling joggling dies. Joggling, off-setting, or crimping, is of special importance as it is frequently necessary to joggle a plate, or extruded or drawn section, in order to assemble a complex fitting properly in the airplane structure. A clever system of joggle dies, using a sliding shoe and return springs, serves to convert the vertical motion of the press into a desired transverse and angular motion to achieve the various degrees of joggle required.

A separate phase of sheet-metal work is the draw bench, where strip stock is drawn through dies to produce various channel forms. These are then heat-treated and pulled in a stretcher to just beyond their yield point in order to straighten them. A great deal of tube bending is required in connection with plumbing, conduits, and some structural parts. Nearly 900 ft. of tubing is used in each PBY and most of this is bent at some place or other. The motor mount ring is rolled in a ring-rolling machine. The beaching gear strut is bent in a die on a press. But most of the bending is done on a set of tube bending machines instead of by the old hand bending methods. On control cable ends the old method of hand splicing a loop is eliminated through use of a Standard Machine Company swager with which the terminal ends are swaged to the cables. Cold working of the stainless steel terminals during swaging improves their strength also. A "cable-proofing" machine built in the Consolidated shops takes initial stretch out of all cables prior to their installation.

All rivets used in the plant are produced on two rivet headers, one National and one Manville, which turn out as many as a million rivets a week of varying sizes and types. As there are a great many different rivet sizes required in the construction of such a large plane it has been found more satisfactory to manufacture the rivets as needed rather than to carry them in stock. Another factor is the close control that must be maintained on rivet heat treat. After heat-treat the rivets are stored immediately in a large electric refrigerator to keep them from aging prior to driving. This refrigerator serves as supply headquarters for some 37 small electric refrigerators throughout the plant. The small refrigerators are on wheels and may be moved about to suit the convenience of the various rivet driving crews.

Machines methods of a portable kind have been applied to many of the sub-assemblies built up in the welding shop. These bulky assemblies do not lend themselves to handling in the machine shop and are faced, drilled, and reamed at attachment points, or where accessories mount, through use of special fixtures and jigs, with boring bars, spot facers, reamers, etc., all operated by hand electric or pneumatic motors.

But the heart of the PBY production program, or any other metal plane that may be produced in the Consolidated plant, is in the machine shop and toolroom. All production starts in the toolroom with the manufacture of jigs, fixtures and special tools. But so important is elimination of lost time between final design and finished product, because of rapid design obsolescence, especially in the

Pneumatic tube-bending machines are now coming into play. The Model 28 Consolidated twin engined flying boats use approximately 900 ft. of tubing per plane. It finds a place in extinguisher lines, fuel oil lines and for conduit

Archbold Due July 3 On Final Leg of Flight

S.D. Union 6/28/39

Richard Archbold, research director, American Museum of Natural history, en route to San Diego from Sydney, Australia, via Africa, the West Indies and New York, was expected to leave Dakar, West Africa, today on the final legs of his homeward bound flight. He is expected to arrive here July 3 in his San Diego built flying boat.

A New Boat with a New Wing

CHIEF FEATURE of interest in the new twin-motor Consolidated Model 31 flying-boat, which flew first early in May, is its Davis Wing. Its designer, David Richard Davis, was formerly with the Douglas Aircraft Company. His claims for his new section were confirmed by wind-tunnel tests at the California Institute of Technology (Calteck), but the authorities there were doubtful of the practical applications.

We know nothing of the section ourselves except that its designer claims for it a 20% reduction in drag compared with current designs. We assume that he has achieved this by moving the greatest depth back towards the middle from the more usual position somewhere about one-third of the chord back from the leading edge.

We also assume, in view of the doubts expressed at Calteck, that the section is very thin, or, in technical jargonese, has a low thickness-chord (t/c) ratio. This is borne out by the photographs of the new boat. Information from the United States confirms that the surface of the wing is flush-riveted.

So far there is no information about the relative efficiencies of the Davis Wing and the laminar-flow aerofoil developed by the National Advisory Committee for Aeronautics. So far there is no report that the new N.A.C.A. aerofoil has been flown.

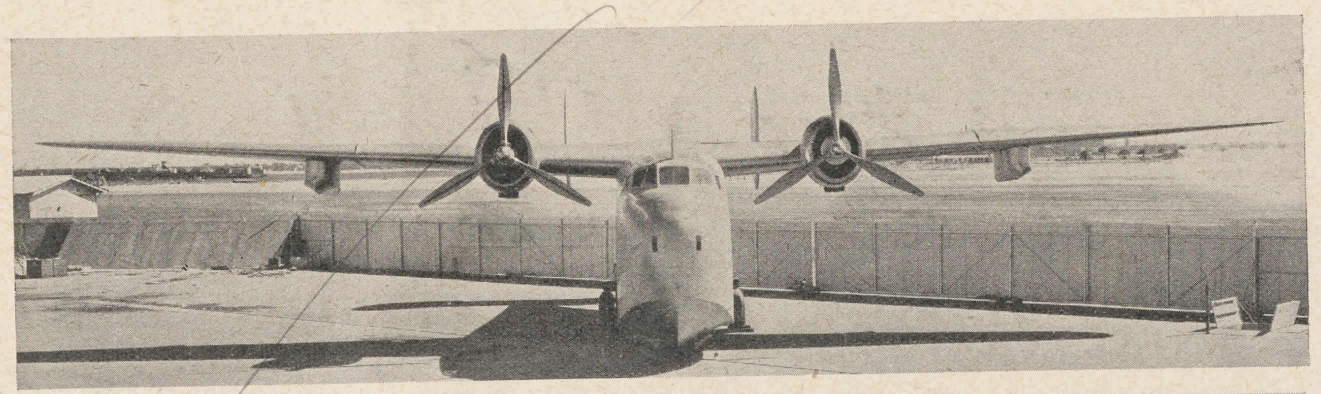
The Model 31 has been built as a Private Venture by the Consolidated Aircraft Corporation of San Diego, California, U.S.A., and, according to report, Reuben Fleet, President and General Manager of the Corporation, has contracted to pay a handsome royalty for every Davis Wing his corporation builds.

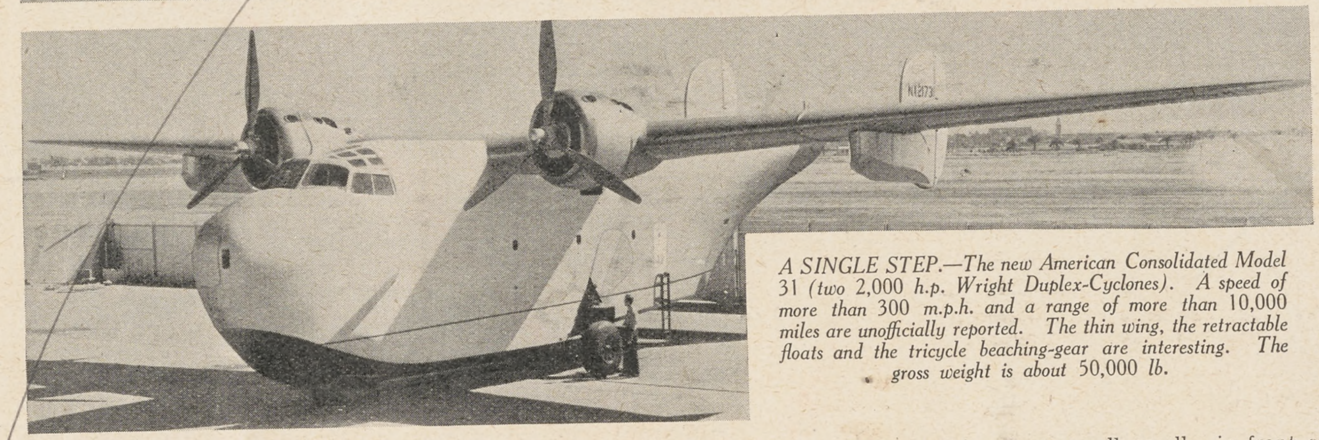
Aircraft construction in the United States seems to follow the same laws as here. We have been told that because the boat was built as a Private Venture, the design and construction, unhampered by Naval requirements, took only ten months, compared with the two or three years normally needed for an aeroplane of this size.

Although the Model 31 does not conform to any specification of the U.S. Navy, its makers believe that its extraordinary performance will probably cause its adoption for military work.

The Consolidated Model 31 high-wing cantilever monoplane has two 2,000 h.p. 18-cylinder Wright Duplex-Cyclone two-row radials. The gross weight is 50,000 lb. (22,660 kg.). The disposable load is supposed to be 1½ times the empty weight.

The maximum speed is quoted unofficially as more than 300 m.p.h. *Time* (New York) reports the "high speed" as 275 m.p.h.; this may mean the maximum cruising speed, which is the only speed of interest to commercial operators. If these figures are correct, the combination of load-carrying ability and speed is considerably better than that of any contemporary aeroplane.





A SINGLE STEP.—The new American Consolidated Model 31 (two 2,000 h.p. Wright Duplex-Cyclones). A speed of more than 300 m.p.h. and a range of more than 10,000 miles are unofficially reported. The thin wing, the retractable floats and the tricycle beaching-gear are interesting. The gross weight is about 50,000 lb.

In civil form the Model 31 can carry up to 52 passengers by day or 28 passengers in bunks at night. Twenty-eight passengers could be carried in comfort across the Atlantic.

Hydraulically operated Fowler flaps extend from the ailerons to the hull. The whole of the wing has stressed metal covering except for the ailerons and flaps which are fabric-covered.

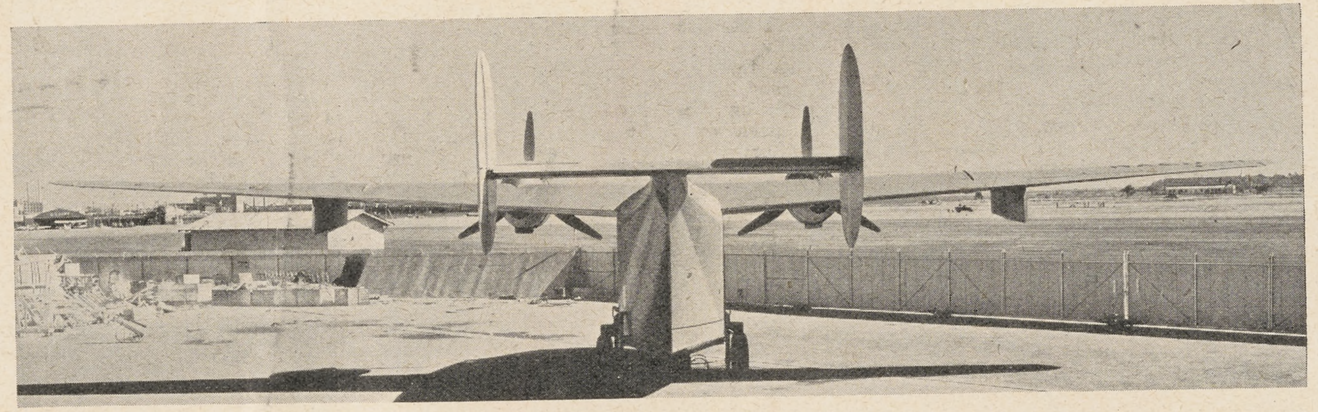
The outboard floats retract into the underside of each wing. The wing-tips of the Model 31 are too small for the sideways retraction of the floats as on the earlier Consolidated PBY.

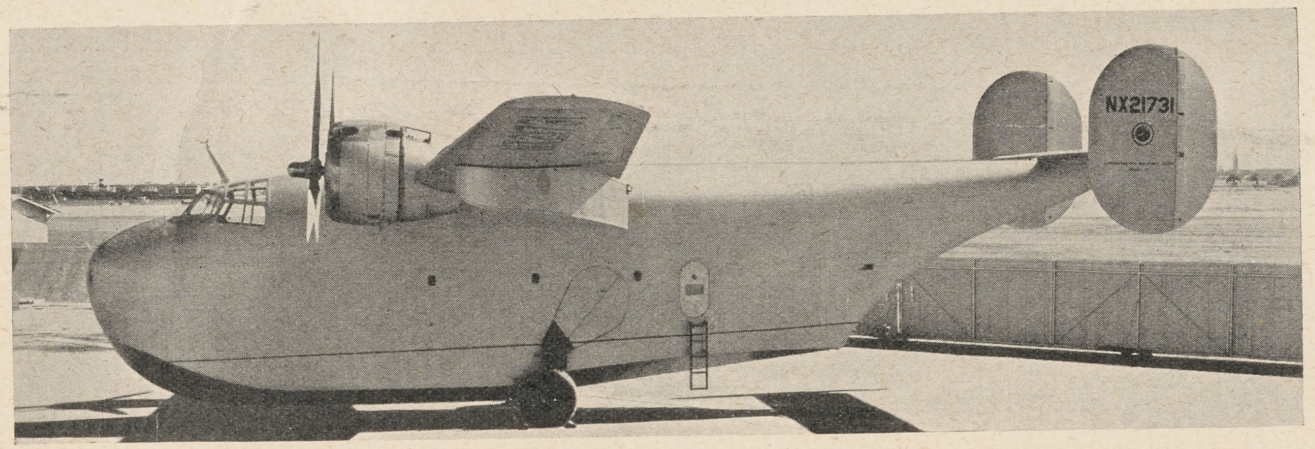
The fuel-tanks are built into the centre section in standard Consolidated fashion. The surfaces of the wing form the top and bottom of the tanks.

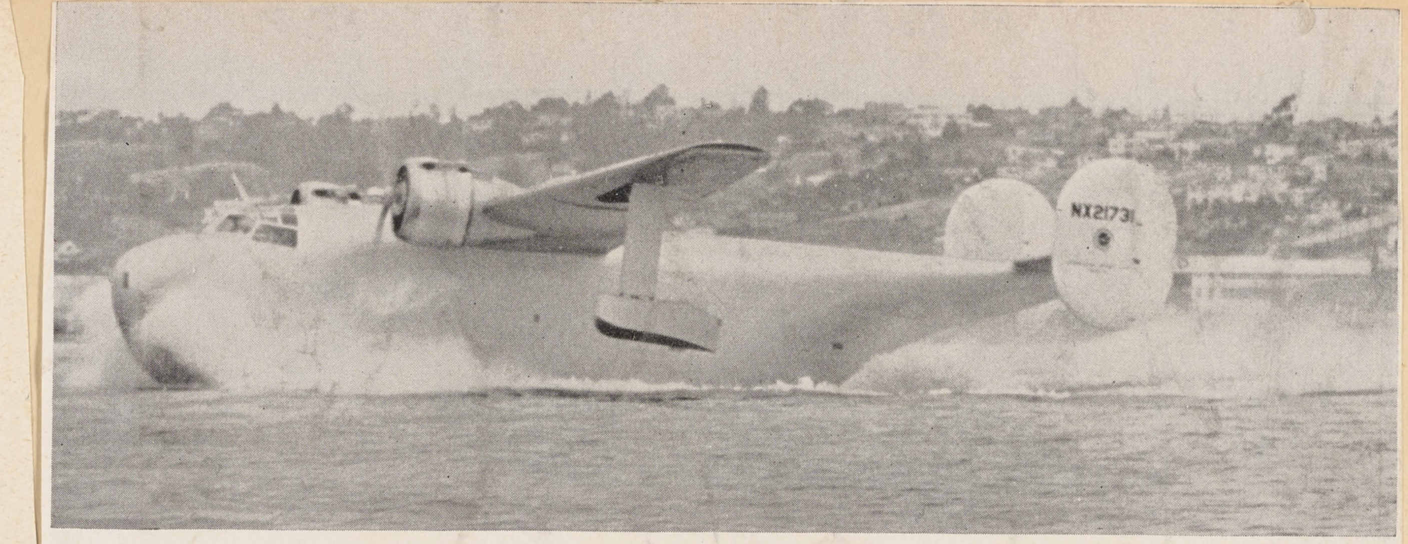
The motors are mounted on very small nacelles in front of the wing. They drive three-blade Hamilton Hydromatic constant-speed fully-feathering airscrews of 16 ft. (4.877 m.) diameter. The long-chord cowlings of the motors are oval in cross-section, perhaps because the carburetter intakes and oil coolers are encowled above and below the motors.

The existence of the new 18-cylinder Wright motors, rated at 2,000 h.p. each for take-off, had not been mentioned before.

The very deep hull of the Model 31 has two decks. The control cabin is above. Normally a crew of five is carried, two pilots, a flight engineer, a radio operator and a navigator. On the lower deck there are eight large compartments.







"Hush-Hush" Boat

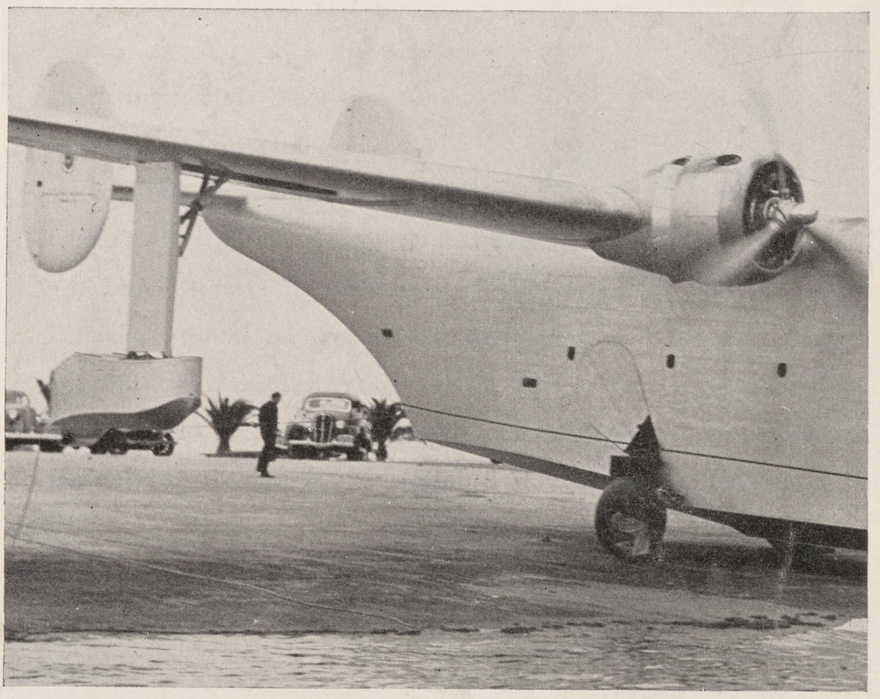
Twin engined Consolidated combines high speed and long range

CONSOLIDATED'S "hush-hush" mystery plane, the Model 31 twin-engined flying boat, took to the air May 5th with William Wheatley at the controls. The new ship, a high-wing cantilever monoplane, of all metal construction, combines high speed, long range, and heavy striking power in a plane of relatively small size. It is powered with two Wright 18 cylinder twin-row engines rated 2,000 hp. for takeoff, driving 16′ dia. Hamilton-Standard 3 blade propellers.

Stability on the water is provided by outboard floats which retract against the under side of the wing in flight. The relatively high taper of the wing prevents tip retraction of the floats as on the PBY series. A tri-cycle beaching gear is permanently attached and is also fully retractable within hull wells. Although intended strictly as a beaching gear, it is believed rugged enough to withstand airport landings in an emergency.

Gross weight is approximately 50,000 lb., wing span 110 ft., over-all length 73 ft., height 22 ft., and maximum wing chord 14 ft. Although little detailed information is available, it is understood to have a wing with high taper ratio, an aspect ratio of approximately ten to one, and a maximum loading of more than 45 lb. per sq.ft. Gross wing area is reported at approximately 1100 sq.ft. Of particular interest is the use of a new type airfoil recently developed by David R. Davis, independent aeronautical engineer. The Davis airfoil is reported to possess a number of interesting characteristics, including low drag and low center of pressure travel. Hydraulically operated Fowler wing flaps assist landings and take-offs. Although no performance estimates have been released, engineers have estimated the plane to have a top speed ranging from 285 m.p.h. to upward of 300 m.p.h., and an all-out maximum range, if stripped for record purposes, of better than 10,000 miles.

Reports of preliminary taxiing tests, and of the test flight which lasted approximately one hour, credited the plane with excellent stability on the water, quick take-off, and smooth landing. The hull is of unique design and is said to be the result of the newest testing technique in the Langley Field towing basin, where complete scale models are now being "flown" off the water instead of limiting test runs with a bare hull. The Model 31 differs materially from current hull design, having unusual depth of hull combined with a relatively narrow planing bottom, and a peculiarly stubby appearance aft.



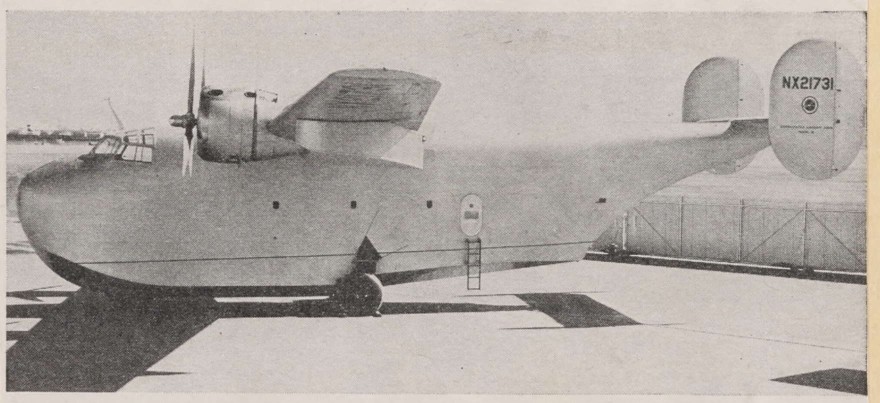
Closeup of the Consolidated Model 31 showing the method of retracting the wing tip floats and the permanent retractable beaching gear.

In construction the Consolidated Model 31 is of conventional skin-stressed design. The wings, tail surfaces, and planing surface of the hull bottom are all flush riveted. Ailerons, flaps, rudders and elevators are fabric covered. The tail consists of a cantilever stabilizer with twin fins and rudders mounted at the ends.

Two flight decks are provided in the hull, one above the other, providing a large flight control compartment, and eight additional compartments for passengers and payload. As a commercial airliner the Model 31 has a day capacity of 52 passengers and a night capacity of 28 passengers, with sleeper accommodations. It is said to be capable of operating in trans-Atlantic service with a load of 28 passengers. Cruising speed on 50 per cent power has been unofficially estimater at better than 200 m.p.h. As a military airplane the Model 31 would augment the PBY series of twin-engine patrol bombers which it greatly exceeds in speed, range, and load carrying ability. However, the plane is a private venture on the part of Consolidated Aircraft Corp., not having been subject to the ordinary procurement routine which adds so materially to the cost and time for construction of prototype military aircraft. As a result the design was developed, built and test flown within a period of only ten months, instead of the two to three years required heretofore under normal procurement procedure.

Military men who have knowledge of the capabilities of the Model 31 base their high estimate of its naval effectiveness primarily on its ability to locate and destroy with relative ease all but the most heavily armed surface vessels. With its high speed, long range, and ability to carry a heavy bomb load, the Model 31 is believed capable of sweeping large areas of ocean entirely free of all enemy vessels except heavily protected fleets of heavy warships. It is pointed out that its high speed makes this plane nearly immune against attack by pursuit planes of current vintage, and materially reduces effectiveness of anti-aircraft fire against it. Yet the bomb carrying capacity is sufficient to cripple any ship afloat if hit but once by a bomb of the maximum size this plane can carry.

No further information on the plane is available as we go to press, but aviation people everywhere may well watch with interest for word of civil or military application of the Consolidated Model 31.



A distinctive feature of the Model 31 is the permanent beaching gear of the tricycle type which is fully retractable within wells in the hull. Although it is intended primarily for beaching, the gear is believed to be rugged enough to withstand airport landings in an emergency.

BOMBERS LEAVING FOR HAWAII TODAY

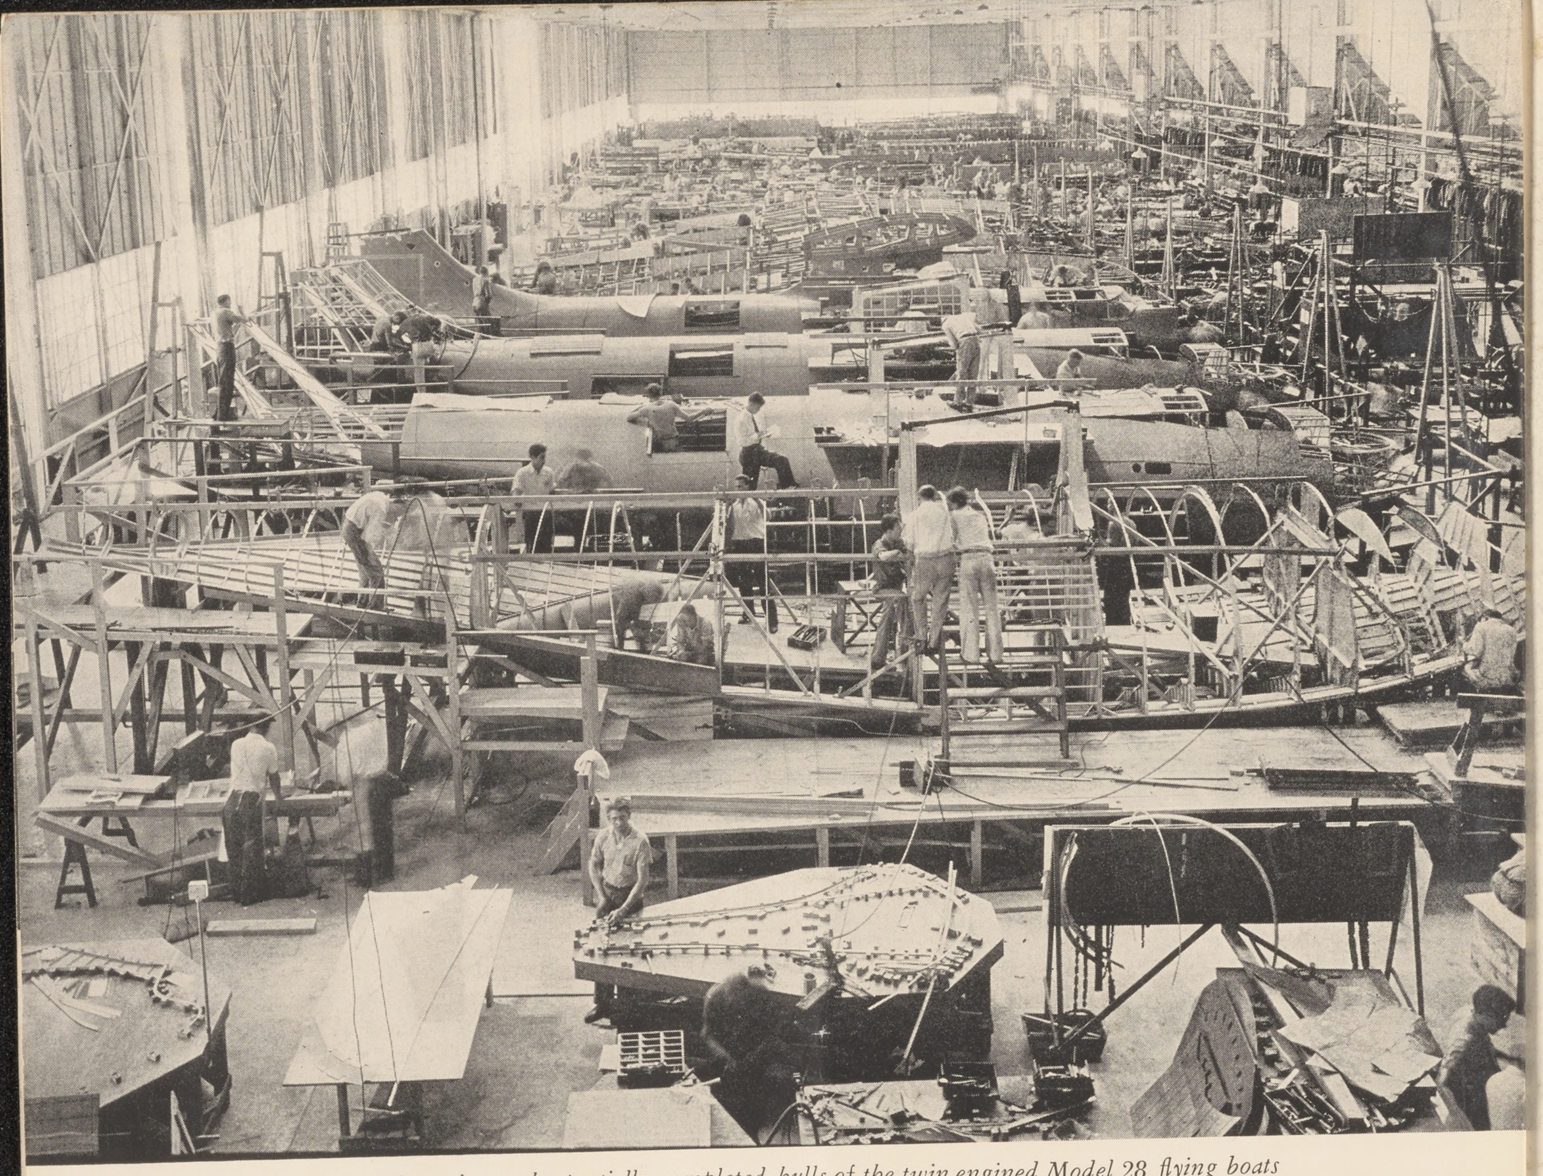
S.D. SUN 6/28/39

The non-stop, 2570-mile trans-pacific mass flight of 15 San Diego patrol bombers to Hawaii was to begin at 3 p. m. today, 24 hours ahead of the original schedule, to take advantage of favorable weather conditions en route, North Island officials announced.

A crew of 105 officers and enlisted men, commanded by Lieut.-Comdr. Sam L. La Hache, comprised the flight personnel. The Consolidated bombers will be delivered to Pearl Harbor and assigned to Patrol Squadron One in the eighth such ferry trip to distant air bases.

Nineteen hours will be required for the hop, Rear Adm. A. B. Cook, Aircraft Scouting Force commander, estimated.

Weather data has been furnished the squadron here during the past few days by the aircraft tenders Avocet, Pelican and Childs, the destroyers Dent and Waters, and Rear Adm. Cook's flagship Memphis, all stationed along the Great Circle route to Hawaii. They also will serve as guard ships during the flight.



The hull assembly line shows the partially completed hulls of the twin engined Model 28 flying boats

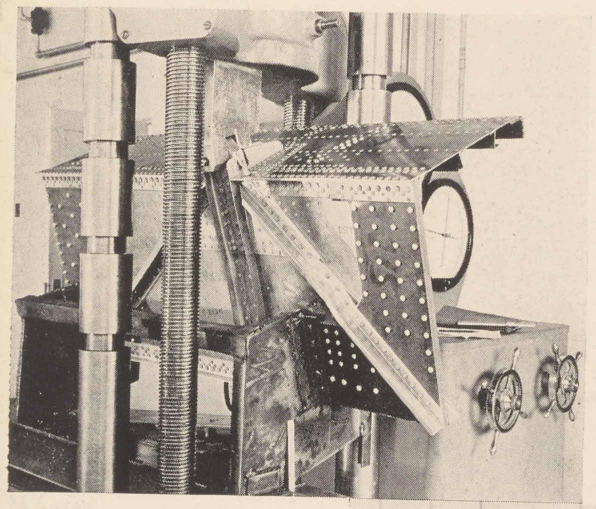
military field, that production of a new type is usually started through the machine shop simultaneously with tool and fixture orders that go to the tool shop. As special fixtures become available they are placed in the production line, but production does not wait for them.

Consolidated performs 85 per cent of all machine work in its own shops and is well equipped for the full range of work required in turning out a plane of such size as the PBY. Toolroom equipment ranges from the huge Cleveland planer with 30-ft. bed to the Swiss jig borer used on precision jig work. Most blanking dies now are made on the DoAll Metal-Master from $\frac{1}{8}$-in. crucible steel sheet, with a hardened punch $\frac{1}{8}$ in. thick, at a cost of a third that of the conventional blanking die. The operation with such dies is a little slower, but the work is entirely satisfactory and it is economically possible to make a die for production lots as small as 30 where previously at least 180 parts were required in a run to pay the die cost. Other special toolroom equipment includes a Pratt & Whitney surface grinder, and a Fosdick radial for large jig and fixture work; in addition to the usual battery of lathes, mills and shapers.

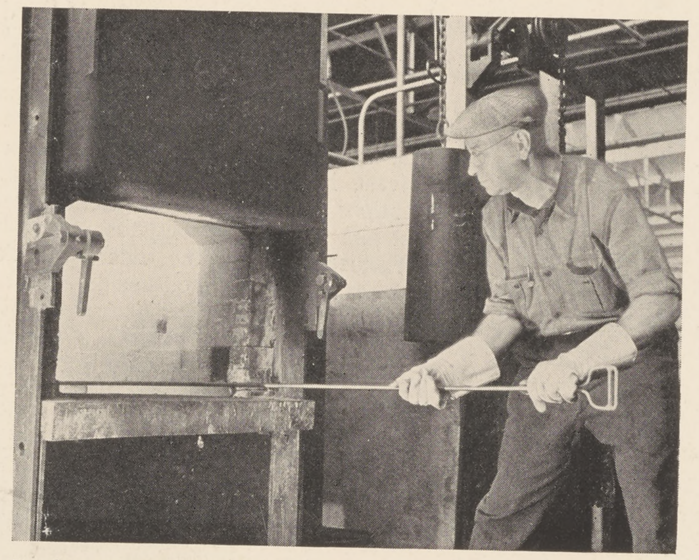
Another development that keeps the toolroom busy is the use of metal-forming blocks in place of the customary wood blocks for miscellaneous assembly jigs. Wood blocks have the advantage of cheapness, but the disadvantages of being subject to warping, cracking and weather changes which produce inaccuracies in the work. The wood blocks also wear rapidly and become unsatisfactory for precision assembly. Such blocks are widely used for all flat-plate assembly layouts such as for ribs, bulkheads and spars. Making such blocks and formers of cast iron or steel is prohibitively expensive. But at the Consolidatetd plant, they have hit on the happy idea of having a local foundry melt up all the aluminum and duralumin scrap and cast it into standard slabs, rods, channels, and other shapes lending themselves to jig and former work, and forming blocks. The light alloy material works up easily into the desired shape, but it makes added work for the toolroom and is another example of the use of metal in aircraft production. Much less expensive than steel or cast iron, the alloy blocks hold their shape throughout a production run, do not chip or wear, and so more than pay for themselves through speeding assembly operations and insuring greater accuracy of assembled parts.

Since each new aircraft design represents an entirely new tooling problem it has been necessary to work out tooling methods that will cause a minimum of delay in production, and still produce satisfactory tools. All frills are eliminated as tools are usually for short runs of a few hundred parts at the most. Relative importance of tooling work is shown by the fact that the toolroom is about equal in size and equipment to the production machine shop. An interesting result is that when tooling is completed on a new model, the toolroom goes into production on aircraft parts just like the rest of the machine shop.

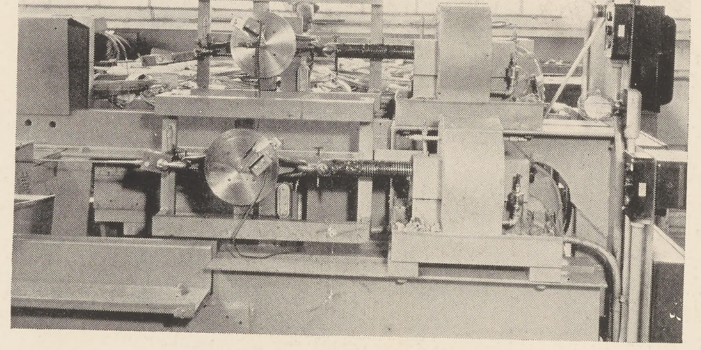
Much of the aircraft work is bulky, or light and springy, and special set-



Engineering advances are checked and developed in the physical testing laboratory. Here is a sample wing fitting set up in a 200,000 lb. Southwark-Emery testing machine



Steel parts are heat-treated in furnaces such as this



The power end of the cable stretching machine is shown. Having a capacity of 20,000 lbs., it was designed and built by Consolidated Aircraft for prestretching all control cables that go into its ships

ups are required in practically every case. Some production machine work is done, as in the case of rollers, bushings and collars produced on the automatic screw machines or on turret lathes. However, a much more typical operation is the machining of an odd-shapped strut of welded chrome-molybdenum steel, on which the attachment end requires a facing operation held to close tolerances. This requires a set-up in a Cincinnati vertical mill so that the strut leg can extend out over the table. Another particular problem involves back spot-facing of an odd shaped bulky alloy casting; or the machining of a long thin taper on a duralumin fitting.

A special set-up has been developed for such scarfing, or taper work, as there is a considerable amount of it. A multitude of odd-shaped small machined parts are used throughout the airplane and many special set-ups have been developed to handle them. One such is a channel block fixture in which cable terminals are held by means of setscrews while a triple straddle mill job is done on a horizontal mill to machine out the terminal slot and simultaneously face both outside surfaces of the fitting. This fixture accommodates six terminal ends per operation. Much precision grinding is done in connection with bushings and rollers required for the control system. This work has become so important that a new cenerless grinder was recently installed.

Another example of the difficult machine work required is the spot facing of the engine mount attachment points which are built integral with the center-section oil tank. This tank serves the three-fold purpose of a tank, a part of the wing nacelle truss and the base for the engine mount. After the tank has been built and tested it is sent to the machine shop for spot facing of the attachment points. In order to do this job at all, and to do it accurately, set-up was worked out on a Dreses radial drill through use of a floor segment arc track which carries a strut to support the swing drill arm. The purpose of the track and strut is to prevent any tendency of the long overhang of the drill to cause spring, resulting in chatter, or spotfacing out of an accurate plane. The strut is carried over the track on rollers so that it is practicable to swing the arm past the work with the spotfacer mounted in the drill head. A special jig is required to hold the tank during this operation, to insure accuracy, as the tank is quite bulky, measuring $1\frac{1}{2}$ x $2\frac{1}{2}$ x 4 ft. in size.

Matching the four spotfaces on the oil tank are the four faces of the engine mount. The engine mount structure is bulky and awkward from a machining standpoint, yet the mounting faces must match those of the tank. To accomplish this the entire engine mount, which is a welded steel tube structure, is placed in a large jig and the four attachment points spotfaced in a radial drill. Then, using these four spots as the set-up face, the work is mounted in a special fixture while the engine attachment lugs on the opposite end of the mount are straddle milled in parallel with the spotface plane. Because of the open nature of the engine mount structure the danger of springing the work has to be carefully guarded against. A small allowance

Archbold Due July 3 On Final Leg of Flight

S.D. Union 6/28/39

Richard Archbold, research director, American Museum of Natural history, en route to San Diego from Sydney, Australia, via Africa, the West Indies and New York, was expected to leave Dakar, West Africa, today on the final legs of his homeward bound flight. He is expected to arrive here July 3 in his San Diego built flying boat.

A New Boat with a New Wing

CHIEF FEATURE of interest in the new twin-motor Consolidated Model 31 flying-boat, which flew first early in May, is its Davis Wing. Its designer, David Richard Davis, was formerly with the Douglas Aircraft Company. His claims for his new section were confirmed by wind-tunnel tests at the California Institute of Technology (Calteck), but the authorities there were doubtful of the practical applications.

We know nothing of the section ourselves except that its designer claims for it a 20% reduction in drag compared with current designs. We assume that he has achieved this by moving the greatest depth back towards the middle from the more usual position somewhere about one-third of the chord back from the leading edge.

We also assume, in view of the doubts expressed at Calteck, that the section is very thin, or, in technical jargonese, has a low thickness-chord (t/c) ratio. This is borne out by the photographs of the new boat. Information from the United States confirms that the surface of the wing is flush-riveted.

So far there is no information about the relative efficiencies of the Davis Wing and the laminar-flow aerofoil developed by the National Advisory Committee for Aeronautics. So far there is no report that the new N.A.C.A. aerofoil has been flown.

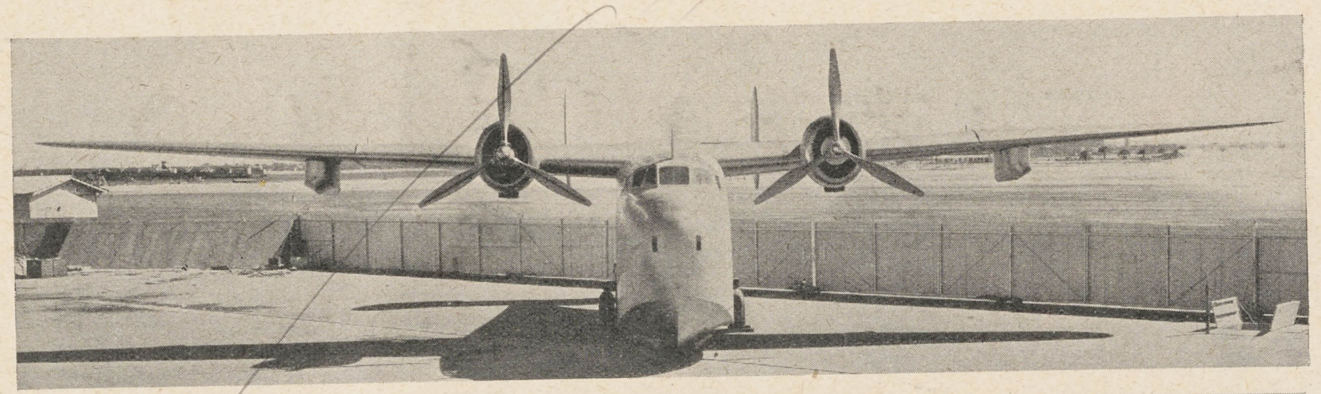
The Model 31 has been built as a Private Venture by the Consolidated Aircraft Corporation of San Diego, California, U.S.A., and, according to report, Reuben Fleet, President and General Manager of the Corporation, has contracted to pay a handsome royalty for every Davis Wing his corporation builds.

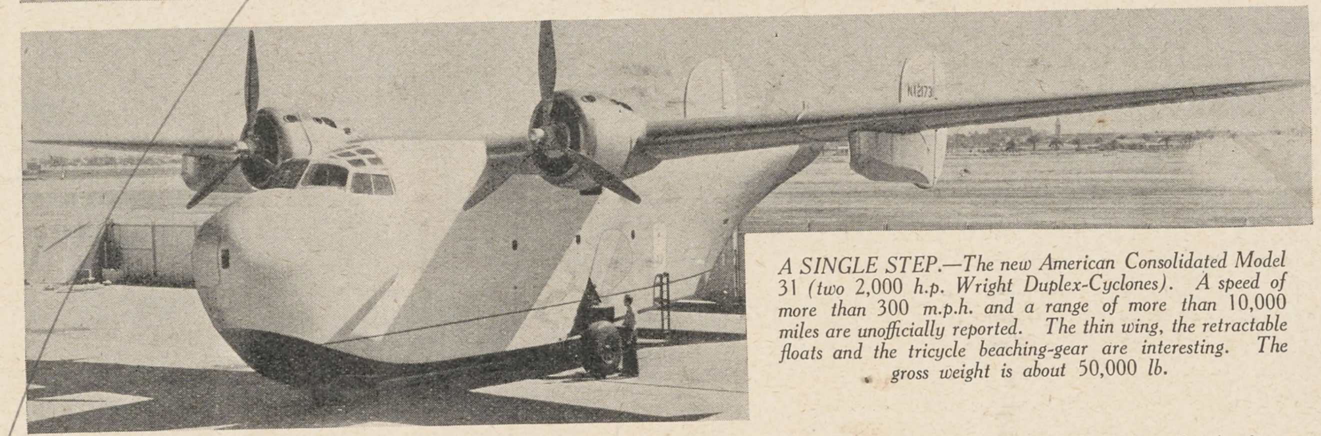
Aircraft construction in the United States seems to follow the same laws as here. We have been told that because the boat was built as a Private Venture, the design and construction, unhampered by Naval requirements, took only ten months, compared with the two or three years normally needed for an aeroplane of this size.

Although the Model 31 does not conform to any specification of the U.S. Navy, its makers believe that its extraordinary performance will probably cause its adoption for military work.

The Consolidated Model 31 high-wing cantilever monoplane has two 2,000 h.p. 18-cylinder Wright Duplex-Cyclone two-row radials. The gross weight is 50,000 lb. (22,660 kg.). The disposable load is supposed to be 1½ times the empty weight.

The maximum speed is quoted unofficially as more than 300 m.p.h. *Time* (New York) reports the "high speed" as 275 m.p.h.; this may mean the maximum cruising speed, which is the only speed of interest to commercial operators. If these figures are correct, the combination of load-carrying ability and speed is considerably better than that of any contemporary aeroplane.





A SINGLE STEP.—The new American Consolidated Model 31 (two 2,000 h.p. Wright Duplex-Cyclones). A speed of more than 300 m.p.h. and a range of more than 10,000 miles are unofficially reported. The thin wing, the retractable floats and the tricycle beaching-gear are interesting. The gross weight is about 50,000 lb.

In civil form the Model 31 can carry up to 52 passengers by day or 28 passengers in bunks at night. Twenty-eight passengers could be carried in comfort across the Atlantic.

Hydraulically operated Fowler flaps extend from the ailerons to the hull. The whole of the wing has stressed metal covering except for the ailerons and flaps which are fabric-covered.

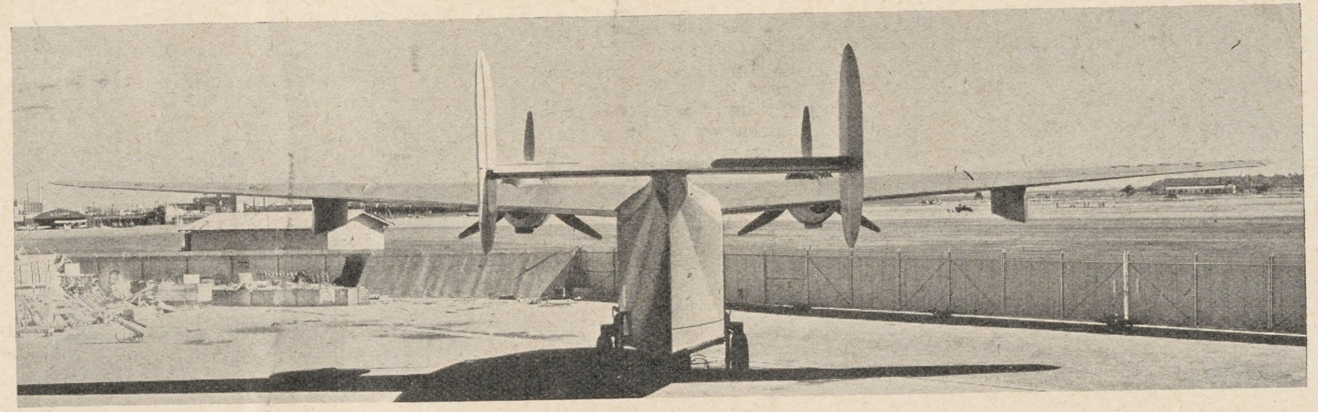
The outboard floats retract into the underside of each wing. The wing-tips of the Model 31 are too small for the sideways retraction of the floats as on the earlier Consolidated PBY.

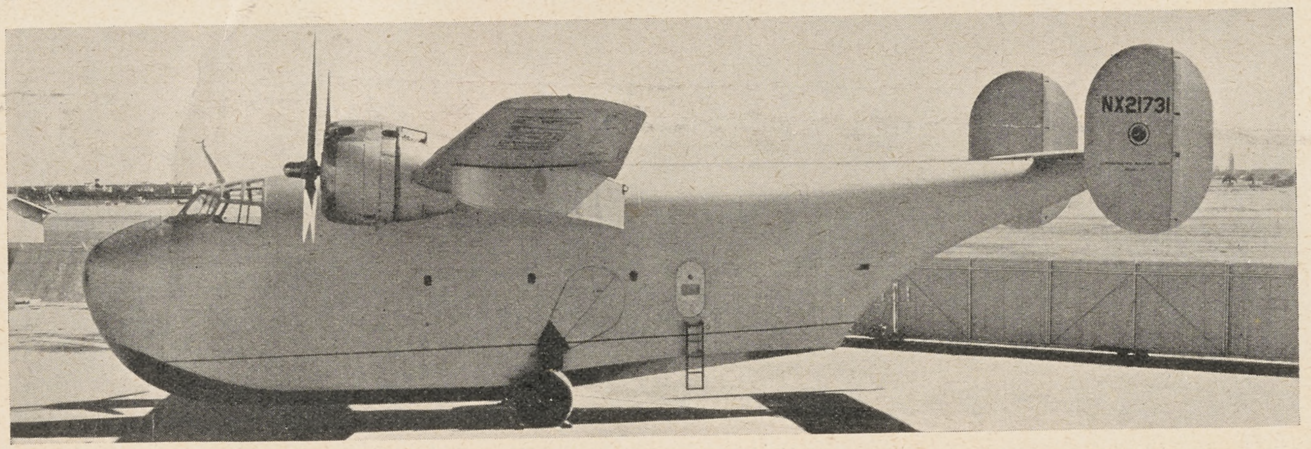
The fuel-tanks are built into the centre section in standard Consolidated fashion. The surfaces of the wing form the top and bottom of the tanks.

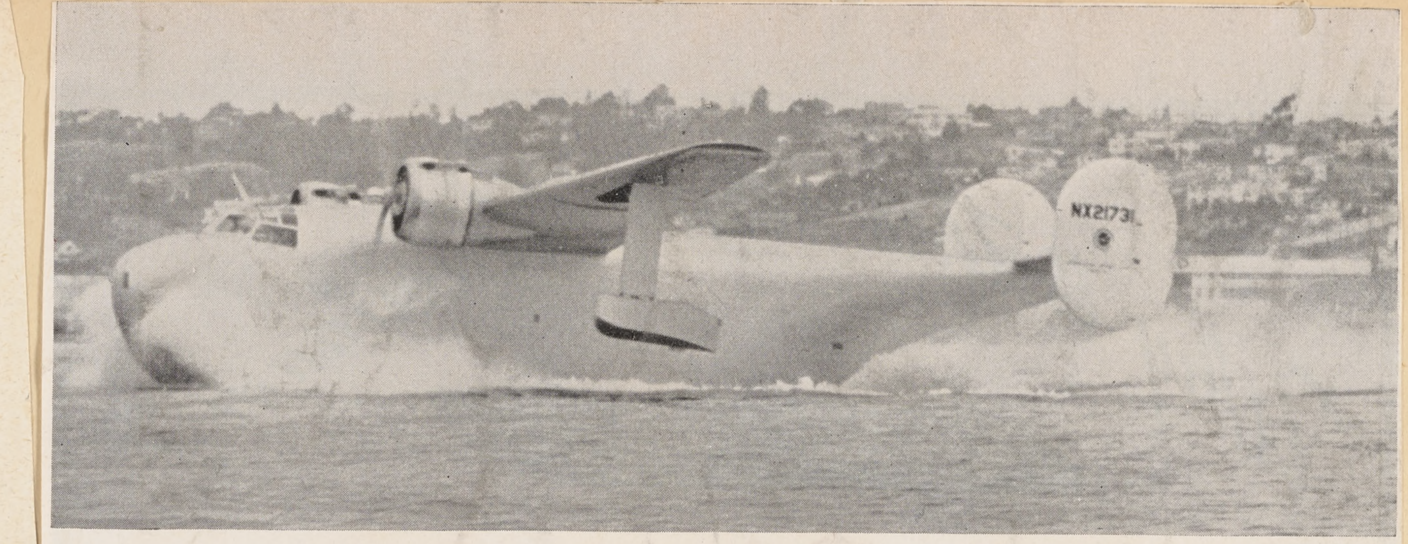
The motors are mounted on very small nacelles in front of the wing. They drive three-blade Hamilton Hydromatic constant-speed fully-feathering airscrews of 16 ft. (4.877 m.) diameter. The long-chord cowlings of the motors are oval in cross-section, perhaps because the carburetter intakes and oil coolers are encowled above and below the motors.

The existence of the new 18-cylinder Wright motors, rated at 2,000 h.p. each for take-off, had not been mentioned before.

The very deep hull of the Model 31 has two decks. The control cabin is above. Normally a crew of five is carried, two pilots, a flight engineer, a radio operator and a navigator. On the lower deck there are eight large compartments.







"Hush-Hush" Boat

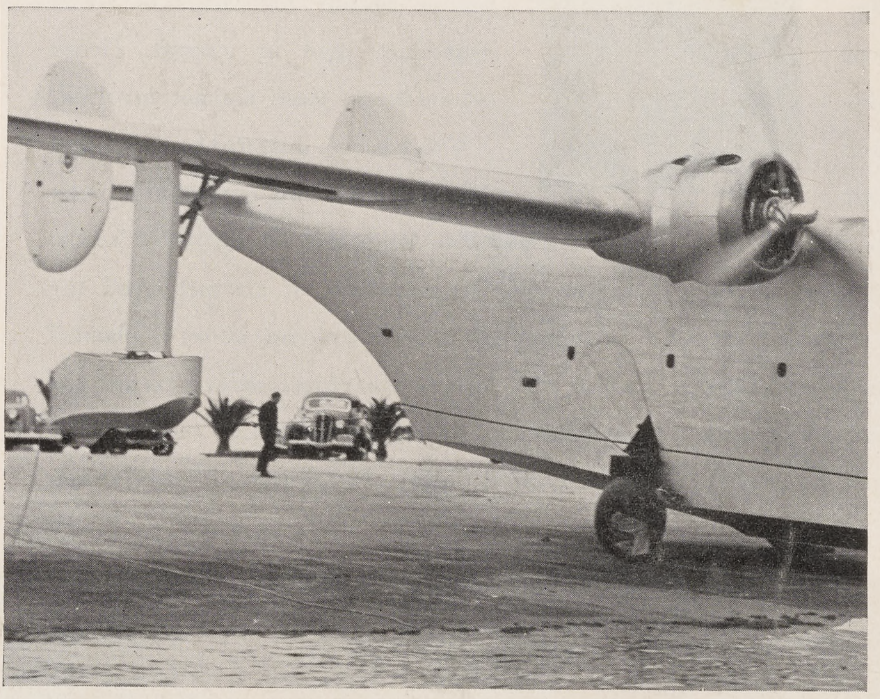
Twin engined Consolidated combines high speed and long range

CONSOLIDATED'S "hush-hush" mystery plane, the Model 31 twin-engined flying boat, took to the air May 5th with William Wheatley at the controls. The new ship, a high-wing cantilever monoplane, of all metal construction, combines high speed, long range, and heavy striking power in a plane of relatively small size. It is powered with two Wright 18 cylinder twin-row engines rated 2,000 hp. for takeoff, driving 16′ dia. Hamilton-Standard 3 blade propellers.

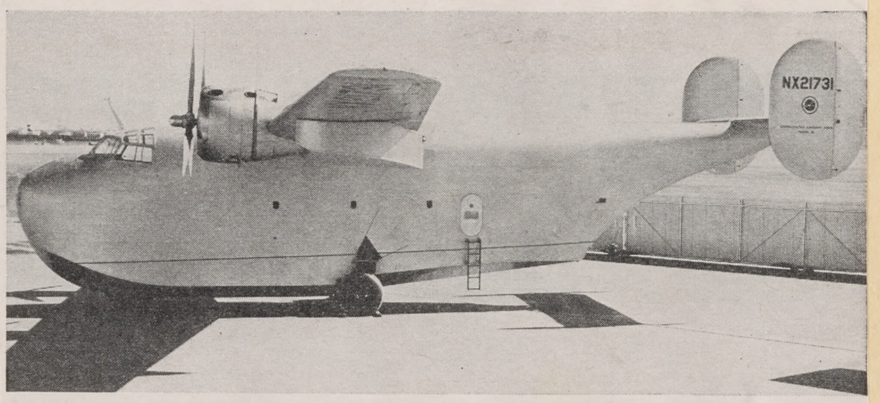
Stability on the water is provided by outboard floats which retract against the under side of the wing in flight. The relatively high taper of the wing prevents tip retraction of the floats as on the PBY series. A tri-cycle beaching gear is permanently attached and is also fully retractable within hull wells. Although intended strictly as a beaching gear, it is believed rugged enough to withstand airport landings in an emergency.

Gross weight is approximately 50,000 lb., wing span 110 ft., over-all length 73 ft., height 22 ft., and maximum wing chord 14 ft. Although little detailed information is available, it is understood to have a wing with high taper ratio, an aspect ratio of approximately ten to one, and a maximum loading of more than 45 lb. per sq.ft. Gross wing area is reported at approximately 1100 sq.ft. Of particular interest is the use of a new type airfoil recently developed by David R. Davis, independent aeronautical engineer. The Davis airfoil is reported to possess a number of interesting characteristics, including low drag and low center of pressure travel. Hydraulically operated Fowler wing flaps assist landings and take-offs. Although no performance estimates have been released, engineers have estimated the plane to have a top speed ranging from 285 m.p.h. to upward of 300 m.p.h., and an all-out maximum range, if stripped for record purposes, of better than 10,000 miles.

Reports of preliminary taxiing tests, and of the test flight which lasted approximately one hour, credited the plane with excellent stability on the water, quick take-off, and smooth landing. The hull is of unique design and is said to be the result of the newest testing technique in the Langley Field towing basin, where complete scale models are now being "flown" off the water instead of limiting test runs with a bare hull. The Model 31 differs materially from current hull design, having unusual depth of hull combined with a relatively narrow planing bottom, and a peculiarly stubby appearance aft.



Closeup of the Consolidated Model 31 showing the method of retracting the wing tip floats and the permanent retractable beaching gear.



A distinctive feature of the Model 31 is the permanent beaching gear of the tricycle type which is fully retractable within wells in the hull. Although it is intended primarily for beaching, the gear is believed to be rugged enough to withstand airport landings in an emergency.

In construction the Consolidated Model 31 is of conventional skin-stressed design. The wings, tail surfaces, and planing surface of the hull bottom are all flush riveted. Ailerons, flaps, rudders and elevators are fabric covered. The tail consists of a cantilever stabilizer with twin fins and rudders mounted at the ends.

Two flight decks are provided in the hull, one above the other, providing a large flight control compartment, and eight additional compartments for passengers and payload. As a commercial airliner the Model 31 has a day capacity of 52 passengers and a night capacity of 28 passengers, with sleeper accommodations. It is said to be capable of operating in trans-Atlantic service with a load of 28 passengers. Cruising speed on 50 per cent power has been unofficially estimater at better than 200 m.p.h. As a military airplane the Model 31 would augment the PBY series of twin-engine patrol bombers which it greatly exceeds in speed, range, and load carrying ability. However, the plane is a private venture on the part of Consolidated Aircraft Corp., not having been subject to the ordinary procurement routine which adds so materially to the cost and time for construction of prototype military aircraft. As a result the design was developed, built and test flown within a period of only ten months, instead of the two to three years required heretofore under normal procurement procedure.

Military men who have knowledge of the capabilities of the Model 31 base their high estimate of its naval effectiveness primarily on its ability to locate and destroy with relative ease all but the most heavily armed surface vessels. With its high speed, long range, and ability to carry a heavy bomb load, the Model 31 is believed capable of sweeping large areas of ocean entirely free of all enemy vessels except heavily protected fleets of heavy warships. It is pointed out that its high speed makes this plane nearly immune against attack by pursuit planes of current vintage, and materially reduces effectiveness of anti-aircraft fire against it. Yet the bomb carrying capacity is sufficient to cripple any ship afloat if hit but once by a bomb of the maximum size this plane can carry.

No further information on the plane is available as we go to press, but aviation people everywhere may well watch with interest for word of civil or military application of the Consolidated Model 31.

BOMBERS LEAVING FOR HAWAII TODAY

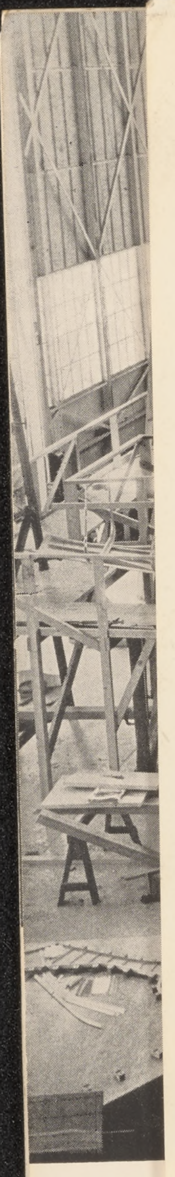
S.D. SUN 6/28/39

The non-stop, 2570-mile transpacific mass flight of 15 San Diego patrol bombers to Hawaii was to begin at 3 p. m. today, 24 hours ahead of the original schedule, to take advantage of favorable weather conditions en route, North Island officials announced.

A crew of 105 officers and enlisted men, commanded by Lieut.-Comdr. Sam L. La Hache, comprised the flight personnel. The Consolidated bombers will be delivered to Pearl Harbor and assigned to Patrol Squadron One in the eighth such ferry trip to distant air bases.

Nineteen hours will be required for the hop, Rear Adm. A. B. Cook, Aircraft Scouting Force commander, estimated.

Weather data has been furnished the squadron here during the past few days by the aircraft tenders Avocet, Pelican and Childs, the destroyers Dent and Waters, and Rear Adm. Cook's flagship Memphis, all stationed along the Great Circle route to Hawaii. They also will serve as guard ships during the flight.



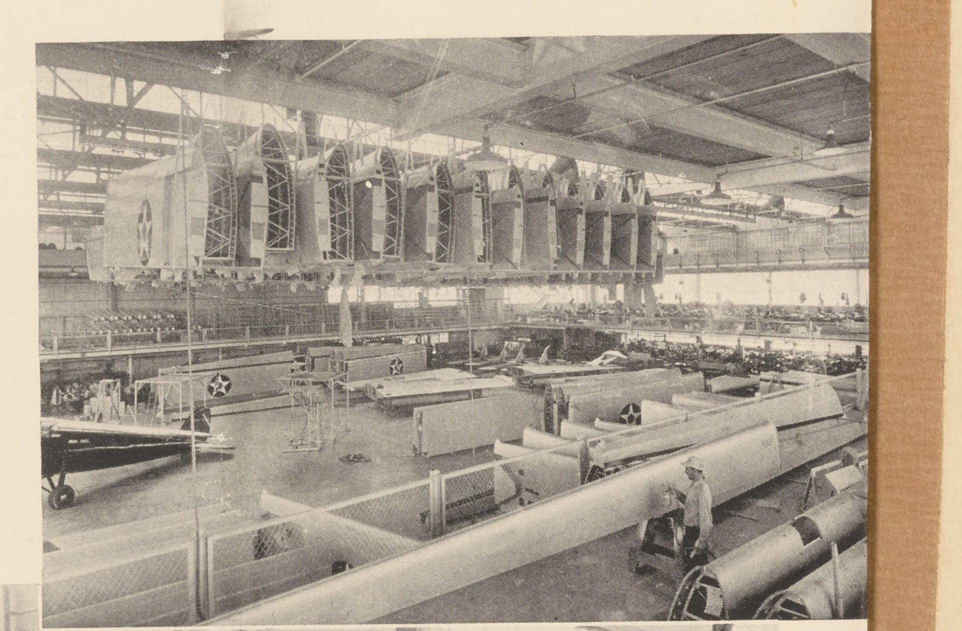
in the welded structure is provided for machining.

Throughout assembly work one particular tool plays an important part. This is the riveter, which is used in many forms. There are hand rivet guns for driving rivets, hand squeezers for one-shot operations, machine riveters, special rivet jigs with side throat yokes for rivet squeezing on large assemblies such as spars.

Almost innumerable devices have been developed to speed final assembly. These range all the way from the simple expedient of filling the hull with water to see if it leaks, to the roll-over rings by which the hulls are hoisted and turned when the bottom has been skinned and it is time to start on the top. Final attachment of the outer wing panels to the center section is done out in the open yard with a hoist rack actuated by automobile differential drives operated by a drum and cable system which takes the wing from a low loading level up to the attaching position. The rack is mounted on rubber tired wheels to permit maneuvering the wing panels into position with minimum effort.

The final airplane truly represents a machine-made product from nose to tail. In wings, hull, and tail hundreds of machined fittings, struts, and structural or control parts take thei place in a flying boat that is literall born in the machine shop.

Some of the work back of the pro duction line is not apparent, even t the close observer. For example, th physical and chemical laboratory i constantly testing parts and material to destruction; and the photo labora tory makes 7,000 negatives and mor than 20,000 prints yearly to serve a a detailed guide for engineering an production departments. These pho tographs aid in maintaining an un failing standard, so that each com pleted PBY will be identical with he sisters.



In the experimental building, all new projects of plane design are conducted. If necessary this area could be turned over to production

Assembly devices range from wood boards, similar to those shown in the foreground, to the big hull assembly fixtures in the background. For the large fixtures steel is employed

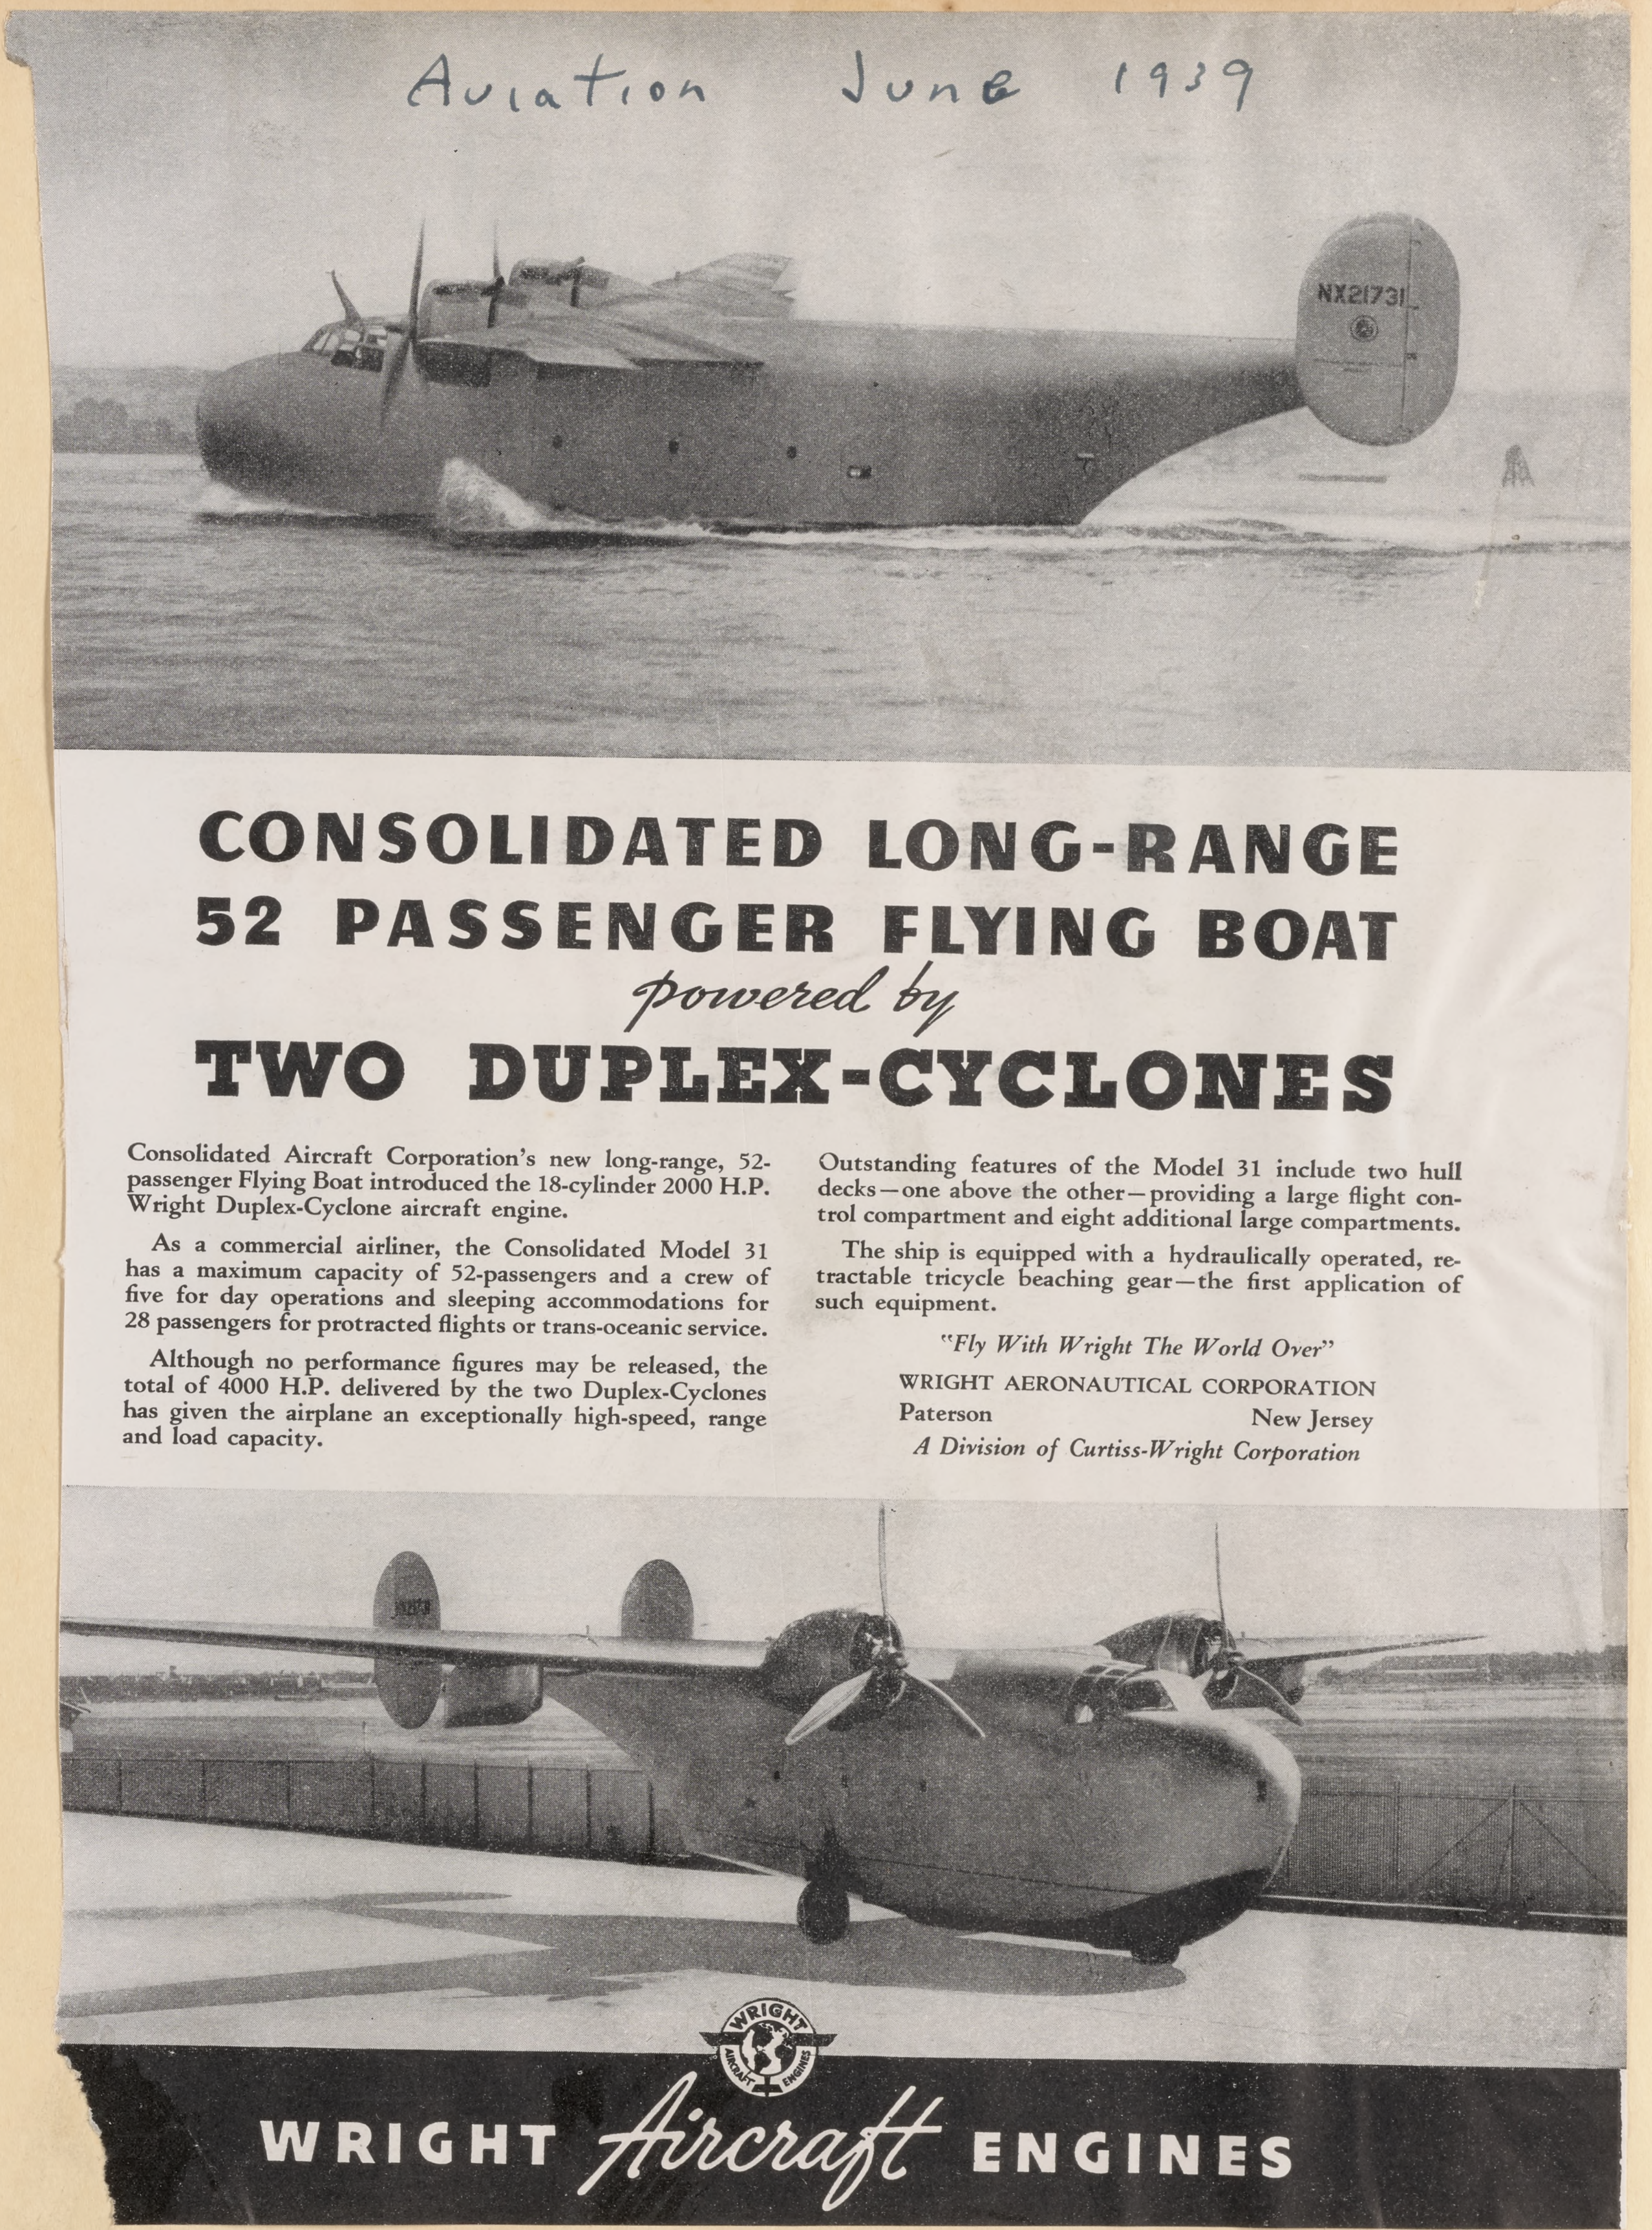
Aviation June 1939



CONSOLIDATED LONG-RANGE 52 PASSENGER FLYING BOAT

powered by

TWO DUPLEX-CYCLONES

Consolidated Aircraft Corporation's new long-range, 52-passenger Flying Boat introduced the 18-cylinder 2000 H.P. Wright Duplex-Cyclone aircraft engine.

As a commercial airliner, the Consolidated Model 31 has a maximum capacity of 52-passengers and a crew of five for day operations and sleeping accommodations for 28 passengers for protracted flights or trans-oceanic service.

Although no performance figures may be released, the total of 4000 H.P. delivered by the two Duplex-Cyclones has given the airplane an exceptionally high-speed, range and load capacity.

Outstanding features of the Model 31 include two hull decks—one above the other—providing a large flight control compartment and eight additional large compartments.

The ship is equipped with a hydraulically operated, retractable tricycle beaching gear—the first application of such equipment.

Archbold Due July 3 On Final Leg of Flight

S.D. Union 6/28/39

Richard Archbold, research director, American Museum of Natural history, en route to San Diego from Sydney, Australia, via Africa, the West Indies and New York, was expected to leave Dakar, West Africa, today on the final legs of his homeward bound flight. He is expected to arrive here July 3 in his San Diego built flying boat.

A New Boat with a New Wing

CHIEF FEATURE of interest in the new twin-motor Consolidated Model 31 flying-boat, which flew first early in May, is its Davis Wing. Its designer, David Richard Davis, was formerly with the Douglas Aircraft Company. His claims for his new section were confirmed by wind-tunnel tests at the California Institute of Technology (Calteck), but the authorities there were doubtful of the practical applications.

We know nothing of the section ourselves except that its designer claims for it a 20% reduction in drag compared with current designs. We assume that he has achieved this by moving the greatest depth back towards the middle from the more usual position somewhere about one-third of the chord back from the leading edge.

We also assume, in view of the doubts expressed at Calteck, that the section is very thin, or, in technical jargonese, has a low thickness-chord (t/c) ratio. This is borne out by the photographs of the new boat. Information from the United States confirms that the surface of the wing is flush-riveted.

So far there is no information about the relative efficiencies of the Davis Wing and the laminar-flow aerofoil developed by the National Advisory Committee for Aeronautics. So far there is no report that the new N.A.C.A. aerofoil has been flown.

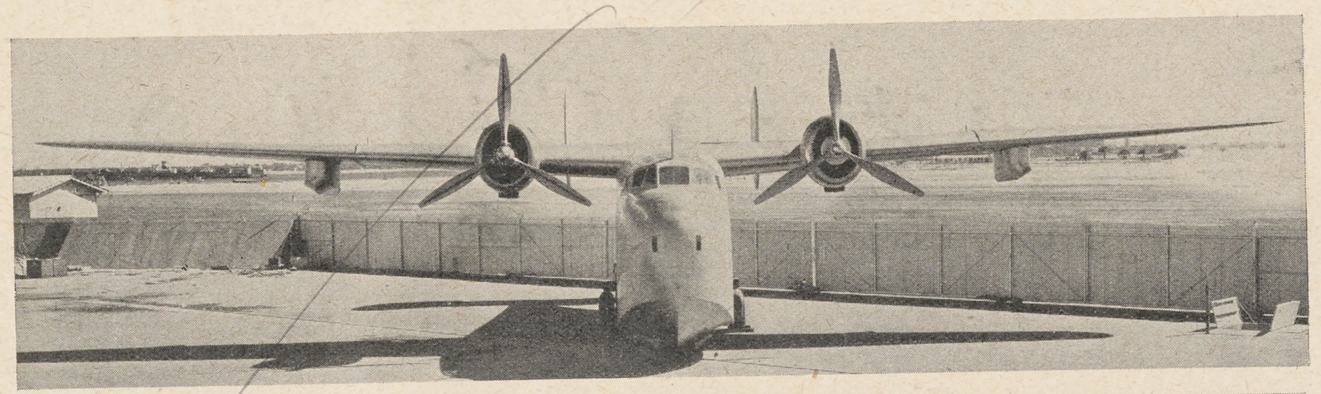
The Model 31 has been built as a Private Venture by the Consolidated Aircraft Corporation of San Diego, California, U.S.A., and, according to report, Reuben Fleet, President and General Manager of the Corporation, has contracted to pay a handsome royalty for every Davis Wing his corporation builds.

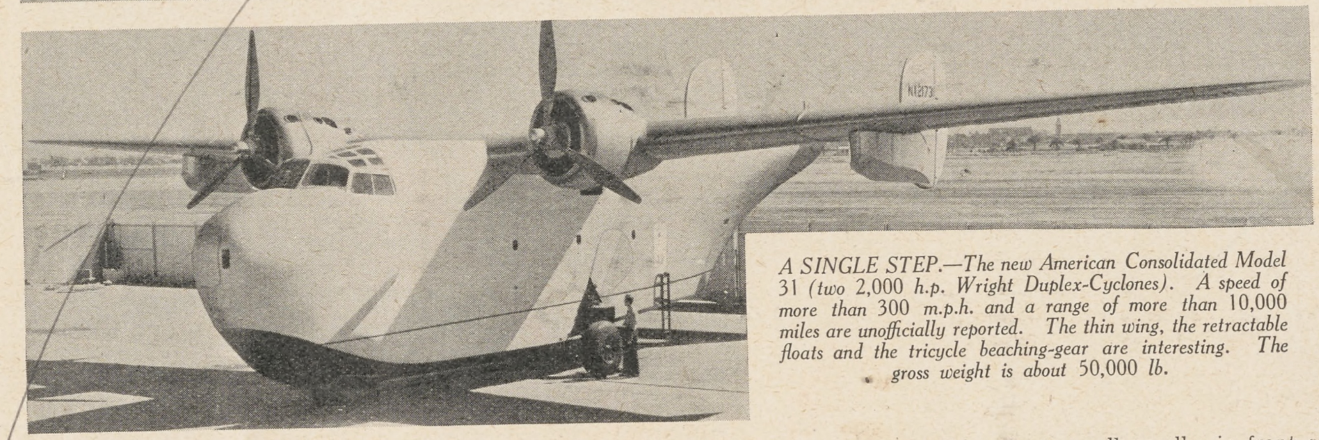
Aircraft construction in the United States seems to follow the same laws as here. We have been told that because the boat was built as a Private Venture, the design and construction, unhampered by Naval requirements, took only ten months, compared with the two or three years normally needed for an aeroplane of this size.

Although the Model 31 does not conform to any specification of the U.S. Navy, its makers believe that its extraordinary performance will probably cause its adoption for military work.

The Consolidated Model 31 high-wing cantilever monoplane has two 2,000 h.p. 18-cylinder Wright Duplex-Cyclone two-row radials. The gross weight is 50,000 lb. (22,660 kg.). The disposable load is supposed to be 1½ times the empty weight.

The maximum speed is quoted unofficially as more than 300 m.p.h. *Time* (New York) reports the "high speed" as 275 m.p.h.; this may mean the maximum cruising speed, which is the only speed of interest to commercial operators. If these figures are correct, the combination of load-carrying ability and speed is considerably better than that of any contemporary aeroplane.





A SINGLE STEP.—The new American Consolidated Model 31 (two 2,000 h.p. Wright Duplex-Cyclones). A speed of more than 300 m.p.h. and a range of more than 10,000 miles are unofficially reported. The thin wing, the retractable floats and the tricycle beaching-gear are interesting. The gross weight is about 50,000 lb.

In civil form the Model 31 can carry up to 52 passengers by day or 28 passengers in bunks at night. Twenty-eight passengers could be carried in comfort across the Atlantic.

Hydraulically operated Fowler flaps extend from the ailerons to the hull. The whole of the wing has stressed metal covering except for the ailerons and flaps which are fabric-covered.

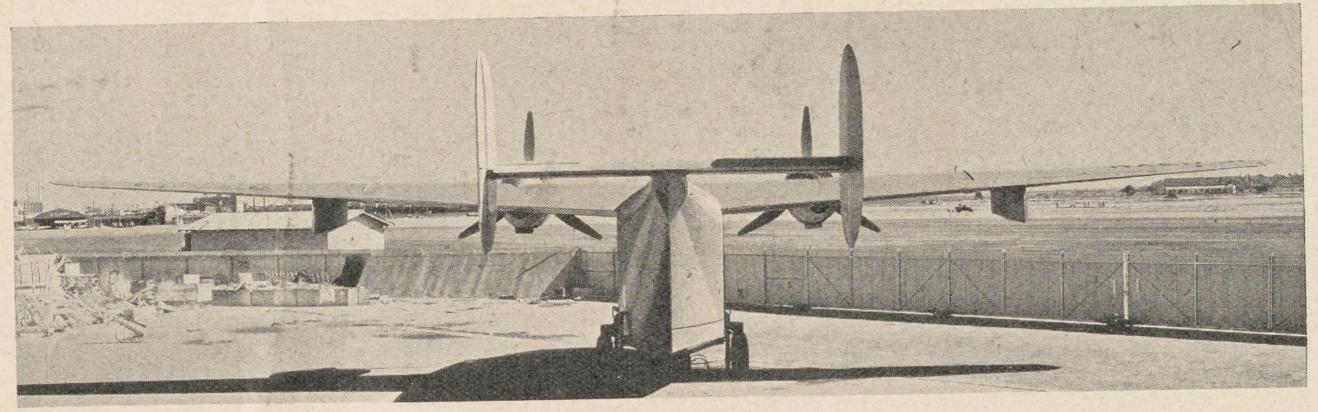
The outboard floats retract into the underside of each wing. The wing-tips of the Model 31 are too small for the sideways retraction of the floats as on the earlier Consolidated PBY.

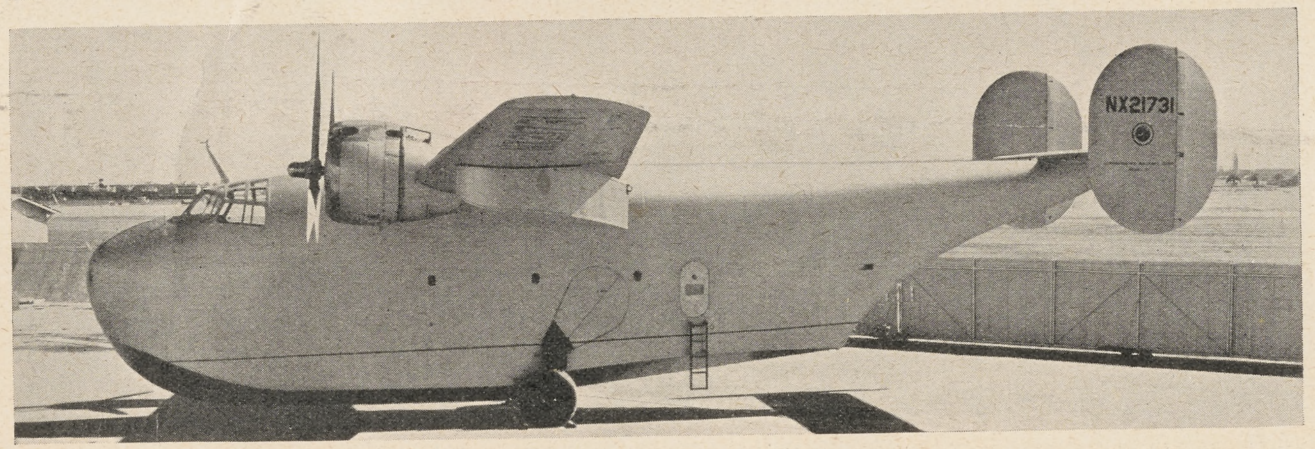
The fuel-tanks are built into the centre section in standard Consolidated fashion. The surfaces of the wing form the top and bottom of the tanks.

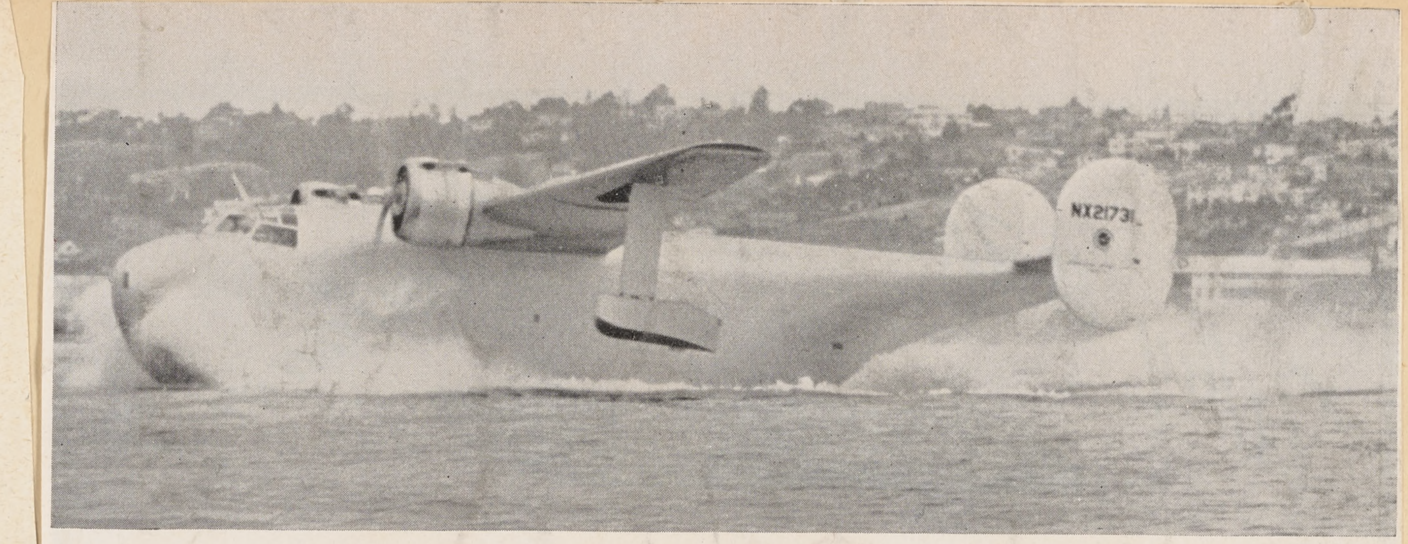
The motors are mounted on very small nacelles in front of the wing. They drive three-blade Hamilton Hydromatic constant-speed fully-feathering airscrews of 16 ft. (4.877 m.) diameter. The long-chord cowlings of the motors are oval in cross-section, perhaps because the carburetter intakes and oil coolers are encowled above and below the motors.

The existence of the new 18-cylinder Wright motors, rated at 2,000 h.p. each for take-off, had not been mentioned before.

The very deep hull of the Model 31 has two decks. The control cabin is above. Normally a crew of five is carried, two pilots, a flight engineer, a radio operator and a navigator. On the lower deck there are eight large compartments.





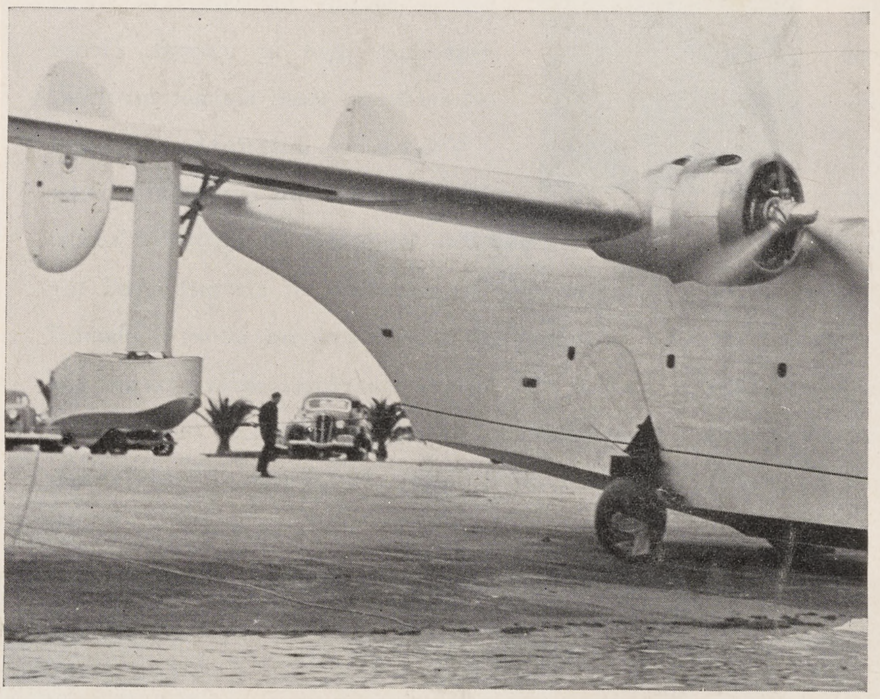


"Hush-Hush" Boat

Twin engined Consolidated combines high speed and long range

CONSOLIDATED'S "hush-hush" mystery plane, the Model 31 twin-engined flying boat, took to the air May 5th with William Wheatley at the controls. The new ship, a high-wing cantilever monoplane, of all metal construction, combines high speed, long range, and heavy striking power in a plane of relatively small size. It is powered with two Wright 18 cylinder twin-row engines rated 2,000 hp. for takeoff, driving 16′ dia. Hamilton-Standard 3 blade propellers.

Stability on the water is provided by outboard floats which retract against the under side of the wing in flight. The relatively high taper of the wing prevents tip retraction of the floats as on the PBY series. A tri-cycle beaching gear is permanently attached and is also fully retractable within hull wells. Although intended strictly as a beaching gear, it is believed rugged enough to withstand airport landings in an emergency.



Closeup of the Consolidated Model 31 showing the method of retracting the wing tip floats and the permanent retractable beaching gear.

Gross weight is approximately 50,000 lb., wing span 110 ft., over-all length 73 ft., height 22 ft., and maximum wing chord 14 ft. Although little detailed information is available, it is understood to have a wing with high taper ratio, an aspect ratio of approximately ten to one, and a maximum loading of more than 45 lb. per sq.ft. Gross wing area is reported at approximately 1100 sq.ft. Of particular interest is the use of a new type airfoil recently developed by David R. Davis, independent aeronautical engineer. The Davis airfoil is reported to possess a number of interesting characteristics, including low drag and low center of pressure travel. Hydraulically operated Fowler wing flaps assist landings and take-offs. Although no performance estimates have been released, engineers have estimated the plane to have a top speed ranging from 285 m.p.h. to upward of 300 m.p.h., and an all-out maximum range, if stripped for record purposes, of better than 10,000 miles.

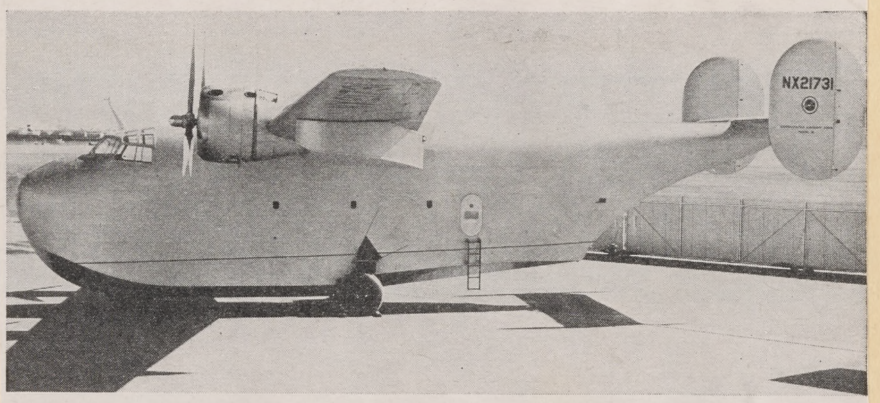
Reports of preliminary taxiing tests, and of the test flight which lasted approximately one hour, credited the plane with excellent stability on the water, quick take-off, and smooth landing. The hull is of unique design and is said to be the result of the newest testing technique in the Langley Field towing basin, where complete scale models are now being "flown" off the water instead of limiting test runs with a bare hull. The Model 31 differs materially from current hull design, having unusual depth of hull combined with a relatively narrow planing bottom, and a peculiarly stubby appearance aft.

In construction the Consolidated Model 31 is of conventional skin-stressed design. The wings, tail surfaces, and planing surface of the hull bottom are all flush riveted. Ailerons, flaps, rudders and elevators are fabric covered. The tail consists of a cantilever stabilizer with twin fins and rudders mounted at the ends.

Two flight decks are provided in the hull, one above the other, providing a large flight control compartment, and eight additional compartments for passengers and payload. As a commercial airliner the Model 31 has a day capacity of 52 passengers and a night capacity of 28 passengers, with sleeper accommodations. It is said to be capable of operating in trans-Atlantic service with a load of 28 passengers. Cruising speed on 50 per cent power has been unofficially estimater at better than 200 m.p.h. As a military airplane the Model 31 would augment the PBY series of twin-engine patrol bombers which it greatly exceeds in speed, range, and load carrying ability. However, the plane is a private venture on the part of Consolidated Aircraft Corp., not having been subject to the ordinary procurement routine which adds so materially to the cost and time for construction of prototype military aircraft. As a result the design was developed, built and test flown within a period of only ten months, instead of the two to three years required heretofore under normal procurement procedure.

Military men who have knowledge of the capabilities of the Model 31 base their high estimate of its naval effectiveness primarily on its ability to locate and destroy with relative ease all but the most heavily armed surface vessels. With its high speed, long range, and ability to carry a heavy bomb load, the Model 31 is believed capable of sweeping large areas of ocean entirely free of all enemy vessels except heavily protected fleets of heavy warships. It is pointed out that its high speed makes this plane nearly immune against attack by pursuit planes of current vintage, and materially reduces effectiveness of anti-aircraft fire against it. Yet the bomb carrying capacity is sufficient to cripple any ship afloat if hit but once by a bomb of the maximum size this plane can carry.

No further information on the plane is available as we go to press, but aviation people everywhere may well watch with interest for word of civil or military application of the Consolidated Model 31.



A distinctive feature of the Model 31 is the permanent beaching gear of the tricycle type which is fully retractable within wells in the hull. Although it is intended primarily for beaching, the gear is believed to be rugged enough to withstand airport landings in an emergency.

BOMBERS LEAVING FOR HAWAII TODAY

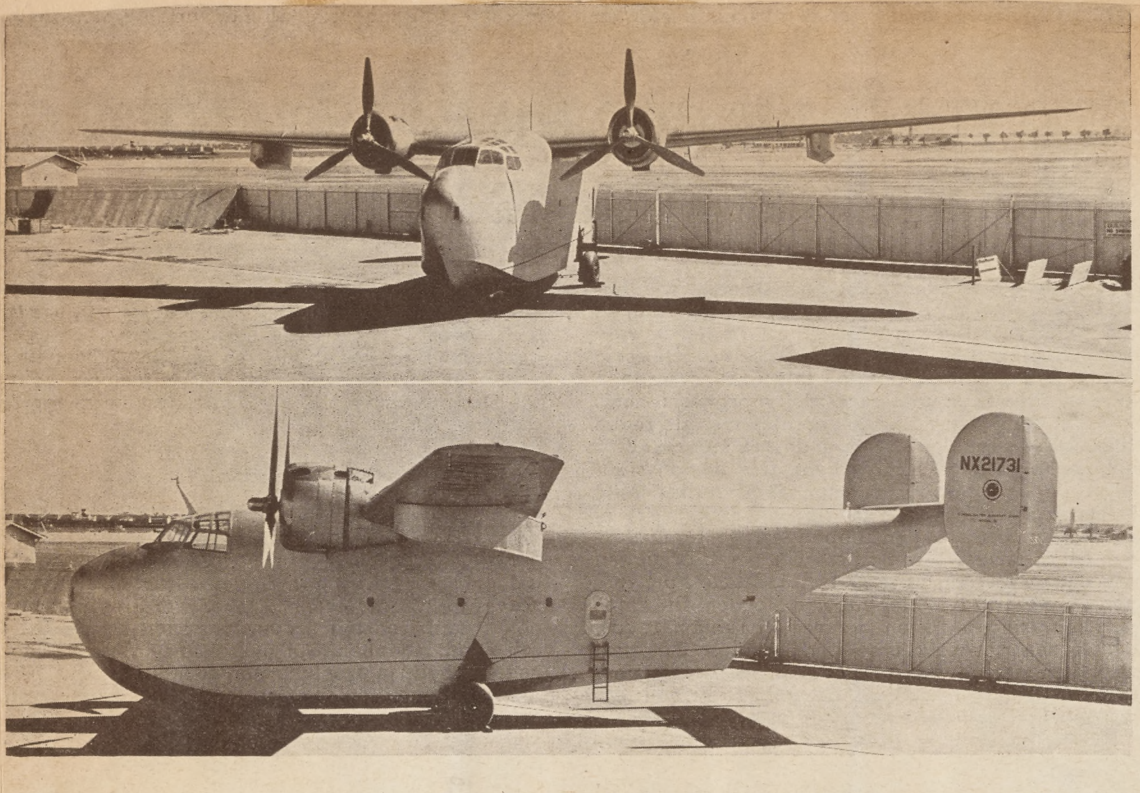
S.D. SUN 6/28/39

The non-stop, 2570-mile trans-pacific mass flight of 15 San Diego patrol bombers to Hawaii was to begin at 3 p. m. today, 24 hours ahead of the original schedule, to take advantage of favorable weather conditions en route, North Island officials announced.

A crew of 105 officers and enlisted men, commanded by Lieut.-Comdr. Sam L. La Hache, comprised the flight personnel. The Consolidated bombers will be delivered to Pearl Harbor and assigned to Patrol Squadron One in the eighth such ferry trip to distant air bases.

Nineteen hours will be required for the hop, Rear Adm. A. B. Cook, Aircraft Scouting Force commander, estimated.

Weather data has been furnished the squadron here during the past few days by the aircraft tenders Avocet, Pelican and Childs, the destroyers Dent and Waters, and Rear Adm. Cook's flagship Memphis, all stationed along the Great Circle route to Hawaii. They also will serve as guard ships during the flight.



De nieuwste civiele vliegboot van Consolidated. Het interieur is verdeeld in twee dekken. De zijdrijvers zijn intrekbaar.

Vliegwereld 8 June 1939

329

Een nieuwe vliegboot van Consolidated. Zoowel voor civiel als militair gebruik.

CONSOLIDATED is wel het meest bekend geworden door haar militaire vliegbooten, waarvan de PBY's wel zéér sterk de aandacht door opvallende vliegprestaties tot zich hebben getrokken.

De nieuwe vliegboot van deze firma, die dezer dagen te San Diego te water gelaten werd, wordt aangekondigd als een waardige opvolger van de PBY vliegbooten, doordat zij dezen nog belangrijk in snelheid, vliegbereik en vervoerscapaciteit moet overtreffen. Uiteraard worden echter de prestaties van Model 31, zooals Consolidated's nieuwe constructie heet, nog geheim gehouden.

De Consolidated 31 is een tweemotorige boot, uitgerust met Wright 18-cylinder motoren, die ieder ca. 2000 pk in den start leveren. Het totale gewicht van de vliegboot bedraagt niet minder dan 22630 kg. Er kunnen dan ook 52 passagiers worden meegenomen wanneer dagcomfort wordt vereischt, terwijl 28 passagiers vervoerd kunnen worden, wanneer slaapgelegenheden noodzakelijk zijn. Laatstgenoemd passagiersaantal komt dan ook voor eventueele transatlantische vluchten in aanmerking.

Onwillekeurig gaan bij het noemen van transatlantische vluchten de gedachten naar de plannen van American Export Airlines, die bereids maanden geleden een Consolidated vliegboot aanschafte, waarbij werd aangekondigd, dat binnenkort over belangrijk grootere en snellere vliegbooten kon worden beschikt. Alhoewel thans de fabriek, bij de te water lating van dit nieuwe product, de Export Airlines niet heeft genoemd, mag men toch aannemen, dat het in de bedoeling ligt deze vliegbooten Model-31 aan de American Export Airlines te leveren.

Wat de ontwikkeling en den bouw van dit nieuwe type betreft, deelt de Consolidated-fabriek zèlf

---

15 LONG-RANGE PATROL PLANES WILL LEAVE S. D. WEDNESDAY FOR HAWAII; EIGHTH MASSED FERRY HOP

S.D.UNION 6/23/39

Fifteen long-range patrol planes of Patrol Squadron 1, manned by 105 officers and men, and commanded by Comdr. Sam La Hache, will take off from San Diego harbor, flight conditions permitting, at 2 p.m. Wednesday for Pearl Harbor, Hawaii.

The planes will follow the great circle route over the 2570-mile airway, according to Rear Adm. Arthur B. Cook, commander, scouting force aircraft. The flight is expected to be completed in 19 hours.

GUARD SHIPS START

Plane guard ships already have started moving to their stations. They will be strung out at about 200-mile intervals. Ships will include the tender Pelican; destroyers Dent, Waters and Childs, cruiser Memphis and the tender Avocet.

The Memphis, flagship of Adm. Cook, will leave the harbor tomorrow afternoon for her station 600 miles west of Pt. Loma.

This will be the eighth massed ferry flight by the navy's patrol bombers to Hawaii, the Canal Zone and the Caribbean. As usual naval authorities characterize it as "of a routine nature."

WILL RETURN HERE

Adm. Cook will return aboard the Memphis as soon as the flight is completed. He announced aboard the flagship yesterday he will cruise to north Pacific ports and probably inspect fleet air bases at Sand Point and Sitka some time this fall.

Adm. Cook, who but a few days ago assumed command of the navy's patrol wings after serving two years as chief of the bureau of aeronautics, has the following officers on his staff:

Comdr. Ralph E. Davison, chief of staff; Lt. Comdr. Spencer H. Warner, operations; Lt. Comdr. Boynton L. Braun, who commanded one of the navy's massed flights to Hawaii, gunnery and tactics officer; Lt. Comdr. James V. Carney, engineering; Lt. Comdr. Alden R. Sanborn, material; Lt. Comdr. Hugh H. Goodwin, flag secretary; Lt. Robert S. Purvis, flag lieutenant; Lt. Andrew H. Bergerson, communications; Lt. Lester E. McDonald, medical officer; Comdr. Edwin D. Foster, supply officer; Lt. Donald W. Twiggs, officer in charge of aircraft stores; Fred Traxler, chief pay clerk, assistant to supply officer.

FLIGHT PERSONNEL

Following is the personnel of Patrol Squadron 1:

Plane 1—Lt. Comdr. Sam La Hache, first pilot; W. Mercer, aviation cadet, second pilot; L. G. Lehrer, ACMM; G. C. Sorensen, ACMM; C. G. Parks, CRM; R. L. Smyth, RM3C; R. C. Smith, M. Att-2c.

Plane 2—Lt. H. A. House; B. M. Murray, aviation cadet; J. B. Gaines, RM2c; F. G. Wohlhuter, ACMM; W. F. Orr, ACMM; R. Moore, AMM3C; J. C. Sitherwood, RM2C.

Plane 3—Lt. D. H. McDonald; L. S. Boeck, aviation cadet; D. D. Lurvey, AMM1C; A. S. Haynes, AMM1C; K. Walters, AMM3C; O. A. Carlock, RM2C; E. J. Schmitt, AOM3C.

Plane 4—Lt. A. D. Schwarz; A. H. Perry, aviation cadet; P. M. Bryant, AMM1C; S. W. Jarboe, ACMM; L. D. Clark, AMM2C; J. T. Hubbard, AMM2C; R. A. Palenga, RM1C.

IN PLANE 5

Plane 5—Lt. D. S. Crowley; L. C. Deede, aviation cadet; J. T. McGroarty, AMM1C; W. Gannott, AMM2C; L. E. Parsons, RM2C; W. J. Anderson, AOM1C.

Plane 6—Lt. J. B. Burks; D. A. Campbell, aviation cadet; C. H. Evans, AMM2C; C. O. Roper, AMM1C; J. A. Nelson, AMM2C; N. T. Whitford, RM2C; P. W. Sparks, RM2C.

Plane 7—Lt. J. O. Lambrecht; Lt. R. E. Stanley; J. H. Russell, aviation cadet; J. H. Davies, AMM2C; M. A. Larson, AMM1C; A. J. Holder, AMM2C; R. L. Pettit, RM1C.

Plane 8—Lt. P. G. Bunce; W. W. Hester jr., aviation cadet; T. Moreland, RM2C; C. E. Pierce, AMM1C; F. L. Rosemund, AMM3C; M. G. Irano, RM1C; A. M. Volpe, ACCM.

Plane 9—Lt. R. L. Poor; C. M. Brower, aviation cadet; T. S. Gay, ACM; L. R. Erreca, ACMM; N. Phinney, AMM3C; A. D. Forrest, RM1C; R. Pratt, Sea1C.

WILL FLY No. 10

Plane 10—Lt. H. P. Burden; M. U. Beebe, aviation cadet; W. D. Eddy, AMM1C; L. J. Corning, AMM1C; W. J. Baker, AMM3C; J. F. Donnell, RM1C; J. E. Cowart, RM3C.

Plane 11—Lt. G. S. James jr.; O. O. Dean, aviation cadet; D. C. Westfall, RM2C; J. Z. Walker, AMM1C; W. R. Lee, AMM3C; F. N. Vanderhoef, RM1C; J. J. Smies, Y3C.

Plane 12—Lt. J. A. Smith; E. W. Bishop, aviation cadet; H. T. Blanchard, AMM2C; A. W. Cartee, ACMM; J. J. Hecker, AMM3C; A. W. Capron, RM3C; P. G. Krings, RM3C.

Plane 13—R. J. H. Conn; M. J. Berg, aviation cadet; R. C. Christian, ACMM; C. S. Dutcher, AMM2C; J. P. Tate, RM1C; V. M. Standiford, AM1C; C. I. Cundiff, Sea1C.

Plane 14—Lt. G. R. Luker; E. O. Laakso, aviation cadet; L. H. Mantooth, aviation cadet; W. Schauer, AMM2C; J. F. Christleit, AMM2C; F. R. Pollard, RM2C; J. C. Hasenfuss, Sea1C.

Plane 15—Lt. C. H. Clark; E. L. Christman, aviation cadet; C. D. Bray, AMM3C; S. P. Rutledge, ACMM; J. A. Benfante, AMM2C; R. W. Preece, RM2C; O. E. Blair, PTR1C.

15 Bombers Head For Hawaii Next Month

The 2570-mile aerial "bridge" which San Diego Navy airboat squadrons have built across the Pacific to Hawaii will be traversed once again next week in a nonstop flight of 15 bombers from North Island to Pearl Harbor.

Rear Adm. Arthur B. Cook, chief of the Bureau of Aeronautics today made formal announcement of the scheduled takeoff at about 3:30 p. m. Wednesday, weather permitting, of the planes, piloted by 105 officers and men of Patrol Squadron One. Nineteen hours will be required for the hop, Rear Adm. Cook estimated.

SHIPS STATIONED

Six ships will be stationed along the Great Circle route to be followed by the planes, furnishing weather information and serving as guards in case any are forced down. In order of their position from the mainland, they will be the aircraft tender Pelican, the destroyers Dent and Waters, the Memphis, Rear Adm. Cook's flagship; the aircraft tenders Avocet and Childs.

This will be the eighth long-distance "ferry flight," which the Aircraft Scouting Force has found to be the "most simple and economical" method of delivering the giant airboats to distant bases, according to Rear Adm. Cook.

BEST TIME

Best time ever made in the San Diego-Hawaii flight was that of 17 bombers which, by coincidence, flew the route in 17 hours, 17 minutes Sept. 7, 1938.

Not included in the list of eight delivery hops is the most spectacular non-stop flight ever made by the U. S. Navy—48 planes from San Diego to the Canal Zone Jan. 11, 1939—to join the Fleet in winter war games in the Caribbean.

Following is the crew list by plane:

1st pilot Lt.-Cdr. S. L. La Hache, 2nd pilot Av. Cadet W. Mercer, Ard pilot L. G. Lehrer, ACMM*; flt. eng. G. C. Sorensen, ACMM; 1st radioman C. G. Parks, CRM; 2nd radioman R. L. Smyth, RM3c; passenger R. C. Smith, M.Att2c.

1-P-2

1st pilot Lt. H. A. House, 2nd pilot Av. Cadet P. M. Murray, 3rd pilot Av. Cadet L. H. Mantooth; flt. eng. F. G. Wohlhuter, ACMM; 1st mech. W. F. Orr, ACMM; 2nd mech. R. Moore, AMM3c; radioman J. C. Sitherwood, RM2c.

1-P-3

1st pilot Lt. (jg) D. H. McDonald, 2nd pilot Av. Cadet L. S. Boeck, 3rd pilot D. D. Lurvey, AMM1c*; flt. eng. A. S. Haynes, AMM1c; 1st mech. W. Walters, AMM3c; radioman, O. A. Carlock, RM2c; passenger, E. J. Schmitt, AOM3c.

1-P-4

1st pilot Lt. A. D. Schwarz, 2nd pilot Av. Cadet A. H. Perry, 3rd pilot P. M. Bryant, AMM1c* flt. eng. S. W. Jarboe, ACMM; 1st mech. L. D. Clark, AMM2c; 2nd mech. J. T. Hubbard, AMM2c; radioman R. A. Palenga, RM1c.

1-P-5

1st pilot Lt. (jg) D. S. Crowley, 2nd pilot Av. Cadet L. C. Deede, 3rd pilot J. T. McGroarty, AMM1c* flt. eng. L. McIntyre, ACMM; 1st mech. W. Gannott, AMM2c; radioman L. E. Parsons, RM2c; passenger W. J. Anderson, AOM1c.

1-P-6

1st pilot Lt. (jg) J. B. Burks, 2nd pilot Av. Cdt. D. A. Campbell, 3rd pilot C. H. Evans, AMM2c*; flt. eng. C. O. Roper, AMM1c; 1st mech. J. A. Nelson, AMM2c; 1st radioman N. T. Whitford, RM2c; 2nd radioman P. W. Sparks, RM3c.

1-P-7

1st pilot Lt. J. O. Lambrecht, 2nd pilot Lt. (jg) R. E. Stanley, 3rd pilot Av. Cadet J. H. Russell, 4th pilot, J. H. Davies, AMM2c; flt. eng. M. A. Larson, AMM1c; 1st mech. A. J. Holder, AMM2c; radioman, R. L. Pettit, RM1c.

1-P-8

1st pilot Lt. (jg) P. G. Bunce, 2nd pilot Av. Cadet W. W. Hester Jr., Ard pilot T. Moreland, RM2c* flt. eng. C. E. Pierce, AMM1c; 1st mech. F. L. Rosenmund, AMM3c; radioman M. G. Irano PM1c; passenger A. M. Volpe, ACCM.

1-P-9

1st pilot Lt. (jg) R. L. Poor, 2nd pilot Av. Cadet C. M. Brower, 3rd pilot, T. S. Gay Jr., ACM*flt. eng. L. R. Erreca, ACMM; 1st mech. N. Phinney, AMM3c; radioman H. V. Heidemann, RM2c; passenger F. Pratt, Sea1c.

1-P-10

1st pilot Lt. H. P. Burden, 2nd pilot Av. Cadet M. U. Beebe, 3rd pilot, W. D. Eddy, AMM1c* flt. eng. L. J. Corning, AMM1c; 1st mech. W. J. Baker, AMM3c; 1st radioman J. F. Donnell, RM1c; 2nd radioman J. E. Cowart, RM3c.

1-P-11

1st pilot Lt. (jg) G. S. James Jr., 2nd pilot Av. Cadet E. O. Lookso, 3rd pilot D. C. Westfall, RM2c*, flt. eng. J. Z. Walker, AMM1c; 1st mech. W. R. Lee, AMM3c; radioman F. N. Vanderhoef, RM1c, passenger J. J. Smies Y3c.

1-P-12

1st pilot Lt. (jg) J. A. Smith, 2nd pilot Av. Cadet E. W. Bishop, 3rd pilot, H. T. Blanchard, AMM2c*, flt. eng. A. W. Cartee ACMM; 1st mech. J. J. Hecker, AMM3c; 1st radioman A. W. Capron, RM3c; 2nd radioman P. G. Krings, RM3c.

1-P-13

1st pilot Lt. R. J. H. Conn (VP-7), 2nd pilot Av. Cadet M. J. Berg; 3rd pilot J. W. Moreno, ACOM* flt. eng. C. S. Dutcher, AMM2c, radioman J. P. Tate, RM1c; passenger, V. M. Standiford, AM1c; passenger C. I. Cundiff, Sea1c

1-P-14

1st pilot Lt. (jg) G. R. Luker (VP-9), 2nd pilot Av. Cadet O. O. Dean, 3rd pilot W. Schauer, AMM2c* flt. eng. J. F. C. Christeleit Jr., AMM2c; 1st mech. R. E. Butterbaugh, AMM3c; radioman F. R. Pollard, RM2c; passenger J. D. Hasenfuss, Sea1c.

1-P-15

1st pilot Lt. (jg) C. H. Clark (VP-7), 2nd pilot Av. Cadet E. L. Christman, 3rd pilot C. D. Bray, AMM3c*; flt. eng. S. P. Rutledge, ACMM; 1st mech. F. B. Pollard, AMM1c; radioman R. W. Preece, RM2c; passenger. O. E. Blair, Ptr1c.

Sydney Flying Boat Alights at Mahe On Way to Africa

SYDNEY, New South Wales, June 16 (AP)—The flying boat Guba blazing a new air route of almost 5,000 miles over the Indian Ocean from Western Australia to East Africa, alighted at 8:45 a. m., G. M. T. (3:45 a. m., E. S. T.) today at Mahe in a flight of eight hours and seven minutes from Diego Garcia, in the Chagos Archipelago. Its destination is Mombasa, Kenya Colony.

The flying boat, lent for the survey flight by Richard Archbold, a wealthy young American, left Port Hedland, Australia, on June 4. Russell Rogers, the pilot, and Lewis Yancey, the Navigator, are Americans. Capt. Percy G. Taylor of Sydney is the sponsor of the flight.

Archbold Alters Route Home

S.D.UNION 6/26/39

BULLETIN

Richard Archbold and his crew in the Guba took off early today from Lagos for Dakar on the west coast of Africa, Barney Boyd, San Diego radio contact man reported. Boyd received a message from the Guba relayed by a Florida amateur.

* * *

Change in the itinerary of the 20,000-mile homeward bound flight from Australia via Africa of Richard Archbold, research director, American Museum of Natural History, was reported in radio advices received here yesterday.

According to a relayed message received by Barney Boyd, local radio amateur, Archbold, flying his San Diego-built seaplane Guba, will fly from Dakar, Africa, to New York instead of to Miami, Fla., and thence overland to San Diego. He is due to arrive at New York July 1. Whether he will attempt to fly direct from New York to San Diego or come here via Miami and the southern airway is not known. He is due here July 3.

The last radio advices from Archbold placed the Guba in the latitude of Dakar on the west African coast.

Archbold's homeward-bound flight started from Sydney, Australia.

---

15 Navy Bombers May Hop Today

S.D.UNION 6/27/39

Fifteen of the navy's big patrol bombers are in readiness for the take-off of a massed flight to Hawaii, with a possibility that the flight, scheduled for tomorrow, may begin today.

The flight, a routine affair, will be under command of Lt. Comdr. Sam LaHache, U.S.N. Scheduled time of takeoff is 2 p.m. tomorrow; it was intimated yesterday, however, that changing weather conditions may make departure today more advisable.

Meanwhile, orders were issued to district naval craft to keep clear of the take-off course at the time when the heavily-loaded planes get under way; a request also was made for fishing and other commercial craft to keep out of the way of the planes. At the time of the flight flag "U" of the International code—four squares, alternately red and white—will be flown from hangar No. 69 on the north beach at North Island; if take-off is after dark, two vertical red lights will be shown. Navy boats will be on hand to patrol the course, and will warn approaching vessels by the display of a red flag by day or a red lantern by night.

ARCHBOLD ON WAY TO DAKAR, AFRICA

S.D.SUN 6/26/39

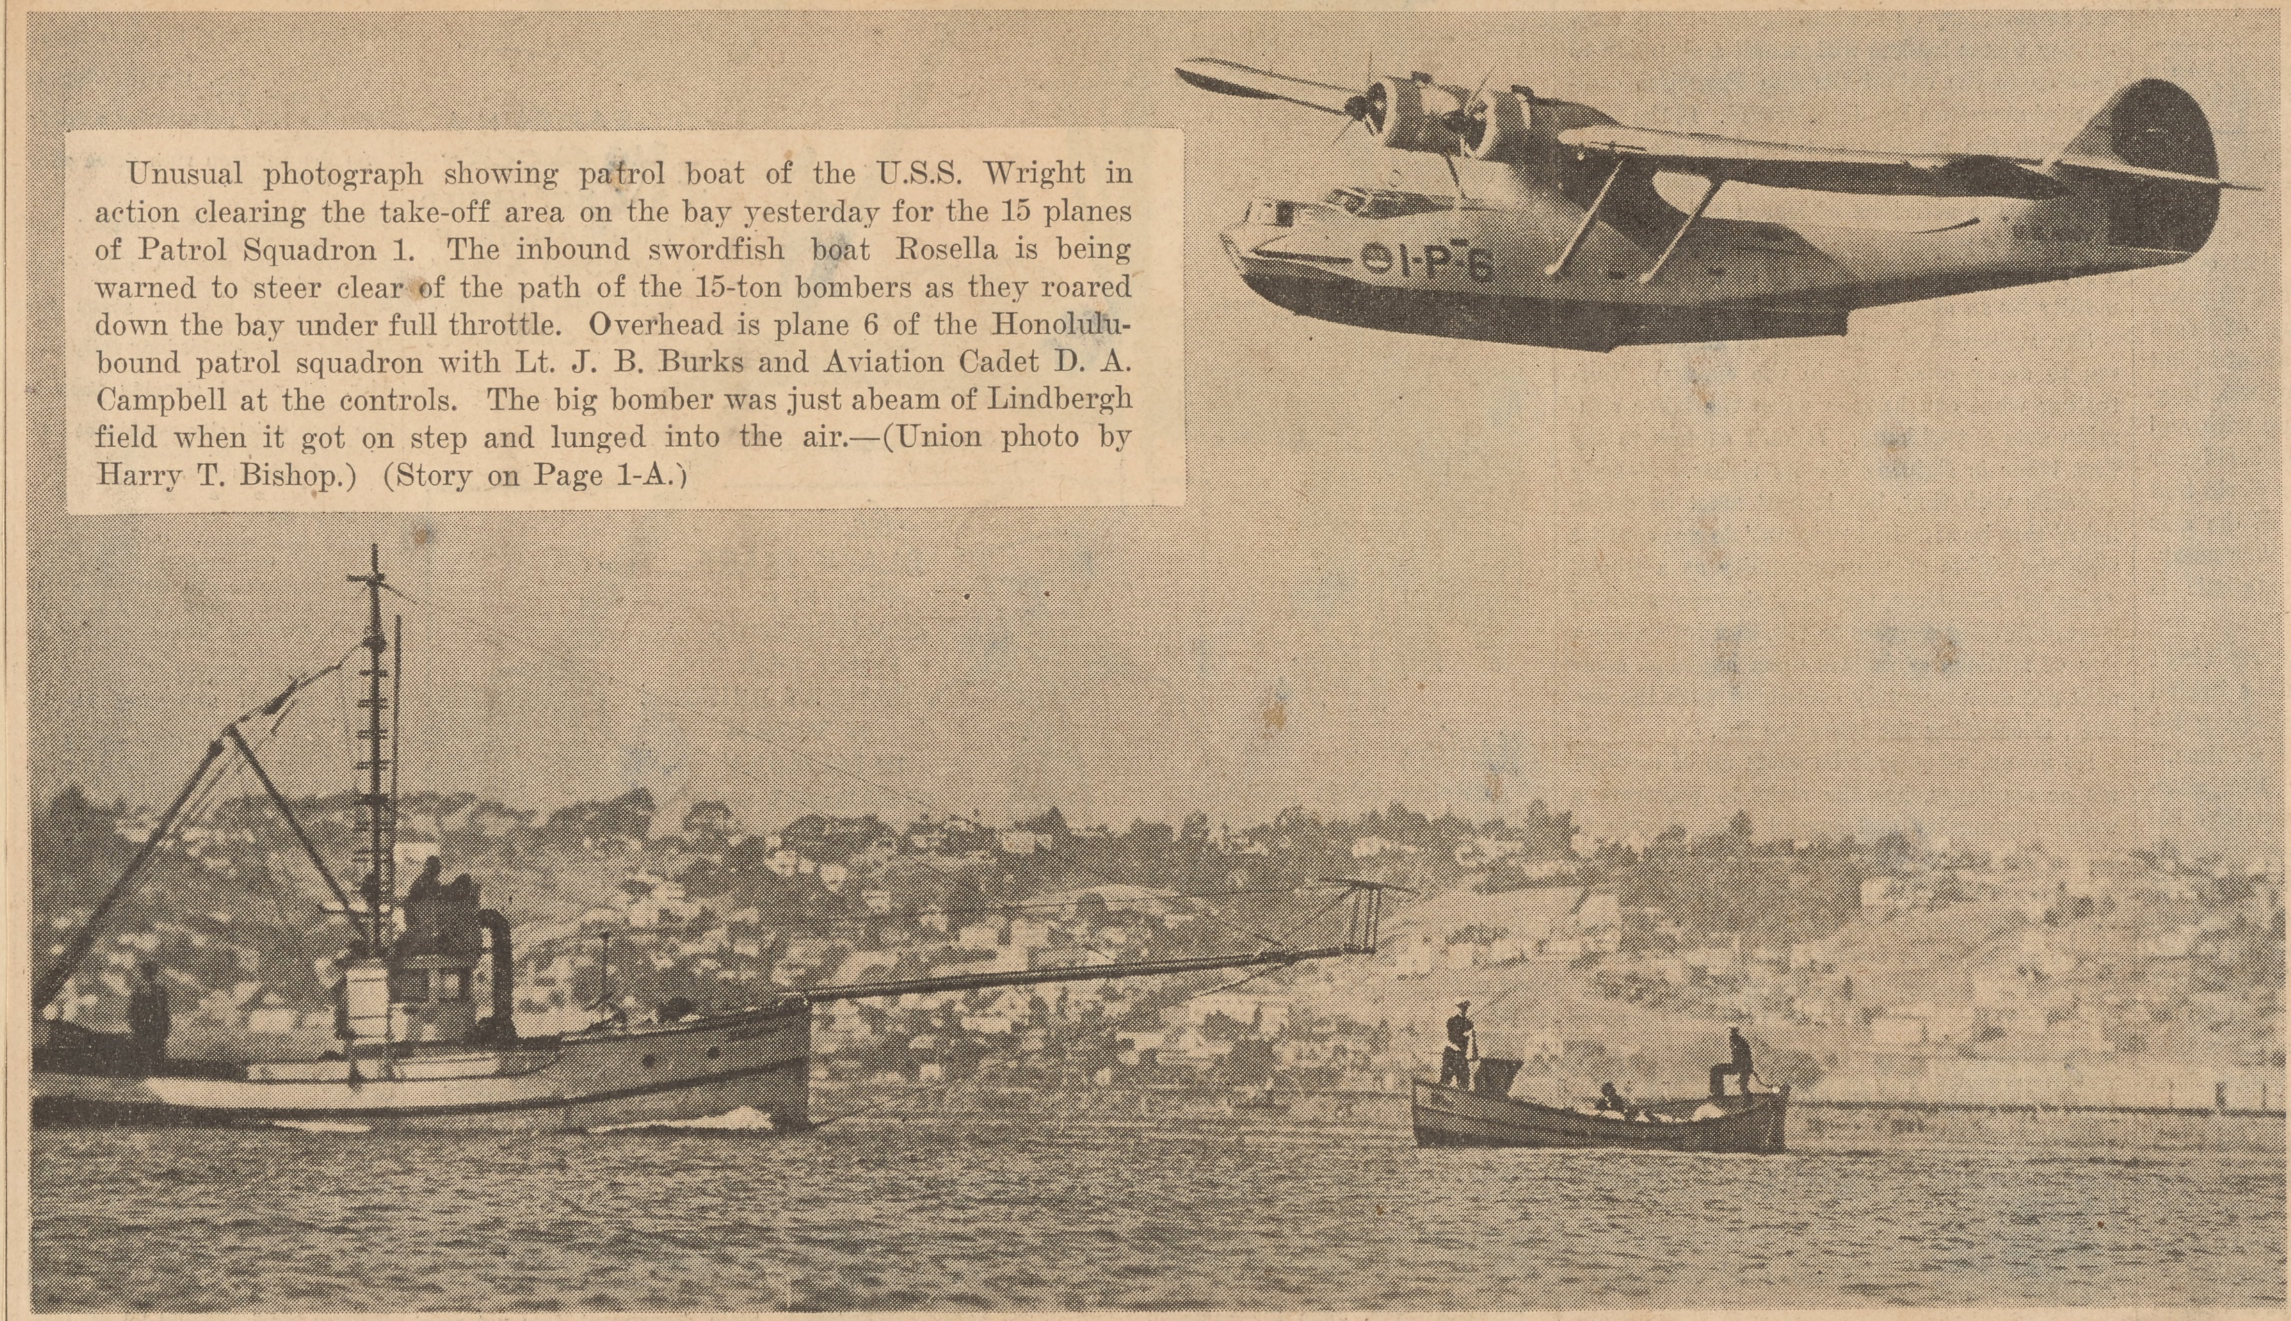
Homeward bound after more than a year's adventures that took them into the jungles of Netherlands New Guinea, across Australia, the Indian ocean and Africa, the six-man flight crew of the Consolidated airboat Guba, led by Richard Archbold, millionaire scientist-aviator, was due in Dakar, Africa, today, ready to span the Atlantic to the United States.

The Guba took off from Lagos, on the Gold Coast, in a 1000-mile flight to Dakar, on the extreme western tip of Africa, at 10:16 p. m. Sunday (PST), Barney F. Boyd, local amateur wireless operator, reported.

Mr. Archbold announced the Guba will attempt to reach New York City via the Virgin Islands, July 1, en route to San Diego. The fliers have been commissioned by the British air ministry to pilot a Consolidated bomber to England early next month.

SAN DIEGO, CALIFORNIA, WEDNESDAY MORNING, JUNE 28, 1939 S.D. UNION

PATROL FLAGS DOWN FISHING BOAT AS 15-TON NAVY BOMBERS TAKE OFF FOR HONOLULU



Unusual photograph showing patrol boat of the U.S.S. Wright in action clearing the take-off area on the bay yesterday for the 15 planes of Patrol Squadron 1. The inbound swordfish boat Rosella is being warned to steer clear of the path of the 15-ton bombers as they roared down the bay under full throttle. Overhead is plane 6 of the Honolulu-bound patrol squadron with Lt. J. B. Burks and Aviation Cadet D. A. Campbell at the controls. The big bomber was just abeam of Lindbergh field when it got on step and lunged into the air.—(Union photo by Harry T. Bishop.) (Story on Page 1-A.)

15 S. D. Bombers On Hawaii Flight

S.D. UNION 6/28/39

Nearly Half Way; Weather Good

BULLETIN

(North Island naval officials reported at 9:30 last night that the Honolulu-bound naval flying boats had just passed over the destroyer Watters, third flight guard ship, 750 miles west of San Diego. The ships were making 135 miles an hour and weather conditions were "good," officials said.

With the trade winds behind them, 15 of the navy's huge patrol-bomber planes last night were roaring toward Hawaii, where they are scheduled to end their flight from San Diego by noon today.

Following the great circle course on their hop of 2278 nautical miles, the planes and their personnel of 105 officers and men are expected to reach the Hawaiian islands in 19

(Picture on Page 1-B)

hours; they left here around 4 yesterday afternoon, the flight having been stepped up nearly 24 hours after a consultation of weather maps, which showed that more favorable conditions might be expected today than tomorrow; originally it was planned for the flight to begin at 2 o'clock this afternoon.

Lt. Comdr. Sam LaHache, commanding Patrol Squadron VP-1, is pilot of the leading plane, as well as in command of the entire group of 14.

ADM. COOK AT SEA

Meanwhile Rear Adm. Arthur B. Cook, commanding the scouting force aircraft, is at sea, in the center of the operations of his long-range planes; Adm. Cook's flagship, the U.S.S. Memphis, sailed Saturday to become a "plane guard" ship for the flight. Other surface craft, strung out between here and Pearl Harbor, are the U. S. S. Dent and Waters, destroyers; the U. S. S. Childs, destroyer now attached to the patrol wing at Pearl Harbor, and the U. S. S. Pelican and Avocet, minesweepers operating as aircraft tenders for the same organization. The Dent and Waters, of Destroyer Division 19, left Pearl Harbor for San Diego a week or more ago, accompanied by two other destroyers and four submarines; the submarines and the other two surface craft, the U. S. S. Rathburne and Talbot, entered port yesterday morning, leaving the other two for station duty.

The flight, like others which have preceeded it in the past few years, is considered a routine transfer of the San Diego-built Consolidated planes from here to Pearl Harbor, and there was little of the unusual to mark the departure of the 15 heavily-loaded planes yesterday. Navy small craft patrolled the bay around the take-off area, removing a few bits of drifting wood, and warning other harbor craft away from the zone of flight; the only unusual feature was the stopping of the North Island ferries, normally at their busiest time around that hour, for a few minutes while the planes taxied up into the wind and got away.

PLANES LISTED

Following are the first and second pilots of the 15 planes:

Plane 1—Lt. Cmdr. Sam LaHache, Avn. Cdt. W. Mercer.

Plane 2—Lt. H. A. House, Avn. Cdt. J. B. Gaines.

Plane 3—Lt. D. H. McDonald, Avn. Cdt. L. S. Boeck.

Plane 4—Lt. A. D. Schwartz, Avn. Cdt. A. H. Perry.

Plane 5—Lt. D. S. Crowley, Avn. Cdt. L. C. Deede.

Plane 6—Lt. J. B. Burks, Avn. Cdt. D. A. Campbell.

Plane 7—Lt. J. O. Lambrecht, Avn. Cdt. R. E. Stanley.

Plane 8—Lt. P. G. Bunce, Avn. Cdt. W. W. Hester jr.

Plane 9—Lt. R. L. Poor, Avn. Cdt. C. M. Brower.

Plane 10—Lt. H. P. Burden, Avn. Cdt. M. U. Beebe.

Plane 11—Lt. G. S. James jr., Avn. Cdt. O. O. Dean.

Plane 12—Lt. J. A. Smith, Avn. Cdt. E. W. Bishop.

Plane 13—Lt. R. J. H. Conn, Avn. Cdt. M. J. Berg.

Plane 14—Lt. G. R. Lasker, Avn. Cdt. E. O. Laakso.

Plane 15—Lt. C. H. Clark, Avn. Cdt. E. L. Christman.

Flights such as the one under way have become relatively commonplace with the navy. Early in 1937, 12 of the big planes flew from here to Honolulu in 21 hours 43 minutes; that was on Jan. 28. On April 3 of the same year, 12 more went to Hawaii in 21 hours 21 minutes. On Jan. 19, 1938, 18 planes made it in 20 hours 30 minutes, and on Sept. 6, 17 of the planes left here, crossing in 17 hours 17 minutes.

S.D. TRIBUNE

DELIVERY BY AIR; ENGLAND GOAL OF CONSAIR CRAFT

6/27/39

Delivery by air of a military plane from San Diego to England is planned next month in a one-stop flight of a new Consolidated 28-5 military export flying boat leaving here July 15, The Associated Press reported from Burbank. The office of the British air ministry at Lockheed Aircraft Corp. announced that the craft will be flown to Britain with a stop at Botwood, N. F., 3300 miles distant.

The total distance of the flight from here to Felizstone, Suffolk, England, will be 5750 miles. Squadron Leader James R. Addams, British air ministry representative in California, said the flight will be the longest delivery flight on record. It marks the first delivery by air of a military plane from the United States to England.

Rogers Captain

Addams said the huge craft, which made its initial "shakedown flight" here June 14 with William B. Wheatley, Consolidated test pilot at the controls, will be flown to England by Russell Rogers and the crew of the Richard Archbold scientific exploration plane Guba, due here early next month from New Guinea, via the Indian ocean, Africa and the Atlantic. Rogers will be captain and pilot; Lewis Yancey, navigator and co-pilot; Ray Booth, radio engineer, and Gerald Brown, flight engineer. Addams and Wing Comdr. Phil Mackworth of the Royal Air Force also will be aboard, it was reported.

Model 28-5 was developed from the Consolidated PBY-type plane built for the American navy. The craft bears the military markings of the Royal Air Force, and was ordered from the Consolidated Aircraft Corp. during a visit here of air ministry officials.

ARCHBOLD HOPS FOR VIRGIN ISLANDS EN ROUTE TO S. D.

SD. TRIBUNE 6/29/39

The San Diego-built flying boat Guba, which recently completed a crossing of the Indian ocean, today hopped off from Daka, Senegal, French Africa, for Charlotte Amalie (St. Thomas), Virgin islands, en route to the United States, The Associated Press reported. The big plane left Dakar at 3:10 a.m. (Pacific time) and is expected at the Virgin islands tomorrow.

San Diego is the ultimate goal of the Guba, with the flying boat tentatively expected to arrive here next Monday. The Guba was built at the Consolidated Aircraft Corp. plant for Richard Archbold, research associate of the American Museum for Natural History. Archbold spent most of the last year in New Guinea on a scientific expedition. He left San Diego June 2, 1938, and crossed the Pacific to New Guinea. The Guba left Australia June 3 this year for a survey flight across the Indian ocean for the Australian government, arriving at Mombasa, East Africa, June 21, and then flying across Africa to Dakar.

S.D. UNION 6/30/39

Fliers Will Be Guests Of Ice Rink Star

Navy and civilian aviation officials will be guests of Vivi-Anne Hulten, headliner in the Hollywood all-star ice revue, tonight at Glacier Garden. In their honor she will present a new number with an aerial theme.

Before the performance, Miss Hulten will greet her guests at a reception and cocktail party in Hotel San Diego. The party will include Capt. and Mrs. J. C. Horton, Capt. and Mrs. Walter Gross, Lt. and Mrs. L. J. Hopwood, Mr. and Mrs. T. Claude Ryan, Mr. and Mrs. Paul Wilcox, Mr. and Mrs. Harvey Moonert, Earl Prudden, Sam Breder, Mr. and Mrs. Don Fry, Mr. and Mrs. Frank Learman.

Reduced prices are announced for the final performances tonight and tomorrow night.

Bombers Break S. D.-Hawaii Flight Record

S.D. UNION 6/29/39

Establishing a new flying record of 16 hours and 17 minutes from San Diego to Hawaii, 15 long-range bombers of Patrol Squadron 1 landed at 8:57 a.m. at Pearl Harbor yesterday, 16 hours and 17 minutes after they took off from San Diego Tuesday afternoon.

Naval air officers at Pearl Harbor reported the first plane passed over the harbor at 8:04 but it was 53 minutes later before the last of the squadron had landed safely.

Of the five navy massed flights to the crossroads of the Pacific from San Diego, the fastest time heretofore was achieved last Sept. 6 when 17 bombers flew the 2500-mile airway in 17 hours 17 minutes.

Patrol Squadron 1, commanded by Lt. Comdr. Sam La Hache, is to become a unit of Patrol Wing 2 which next month will be placed in command of Rear Adm. Arthur L. Bristol with the U.S.S. Langley as flagship.

Crew of the plane tender Pelican, arriving yesterday, reported the planes flew at such altitude they were unable to sight them.

Comdr. La Hache said that favorable winds were helpful in creating the new flight record, according to an Associated Press dispatch from Pearl Harbor.

---

15 S. D. BOMBERS LAND IN HAWAII

S.D. SUN 6/28/39

Favored by strong tailwinds, 15 Consolidated Navy airboats landed in Pearl Harbor at 8:40 a. m. (PST) today, establishing a new transpacific mass flight record of 16 hours, 39 minutes, the United Press reported from Honolulu.

The bombers, attached to Patrol Squadron 1, commanded by Lieut.-Comdr. Sam L. La Hache, took off from San Diego harbor at intervals from 3:47 p. m. yesterday, and joined formation at 4:01 p. m., official starting time of the 2570-mile hop. Flight personnel totaled 105 officers and enlisted men.

Averaging approximately 155 miles per hour, the squadron eclipsed the previous best mark of 17 hours, 17 minutes made by 17 similar planes Sept. 7, 1938.

Patrol Squadron 1 will remain on permanent duty in Pearl Harbor, rapidly being developed into the United States' largest Navy seaplane base.

Archbold Hops For New York; Due Tomorrow

S.D. UNION 6/30/39

MIAMI, Fla., June 29 (A.P.)—Richard Archbold's expeditionary seaplane Guba pursued her course across the Atlantic toward St. Thomas, Virgin islands, tonight and reported plans to arrive Saturday in New York.

Throughout the late afternoon, the flying laboratory was in short-wave contact with W. S. Burkhart, amateur operator, whose station near Miami relayed a series of messages from New York to Archbold.

The plane is returning from a year's expedition for the American Museum of Natural History. Most recent hops were from Australia across the Indian ocean to Mombasa, Kenya colony, on the African east coast, thence across the continent to Lagos and to Dakar, Senegal, in French Africa.

The big plane left Dakar at 12:10 p.m. today (7:10 a.m. E.S.T.) for St. Thomas.

ARCHBOLD TO HOP FOR SAN DIEGO TOMORROW

With Richard Archbold, owner of the $250,000 Consolidated airboat Guba, expected to remain behind, the big plane will take off from New York late tomorrow on a non-stop transcontinental flight to San Diego, it was reported here today. With between 18 and 20 hours required for the 2700-mile journey, the craft is due here about 1 a. m. Wednesday.

After a short rest in San Diego, four men of the Archbold crew—Chief Pilot Russell Rogers, Navigator Lewis Yancey, Engineer Gerald Brown and Radioman Ray Booth, will leave here, probably about Saturday, in a similar Consolidated airboat for delivery to the English Royal Air Force. The fifth member of the Guba crew, Stephen Barrinka, assistant engineer, is not slated to make the trip.

BOMBERS SLASH S. D.-HAWAII TIME

S.D.TRIBUNE

Fifteen Land On 16¼-Hour Pacific Flight

6/28/39

Fifteen giant patrol bombers of Patrol Squadron 1 arrived over Pearl Harbor, T. H., at 8:04 a.m. today, 16 hours, 17 minutes after taking off here yesterday, to establish a new navy record for the flight.

Weather, Wind Favorable

The previous record was 17 hours, 17 minutes, established last September by 17 planes of the same type.

First to land was the lead plane piloted by Lt. Comdr. Sam La Hache, flight commander, at 8:51 a.m., Pacific time. La Hache credited the record-shattering achievement to clear weather, favorable winds and the excellent performance of the giant planes.

Other planes landed in quick succession, without incident, to complete another in the series of navy mass flights.

The take-off from the calm waters of the bay yesterday was marked by that precision which is the navy's pride. The matter-of-fact handling of the heavily loaded seaplanes concealed from the layman's uncritical eye details of the masterful airmanship involved in getting the big bombers into the air.

Six Ships on Course

Plane 1, piloted by La Hache, was first to roar down the take-off area and into the air at 3:47 p.m. The other ships followed at one-minute intervals and headed for a running rendezvous over Pt. Loma.

At sea, strung out along the 2278 nautical miles of the route, were six naval vessels acting as station ships, prepared to rush to the scene in case of emergency. The station ships were led by the cruiser Memphis, flagship of Rear Adm. Arthur B. Cook, scouting force aircraft commander, who was aboard.

Other guard ships were the U.S.S. Dent, Waters and Childs, destroyers, and the U.S.S. Pelican and Avocet, minesweepers. The guard ships were stationed at intervals of about 300 miles.

105 Officers, Men on Hop

Before the take-off, navy small craft patrolled the take-off area, removing drifting wood and warning other harbor craft away. The North Island ferries were halted.

Regarded officially as another in the series of "routine transfers" of men and materials which have blazed a spectacular trail of naval air achievement, the planes carried 105 officers and men, seven to each plane.

The squadron is joining other air units at the Pearl Harbor base, the United States' biggest and most important Pacific outpost.

Other Hawaii flights have included: 12 planes on Jan. 28, 1937; 12 planes on April 3, 1937, and 18 planes on Jan. 19, 1938.

Archbold Plane Due Wednesday From New York

S.D.UNION 7/3/39

Ending one of the most dramatic flights in history, the $250,000 "flying laboratory," built by Consolidated Aircraft Corp. for American Museum of Natural History, is due here from New York at 11 a.m. Wednesday.

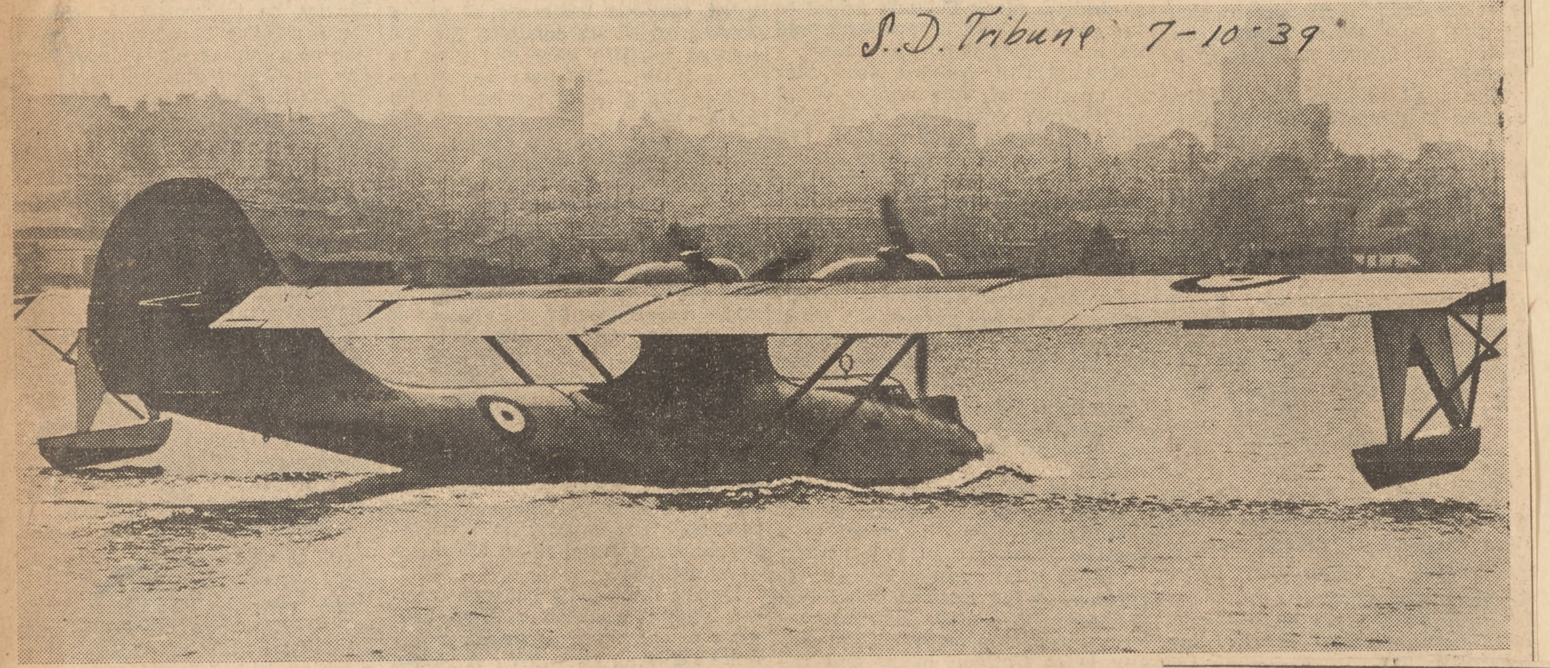
According to word received from Richard Archbold, expedition leader, the big flying boat will take off from Jamaica bay, New York, tomorrow afternoon on a non-stop flight across the continent.

Since the flying boat left San Diego June 3, 1938, it flew across the Pacific to Hollandia, Netherlands New Guinea, engaged in exploratory flights for several months in the vicinity of Lake Habbema, flew to Australia, then blazed an airway from Sydney over the Indian ocean to Africa. From Dakar on the east African coast, the plane winged its way to St. Thomas in the West Indies and then to Jamaica bay.

Russell B. Rogers, pilot, and Lewis A. Yancey, navigator, will remain in San Diego less than 48 hours before they again take to the air in another San Diego-built seaplane, this time for Felixstowe, England, via Botwood, Newfoundland. This ship was built for the British government. It is scheduled to take off on the transcontinental-transoceanic flight Friday.

Consair Airboat Speeding East on Delivery Hop to Britain; 'All Well,' Radio Message

S.D. Tribune 7-10-39



Consolidated's Model 28-5 as it made its second take-off for England today.

TAKES OFF AGAIN AFTER RETURN HERE AS DEFECT FOUND

Consolidated's Model 28-5, twin-engined flying boat built for the British government, made its second take-off for England at 8:23 a.m. today after returning here yesterday morning because of trouble with the craft's automatic pilot when the plane was over Salton sea. It is expected to land at Botwood, N. F., tomorrow for refueling, and depart immediately for the flight across the north Atlantic to Felixtowe, Eng., 5750 miles from San Diego.

At 10:30 a.m. the plane was 230 miles east of San Diego, according to a message received from the craft by Barney Boyd, local radio amateur. Those on the plane reported "everything going nicely." Noon contact with the plane was not made, but by mid-afternoon Boyd said he expected to have another report on the airboat's position.

Gyro Fails To Function

The delivery flight began yesterday under auspicious circumstances, with the plane functioning perfectly and excellent weather forecast for the 3300-mile flight to Botwood. Over the Salton sea the Sperry gyro failed to function, and rather than deliver the craft to British authorities with a broken piece of equipment, Russell Rogers, captain and chief pilot, brought the plane back to San Diego, landing here at 9:15 a.m.

Repairs to the automatic pilot were made by an expert from the naval air station, and Rogers took the plane aloft shortly before dusk yesterday for a short trial flight. Weather conditions for the flight today were declared equally as good as those yesterday, and the flight across the continent is expected to be made without incident, Consolidated officials reported. They pointed out the craft could have been flown to England without the use of the automatic pilot, but wished it to be delivered with all parts in good condition.

Like Archbold's Guba

Model 28-5, a commercial development of the navy PBY planes and similar to Richard Archbold's Guba, which returned here last week from New Guinea, is being flown by the crew of the Guba. With Rogers are Lewis A. Yancey, co-pilot and navigator; Raymond Booth, radio operator, and Gerald Brown, flight engineer.

From San Diego to Newfoundland the plane is scheduled to fly over Phoenix, Albuquerque, Amarillo, Wichita and Kansas City, near Chicago and Detroit, and over Lake St. Clair, Toronto, Ottawa and Montreal. Had yesterday's flight been completed, Rogers said he and the other crew members expected to make only a two-hour stop-over

(Continued on Next Page, Col. 6)

Tribune 7-10-39

Consair Plane Off For Britain Delivery

CONTINUED FROM PAGE ONE

this morning at Botwood before continuing to Felixtowe. After the plane is delivered, the crew members will return to this country on the liner Washington July 27, coming to San Diego for further flight duty with the Guba.

"The purpose of the flight is to deliver Model 28-5 to the British Air Ministry," states a Consolidated announcement. "The plane is owned by Consolidated Aircraft Corp. until completion of the delivery flight."

Totes Full Equipment

Unlike the many over-water "routine delivery flights" which the navy has made with Consolidated PBY planes, Model 28-5 will cross the Atlantic without benefit of surface ships stationed over the route of the flight. The craft, however, carries complete navigational equipment, a seven-man life raft, life jackets, parachute flares, signal equipment, water supply, a still, and emergency rations, the equipment in general being similar to that used by the navy department for long distance flights. In the navy's over-water delivery flights, made from San Diego to Honolulu and from ere to Panama, 12 planes or more ave been flown at a time, and to ate no forced landings on the high eas during the delivery flights have een necessary.

Model 28-5 is powered with two ratt and Whitney twin-row Wasp ngines, and two Hamilton standard onstant speed propellers. It is quipped with Sperry gyro and lind flying instruments. It has merican registration No. NRP9630 nd British No. P9630, as well as ritish insignia on the wing and ull. Radio installtion includes two endix transmitters, operating on requencies selected for transcon- nental and north Atlantic route peration; two Bendix all-wave re- eivers, having a tuning range of om 150 to 1500 kc. and 1800 to ,000 kc., capable of receiving tele- hone and c.w. signals, and one Ben- ix radio direction finder.

Union 7-5-39

Guba Leaves N. Y.; Due Here Tomorrow

On the final lap of the 20,000-mile flight from Sydney, Australia, via Africa, the West Indies and New York, the San Diego-built flying boat Guba left New York for New Orleans at 7 o'clock last night, according to word received by Consolidated Aircraft Corp. officials.

The plane is to take off from New Orleans at midnight tonight, arriving here at 10 a.m. tomorrow.

Richard Archbold, research associate of American Museum of Natural History, will remain in New York. Archbold has been with the plane since it left here in June, 1938, for Netherlands New Guinea on a scientific mission for the New York museum.

AVIATION

"NEWSWEEK" JULY 3, 1939

Atlantic Flight Competition Promised by Export Airlines

While the start of its transatlantic passenger service this week (NEWSWEEK, June 26) will probably allow Pan American Airways to rule the North Atlantic almost unchallenged for perhaps a full year—no potential rivals have airplanes to match Pan American's four 82,500-pound Boeing Clippers—it faces stiff competition eventually.

The British Imperial Airways have ordered a fleet of 64,000-pound flying boats from Short Bros., Ltd., and since these will not likely be ready until 1940 it is planning to use ships of the Cavalier class by refueling them in the air shortly after take-off. But the boats are not yet completely adapted to this service and may not be ready for Atlantic crossings—even for mail only—until late this year.

Germany is rushing work on a big six-engined flying boat at the Blohm & Voss factory at Hamburg. It will have a gross weight of between 80,000 and 90,000 pounds. But, as in the case of the British, there is a catch for the Germans: the plane can hardly be ready for service this year. In addition, the United States has refused the German Air League permission to operate here until an American carrier is ready to run an air line to Germany.

France, after a slow start, is making good headway. Until recently it had only the nine-year-old flying boat Lt. de Vaisseau Paris for its survey flights. Last week, however, it completed a transatlantic round-trip test flight of a new six-engined, 80,000-pound Latécoère flying boat, the Ville de St. Pierre. Forerunner of several large planes under construction for Air France Transatlantique, it promises to put France definitely in the running by next year.

But the most aggressive challenge to Pan American dominance is home-grown—a challenge that took shape last week in New York, where American Export Airlines held christening ceremonies for a survey flying boat now bearing the name "Transatlantic." A commercial version of the Navy's standard Consolidated patrol bombers, this plane has a gross weight of only 27,000 pounds. Despite its lightness, it is large enough to carry out a program of survey flights to begin late in July.

Moreover, the company which owns it, a subsidiary of the successful American Export Lines, seems fully determined to establish a complete transatlantic service. It has gathered a well-qualified nucleus of officials and executives. It has organized the parent company's fleet of eighteen vessels, which ply largely between New York and Mediterranean ports, into a floating weather-reporting system, and made plans to use its European and African offices to handle air-line business.

Finally, American Export has applied to the Civil Aeronautics Authority for route certificates by both the Northern and Southern Atlantic routes, and has formed an operating agreement with Italy's state air line. It also is reported to be negotiating for a fleet of Consolidated Model 31 flying boats of 50,000 pounds gross weight, powered with two of the new 2,000 horsepower Wright engines. Reported to have a cruising speed of "well over 200 miles an hour" these planes would be at least 50 miles an hour faster than the Clippers and make American Export a formidable Pan American competitor -- perhaps by the summer of 1940.

Dixie Clipper Ends Atlantic Hop With Passengers

MARSEILLE, France (AP)—The Dixie Clipper today completed the first scheduled trans-Atlantic flight with paying passengers when she arrived here from Port Washington, N. Y., via Horta, the Azores, and Lisbon, Portugal, at 1:20 p. m. (8:20 a. m. E. S. T.).

SOUTHAMPTON, England (AP)—The Yankee Clipper, Pan American Airways flying boat, which this week made an inaugural scheduled air-mail flight across the North Atlantic, started her return trip today with a cargo of mail and 15 guests.

CHARLOTTE AMALIE (St. Thomas), Virgin Islands (AP)—The flying boat Guba, which recently crossed the Indian Ocean, alighted here today after a 3,200-mile trans-Atlantic flight from Dakar, French West Africa.

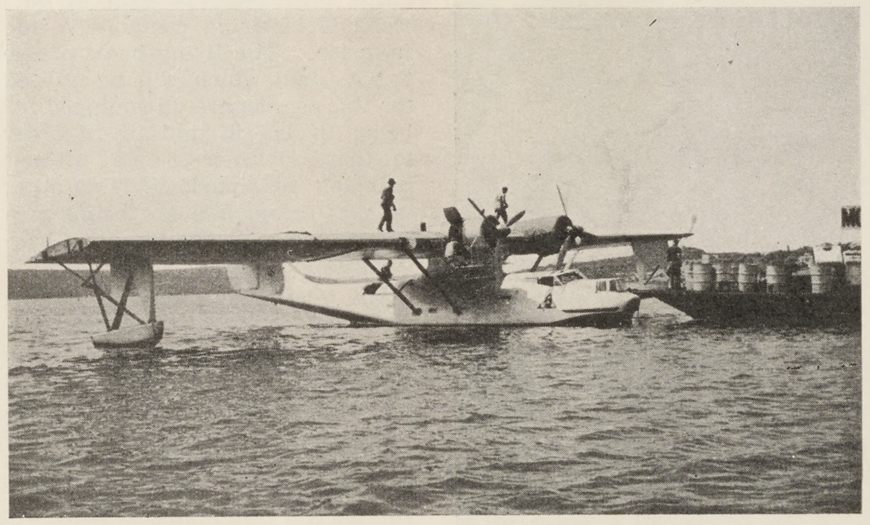
The plane, commanded by Richard Archbold of the American Museum of Natural History, is expected to leave for New York at daylight, July 1. The big "flying laboratory" first flew to New Guinea for research work.

NEW YORK (AP)—The American Export Airlines, 15-ton "Trans-Atlantic" took off today on the first of a series of survey flights for a new air service to Europe. First scheduled stop was Horta, the Azores, with other stops at Lisbon, Portugal, Viscarosse and Marseille, France.

Indian Ocean Survey Flight

Most Important Project. Australia's Vital Interest

Of supreme importance to Australia is the survey flight, which is planned to commence about the middle of next month, from West Australia to Africa.



Richard Archbold's Consolidated PBY-2 Flying-Boat, "Guba," which will carry the trans-Indian Ocean survey party from West Australia to Africa, via the Cocos Islands, Chagos Islands and Seychelles Islands, in June. It is seen refuelling in Rose Bay, Sydney. *("Air-Log" photo.)*

Variously referred to as "The Reserve Route" and in other fashions, it might well become, under exigencies of circumstance, the ONLY aerial route open between England and Australia for link communication by aircraft, so it should be regarded as a much more important piece of work than the "Reserve" title suggests. Though it is not the only possible All-Red aerial route (we could travel via Canada) seasonal severity in the North Atlantic make that crossing a definitely inferior one from the ease-of-operations point of view to that which could link England with Australia via the west coast of Africa—trans-Africa—trans-Indian Ocean route.

By arrangement with the Commonwealth Government, the well-known American millionaire, Mr. Richard Archbold, research associate of the American Museum of National History, has made his Consolidated PBY-2 flying-boat, "Guba," available for the survey.

This very fine product of aircraftsmanship received its name from a type of tropical storm common to New Guinea, where Mr. Archbold's first expedition, about three years ago, lost the Fairchild Amphibian with which they were preparing to make exploratory excursions as the result of one of these tropical willy-willies turning up at an inappropriate moment.

Ordinarily, the Consolidated PBY-2 is a twin-engined 14-place flying boat, with a wing span of 104 feet, length of 67 feet 1 inch, gross weight of 27,000 lbs., and a maximum payload of 9,250 lbs. Its engines are twin-row Pratt and Whitney radials of 900 h.p. each, and it has a cruising range of 4,000 miles and a cruising speed of 170 m.p.h. The "Guba" is, indeed, a most luxurious craft.

On the projected flight the personnel will be:—

Mr. Richard Archbold, owner of the "Guba," reputedly one of the wealthiest of citizens of the U.S.A.;

Captain P. G. Taylor, who will be in charge of the survey. Mr. Taylor holds one of the only two first-class aircraft navigators' licences in force in Australia;

Captain Lewis A. Yancey, navigator to the Archbold Expedition and also on this flight;

Mr. R. Rogers, Chief Pilot;

Mr. R. Boothold, Radio Operator;

Mr. G. Brown, Chief Engineer;

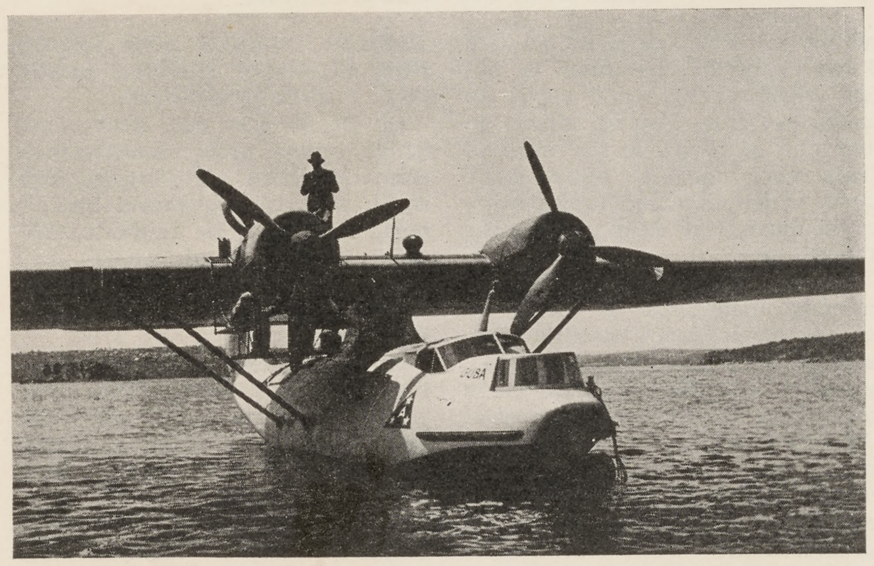
Mr. S. Berrinka, Second Engineer; and

Mr. J. Percival, in charge of mail.

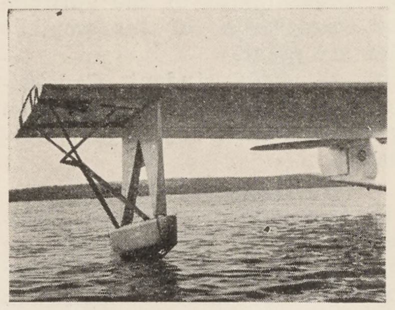
The route to be flown will be from the West Australian coast (probable point of departure, Port Hedland) to Cocos Islands, about 1,230 nautical miles (1,416 statute miles); Cocos Island to Diego Garcia, Chagos Islands, 1,472 nautical miles (1,680 statute miles); Chagos Island to Seychelles Is., 1,022 nautical miles (1,184 statute miles), and Seychelles Is. to Mombasa (Kenya) 950 nautical miles (1,083 statute miles)—a total of 4,674 nautical (or 5,363 statute) miles. (The nautical mile in British usage is 6,080 feet).

A special Air-mail stamp with a face value of 5/- is to be printed.

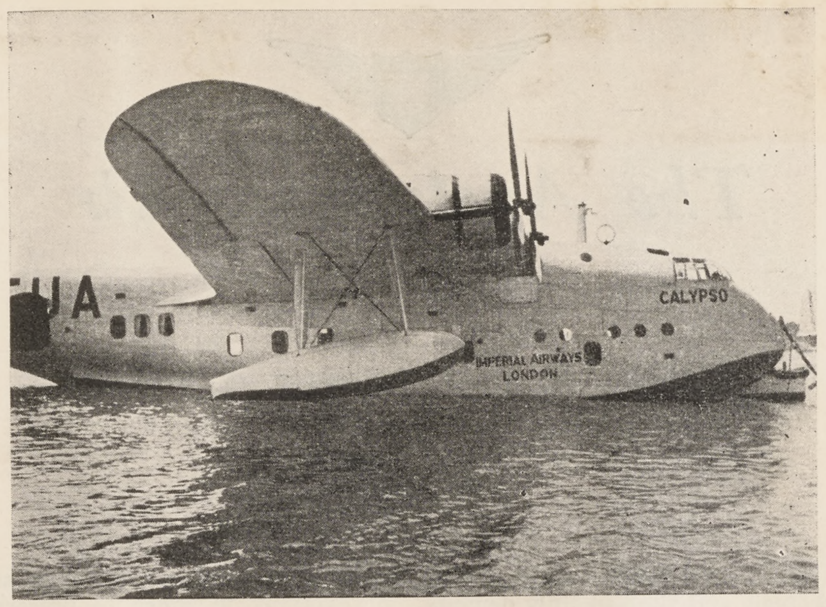
(Continued on next page.)



Close-up of the "Guba". Note engineers sitting in frame seats working on starboard engine. Everything on the "Guba" "breathes" comfort. *("Air-Log" photo)*



The unusual and efficient wing-tip float of a Consolidated PBY-2 Flying-Boat. It folds into and forms the wing-tip in flight. *("Air-Log" photo.)*



In contrast to the low-lying sleekness of the Consolidated PBY-2 Flying-Boat, "Guba," we show here the Imperial Airways' Empire "C" Class Flying-Boat, "Calypso" (G-AEUA). Notice the difference in wing types and wing-tip floats. Through the fourth round "port-hole" from the nose may be seen the figure of a man standing on top of the Flying-Boat "Guba," which was lying about 100 yards on the port side of the "Calypso" at the time this photo was taken.

Aluminium Industry

To be Developed in Australia.

The recent visit of the British Air Mission to Australia, has brought before the public, for perhaps the first time, the increasing importance of Aluminium and its alloys in the construction of both military and civil aircraft.

Frequent references have been made in the press, to the fact that Australia is not a producer of Aluminium and that this condition may result in delays in local aircraft production and also that in the event of a national emergency, serious difficulties might arise in regard to securing Aluminium supplies from overseas.

It is admitted that Australia is not a producer of Aluminium, but this is not as important from a defence point of view as it would at first appear, for it is the availability of adequate Aluminium fabrication resources which is the most important first consideration.

Bauxite—the ore of Aluminium—is available in Australia, but in very limited quantities and at present only of very low grade quality, which situation makes it impossible to produce satisfactorily, the necessary Bauxite concentrates, or Alumina, from which Aluminium ingot is electrolytically smelted.

Unless high grade Bauxite can be eventually obtained in Australia, the costly production of Bauxite concentrates, which is entirely a chemical process, must be carried out with imported Bauxite and the ingot smelted from these concentrates.

Aluminium smelting operations require abundant supplies of very cheap electrical power and of all electro-metallurgical operations, the smelting of Aluminium consumes the most electricity.

Raw materials, other than Bauxite and unobtainable in Australia, such as Cryolite, Petroleum Coke, Fluorspar, etc., are necessary to obtain finally the smelter Aluminium ingot and after this is produced costly fabrication operations are necessary before Aluminium is in a useful form for aircraft and general engineering purposes.

Adequate facilities for the fabrication of Aluminium and its alloys are thus the first essential operations, as far as Australia is concerned at the present time, so that plates, sheet, strip, bar, rod, wire, tubing and shapes can be made available for local aircraft construction—these being produced from imported ingot.

Up to the present time the rolling of Aluminium and the rolling and heat treatment of strong Aluminium alloy sheets—the principal aircraft requirement—has not been carried out in Australia. However, this condition is about to be changed for a company has recently been formed in Australia to provide the complete fabrication of Aluminium and its alloys at Sydney, N.S.W.

This company—Australian Aluminium Company Pty., Ltd.—is preparing plans for the erection of Aluminium sheet rolling mills and extrusion equipment for the production of bar, rod and shapes. All grades of Aluminium alloys, including Duralumin, will be fabricated to meet British and American aircraft material specifications.

The new plant to be erected will produce a wide range of Aluminium alloys for foundry purposes, so that Aluminium castings can be made in Australia in all branches of industry from locally manufactured Aluminium alloys.

In addition to provision being made for foundry alloys the extrusion equipment to be installed will be capable of producing Aluminium alloy forging billets from which forged aero engine pistons, crank cases, air screws, etc., can be manufactured by aero engine builders in Australia.

The site of the plant is to be at Granville, near Sydney, where forty-seven acres of land have been acquired and an immediate start is to be made with building operations.

Large stocks of imported Alum-

(Continued on page 23.)

Navy Busy, Sends 15 Planes To Islands, Orders Maneuvers

S.D. CLUB NEWS

All in the day's work, the Navy sent another batch of big Consair planes on a mass flight to Hawaii last week. In record time of 16 hours, 17 minutes, Patrol Squadron 1, Lt. Comdr. Sam La Hache commanding, took off from the bay Tuesday, landed early Wednesday morning at Pearl Harbor. "Routine transfer," the Navy called it.

Five times before the Navy sent mass flights across the 2,500-mile waterway to Hawaii, all without mishap. And it was only about 12 years ago that an air race to Hawaii resulted disasterously for several entrants!

In other specialties, the Navy was busy last week. Ships began standing out to sea for maneuvers in Hawaii and the north Pacific. The new submarine, Seal, sistership of the Squalus, is due in today (Wednesday).

Capt. John S. McCain, former commander of the Ranger, reported in from Norfolk to succeed Capt. Arthur L. Bristol as commanding officer of Naval Air Station. Comdr. H. M. Mullinix, formerly aviation officer on Adm. E. C. Kalbfus' staff, will become exec at the air station July 8, succeeding Comdr. A. E. Armstrong who goes to the aeronautics bureau in Washington.

Finish Survey Flight

Union 7-10-39

NEW YORK, July 9 (A.P.)—The American Export Airlines' twin-motored plane Transatlantic completed its first round-trip survey flight to Europe today, setting down at Floyd Bennett field 22 hours and 50 minutes after leaving Horta, The Azores.

Union 7-10-39

Britain-Bound Airboat Returns

(Continued From Page 1)

41 hours over the 5750-mile course to Felixstowe. Obviously the physical handicaps were too great and the only sensible decision was to turn back. Furthermore, I did not want to turn the ship over to the British government with anything wrong with the equipment."

YANCEY DISAPPOINTED

For a brief period yesterday morning it was feared the big air boat had made a forced landing when radio signals abruptly were halted while Ray Booth, radioman, was conversing with Barney Boyd, local radio amateur. Rogers explained the flying boat radio suddenly was switched to the department of commerce radio station at Lindbergh field, where a report of the mishap to the plane was made for transmittal to Washington.

Lewis A. Yancey, co-pilot and navigator, was disappointed over the minor incident which caused the plane to return after a perfect take-off and with virtually perfect flying conditions for the voyage to Newfoundland.

Yancey asserted it is as safe to fly across the continent in a flying boat as in a huge transport land plane.

LAND ROUTE SAFE

"Flying at an altitude of 12,000 feet there are many places to land on water safely whereas flying fields capable of accommodating land planes of the size of the army's flying fortresses are few and far between," he said.

"On the air route between San Diego and Chicago there are numerous rivers and lakes where we could make a forced landing safely. From Chicago to Botwood we will be flying over water virtually the entire distance, including a section of the Great Lakes, the Great Lakes waterway and the St. Lawrence river.

"Our weather reports indicated we would have reached Botwood without encountering a heavy storm had we been able to continue. We were about ready to pick up a strong tail wind over Imperial valley when the automatic pilot went haywire. We intended to refuel without delay at Botswood and continue the 2125 miles to Felixstowe, which would have brought us into the British naval air base by Tuesday morning."

GUBA CREW IN CHARGE

Yancey said brilliant sunshine greeted the plane when it topped the clouds over the mountains. It was raining slightly when the ship slipped out of the clouds on its return to the airport.

Flying with Rogers, Yancey and Booth is Gerald Brown, flight engineer. All are members of the crew of Richard Archbold's air boat, the Guba, which completed a 13-month tour over three continents and oceans last Thursday. They are to return to the U. S. from England on the liner Washington July 27, coming here for further flight duty with the Guba, probably on another scientific expedition to Netherlands' New Guinea.

TO FOLLOW LAKES

The flight from San Diego to Botwood will be via Phoenix, Albuquerque, Wichita, Kansas City, Chicago, Detroit, Lake St. Clair, Toronto, Ottawa, Montreal and Quebec. The Great Circle route will be followed over the North Atlantic to Ireland and England.

The plane is fitted with complete navigational equipment, including a seven-man life raft, life jackets, parachute flares, water supply and emergency rations.

Although the air boat was built to the order of the British government the craft is owned by Consolidated Aircraft Corp. until it is formally turned over to the royal air force at Felixstowe. This was one of the chief reasons why Rogers refused to take any unnecessary chances when the robot pilot failed to perform.

Union 7-10-39

Britain-Bound Airboat Returns

Robot Pilot Fails Over Salton Sea

The 15-ton Consolidated flying boat, destined for delivery to the British royal air force at Felixstowe, England, which left San Diego at 7:27 a.m. yesterday on a 3300-mile nonstop flight to Botwood, Newfoundland, returned to the harbor at 9:15 a.m.

Russell Rogers, captain and chief pilot, reported the automatic pilot failed to function. At the time he air boat was 10,000 feet above the Salton sea.

Soon after 10 a.m. the plane was taken out of the water and towed back to the Consolidated plant. The defective apparatus was adjuted by an expert from Naval Air station and soon before dusk Rogers took the plane aloft for a short trial flight. He plans to leave at 8 this morning.

WEATHER IDEAL

Rogers said he turned back with reluctance, as weather conditions were ideal for a successful flight across the continent and Atlantic.

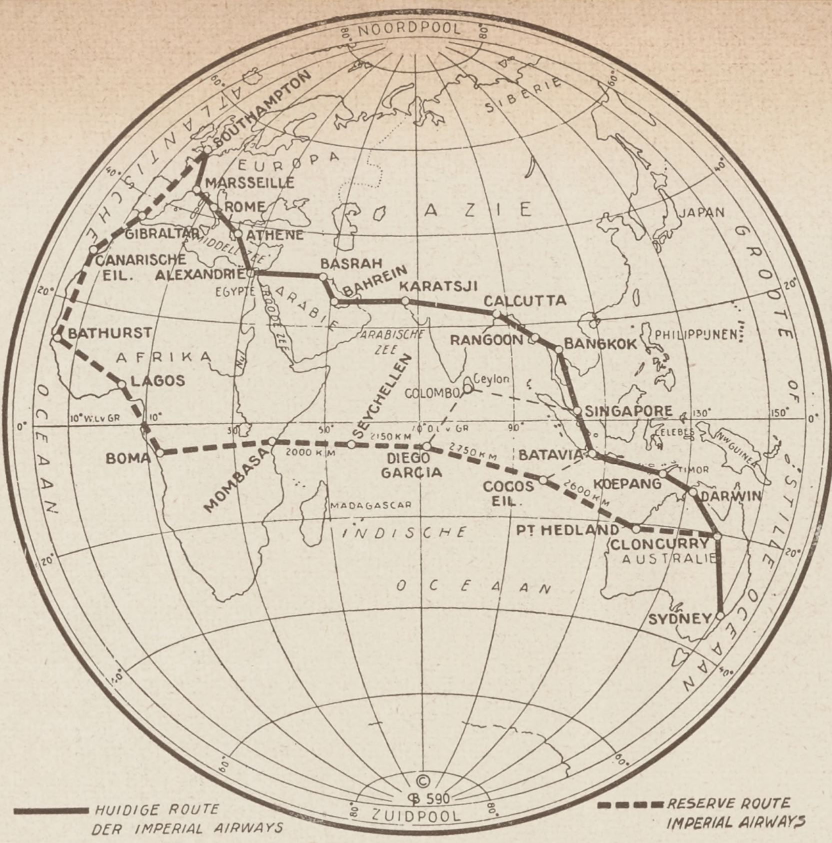
"We had intended to refuel immediately on landing at Botwood Monday morning and to continue the flight to England with less than two hours rest," Rogers said.

"With the automatic pilot out of commission, this would have required steering the plane by hand

(Continued on Page 2, Col. 2)

DE INDISCHE OCEAAN DOOR DE LUCHT VEROVERD!

Een uiterst belangrijke vlucht voor de Britsche Imperiale verbindingen. • De eerste directe luchtverbinding tusschen Australië en Afrika.



De tocht van de vliegboot Guba over den Indischen Oceaan heeft ten doel de mogelijkheid te onderzoeken van een nieuwe route voor de Britsche Imperiale luchtlijnen. Deze route zal in tijd van oorlog dienen ter handhaving van de luchtverbinding met Singapore en Australië. Is de huidige route circa 21.000 km lang, de nieuwe route heeft een lengte van 26.000 km en is dus 5.000 km langer.

De taal van de groote internationale persbureaux is kort maar krachtig. De woorden, die dikwijls over duizenden kilometers geseind moeten worden, zijn duur en daarom moeten wij genoegen nemen met telegrammen als: ,,Vanmorgen is de Australische vliegboot Guba wegens ongunstige weersomstandigheden naar Batavia teruggekeerd''. Of: ,,De Guba is hedenmiddag om vier uur op Mombasa aangekomen.''

Dikwijls is het heel moeilijk dergelijke simplistische berichten tot hun ware beteekenis te herleiden, maar voor de jongste vlucht van de Consolidated vliegboot kunnen wij instaan als voor een der belangrijkste gebeurtenissen in de luchtvaart van den laatsten tijd.

Het Engelsche Ministerie van Luchtvaart had zelfs een speciale berichtgeving over de vorderingen van de boot in het leven geroepen, terwijl de heele vlucht toch een zuiver Australische onderneming heet te zijn. Dat is ook de dekmantel, waaronder het werkelijke belang van de vlucht niet zoozeer in het oog loopt.

Waarom deze vlucht zoo belangrijk was? Wel, in het kader van de internationale moeilijkheden, welke voor het Britsche wereldrijk epidemisch schijnen te zijn, zoeken de autoriteiten van Whitehall dagelijks naar veilige verbindingswegen tusschen de verschillende gebiedsdeelen van het Imperium. Dat dit een noodzakelijkheid is, zal een ieder inzien. Een luchtweg als Londen—Calcutta, zooals deze thans wordt uitgevoerd door de Short-booten, is uiterst kwetsbaar. Hij leidt over heel Zuid-Europa, met inbegrip van Italië, over Arabië en Perzië, waar het Engelsche gezag nog wel zóó in eere wordt gehouden, dat de vliegdienst niet het minste gevaar loopt, maar 't kan verkeeren, om met Brederode te spreken. Vandaag strijken wij elkaar onder de kin en morgen slaan wij elkanders hoofd in. Italië mocht eens in verwikkelingen een vliegverbod uitvaardigen, er zou zelfs eens oorlog kunnen komen. Mogelijk, nietwaar? Tegenwoordig zijn dat factoren, waar zelfs kleine, vredelievende mogendheidjes terdege rekening mee moeten houden. Laat staan de groote machten, die vitale levensbronnen over den heelen aardbol verspreid hebben zooals de Engelschen.

Daarom zoeken de satellieten van Sir Kingsley Wood naar een luchtweg, die onder alle omstandigheden als een veilige bevlogen kan worden.

Dit is uiteraard geen zonderlinge gedachte, want in den wereldoorlog schakelden de Engelschen stante pede hun ,,safety-road'' om de Kaap in. En dat zelfde, veilige Afrika is weer gekozen om de ,,safety road in the air'' onder zijn hoede te nemen. De Engelschen kunnen, van Londen over Fransch gebied vliegend, ongehinderd Noord-Afrika bereiken en het kustgebied is nog steeds in Fransche handen. In het Afrikaansche werelddeel zijn slechts enkele deelen niet in Fransch-Engelsche handen. Die behooren tot Italiaansch of Portugeesch territorium. Deze strooken kunnen gemakkelijk en zonder eenig gevaar omzeild, in casu omvlogen, worden. De weg door de lucht van Engeland naar Zuid-Afrika is dus vrij. Mombasa, een belangrijke havenplaats aan de Oostkust, met ontzaglijk omvangrijke handelsbetrekkingen en een rijk achterland, werd als uitgangspunt voor den nieuwen weg, dien veiligen ,,highroad of the air'', gekozen. Van hieruit moesten luchtwegen gezocht worden, zoowel naar Voor-Indië als naar Australië.

De Amerikaansche Clipperdienst ten voorbeeld.

Nu deed men heel verstandig, door den vermaarden clipperdienst van Pan American Airways ten voorbeeld te stellen. Wie de kaart goed voor oogen heeft, kan zich de situatie voorstellen: Amerika door die paar kleine plukjes land in zee als steunpunten over den oceaan met de Philippijnen verbonden en verderop nog met Hongkong, terwijl er van een dezer ,,pollen'' in de zee een aftakking naar Australië leidde.

Deze skybridge is wellicht nog verbazingwekkender dan de brug over de Golden Gate, omdat de luchtbrug een synthese en een apotheose is van vliegtuigbouw en navigatiekunst. Pan American vliegt dezen dienst tegenwoordig met het gemak van een tripje Amsterdam—Londen, met Guam, Wake en Honolulu als steunpunten. De Atlantische Oceaan, die veel kleiner is dan zijn ,,Stille'' broeder, heeft twee steunpunten: de Bermuda's en de Azoren, en de Indische Oceaan weer drie: de Cocoseilanden, de Chagos Archipel en de Seychellen, zooals men op bijgaand schetskaartje kan zien. De Australische regeering besloot daarom eens langs deze route vliegend den weg naar Afrika te onderzoeken, zooals enkele jaren geleden Pan American den weg naar Manila verkende. Dat wil zeggen: lukt zoo'n vlucht en zijn de rapporten gunstig, dan kan men gerust wedden op de totstandkoming binnen afzienbaren tijd van een geregelden luchtdienst. Want tegenwoordig laat men er in de luchtvaart geen gras over groeien. Dat hebben wij nu weer met den Atlantic Clipper gezien, waarmee de Amerikanen een dienst hebben geopend, zonder over een in onze solide Hollandsche oogen voldoende ervaring in deze regionen te beschikken.

Wie is Guba?

Guba is een oude naam uit het land der Maori's, als wij het wel hebben. Maar zeker is Guba een Consolidated vliegboot met een bijzondere inrichting. Oorspronkelijk een civiele versie van de bekende PBY van de Amerikaansche marine — ook American Export heeft zoo'n uitvoering besteld voor haar oceaan-vrachtdienst — heeft men in den neus een draaibaren koepel aangebracht (wij kunnen hier beter van een ,,boeg'' dan van een ,,neus'' spreken) met een graadverdeeling, waardoor het geheel als zonnekompas gebruikt wordt. De bestuurder heeft er van zijn zitplaats een kijkje op, zoodat hij, de standswisselingen van de zon er bij berekenend, een goed kompas heeft in deze regionen, waar bijna altijd de zon schijnt.

Willen wij de doopceel van dit type nog verder lichten, dan dienen wij te vermelden, dat de Amerikaansche marine er kort geleden nog massale vluchten mee heeft gemaakt, van de basis San Diego naar Honolulu en naar het Panamakanaal, zonder tusschenlanding, welke vluchten van groot belang waren voor de Amerikaansche defensie.

Met de Guba heeft de vermaarde Amerikaansche Archbold-expeditie een vlucht naar Nieuw-Guinea gemaakt, waar het toestel voor een expeditie werd gebruikt. De Australische regeering charterde de boot nu voor een onderzoeking van de ,,emergency'' route, zooals de Engelschen den nieuwen weg noemen.

Dit traject, dat vele duizenden kilometers lang is, werd nog nimmer in de geschiedenis van de luchtvaart vermeld. Niemand heeft zich er tot dusver aan gewaagd, zelfs niet een Kingsford Smith. En zelfs niet in die periode van Smith, Lindbergh, Johnson, Mollison, Sir Allan Cobham e.a., waarin bijna alle mogelijke en onmogelijke luchtwegen werden verkend.

De gezagvoerder van de Guba is kapitein Taylor, een oud zeeman, die dan ook meer om zijn voortreffelijke navigatorische kennis dan om zijn bestuurderskunsten voor dezen tocht werd aangesteld. Taylor is de man, van wien men zegt, dat hij meer met zijn sextant doet dan met den stuurknuppel. Kingsford Smith, met wien hij in de grijze dagen van de luchtvaart met een Fokker F-7 een beetje de Zuidzee en tweemaal de Tasmanzee werkelijk ,,overkachelde'', zei eens van Taylor: ,,Wat hij niet met zijn sextant kan, is waarlijk de moeite niet waard.''

Men had vertrouwen in good old Taylor, zooals de passagier aan boord van een grooten stoomer vertrouwen in zijn kapitein heeft. En Taylor heeft het ook gedaan, rustig aan, geen risico nemend, wijkend voor gevaarlijke depressies en met...... zijn sextant.

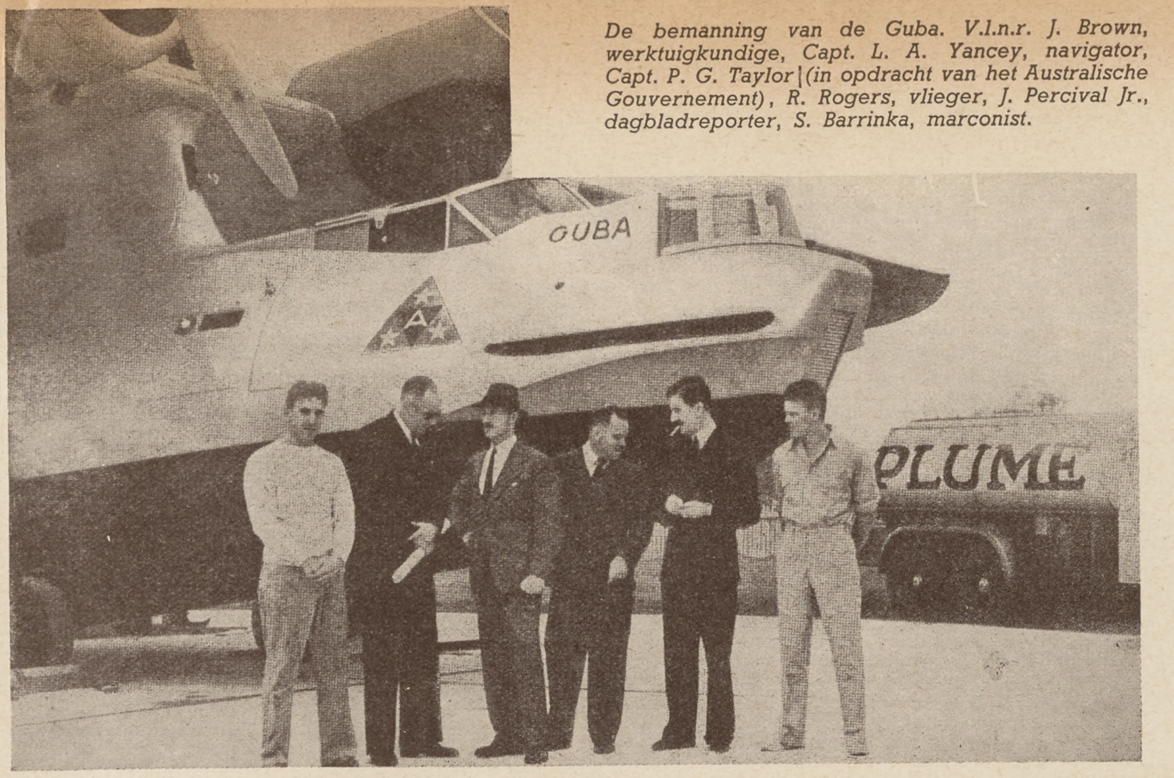
Een goede navigator is in den Indische Oceaan ook een conditio sine qua non. Nergens in de omgeving is een peilstation, ja men is practisch op zijn eigen weerberichtendienst aangewezen.

Taylor verzamelt een schat aan gegevens.

In tegenstelling met de op ons kaartje geprojecteerde route, is de reis niet in Port Hedland op Australië begonnen. In Batavia startte Taylor, maar keerde uren later weer terug, omdat hij te slecht weer had ondervonden. De Cocos-eilanden, het doel van de eerste étappe, werden dus niet bereikt. Nog eens geprobeerd en toen ging het goed. De paar blanken op deze eilandengroep konden hun oogen niet gelooven, toen daar zoo'n snelle, groote vogel op het water neerstreek en een paar dagen later waren het hun broeders op den Chagos-archipel, hun buren van ,,eventjes'' 2800 kilometer verderop'', die de oogen uitwreven. Voor het eerst in de historie daalde een vliegtuig bij deze eilanden.

En bij al die sensaties voor de inwoners heeft Taylor een schat van waardevolle gegevens verzameld. Overal bleef hij een tijdje om zich te oriënteeren. Hij maakte tochten over de eilanden, vloog er over heen, fotografeerde en verzamelde rapporten over de weersomstandigheden. Zoodat de autoriteiten in Australië hun vreugde nu niet op kunnen, nu zij dien heelen dienst, dien zij zich al zoolang gedroomd hadden, hier zoo maar op papier voor hun zagen.

Want het gàát, zegt Taylor, die geen enkele reden ziet, waardoor de dienst langs deze route niet terstond geopend zou kunnen worden. Taylor heeft voorts op verschillende punten op de drie eilandengroepen geschikt terrein gevonden voor den aanleg van velden voor *land*vliegtuigen. Verder zijn er tal



De bemanning van de Guba. V.l.n.r. J. Brown, werktuigkundige, Capt. L. A. Yancey, navigator, Capt. P. G. Taylor (in opdracht van het Australische Gouvernement), R. Rogers, vlieger, J. Percival Jr., dagbladreporter, S. Barrinka, marconist.

29 Juni 1939

van schitterende baaien voor bases voor een dienst met vlieg*booten*.

De resultaten.

DE resultaten van deze merkwaardige vlucht kan men nu in enkele punten neerleggen.

1e. De „emergency" route blijkt niet moeilijk te bevliegen te zijn en met haar drie steunpunten binnen de actie-radius van de moderne vliegbooten en tevens van de vier-motorige landvliegtuigen te liggen.

2e. Door deze route kan de snelste verbinding van Afrika met Australië tot stand worden gebracht.

3e. Zij kan tevens gebruikt worden, wanneer het vliegveld op Ceylon klaar is, om via de Seychellen en Ceylon Britsch Indië met West- en Zuid Afrika te verbinden.

4e. Er kan nu een „sky bridge" tusschen Zuid-Afrika en Singapore geslagen worden, wat economisch en militair van belang is, omdat men hierdoor de zoozeer gewenschte „beweeglijkheid" in het vervoer bereikt.

5e. Nederlandsch Indië kan langs dezen weg een goeden en snellen commercieelen dienst op Zuid-Afrika beginnen, waardoor de toch reeds belangrijke handelsbetrekkingen tusschen beide gebieden nog aanzienlijk kunnen toenemen.

6e. De uit moreel oogpunt zoo belangrijke schakel tusschen Oost en West in het systeem der Britsche Empire verdediging is gevonden. De Short Sunderland vliegbooten — om maar een enkel voorbeeld te noemen — zouden in enkele dagen, over de drie eilandengroepen vliegend, van Engeland naar Singapore of naar Britsch Indië kunnen vliegen zonder over vijandelijk gebied te komen.

7e. De drie eilanden kunnen worden ingericht voor militaire bases, waardoor in geval van oorlog, met vliegtuigen hier gestationneerd, aan zwerftochten als uit den wereldoorlog met de Embden — die door den Australischen kruiser Sydney bij de Cocos-eilanden in den grond is geboord — gemakkelijk een eind kan worden gemaakt.

De Guba trekt verder……

INMIDDELS trekt de Guba verder. Eerst over het Victoriameer naar Lagos en Dakar. Dan gaat het van de Afrikaansche Westkust naar Guyana en van West-Indië weer naar Florida. Wat er dan met de Guba gebeurt, die op het oogenblik geschiedenis schrijft, is nog niet bekend, maar kapitein Taylor maakt er zich voorloopig nog geen zorgen over.

Er staat hem nog wat voor den boeg……

(SEE ALSO ADV. BACK of THIS PAGE)

Eerste Wereldcongres der Luchtvaartpers

Luchtvaartjournalisten uit verschillende landen treffen elkaar in Rome. ● Terugblik op 10 dagen luchtvaartcongres. ● Een perfecte organisatie kenmerkte deze wereldpremière.

AL degenen, die met de luchtvaartwereld min of meer in verbinding staan en zeker de pioniers onder hen, weten dat er tusschen pers en luchtvaart een nauw contact bestaat. Een ontwikkeling, zooals we die in een kwarteeuw tijds aan het luchttransport hebben zien voltrekken, ware niet denkbaar geweest zonder de belangrijke satelliet, welke altijd en overal aanwezig is waar luchtvaart bedreven wordt.

Naarmate de luchtvaart zich technisch ontwikkelde, voltrok zich in de pers, welke de vliegerij als haar object van beschouwing koos, een splitsing. Er was een groot deel, dat het gebied der luchtvaart bleef exploiteeren als een welkom jachtterrein van sensationeel nieuws, maar er was ook een deel, dat de noodzakelijkheid inzag van serieuze studie dezer technische uiting. Slechts wat dit laatste deel betreft, kan er ook voor de toekomst van vruchtbare samenwerking met de luchtvaart sprake zijn.

Over luchtvaartpers sprekende, kan men slechts doelen op die laatste categorie. En het wil ons voorkomen, dat men bij de keuze der deelnemers aan het „Eerste Wereldcongres der Luchtvaartpers" wel iets meer schiftend had te werk kunnen gaan. Waar het hier echter een debuut van een dergelijk internationaal evenement betreft, laat zich dat verklaren. Het is immers wel uiterst moeilijk vanuit één land de onderlinge verhoudingen tusschen persorganen in alle landen der wereld precies te kunnen beoordeelen.

Interessant is in dit verband op te merken, dat bij één der korte lezingen, die gedurende het congres in de Villa Aldobrandini werden gehouden door Nobre de Almeida, een vertegenwoordiger der Braziliaansche luchtvaartpers, verklaard werd, dat in Brazilië de journalistenkring had besloten een speciale school voor de luchtvaartpers in het leven te roepen, waarmede men een nauwere samenwerking tusschen luchtvaart en pers beoogde.

Klassieke entourage.

ROME biedt wel bijzonder gunstige voorwaarden voor het organiseeren van een congres. Immers, buiten den zuiver zakelijken kant is het wel gewenscht, dat den deelnemers ook eenige verpoozing kan worden geboden. En in dat opzicht kan men in deze stad met haar eeuwen oude cultuurhistorie te kust en te keur gaan.

Zelfs de congresvergaderingen zelf werden gehouden in een bezienswaardigheid van Rome, een oude villa in de buurt van het prachtige, imponeerende monument Victor Emmanuel, de Villa Aldobrandini in de Via Mazzarino.

Een goed functionneerende organisatie in samenwerking met de C.I.T., zorgde voor rondritten door de stad en voor trips naar belangrijke punten in de omgeving van Rome. Zoo werden o.a. de Italiaansche filmstad Cinécitta en de bekende luchtvaartstad Guidonia bezocht. Over laatstgenoemde stad werd in *Vliegwereld*, niet zoo lang geleden, reeds een uitvoerige reportage gebracht, zoodat we hier meenen te mogen volstaan met het voortreffelijke programma kunstvliegen, dat door Italiaansche jachtvliegers werd uitgevoerd.

Een programma, zooals hier werd uitgevoerd, zagen wij alleen door Engeland geëvenaard. Ongelooflijk waren de stoute staaltjes, die door deze luchtvirtuoozen werden uitgevoerd. In ruim een half uur was dit uiterst attractieve programma, dat door den Duce — die per auto uit Rome was gekomen — persoonlijk werd bijgewoond, afgewikkeld. Direct daarna nam Mussolini aan de volant van zijn privé vliegtuig (een Savoia Marchetti) plaats, nadat hij de oudsten der aanwezige luchtvaartjournalisten van de verschillende landen voor een trip van ca. 20 minuten boven Rome en Ostia had uitgenoodigd.

Het bezoek aan Guidonia, dat op het einde van het Congres plaats vond, viel bij alle journalisten bijzonder in den smaak en hier en daar informeerende, kreeg men wel den indruk, dat men meer van dergelijke bezoeken, welke direct met de luchtvaart in verband staan, op prijs zou hebben gesteld. Een visite bijv. aan enkele Italiaansche militaire vliegbases zou zéér zeker bij allen in den smaak zijn gevallen. Wij zijn ervan overtuigd, dat de meeste deelnemers daarvoor gaarne een bezoek aan het Lido van Ostia of de filmstad zouden hebben opgeofferd.

Alhoewel wat het aantal deelnemers betreft Italië en Duitschland sterk in de meerderheid waren, kon men toch van een zéér behoorlijke internationale bezetting spreken. Er waren achtereenvolgens buiten Italië vertegenwoordigd: Engeland, Frankrijk, Duitschland, Nederland, België, Zwitserland, Bohemen, Griekenland, Lithauen, Finland, Hongarije, Roemenië, Polen, Portugal, Marokko, Spanje, Joegoslavië, Ver. Staten en Argentinië.

Wat de werkzaamheden van het Congres zelf betreft, kan men onderscheid maken tusschen het georganiseerde gedeelte, dat zich dagelijks op vastgestelde uren in de Villa Aldobrandini afspeelde en dat hoofdzakelijk bestond uit het voordragen der referaten en de gedachtenwisseling à l'improviste, welke zich overal afspeelde waar congresleden elkaar troffen, hetzij op de zonnige boulevards in Rome, aan de gala-diners of op het Lido in Ostia. Deze laatste gedachtenwisseling, die uiteraard het meest natuurlijke verloop neemt, lijkt ons altijd nog het meest belangrijke kernpunt van ieder internationaal congres.

Hiermede willen we vanzelfsprekend geenszins het belang van de vergaderingen onderschatten. Ook hierbij werd menig interessant probleem aangesneden en door gedachtenwisseling met behulp van tolken van verschillende zijden bezien. De lezingen, welke door de deelnemers werden gehouden, omvatten acht groepen en wel:

1. Het luchtvaartjournalisme en de dagbladpers in dienst van vredes- en oorlogscorrespondentie.
2. Wetenschap en techniek op het gebied van luchtvaartjournalisme.
3. De luchtvaartpers en de jongeren.
4. De luchtfotografie en de luchtvaartpers.
5. De luchtvaart en de radio-omroep.
6. De luchtvaart als inspiratiebron voor kunst en literatuur.
7. De film en de luchtvaart.
8. Selectie en opleiding van luchtvaartjournalisten.

In het algemeen hebben wij den indruk gekregen, dat voor een vruchtbare gedachtenwisseling de onderwerpen meer zullen dienen te worden beperkt. Door de moeilijkheid van het taalverschil gaat toch reeds veel van de aandacht der toehoorders en het juiste begrijpen verloren. Zal men daarentegen zich op een congres tot één, hoogstens drie onderwerpen beperken, dan zal de aandacht zich meer kunnen concentreeren en de vrucht der gedachtenwisseling véél grooter zijn.

We zullen t.z.t., wanneer de tekst der lezingen nauwkeurig is te boek gesteld, op enkele onderwerpen nog nader terug komen, daar thans bij een definitieve bespreking er van mogelijkheden van misverstand, door het snelle tempo van het vertalingswerk, niet denkbeeldig zijn.

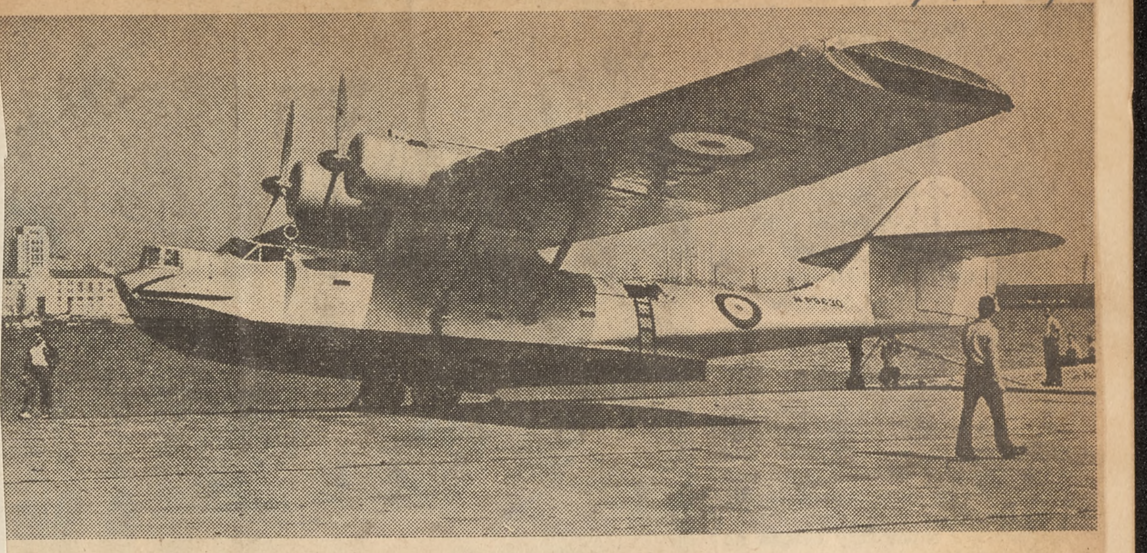
Reeds zijn er aanwijzingen, dat het wereldcongres voor de luchtvaartpers een traditioneel evenement gaat worden en daarmede zal ongetwijfeld het belang en het nut van een dergelijk congres toenemen. Voor 1940 zal Berlijn gastheer van de luchtvaartjournalisten zijn, terwijl in 1942 Rome bij gelegenheid van de groote wereldtentoonstelling wederom haar gastvrijheid heeft toegezegd.

Ons land zal dan in 1941, dank zij het initiatief van den heer Rusman, de luchtvaartjournalisten van alle landen ontvangen. Reeds werd van officieele zijde goedkeuring aan dit plan gehecht, zoodat ons land zich overeenkomstig zijn reputatie op luchtvaartgebied op een juist moment in een nieuw geboren traditie heeft ingeschakeld.

Domyn Keller.

READY FOR 2ND TAKEOFF TO ENGLAND

Union 7-10-39



sfortune overtook this Consolidated air boat designed for delivery to the British Royal air force Felixstowe, England, yesterday when the craft was forced to return to San Diego due to failure the automatic pilot. It will make another try today.

Army Opens Bids In Plane Program

CONTINUED FROM PAGE ONE

for construction of two and four-engine bombers were first on the list of bid openings, which will continue through Saturday.

Consolidated, which recently was awarded a new contract for navy planes, built the PBY series of patrol bombers, which have figured notably in long-distance mass flights to Hawaii, the Canal Zone and Alaska and participated in the recent Caribbean war games. Consair authorities said today the firm had entered bids on several types of planes for the army.

Ryan spokesmen did not reveal the extent of their participation in the new bidding but indicated the company was vitally interested in the awards. The firm, which recently moved into new and elaborate quarters at Lindbergh field, has furnished the army with planes of its famed ST series for training purposes.

Meanwhile, two developments have grown out of the army's plans to utilize as many as possible of the nation's aircraft producing facilities.

Procedure Changed

Gearing its defense machinery to the limit, the air corps today asked tentative warplane bids on a plant-capacity basis, The Associated Press reported from Dayton, O. This was a departure from the corps' previous procedure for bids on specific allotments and Wright field procurement officers said the accelerated program was the first of its kind.

Meanwhile, the war department is considering asking congress for emergency authority to negotiate contracts on a "cost-plus" basis, rather than on the usual low-bid basis, The Associated Press reported from Washington, D. C.

This would revive the World war procedure of placing orders on the basis of cost, plus a limited profit. This would alleviate the fear that the 34 largest American plane manufacturers would be swamped with orders, while other factories would remain virtually idle at a time when all facilities were needed.

The program as contemplated by congress and the air corps would assure an air force of at least 5500 planes by 1941. In voting funds for the program, congress provided for recapture of all profits in excess of 12 percent.

Primary instruction for 396 cadets, who later will be placed at army fields for advanced work, is under way at nine scattered civilian schools. The program in the next two years calls for 2100 additional fliers and approximately 18,000 mechanics to man the equipment.

CONSOLIDATED EYES ARMY BIDS

Opening Of Estimates To Start Tomorrow

Sun 7-4-39

Aviation

Consolidated Aircraft Corp. officials this week will learn whether their bids on Army planes, to be opened in Wright Field, Dayton, O., beginning tomorrow, may net the concern large production orders for one or more types of war craft.

Estimates from manufacturers throughout the United States will be compared at Wright Field from tomorrow through Saturday on eight different kinds of planes.

TYPES KEPT SECRET

Although company officials have refused to reveal the specific types for which local bids have been submitted, it is believed that Consolidated will compete for contracts for twin-engined bombers to replace the now obsolete Douglas B-18, and for four-motored bombers, improvements over the Boeing "flying fortress."

Work has started at the local factory on a $2,880,000 contract for an experimental prototype and a small number of service test craft of the four-motored Army bombardment type. Also under way at the plant is a $4,700,000 order for six four-motored Navy patrol bombers.

BID SCHEDULE

The schedule of opening of bids at Wright Field follows:

July 5—Four-engined bombers, with estimates to be received on lots up to 250; twin-engined bombers, lots up to 700.

July 6—Advanced training planes, lots up to 500.

July 7—Primary training planes, lots up to 1000; basic training planes, lots up to 1000.

July 8—Multiplace fighter planes, lots up to 100; observation planes, lots up to 400; twin-engined pursuit planes, lots up to 200.

AMERICAN EXPORT'S CURRENT ACTIVITIES. American Export Airlines is "negotiating with U.S.aircraft manufacturers to produce non-stop trans-Atlantic luxury airliners which will carry a minimum of 40 passengers,and plans to inaugurate passenger service in addition to its mail and express service within the next 2½ years,the period required for development and construction of such aircraft," the company reveals in its latest house organ. The Consolidated PBY survey plane is now based at Floyd Bennett field. The Coast Guard,City of New York and other agencies are making possible use of ramp, hangar, machine shop, office and operations space. Communications systems,including Weather Bureau teletype,radio and telephones,are now in operation. A 24-hour weather observation bureau is operating at the company's base.

Navy Busy, Sends 15 Planes To Islands, Orders Maneuvers

S.D. CLUB NEWS

All in the day's work, the Navy sent another batch of big Consair planes on a mass flight to Hawaii last week. In record time of 16 hours, 17 minutes, Patrol Squadron 1, Lt. Comdr. Sam La Hache commanding, took off from the bay Tuesday, landed early Wednesday morning at Pearl Harbor. "Routine transfer," the Navy called it.

Five times before the Navy sent mass flights across the 2,500-mile waterway to Hawaii, all without mishap. And it was only about 12 years ago that an air race to Hawaii resulted disasterously for several entrants!

In other specialties, the Navy was busy last week. Ships began standing out to sea for maneuvers in Hawaii and the north Pacific. The new submarine, Seal, sistership of the Squalus, is due in today (Wednesday).

Capt. John S. McCain, former commander of the Ranger, reported in from Norfolk to succeed Capt. Arthur L. Bristol as commanding officer of Naval Air Station. Comdr. H. M. Mullinix, formerly aviation officer on Adm. E. C. Kalbfus' staff, will become exec at the air station July 8, succeeding Comdr. A. E. Armstrong who goes to the aeronautics bureau in Washington.

Finish Survey Flight

Union 7-10-39

NEW YORK, July 9 (A.P.)—The American Export Airlines' twin-motored plane Transatlantic completed its first round-trip survey flight to Europe today, setting down at Floyd Bennett field 22 hours and 50 minutes after leaving Horta, The Azores.

Union 7-10-39

Britain-Bound Airboat Returns

(Continued From Page 1)

41 hours over the 5750-mile course to Felixstowe. Obviously the physical handicaps were too great and the only sensible decision was to turn back. Furthermore, I did not want to turn the ship over to the British government with anything wrong with the equipment."

YANCEY DISAPPOINTED

For a brief period yesterday morning it was feared the big air boat had made a forced landing when radio signals abruptly were halted while Ray Booth, radioman, was conversing with Barney Boyd, local radio amateur. Rogers explained the flying boat radio suddenly was switched to the department of commerce radio station at Lindbergh field, where a report of the mishap to the plane was made for transmittal to Washington.

Lewis A. Yancey, co-pilot and navigator, was disappointed over the minor incident which caused the plane to return after a perfect take-off and with virtually perfect flying conditions for the voyage to Newfoundland.

Yancey asserted it is as safe to fly across the continent in a flying boat as in a huge transport land plane.

LAND ROUTE SAFE

"Flying at an altitude of 12,000 feet there are many places to land on water safely whereas flying fields capable of accommodating land planes of the size of the army's flying fortresses are few and far between," he said.

"On the air route between San Diego and Chicago there are numerous rivers and lakes where we could make a forced landing safely. From Chicago to Botwood we will be flying over water virtually the entire distance, including a section of the Great Lakes, the Great Lakes waterway and the St. Lawrence river.

"Our weather reports indicated we would have reached Botwood without encountering a heavy storm had we been able to continue. We were about ready to pick up a strong tail wind over Imperial valley when the automatic pilot went haywire. We intended to refuel without delay at Botswood and continue the 2125 miles to Felixstowe, which would have brought us into the British naval air base by Tuesday morning."

GUBA CREW IN CHARGE

Yancey said brilliant sunshine greeted the plane when it topped the clouds over the mountains. It was raining slightly when the ship slipped out of the clouds on its return to the airport.

Flying with Rogers, Yancey and Booth is Gerald Brown, flight engineer. All are members of the crew of Richard Archbold's air boat, the Guba, which completed a 13-month tour over three continents and oceans last Thursday. They are to return to the U. S. from England on the liner Washington July 27, coming here for further flight duty with the Guba, probably on another scientific expedition to Netherlands' New Guinea.

TO FOLLOW LAKES

The flight from San Diego to Botwood will be via Phoenix, Albuquerque, Wichita, Kansas City, Chicago, Detroit, Lake St. Clair, Toronto, Ottawa, Montreal and Quebec. The Great Circle route will be followed over the North Atlantic to Ireland and England.

The plane is fitted with complete navigational equipment, including a seven-man life raft, life jackets, parachute flares, water supply and emergency rations.

Although the air boat was built to the order of the British government the craft is owned by Consolidated Aircraft Corp. until it is formally turned over to the royal air force at Felixstowe. This was one of the chief reasons why Rogers refused to take any unnecessary chances when the robot pilot failed to perform.

Union 7-10-39

Britain-Bound Airboat Returns

Robot Pilot Fails Over Salton Sea

The 15-ton Consolidated flying boat, destined for delivery to the British royal air force at Felixstowe, England, which left San Diego at 7:27 a.m. yesterday on a 3300-mile nonstop flight to Botwood, Newfoundland, returned to the harbor at 9:15 a.m.

Russell Rogers, captain and chief pilot, reported the automatic piot failed to function. At the time the air boat was 10,000 feet above the Salton sea.

Soon after 10 a.m. the plane was taken out of the water and towed back to the Consolidated plant. The defective apparatus was adjuted by an expert from Naval Air station and soon before dusk Rogers took the plane aloft for a short trial flight. He plans to leave at 8 this morning.

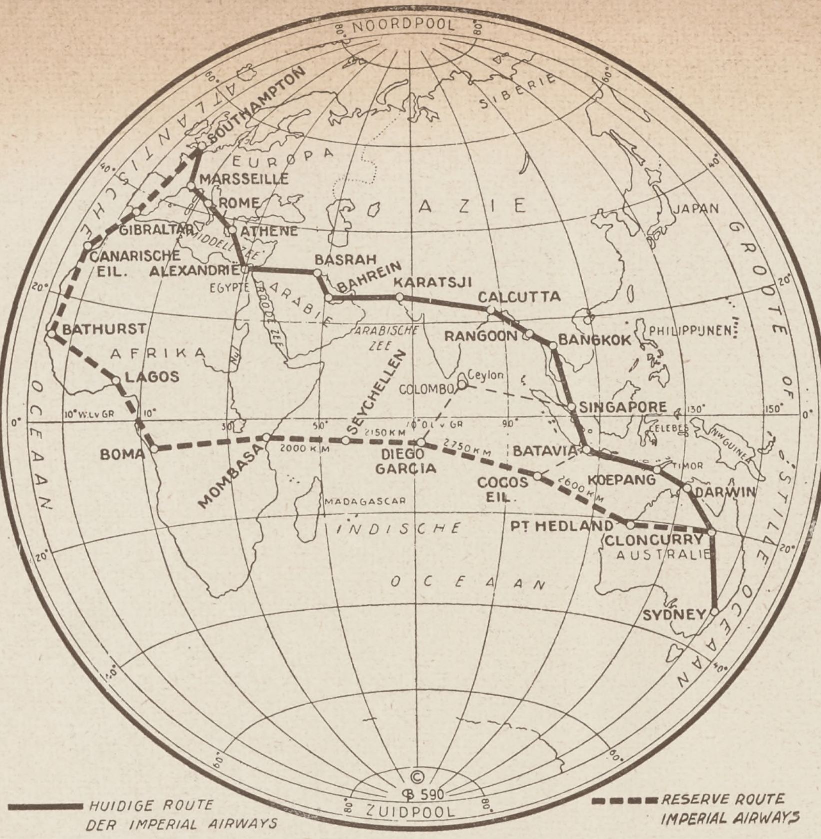
WEATHER IDEAL

Rogers said he turned back with reluctance, as weather conditions were ideal for a successful flight across the continent and Atlantic.

"We had intended to refuel immediately on landing at Botwood Monday morning and to continue the flight to England with less than two hours rest," Rogers said.

"With the automatic pilot out of commission, this would have required steering the plane by hand

(Continued on Page 2, Col. 2)



DE INDISCHE OCEAAN DOOR DE LUCHT VEROVERD!

Een uiterst belangrijke vlucht voor de Britsche Imperiale verbindingen. ● De eerste directe luchtverbinding tusschen Australië en Afrika.

De tocht van de vliegboot Guba over den Indischen Oceaan heeft ten doel de mogelijkheid te onderzoeken van een nieuwe route voor de Britsche Imperiale luchtlijnen. Deze route zal in tijd van oorlog dienen ter handhaving van de luchtverbinding met Singapore en Australië. Is de huidige route circa 21.000 km lang, de nieuwe route heeft een lengte van 26.000 km en is dus 5.000 km langer.

De taal van de groote internationale persbureaux is kort maar krachtig. De woorden, die dikwijls over duizenden kilometers geseind moeten worden, zijn duur en daarom moeten wij genoegen nemen met telegrammen als: ,,Vanmorgen is de Australische vliegboot Guba wegens ongunstige weersomstandigheden naar Batavia teruggekeerd''. Of: ,,De Guba is hedenmiddag om vier uur op Mombasa aangekomen.''

Dikwijls is het heel moeilijk dergelijke simplistische berichten tot hun ware beteekenis te herleiden, maar voor de jongste vlucht van de Consolidated vliegboot kunnen wij instaan als voor een der belangrijkste gebeurtenissen in de luchtvaart van den laatsten tijd.

Het Engelsche Ministerie van Luchtvaart had zelfs een speciale berichtgeving over de vorderingen van de boot in het leven geroepen, terwijl de heele vlucht toch een zuiver Australische onderneming heet te zijn. Dat is ook de dekmantel, waaronder het werkelijke belang van de vlucht niet zoozeer in het oog loopt.

Waarom deze vlucht zoo belangrijk was? Wel, in het kader van de internationale moeilijkheden, welke voor het Britsche wereldrijk epidemisch schijnen te zijn, zoeken de autoriteiten van Whitehall dagelijks naar veilige verbindingswegen tusschen de verschillende gebiedsdeelen van het Imperium. Dat dit een noodzakelijkheid is, zal een ieder inzien. Een luchtweg als Londen—Calcutta, zooals deze thans wordt uitgevoerd door de Short-booten, is uiterst kwetsbaar. Hij leidt over heel Zuid-Europa, met inbegrip van Italië, over Arabië en Perzië, waar het Engelsche gezag nog wel zóó in eere wordt gehouden, dat de vliegdienst niet het minste gevaar loopt, maar 't kan verkeeren, om met Brederode te spreken. Vandaag strijken wij elkaar onder de kin en morgen slaan wij elkanders hoofd in. Italië mocht eens in verwikkelingen een vliegverbod uitvaardigen, er zou zelfs eens oorlog kunnen komen. Mogelijk, nietwaar? Tegenwoordig zijn dat factoren, waar zelfs kleine, vredelievende mogendheidjes terdege rekening mee moeten houden. Laat staan de groote machten, die vitale levensbronnen over den heelen aardbol verspreid hebben zooals de Engelschen.

Daarom zoeken de satellieten van Sir Kingsley Wood naar een luchtweg, die onder alle omstandigheden als een veilige bevlogen kan worden.

Dit is uiteraard geen zonderlinge gedachte, want in den wereldoorlog schakelden de Engelschen stante pede hun ,,safety-road'' om de Kaap in. En dat zelfde, veilige Afrika is weer gekozen om de ,,safety road in the air'' onder zijn hoede te nemen. De Engelschen kunnen, van Londen over Fransch gebied vliegend, ongehinderd Noord-Afrika bereiken en het kustgebied is nog steeds in Fransche handen. In het Afrikaansche werelddeel zijn slechts enkele deelen niet in Fransch-Engelsche handen. Die behooren tot Italiaansch of Portugeesch territorium. Deze strooken kunnen gemakkelijk en zonder eenig gevaar omzeild, in casu omvlogen, worden. De weg door de lucht van Engeland naar Zuid-Afrika is dus vrij. Mombasa, een belangrijke havenplaats aan de Oostkust, met ontzaglijk omvangrijke handelsbetrekkingen en een rijk achterland, werd als uitgangspunt voor den nieuwen weg, dien veiligen ,,highroad of the air'', gekozen. Van hieruit moesten luchtwegen gezocht worden, zoowel naar Voor-Indië als naar Australië.

De Amerikaansche Clipperdienst ten voorbeeld.

Nu deed men heel verstandig, door den vermaarden clipperdienst van Pan American Airways ten voorbeeld te stellen. Wie de kaart goed voor oogen heeft, kan zich de situatie voorstellen: Amerika door die paar kleine plukjes land in zee als steunpunten over den oceaan met de Philippijnen verbonden en verderop nog met Hongkong, terwijl er van een dezer ,,pollen'' in de zee een aftakking naar Australië leidde.

Deze skybridge is wellicht nog verbazingwekkender dan de brug over de Golden Gate, omdat de luchtbrug een synthese en een apotheose is van vliegtuigbouw en navigatiekunst. Pan American vliegt dezen dienst tegenwoordig met het gemak van een tripje Amsterdam—Londen, met Guam, Wake en Honolulu als steunpunten. De Atlantische Oceaan, die veel kleiner is dan zijn ,,Stille'' broeder, heeft twee steunpunten: de Bermuda's en de Azoren, en de Indische Oceaan weer drie: de Cocoseilanden, de Chagos Archipel en de Seychellen, zooals men op bijgaand schetskaartje kan zien. De Australische regeering besloot daarom eens langs deze route vliegend den weg naar Afrika te onderzoeken, zooals enkele jaren geleden Pan American den weg naar Manila verkende. Dat wil zeggen: lukt zoo'n vlucht en zijn de rapporten gunstig, dan kan men gerust wedden op de totstandkoming binnen afzienbaren tijd van een geregelden luchtdienst. Want tegenwoordig laat men er in de luchtvaart geen gras over groeien. Dat hebben wij nu weer met den Atlantic Clipper gezien, waarmee de Amerikanen een dienst hebben geopend, zonder over een in onze solide Hollandsche oogen voldoende ervaring in deze regionen te beschikken.

Wie is Guba?

Guba is een oude naam uit het land der Maori's, als wij het wel hebben. Maar zeker is Guba een Consolidated vliegboot met een bijzondere inrichting. Oorspronkelijk een civiele versie van de bekende PBY van de Amerikaansche marine — ook American Export heeft zoo'n uitvoering besteld voor haar oceaan-vrachtdienst — heeft men in den neus een draaibaren koepel aangebracht (wij kunnen hier beter van een ,,boeg'' dan van een ,,neus'' spreken) met een graadverdeeling, waardoor het geheel als zonnekompas gebruikt wordt. De bestuurder heeft er van zijn zitplaats een kijkje op, zoodat hij, de standswisselingen van de zon er bij berekenend, een goed kompas heeft in deze regionen, waar bijna altijd de zon schijnt.

Willen wij de doopceel van dit type nog verder lichten, dan dienen wij te vermelden, dat de Amerikaansche marine er kort geleden nog massale vluchten mee heeft gemaakt, van de basis San Diego naar Honolulu en naar het Panamakanaal, zonder tusschenlanding, welke vluchten van groot belang waren voor de Amerikaansche defensie.

Met de Guba heeft de vermaarde Amerikaansche Archbold-expeditie een vlucht naar Nieuw-Guinea gemaakt, waar het toestel voor een expeditie werd gebruikt. De Australische regeering charterde de boot nu voor een onderzoeking van de ,,emergency'' route, zooals de Engelschen den nieuwen weg noemen.

Dit traject, dat vele duizenden kilometers lang is, werd nog nimmer in de geschiedenis van de luchtvaart vermeld. Niemand heeft zich er tot dusver aan gewaagd, zelfs niet een Kingsford Smith. En zelfs niet in die periode van Smith, Lindbergh, Johnson, Mollison, Sir Allan Cobham e.a., waarin bijna alle mogelijke en onmogelijke luchtwegen werden verkend.

De gezagvoerder van de Guba is kapitein Taylor, een oud zeeman, die dan ook meer om zijn voortreffelijke navigatorische kennis dan om zijn bestuurderskunsten voor dezen tocht werd aangesteld. Taylor is de man, van wien men zegt, dat hij meer met zijn sextant doet dan met den stuurknuppel. Kingsford Smith, met wien hij in de grijze dagen van de luchtvaart met een Fokker F-7 een beetje de Zuidzee en tweemaal de Tasmanzee werkelijk ,,overkachelde'', zei eens van Taylor: ,,Wat hij niet met zijn sextant kan, is waarlijk de moeite niet waard.''

Men had vertrouwen in good old Taylor, zooals de passagier aan boord van een grooten stoomer vertrouwen in zijn kapitein heeft. En Taylor heeft het ook gedaan, rustig aan, geen risico nemend, wijkend voor gevaarlijke depressies en met...... zijn sextant.

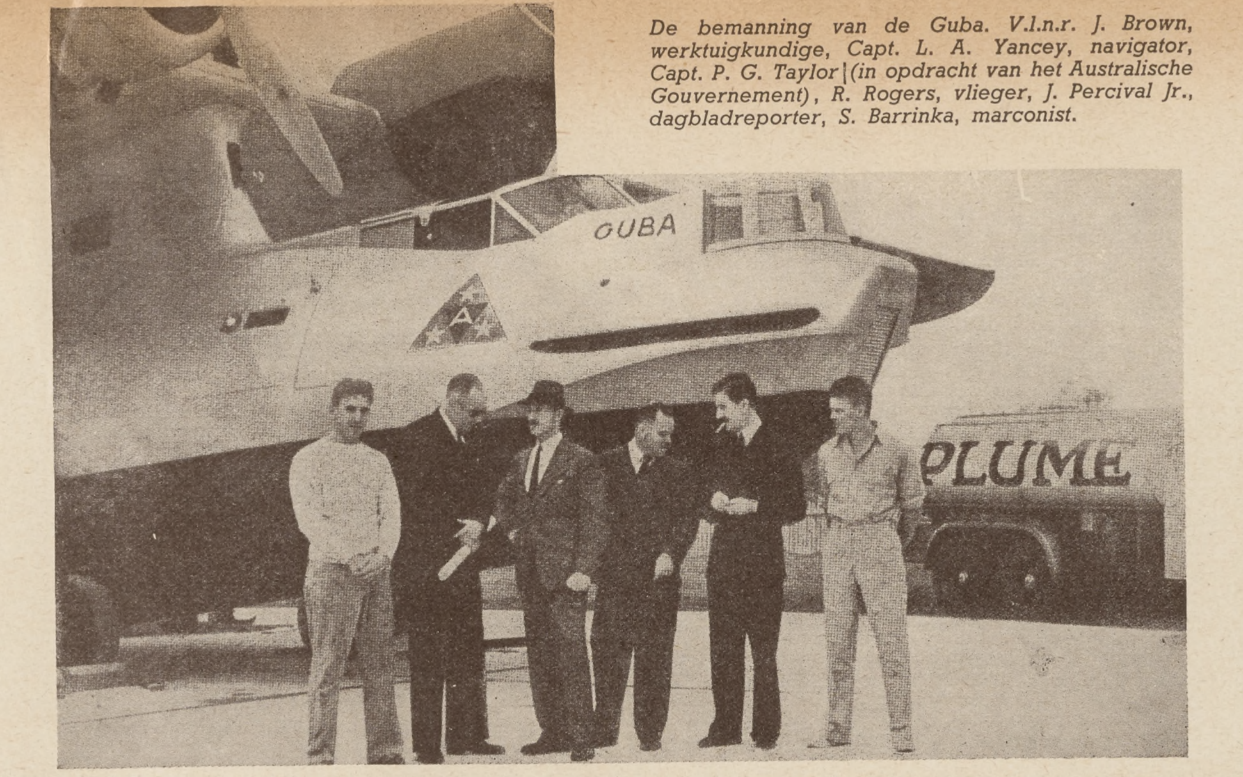
Een goede navigator is in den Indische Oceaan ook een conditio sine qua non. Nergens in de omgeving is een peilstation, ja men is practisch op zijn eigen weerberichtendienst aangewezen.

Taylor verzamelt een schat aan gegevens.

In tegenstelling met de op ons kaartje geprojecteerde route, is de reis niet in Port Hedland op Australië begonnen. In Batavia startte Taylor, maar keerde uren later weer terug, omdat hij te slecht weer had ondervonden. De Cocos-eilanden, het doel van de eerste étappe, werden dus niet bereikt. Nog eens geprobeerd en toen ging het goed. De paar blanken op deze eilandengroep konden hun oogen niet gelooven, toen daar zoo'n snelle, groote vogel op het water neerstreek en een paar dagen later waren het hun broeders op den Chagos-archipel, hun buren van ,,eventjes'' 2800 kilometer verderop'', die de oogen uitwreven. Voor het eerst in de historie daalde een vliegtuig bij deze eilanden.

En bij al die sensaties voor de inwoners heeft Taylor een schat van waardevolle gegevens verzameld. Overal bleef hij een tijdje om zich te oriënteeren. Hij maakte tochten over de eilanden, vloog er over heen, fotografeerde en verzamelde rapporten over de weersomstandigheden. Zoodat de autoriteiten in Australië hun vreugde nu niet op kunnen, nu zij dien heelen dienst, dien zij zich al zoolang gedroomd hadden, hier zoo maar op papier voor hun zagen.

Want het gàat, zegt Taylor, die geen enkele reden ziet, waardoor de dienst langs deze route niet terstond geopend zou kunnen worden. Taylor heeft voorts op verschillende punten op de drie eilandengroepen geschikt terrein gevonden voor den aanleg van velden voor *land*vliegtuigen. Verder zijn er tal



De bemanning van de Guba. V.l.n.r. J. Brown, werktuigkundige, Capt. L. A. Yancey, navigator, Capt. P. G. Taylor (in opdracht van het Australische Gouvernement), R. Rogers, vlieger, J. Percival Jr., dagbladreporter, S. Barrinka, marconist.

van schitterende baaien voor bases voor een dienst met vlieg*booten*.

De resultaten.

De resultaten van deze merkwaardige vlucht kan men nu in enkele punten neerleggen.

1e. De „emergency" route blijkt niet moeilijk te bevliegen te zijn en met haar drie steunpunten binnen de actie-radius van de moderne vliegbooten en tevens van de vier-motorige landvliegtuigen te liggen.

2e. Door deze route kan de snelste verbinding van Afrika met Australië tot stand worden gebracht.

3e. Zij kan tevens gebruikt worden, wanneer het vliegveld op Ceylon klaar is, om via de Seychellen en Ceylon Britsch Indië met West- en Zuid Afrika te verbinden.

4e. Er kan nu een „sky bridge" tusschen Zuid-Afrika en Singapore geslagen worden, wat economisch en militair van belang is, omdat men hierdoor de zoozeer gewenschte „beweeglijkheid" in het vervoer bereikt.

5e. Nederlandsch Indië kan langs dezen weg een goeden en snellen commercieelen dienst op Zuid-Afrika beginnen, waardoor de toch reeds belangrijke handelsbetrekkingen tusschen beide gebieden nog aanzienlijk kunnen toenemen.

6e. De uit moreel oogpunt zoo belangrijke schakel tusschen Oost en West in het systeem der Britsche Empire verdediging is gevonden. De Short Sunderland vliegbooten — om maar een enkel voorbeeld te noemen — zouden in enkele dagen, over de drie eilandengroepen vliegend, van Engeland naar Singapore of naar Britsch Indië kunnen vliegen zonder over vijandelijk gebied te komen.

7e. De drie eilanden kunnen worden ingericht voor militaire bases, waardoor in geval van oorlog, met vliegtuigen hier gestationneerd, aan zwerftochten als uit den wereldoorlog met de Embden — die door den Australischen kruiser Sydney bij de Cocos-eilanden in den grond is geboord — gemakkelijk een eind kan worden gemaakt.

De Guba trekt verder......

Inmiddels trekt de Guba verder. Eerst over het Victoriameer naar Lagos en Dakar. Dan gaat het van de Afrikaansche Westkust naar Guyana en van West-Indië weer naar Florida. Wat er dan met de Guba gebeurt, die op het oogenblik geschiedenis schrijft, is nog niet bekend, maar kapitein Taylor maakt er zich voorloopig nog geen zorgen over

Er staat hem nog wat voor den boeg......

(SEE ALSO ADV. BACK of THIS PAGE)

Eerste Wereldcongres der Luchtvaartpers

Luchtvaartjournalisten uit verschillende landen treffen elkaar in Rome. • Terugblik op 10 dagen luchtvaartcongres. • Een perfecte organisatie kenmerkte deze wereldpremière.

Al degenen, die met de luchtvaartwereld min of meer in verbinding staan en zeker de pioniers onder hen, weten dat er tusschen pers en luchtvaart een nauw contact bestaat. Een ontwikkeling, zooals we die in een kwarteeuw tijds aan het luchttransport hebben zien voltrekken, ware niet denkbaar geweest zonder de belangrijke satelliet, welke altijd en overal aanwezig is waar luchtvaart bedreven wordt.

Naarmate de luchtvaart zich technisch ontwikkelde, voltrok zich in de pers, welke de vliegerij als haar object van beschouwing koos, een splitsing. Er was een groot deel, dat het gebied der luchtvaart bleef exploiteeren als een welkom jachtterrein van sensationeel nieuws, maar er was ook een deel, dat de noodzakelijkheid inzag van serieuze studie dezer technische uiting. Slechts wat dit laatste deel betreft, kan er ook voor de toekomst van vruchtbare samenwerking met de luchtvaart sprake zijn.

Over luchtvaartpers sprekende, kan men slechts doelen op die laatste categorie. En het wil ons voorkomen, dat men bij de keuze der deelnemers aan het „Eerste Wereldcongres der Luchtvaartpers" wel iets meer schiftend had te werk kunnen gaan. Waar het hier echter een debuut van een dergelijk internationaal evenement betreft, laat zich dat verklaren. Het is immers wel uiterst moeilijk vanuit één land de onderlinge verhoudingen tusschen persorganen in alle landen der wereld precies te kunnen beoordeelen.

Interessant is in dit verband op te merken, dat bij één der korte lezingen, die gedurende het congres in de Villa Aldobrandini werden gehouden door Nobre de Almeida, een vertegenwoordiger der Braziliaansche luchtvaartpers, verklaard werd, dat in Brazilië de journalistenkring had besloten een speciale school voor de luchtvaartpers in het leven te roepen, waarmede men een nauwere samenwerking tusschen luchtvaart en pers beoogde.

Klassieke entourage.

Rome biedt wel bijzonder gunstige voorwaarden voor het organiseeren van een congres. Immers, buiten den zuiver zakelijken kant is het wel gewenscht, dat den deelnemers ook eenige verpoozing kan worden geboden. En in dat opzicht kan men in deze stad met haar eeuwen oude cultuurhistorie te kust en te keur gaan.

Zelfs de congresvergaderingen zelf werden gehouden in een bezienswaardigheid van Rome, een oude villa in de buurt van het prachtige, imponeerende monument Victor Emmanuel, de Villa Aldobrandini in de Via Mazzarino.

Een goed functionneerende organisatie in samenwerking met de C.I.T., zorgde voor rondritten door de stad en voor trips naar belangrijke punten in de omgeving van Rome. Zoo werden o.a. de Italiaansche filmstad Cinécitta en de bekende luchtvaartstad Guidonia bezocht. Over laatstgenoemde stad werd in *Vliegwereld*, niet zoo lang geleden, reeds een uitvoerige reportage gebracht, zoodat we hier meenen te mogen volstaan met het voortreffelijke programma kunstvliegen, dat door Italiaansche jachtvliegers werd uitgevoerd.

Een programma, zooals hier werd uitgevoerd, zagen wij alleen door Engeland geëvenaard. Ongeloofelijk waren de stoute staaltjes, die door deze luchtvirtuoozen werden uitgevoerd. In ruim een half uur was dit uiterst attractieve programma, dat door den Duce — die per auto uit Rome was gekomen — persoonlijk werd bijgewoond, afgewikkeld. Direct daarna nam Mussolini aan de volant van zijn privé vliegtuig (een Savoia Marchetti) plaats, nadat hij de oudsten der aanwezige luchtvaartjournalisten van de verschillende landen voor een trip van ca. 20 minuten boven Rome en Ostia had uitgenoodigd.

Het bezoek aan Guidonia, dat op het einde van het Congres plaats vond, viel bij alle journalisten bijzonder in den smaak en hier en daar informeerende, kreeg men wel den indruk, dat men meer van dergelijke bezoeken, welke direct met de luchtvaart in verband staan, op prijs zou hebben gesteld. Een visite bijv. aan enkele Italiaansche militaire vliegbases zou zéér zeker bij allen in den smaak zijn gevallen. Wij zijn ervan overtuigd, dat de meeste deelnemers daarvoor gaarne een bezoek aan het Lido van Ostia of de filmstad zouden hebben opgeofferd.

Alhoewel wat het aantal deelnemers betreft Italië en Duitschland sterk in de meerderheid waren, kon men toch van een zéér behoorlijke internationale bezetting spreken. Er waren achtereenvolgens buiten Italië vertegenwoordigd: Engeland, Frankrijk, Duitschland, Nederland, België, Zwitserland, Bohemen, Griekenland, Lithauen, Finland, Hongarije, Roemenië, Polen, Portugal, Marokko, Spanje, Joegoslavië, Ver. Staten en Argentinië.

Wat de werkzaamheden van het Congres zelf betreft, kan men onderscheid maken tusschen het georganiseerde gedeelte, dat zich dagelijks op vastgestelde uren in de Villa Aldobrandini afspeelde en dat hoofdzakelijk bestond uit het voordragen der referaten en de gedachtenwisseling à l'improviste, welke zich overal afspeelde waar congresleden elkaar troffen, hetzij op de zonnige boulevards in Rome, aan de gala-diners of op het Lido in Ostia. Deze laatste gedachtenwisseling, die uiteraard het meest natuurlijke verloop neemt, lijkt ons altijd nog het meest belangrijke kernpunt van ieder internationaal congres.

Hiermede willen we vanzelfsprekend geenszins het belang van de vergaderingen onderschatten. Ook hierbij werd menig interessant probleem aangesneden en door gedachtenwisseling met behulp van tolken van verschillende zijden bezien. De lezingen, welke door de deelnemers werden gehouden, omvatten acht groepen en wel:

1. Het luchtvaartjournalisme en de dagbladpers in dienst van vredes- en oorlogscorrespondentie.
2. Wetenschap en techniek op het gebied van luchtvaartjournalisme.
3. De luchtvaartpers en de jongeren.
4. De luchtfotografie en de luchtvaartpers.
5. De luchtvaart en de radio-omroep.
6. De luchtvaart als inspiratiebron voor kunst en literatuur.
7. De film en de luchtvaart.
8. Selectie en opleiding van luchtvaartjournalisten.

In het algemeen hebben wij den indruk gekregen, dat voor een vruchtbare gedachtenwisseling de onderwerpen meer zullen dienen te worden beperkt. Door de moeilijkheid van het taalverschil gaat toch reeds veel van de aandacht der toehoorders en het juiste begrijpen verloren. Zal men daarentegen zich op een congres tot één, hoogstens drie onderwerpen beperken, dan zal de aandacht zich meer kunnen concentreeren en de vrucht der gedachtenwisseling véél grooter zijn.

We zullen t.z.t., wanneer de tekst der lezingen nauwkeurig is te boek gesteld, op enkele onderwerpen nog nader terug komen, daar thans bij een definitieve bespreking er van mogelijkheden van misverstand, door het snelle tempo van het vertalingswerk, niet denkbeeldig zijn.

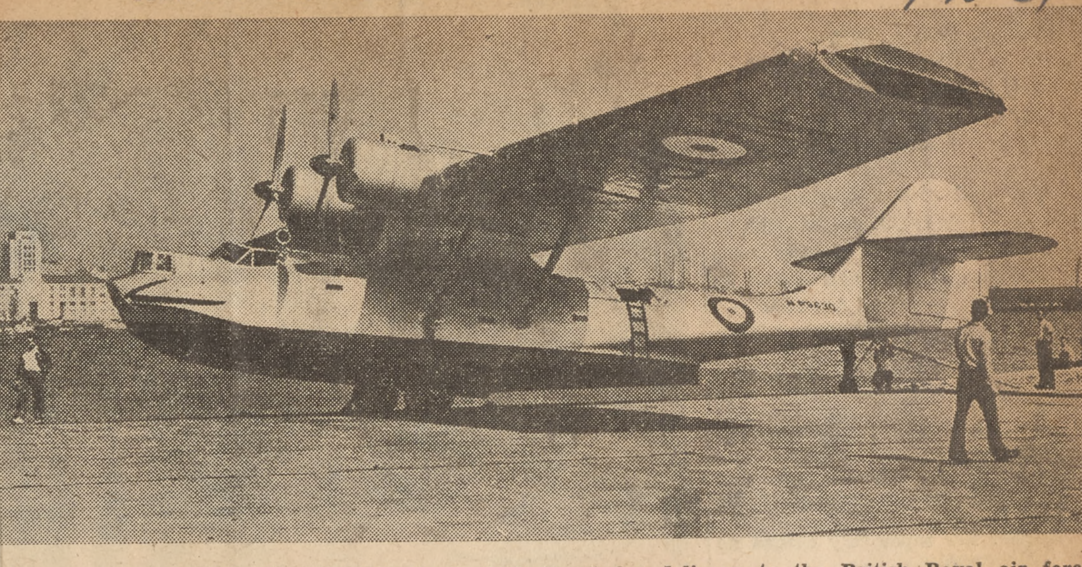
Reeds zijn er aanwijzingen, dat het wereldcongres voor de luchtvaartpers een traditioneel evenement gaat worden en daarmede zal ongetwijfeld het belang en het nut van een dergelijk congres toenemen. Voor 1940 zal Berlijn gastheer van de luchtvaartjournalisten zijn, terwijl in 1942 Rome bij gelegenheid van de groote wereldtentoonstelling wederom haar gastvrijheid heeft toegezegd.

Ons land zal dan in 1941, dank zij het initiatief van den heer Rusman, de luchtvaartjournalisten van alle landen ontvangen. Reeds werd van officieele zijde goedkeuring aan dit plan gehecht, zoodat ons land zich overeenkomstig zijn reputatie op luchtvaartgebied op een juist moment in een nieuw geboren traditie heeft ingeschakeld.

Domyn Keller.

READY FOR 2ND TAKEOFF TO ENGLAND

Union 7-10-39



sfortune overtook this Consolidated air boat designed for delivery to the British Royal air force Felixstowe, England, yesterday when the craft was forced to return to San Diego due to failure the automatic pilot. It will make another try today.

to today asked plane bids on a plant- ca sis, The Associated Press rep ted from Dayton, O. This was a departure from the corps' previous procedure for bids on specific allotments and Wright field procurement officers said the accelerated program was the first of its kind.

Meanwhile, the war department is considering asking congress for emergency authority to negotiate contracts on a "cost-plus" basis, rather than on the usual low-bid basis, The Associated Press reported from Washington, D. C.

This would revive the World war procedure of placing orders on the basis of cost, plus a limited profit. This would alleviate the fear that the 34 largest American plane manufacturers would be swamped with orders, while other factories would remain virtually idle at a time when all facilities were needed.

The program as contemplated by congress and the air corps would assure an air force of at least 5500 planes by 1941. In voting funds for the program, congress provided for recapture of all profits in excess of 12 percent.

Primary instruction for 396 cadets, who later will be placed at army fields for advanced work, is under way at nine scattered civilian schools. The program in the next two years calls for 2100 additional fliers and approximately 18,000 mechanics to man the equipment.

CONSOLIDATED EYES ARMY BIDS

Opening Of Estimates To Start Tomorrow

Sun 7-4-39

Aviation

Consolidated Aircraft Corp. officials this week will learn whether their bids on Army planes, to be opened in Wright Field, Dayton, O., beginning tomorrow, may net the concern large production orders for one or more types of war craft.

Estimates from manufacturers throughout the United States will be compared at Wright Field from tomorrow through Saturday on eight different kinds of planes.

TYPES KEPT SECRET

Although company officials have refused to reveal the specific types for which local bids have been submitted, it is believed that Consolidated will compete for contracts for twin-engined bombers to replace the now obsolete Douglas B-18, and for four-motored bombers, improvements over the Boeing "flying fortress."

Work has started at the local factory on a $2,880,000 contract for an experimental prototype and a small number of service test craft of the four-motored Army bombardment type. Also under way at the plant is a $4,700,000 order for six four-motored Navy patrol bombers.

BID SCHEDULE

The schedule of opening of bids at Wright Field follows:

July 5—Four-engined bombers, with estimates to be received on lots up to 250; twin-engined bombers, lots up to 700.

July 6—Advanced training planes, lots up to 500.

July 7—Primary training planes, lots up to 1000; basic training planes, lots up to 1000.

July 8—Multiplace fighter planes, lots up to 100; observation planes, lots up to 400; twin-engined pursuit planes, lots up to 200.

AMERICAN EXPORT'S CURRENT ACTIVITIES. American Export Airlines is "negotiating with U.S.aircraft manufacturers to produce non-stop trans-Atlantic luxury airliners which will carry a minimum of 40 passengers,and plans to inaugurate passenger service in addition to its mail and express service within the next 2½ years,the period required for development and construction of such aircraft," the company reveals in its latest house organ. The Consolidated PBY survey plane is now based at Floyd Bennett field. The Coast Guard,City of New York and other agencies are making possible use of ramp, hangar, machine shop, office and operations space. Communications systems,including Weather Bureau teletype,radio and telephones,are now in operation. A 24-hour weather observation bureau is operating at the company's base.

100,000-Mile Odyssey Of Airways Ends As Guba Returns To San Diego

S.D. SUN 7/6/39

By HAROLD KEEN

A 13-months' Odyssey over airways cleaved by propellors for the first time in aviation history ended in San Diego today.

The world's largest privately-owned plane, Richard Archbold's $250,000 "flying laboratory" Guba, landed in the bay at 5:15 a. m., completing in 11 hours the final leg of a journey that began here June 2, 1938, and took the crew more than 100,000 miles into tropical jungles, across three continents and three oceans.

The big airboat, which flew from New Orleans overnight, was manned by Russell Rogers, pilot; Capt. Lewis Yancey, navigator; Raymond Booth, radioman; and Gerald Brown and Stephen Barrinka, engineers. Mr. Archbold, a research associate of the American Museum of Natural History, remained in New York.

Only a short rest awaited the crew before it will take to the air again—in another Consolidated seaplane purchased by the English air ministry. According to present plans, the British plane will make a one-stop delivery flight to Felixstowe, England, leaving here either Saturday or Monday on a 3300-mile hop to Botswood, Newfoundland.

Pilot Rogers reported that the Guba made approximately 150 flights with personnel, supplies and equipment from the coastal camp of the museum expedition at Hollandia, Netherlands New Guinea, to the inland bases at Lake Habbema and the Eidenberg river—each a 225-mile round trip. .

The monotony of the expedition duty was relieved occasionally by a hop to Port Moresby, British New Guinea, or to Australia, according to Mr. Rogers. Two new engines were installed several months ago, and a total of 700 flight hours at an average of 150 miles per hour were flown in the past 13 months.

Details of rare finds in the New Guinea jungles were revealed on arrival of the Guba. These included:

A previously unknown species of small bird, with a bluish-black

TUESDAY MORNING, JULY 11, 1939

DINNER IN LONDON TOMORROW NIGHT THEIR GOAL

Union 7-11-39

. . . dinner in London tomorrow night is the goal of airmen who left yesterday morning in a Consolidated flying boat to be delivered to the British government.

Consair Vice President Returns From East

Union 7-11-39

Edgar Gott, Consolidated Aircraft Corp. vice president, who has been in Washington the last nine months, has returned to duty at the Lindbergh field plant. He will relieve Frank Learman of some of the public relations activities in connection with the aircraft factory.

Gott explained that so many factors enter into government contracts for military and navy aircraft it was difficult to predict when additional contracts will be awarded to Consolidated. The plant has a backlog exceeding $7,000,000 for army and navy bombers.

Union 7-11-39

Seaplane Wings Way to England

Dinner in London Tomorrow Planned

BULLETIN

"Everything fine," was the message flashed from the San Diego-built flying boat last night as it neared Chicago on a one-stop flight to England. Barney Boyd, local radio amateur, received the message.

Determined to keep a dinner appointment in a London hotel tomorrow evening despite a 24-hour delay here due to the automatic pilot's failing to function, Russell Rogers took less than 30 seconds to get a 15-ton Consolidated flying boat into the air at 8:23 a.m. yesterday on a one-stop flight to England.

Rogers spun the craft around as soon as the water of the bay had dripped from the air boat's hull. Heading eastward he began steering a course for Botwood, Newfoundland, 3300 miles distant, only stop he intends to make, barring mishap, between here and Felixtowe, England. At Felixstowe he will deliver the plane to the British royal flying corps.

The federal airways communication station reported to The Associated Press that the boat passed over Kansas City at 7:50 p.m. (Pacific Standard time). Rogers said he was flying the radio beacon to Chicago at 7000 feet and that the flight was progressing without incident.

The flight to Botwood, which Rogers hopes to complete within 22

(Continued on Page 2, Col. 7)

* * *

Seaplane Wings Way to England

(Continued From Page 1)

hours, is the longest sustained hop attempted by a seaplane over land and water. Landing in the Bay of Exploits, of which Botwood is the principal seaport, Rogers plans to refuel immediately and before noon today set off across the Atlantic.

The first attempt Sunday to fly to Botwood was cut short 10,000 feet over the Satlon sea when the automatic pilot failed. The plane returned to San Diego for repairs.

Flying with Rogers are Lewis A. Yancy, co-pilot and navigator; Ray Booth, radio operator, and Gerald Brown, flight engineer.

Barney Boyd, radio amateur is keeping in constant contact with the big plane on its flight from San Diego to England. Reports during the early part of the flight indicated that Rogers was carrying out his original flight plan of sailing along at a 12,000-foot altitude to take advantage of prevailing strong tail winds.

Last night's course was over the Great Lakes waterway and the St. Lawrence river to Montreal and Quebec.

Consair Wins $1910 Judgment

Union 7-12-39

★ ★ ★ ★ ★ ★

RULING HITS ENGINEER SENT TO RUSSIA

Consolidated Aircraft Corp., San Diego, won a $1910 judgment in its legal contest with Gilbert A. Henry, young plane engineer, over his failure to accept an assignment in Russia, The Associated Press reported yesterday from Los Angeles.

The corporation sought the amount as transportation expenses to Tagenrog, U.S.S.R., it advanced Henry. The latter asked $2747 for transportation home and loss of salary after his return to the United States.

He said living conditions in Moscow had convinced him his wife and 2-year-old son could not live in Russia for the two years demanded by his contract, and he accordingly turned back.

Superior Judge Thurmond Clarke found for the corporation after having taken the case under advisement earlier.

EADWINDS STAY OMBER'S FLIGHT

~~Union 7-12-39~~
SUN 7-10-39

Strong headwinds today interrupted a projected 3300-mile nonstop flight from San Diego to Botwood, Newfoundland, of a Consolidated patrol bomber being delivered to the British Royal Air Force.

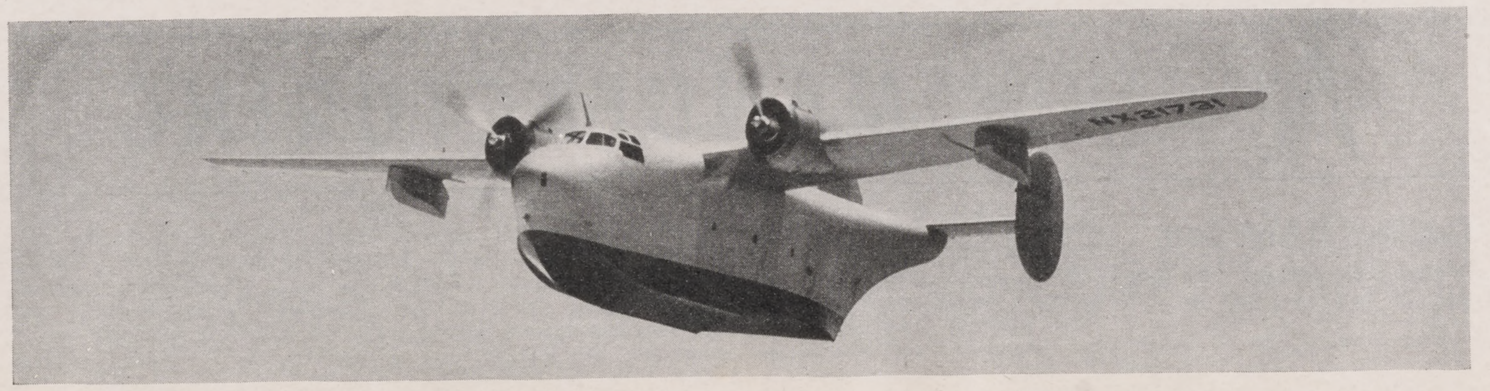
The 13-ton airboat, averaging less than 120 miles per hour as it fought the winds across the continent, was forced down in the harbor of Buffalo, N. Y., at 2:45 a. m. (PST), 18 hours, 22 minutes after taking off from San Diego.

Capt. Russell Rogers, chief pilot of the plane, reported he had enough gasoline left for 11 more hours of flying, but that the continued headwinds placed this amount below the safety factor in the 1100 miles still to go.

From the time the ship left here at 8:23 a. m. yesterday, the plane encountered unfavorable winds. Two hours out of San Diego, the bomber had progressed only 230 miles.

Captain Rogers told Buffalo airport officials he would attempt to take off at 7 a. m. (E. S. T.), tomorrow for Newfoundland.

AVIATION, JULY '39.



FIRST FLIGHT PICTURE: The new Consolidated 52-passenger, long-range flying boat shows off its paces above the factory at San Diego. Its two 2,000 hp. Wright Duplex-Cyclone engines give the 25-ton boat remarkable speed.

Flying Boats by Consolidated

Models and Plant Methods at San Diego

The growth of the Consolidated Aircraft Corporation's plant in San Diego, which has been commensurate with the natural expansion of the aircraft industry as a whole, has been recorded in earlier columns of this magazine. In the present article we include illustrative material not shown in earlier issues of Western Machinery and Steel World, and as a leading feature we introduce the corporation's newest product, Flying Boat "Model 31," here represented in flight over Southern California.

This craft exceeds in speed, range and load capacity the PBY type great twin-engined flying boats illustrated in our issue of July, 1938.

● Model 31 Flying Boat

The Model 31 flying boat is powered by two Wright Aeronautical Corporation 18 cylinder twin-row radial engines, each rated at 2,000 H.P. for takeoff. The propellers are three-blade Hamilton Standard Hydromatic, full feathering type. Approximate weight of the boat is 50,000 pounds. The crew consists of pilot, co-pilot, flight engineer, radio operator and navigator.

Approximate dimensions of the boat are: Wing span, 110 ft.; length overall, 73 ft.; height, 22 ft.; maximum wing chord, 14 ft. No armament is carried.

● General Description and Type of Construction:

The twin-engine flying boat is constructed of aluminum coated aluminum alloy skin internally reinforced with longitudinal stiffeners and transverse bulkheads and frames. The wings, tail surfaces and the planing surface of the hull bottom are flush riveted.

Wing: Full cantilever-integral fuel tanks in center section (following Consolidated standard practice); hydraulically operated Fowler Flaps extend from inboard side of aileron to hull. Outboard floats retract to underside of outer wing panel (wing tips too small to permit retraction at the tip as on PBY's). Ailerons and flaps are fabric-covered.

Tail Surfaces: Full cantilever stabilizer with twin fins and rudders. Rudders and elevators are fabric-covered.

Hull: Two full decks—one above the other—providing a large flight control compartment and eight additional large compartments.

Beaching Gear: Hydraulically operated retractable tricycle beaching gear. The nose wheel is housed in a well in the bottom of the hull and the side wheels swing upward into wells in the side of the hull. The side wheels are removable as well as retractable. The nose wheel well and side wheel wells are completely enclosed by doors for maximum efficiency in flight.

General Information: Unlike previous experimental flying boats which were constructed by the Consolidated Aircraft Corporation under Government contract, the Model 31 is the corporation's private venture. While the Navy Department was cognizant of the construction, the development has not been financed by the Government nor subjected to the ordinary procurement routine, which adds materially to the cost and time for construction. Only ten months were required for the design and construction of the airplane, whereas development of types of similar magnitude has required from two to three years heretofore.

The flight compartment has been completely sound-proofed and furnished with all latest type instruments and equipment.

As a military airplane, the Model 31 would augment the famous series of twin-engine patrol bombers built by Consolidated for the United States Navy. Although no performance figures may be released, the Model 31 greatly exceeds the PBY's in speed, range and load capacity.

● Features of the PBY Boats

Referring to the PBY, which is said to be the world's outstanding service patrol bomber flying boat, its consistent performance and reliability over long distances reflect the character of plant and personnel responsible for its design and construction. Several hundred boats of this type have already been built and delivered by the Consolidated factory, which represents one of the world's most modern and complete plants engaged in aircraft production. With the exception of the new Model 31 referred to above, the photographs reproduced in this article represent typical operations and plant activities in connection with production of the PBY boats.

These boats, when arranged for passenger transportation over relatively short distances, provide seating capacity for forty persons. When used for overnight flights, the arrangement is for 24 seats, convertible immediately into commodious berths for twelve. No sacrifice of military value occurs through incorporation of these features. For defense the PBY carries four machine guns. One of these is in the bow, one on each side of the deck just aft of the wing, and one tunnel gun is located in the hull bottom just forward of the tail. Bombs or torpedoes for offensive purposes are suspended from the wings just outboard of the engines.

The superior load carrying efficiency of this flying boat is attributed to, among other factors, the retractable wing-tip floats and the fuel tanks built integral with the wings. When in their retracted position, the floats create no drag and their buoyancy is sufficient to provide adequate stability on the water should a landing be inadvertently made with wings retracted. They can be raised or lowered in the water if such procedure becomes necessary.

The construction of the fuel tanks integral with the wing structure permits large fuel capacity at greatly reduced weight as compared with separately built tank construction. Moreover, this type of construction prevents all possibility of fuel fumes entering the living quarters. This enables the entire hull structure to be utilized for passengers and for crew and cargo.

The full speed of the PBY at 12,000 feet is stated as 194 miles per hour; the stalling speed is 60.8 miles per hour. The maximum range is 4,200 miles. The service ceiling is 29,200 feet. The climb to 15,000 feet is made in 13.4 minutes.

The plant behind the flying boats referred to is replete with modern and effective facilities of production and houses latest types of machine tools and appurtenances of all types peculiarly adapted to the exacting requirements of the aircraft industry. Many of these tools have already been illustrated in the pages of this magazine.

Unlike metal working plants as a rule, the problems of floor space for building of aircraft are found principally in the sub-assembly and final assembly departments. That is, considering an entire plant, the actual machining department is relatively small as compared with the great areas where bench work is carried on, sub-assemblies prepared and final assembly made.

Handling facilities of all kinds are important in preparation of these metal parts, and especially so for larger elements such as wing and other structures. Monorails, floor stands and trucks, lifting apparatus

S. D. Plane Delayed at Buffalo; Hops Tomorrow for Newfoundland

Consolidated's Model 28-5, being flown from San Diego to England, landed on the Buffalo river at 3:30 a.m. (Pacific time) today to refuel before continuing on to Felixstowe, Eng., via Botwood, N. F., The Associated Press reported from Buffalo, N. Y. The plane left San Diego at 8:23 a.m. yesterday on a projected one-stop flight to England, but adverse head winds necessitated its landing in the Buffalo river to refuel.

Decision to make a landing on the river was made by Russell Rogers, pilot, when strong winds increased the gasoline consumption and cut down the margin of safety. Originally, the schedule called for one refuel stop at Botwood.

Take-Off Early

After delayed refueling, Rogers decided to remain overnight at Buffalo. Consolidated officials were advised the take-off for Botwood would be at 4 a.m. (Pacific time) tomorrow. Only a small amount of fuel was taken on today, and the main refueling for the Atlantic flight will be made at Botwood, as originally planned.

Rogers told Consolidated officials Model 28-5 bucked a 30-mile headwind all the way, despite flying at varying altitudes in an effort to escape it. The pilot reported "everything fine" with the plane.

The landing demonstrated the

Tribune 7-11-39

CONTINUED FROM PAGE ONE

ability of Consolidated flying boats to make emergency stops on transcontinental flights. The planes are equipped only for water landings, but before taking off Rogers said no apprehension was felt on a flight across the continent because of the numerous rivers and lakes. Rogers piloted Richard Archbold's Consolidated plane Guba on the recent New Guinea expedition, where many landings were made on rivers and lakes of the island.

The flight from San Diego to Buffalo was without incident, according to reports yesterday and last night. Forced to put back to San Diego Sunday when the craft's automatic pilot became disabled over Salton Sea, Rogers made a quick take-off yesterday morning, and five hours after leaving San Diego passed south of Albuquerque.

The plane was over Kansas City at 7:50 p.m. (Pacific time), when Rogers reported he was flying the radio beacon to Chicago at 7000 feet. Radio communication with the plane is being maintained by Barney Boyd, local radio amateur.

With Rogers in the craft are Lewis A. Yancey, co-pilot and navigator; Ray Booth, radio operator, and Gerald Brown, flight engineer.

Upon landing at Buffalo, where the Consolidated plant was located before it was transferred to San Diego a few years ago, Rogers said he "figured we had enough fuel to reach Botwood if conditions were favorable, but we didn't want to take any chances on fog as we neared the coast." The twin-motored craft had traversed approximately 2400 miles when it came down in Buffalo harbor, near the municipal marine airport. Rogers said the stop made impossible realization of his hope to keep a dinner engagement in London tomorrow night.

Flying Boat Turns Back After Start for England

San Diego, Cal., July 9 (AP)—A big flying boat's first attempt at a one-stop flight to England was cut short today when it was forced to turn back for San Diego an hour after its take-off.

Crew members said the gyroscopic pilot of the two-engine plane failed to function.

It returned to the harbor at 9.17 a. m. (PST).

The ship is a commercial development of the U. S. navy patrol bombers manufactured for the British air ministry by the Consolidated Aircraft Corporation and is known as the model 28-5 flying boat.

The plan of flight to England calls for only one stop on this continent—at Botwood, Bay of Exploits, Newfoundland. The route then is the great circle course over the North Atlantic, across the center of Ireland and the Irish Channel, thence to Felixstowe, Ispwich, England.

Buffalo ?

FLYING BOAT ON LONG HOP

Buffalo.

Consolidated craft on one-stop England flight

San Diego, Cal., July 10 (AP)—In less than 30 seconds today, Pilot Russell Rogers lifted a fifteen-ton flying boat off San Diego Harbor waters and headed across the continent on a projected one-stop flight to Felixstowe, England.

Rogers was determined to keep a dinner engagement Wednesday at a London Hotel, (Claridge's) despite a 24-hour delay in getting away from California.

The only scheduled stop for the huge Consolidated model 28-5 craft, built for the British air ministry, was Botwood, Bay of Exploits, Newfoundland, 3,300 miles from San Diego.

Rogers and his three crewmen hoped to reach Botwood in 22 hours. The takeoff was at 8.23 a. m. (11.23 a. m. EST).

At 4 p. m. (PST) the ship radioed it had passed over Dalhart, in the Texas Panhandle, en route toward Wichita, Kan.

Cruising speed of the twin-engined 28-5 is 115 miles an hour.

Rogers planned to refuel at the Bay of Exploits and set off before noon tomorrow across the Atlantic. His Felixstowe destination is 2,450 statute miles from Botwood.

Servicing OUR FLYING FLEETS

Good maintenance is the essence of safe operation on the long over-water flights that are routine for Naval air missions. The author is now in charge of aircraft maintenance in the Bureau of Aeronautics.

By Commander Felix B. Stump, U. S. N.

Head of the Maintenance Division Bureau of Aeronautics

The maintenance of naval aircraft has undergone very rapid changes in a comparatively short time. The transition from wood to metal came about almost over night, and a generation of skilled woodworkers passed from the scene or shifted into the metals trades. There is a serious shortage even today of skilled personnel in the art of forming and fastening metals. From a maintenance standpoint, there are many advantages to wood and fabric and wire construction, and it has been said that minor repairs to the older types could be effected with hardly more than a needle and thread and a piece of cigar box. Modern aircraft require a can opener in many instances even for inspections.

The power of the fleet depends upon the efficiency of its bases, upon its shore facilities, without which it cannot operate. Our fleet, however, to a greater extent than that of any other great nation, must be sufficiently self-sustaining to operate for months far away from its essential shore establishments. And naval aviation, a vital part of the fleet, must maintain its efficiency far away from its bases by the efforts of its combat squadron personnel, officers and enlisted men, to a greater extent that any other air force.

In order to provide such trained personnel, our overhaul shops are manned by $\frac{1}{3}$ enlisted men and $\frac{2}{3}$ civilians in continental United States, with a greater proportion of sailors at outlying bases in the Canal Zone and Hawaii. The backbone of squadron maintenance consists of the officers and enlisted men who have had their tour of duty in overhaul shops ashore. There they have learned to be expert engine mechanics, metal workers, instrument and ordnance men. They must constantly perform work within the facilities of their own squadrons, which, in other air forces, would be done at the repair bases.

Aviation in all its phases is progressing so rapidly that it is impossible to visit a well managed aviation repair base, army, navy, or commercial, without finding some equipment (often built locally), some process or procedure, some method of inspection or test, or some shop arrangement different from and superior to all others. Recognizing this, with great benefits in economy, efficiency and quality and with the cooperation of the army and the airlines, the navy endeavors each year to have one or more of the leading personnel of each of our overhaul bases make a tour, generally in a group, of the larger army, navy and commercial overhaul bases in continental United States. At the completion of the tour, the personnel making it assemble in the Navy Department for two or three days for a general discussion and interchange of notes and ideas, in which various specialists and maintenance personnel on duty in the Bureau of Aeronautics participate. A complete report of the tour and discussions is then mailed to all units which would be benefited therefrom.

Naval aircraft will be found from the Mediterranean Sea to the China Coast and from Panama to Alaska. Spare parts must be duplicated when not too costly or arrangements must be provided for quick distribution from a central agency. The multitude of articles necessary for the maintenance of fleet aircraft is magnified by the divergency of types as well as the geographical separation of the points where the material is required.

Storage problems for perishable material are acute in the tropics and the available space aboard the aircraft carriers and other surface craft is a matter of serious moment.

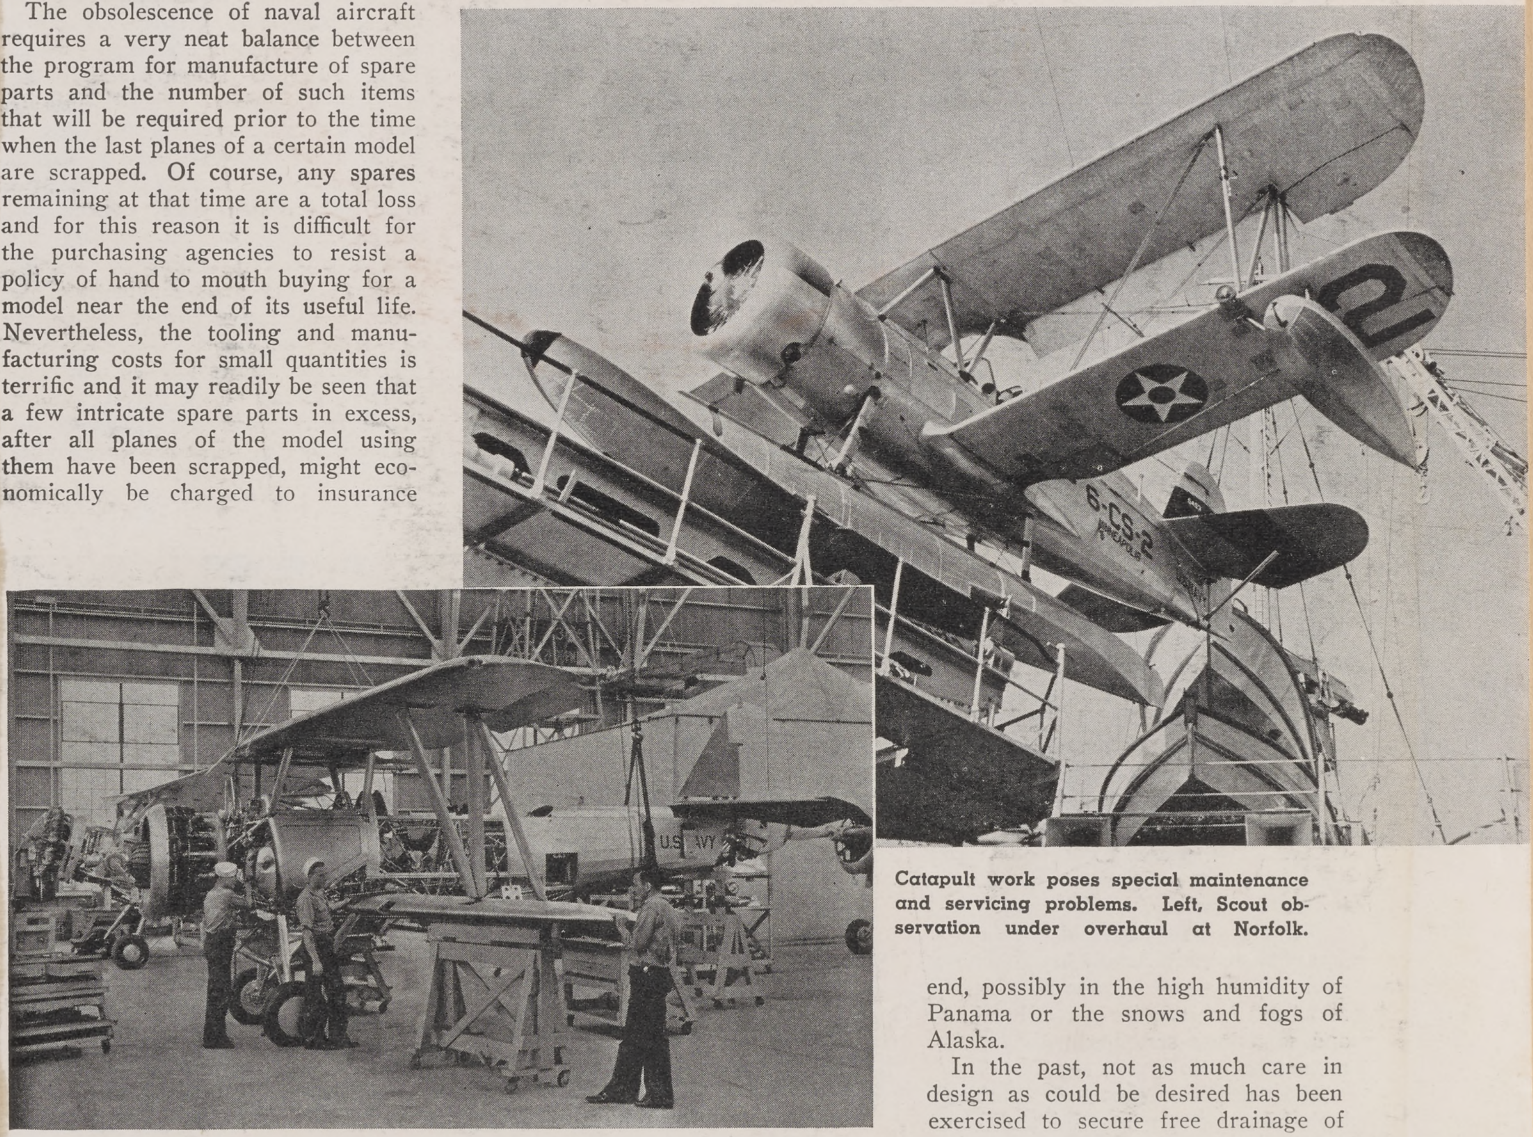
The obsolescence of naval aircraft requires a very neat balance between the program for manufacture of spare parts and the number of such items that will be required prior to the time when the last planes of a certain model are scrapped. Of course, any spares remaining at that time are a total loss and for this reason it is difficult for the purchasing agencies to resist a policy of hand to mouth buying for a model near the end of its useful life. Nevertheless, the tooling and manufacturing costs for small quantities is terrific and it may readily be seen that a few intricate spare parts in excess, after all planes of the model using them have been scrapped, might economically be charged to insurance against the possibility of manufacturing in small quantity at tremendous money cost and equally costly delay.

Standardization is of extreme importance in maintenance, primarily in insuring interchangeability between various parts on various types of airplanes at different maintenance bases. Army-Navy standardization in the past has been accomplished by agreements between the Army Air Corps and the Bureau of Aeronautics. This standardization involved primarily the establishment of records of technical agreements. Such agreements were not promulgated as such for procurement purposes. Under the Aeronautical Board there has been established recently a committee composed of representatives of the Chief of the Bureau of Aeronautics and the Chief of the Army Air Corps charged with coordinating the requirements of the two services to the extent that single joint documents will be issued and promulgated as such for procurement purposes by both services. This system is now in effect and doubtless will have a direct and beneficial bearing on maintenance. Incidentally, Army-Navy standardization is not only considered in terms of the needs of the Army and the Navy but consideration is given, prior to the adoption of these standards, to making them adaptable to commercial aeronautics as well.

Corrosion

A problem particular to the Navy, or possibly to the very few commercial lines which operate over salt water, is that of corrosion. Carrier planes on deck, and the cruiser and battleship planes, perched on their catapults are subjected to salt air, spray, funnel smoke, and sun and rain for months at a time. Flying boats may be anchored out in the water for weeks on end, possibly in the high humidity of Panama or the snows and fogs of Alaska.

In the past, not as much care in design as could be desired has been exercised to secure free drainage of



Catapult work poses special maintenance and servicing problems. Left, Scout observation under overhaul at Norfolk.

NOTE—The opinions or assertions contained in this article are the private ones of the writer and are not to be construed as official or reflecting the views of the Navy Department or the Naval Service at large.

Consolidated craft on one-stop England flight

San Diego, Cal., July 10 (AP)—In less than 30 seconds today, Pilot Russell Rogers lifted a fifteen-ton flying boat off San Diego Harbor waters and headed across the continent on a projected one-stop flight to Felixstowe, England.

Rogers was determined to keep a dinner engagement Wednesday at a London Hotel, (Claridge's) despite a 24-hour delay in getting away from California.

The only scheduled stop for the huge Consolidated model 28-5 craft, built for the British air ministry, was Botwood, Bay of Exploits, Newfoundland, 3,300 miles from San Diego.

Rogers and his three crewmen hoped to reach Botwood in 22 hours. The takeoff was at 8.23 a. m. (11.23 a. m. EST).

At 4 p. m. (PST) the ship radioed it had passed over Dalhart, in the Texas Panhandle, en route toward Wichita, Kan.

Cruising speed of the twin-engined 28-5 is 115 miles an hour.

Rogers planned to refuel at the Bay of Exploits and set off before noon tomorrow across the Atlantic. His Felixstowe destination is 2,450 statute miles from Botwood.

structures. This condition is improving, but, not only in manufacturing, but also in overhaul every possible step should be taken to insure that water or moisture which gains access to the interior of a structure is afforded free drainage so that it may not remain and induce corrosion.

Upon removal from salt water, a seaplane should be washed immediately with fresh water to remove all traces of silt. A light film of oil should be applied to the unpainted parts.

In the same way, design has not always provided for the separation of dissimilar metals and many of the defects found during overhaul can be laid to such errors. Frequently care must be exercised to remedy such mistakes so that corrosion will not develop prior to subsequent overhauls. When dissimilar metals must be used because of structural conditions, they must be insulated from each other in order to forestall electrolytic action and consequent corrosion.

The greatest care in following approved specifications for the heat treating of aluminum alloys is important for strength considerations but is even more vital as a means of resisting corrosion. As an example, properly heat treated aluminum alloy 24ST has been in use in some of the later, larger patrol seaplanes for over a year's service under the most adverse conditions of contact with salt water and spray, with practically no corrosion—a surprisingly gratifying performance.

Barnacles

The growth of barnacles on the underwater surfaces of large seaplanes in the tropics constitutes a serious problem where facilities for readily removing the aircraft from the water are limited. Within a few days the growth of barnacles can become sufficient to prevent take-off without a great reduction in the normal load. Barnacles, some as large as $\frac{3}{8}$ in. in diameter, have completely covered the bottoms of airplanes moored ten days in unclean tropical water. The growth of barnacles occurs to a less, although still serious, degree in clean tropical water. The presence of both river silt and sewage appears favorable to barnacle growth.

Barnacles four days old can be removed with a stiff bristly brush. Those over ten days old become very firmly attached and require wire brushing and sometimes scraping with an aluminum scraper.

The barnacles penetrate through both bituminous paint and aluminum lacquer and attach themselves to the zinc chromate primer underneath. When bituminous paint was covered with "Par-al-ke-tone" there were fewer barnacles but the main advantage of the "Par-al-ke-tone" seemed to be that the barnacles formed were easier to remove.

The following coatings over the basic zinc chromate primer are listed in order of merit for the resistance to the formation of barnacles: "Silosyn," aluminum lacquer, black enamel mixed with bituminous paint, and bituminous paint. Of these, "Silosyn", an acrylate resin base product, gave by far the best results. It was the only one of the group which the barnacles did not penetrate and the amount formed was the least of the lot. Two coats can be sprayed on a large twin-engined seaplane hull in forty-five minutes.

The search for improved protective coatings in an effort to reduce maintenance difficulties has always been assigned high priority by the Bureau of Aeronautics and many developments initiated by the Navy have been passed on to commercial aviation. In particular, the magnesium anodic treatment, zinc chromate primer and a number of synthetic lacquers stand out as important contributions in recent years. The aluminum metal spray has been found very effective in preventing corrosion of steel as well as of aluminum alloy parts, and our standard overhaul practice makes use of this means of protecting engine cylinders in all cruiser and battleship based seaplanes where cleaning of the cylinders after they have been subjected to salt spray is difficult.

Engines

Three recent improvements in engine construction are resulting in more flight time between overhaul and upkeep periods.

The first improvement is the adoption of automatic valve gear lubrication. This has made possible the extension of the operating time between checks and readjustments of valve clearances from thirty hours to one hundred and twenty hours. Indications are that an even longer period may be adopted. Automatic valve gear lubrication reduces wear of the parts of the valve mechanism, particularly the exhaust valve stems and guides. It is no longer necessary to replace these parts on nearly every major overhaul, which was formerly necessary.

The second recent improvement is the adoption of nitriding as a means of hardening cylinder barrels. Service experience to date indicates that nitrided cylinders may last as long as the engine, thus eliminating regrinding, and, therefore, the need for much expensive equipment and skilled work. Thus, it may no longer be necessary to carry a stock of oversize pistons and rings or to rebarrel cylinders.

The third improvement in engine construction is the adoption of prefitted, lead coated silver master rod bearings, which can be installed immediately during overhaul without boring to size, thus eliminating the need for expensive boring equipment and skilled personnel to operate it.

Experience shows that corrosion of engine cylinders will start within twenty-four hours after stopping an engine which has been run on gasoline doped with ethyl fluid. Such corrosion is negligible in the case of engines being run continually as on the airlines. However, when an engine is to be placed in an inoperative status it is necessary to supply it with fresh oil and run it on clear, unleaded gasoline for one hour to remove all traces of ethyl fluid from the cylinders and from the other parts of the engine.

Ignition cable deteriorates rapidly and for that reason overhauled engines do not have ignition cable installed until just before they are to be placed in service. It has been found beneficial to purchase ignition wire in sealed cases and not to open the containers until the wire is actually needed.

One of the most useful items in a modern engine overhaul shop, and in other shops as well, is magnaflux equipment for conducting magnetic analyses of steel parts. By means of it, many small cracks are found which would eventually lead to major failures and would be undetected otherwise.

The duration of the post overhaul test of engines is a source of concern to overhaul activities. A long test is expensive in fuel and labor costs and ties up facilities to too great an extent. A test which is too short will not wear the engine enough to insure reliable performance. The principal concern is to have a sufficient running-in period to seat piston rings properly. Post overhaul engine running may be reduced by lapping the piston rings in their respective cylinders and by using rings having a slight taper on the face, resulting in high unit pressure on the edge, which will cause them to seat quickly. Apparently, with the use of tapered rings a running-in period of four or five hours' duration should be sufficient to insure proper engine performance.

Instruments

It has been found impossible to hire trained instrument men, thus necessitating training of both civilian and enlisted personnel at the navy overhaul bases. It has been found that marked deterioration of instruments will occur in storage due to lubricant evaporation and gasket shrinkage. Therefore, it is often necessary to overhaul instruments that have never been used. Overhauled instruments are often more accurate than new ones, possibly because one man does the whole job. There is an urgent need for an instrument lubricant which will operate satisfactorily throughout the range of —40 deg. F. to +190 deg. F.

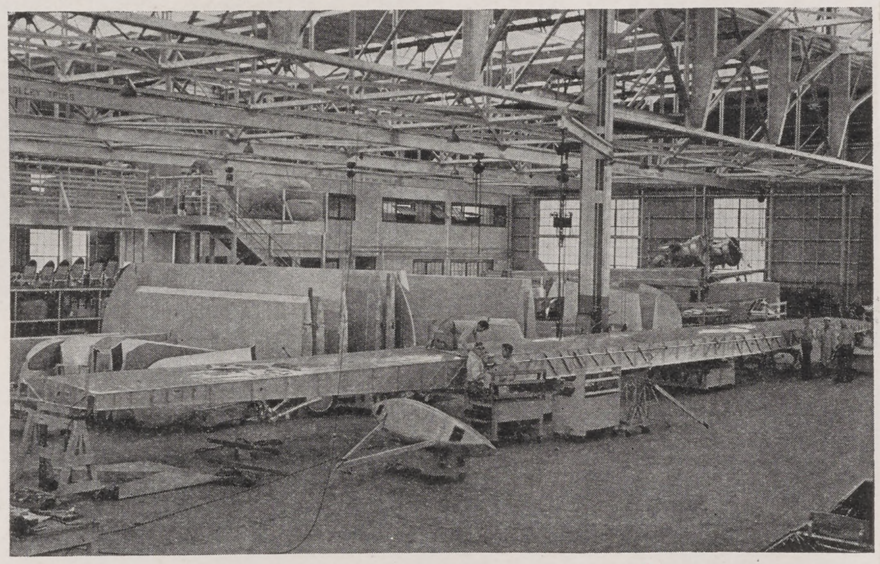
Maintenance and Research

Because of constant advancement in the art of aeronautics, it is many times not possible to obtain, on the first production order, airplanes one hundred per cent satisfactory in all details of design. Although Navy airplanes are subjected to a series of rigid and thorough tests prior to acceptance, experience has repeatedly shown that actual service operations usually bring to light the need for additional refinements. The need for such design changes obviously creates annoying maintenance problems. The discovery of the need for these changes calls for competent maintenance personnel. Further, the solution to the problems in many cases calls for extended research with the result that to a great extent maintenance and research are closely interrelated. For example, the need for a fire resisting doping system became very acute in the wake of several fires originating from sparks from ships funnels falling on airplanes while stowed on the decks of cruisers or battleships. These fires have been greatly minimized recently by the adoption of a fire resistant doping system for the upper surfaces of fabric wings of airplanes assigned to vessels of these types.

Carrier operations have also indicated the advisability of utilizing brakes which possess equal braking power in both directions. Such brakes have been developed and are now standard equipment on currently procured Navy airplanes.

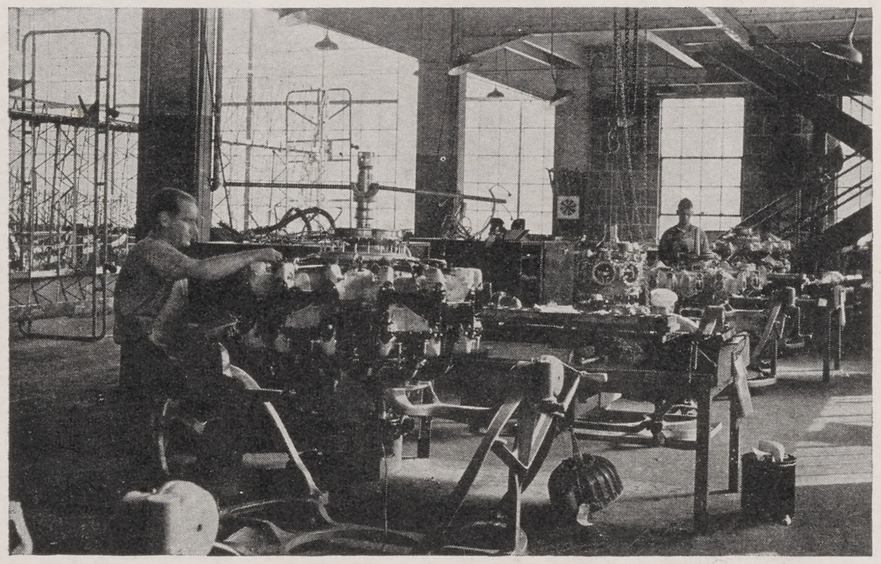
The Navy has been one of the pioneers in the adoption of integral fuel tanks for flying boats. After airplanes in which such tanks were incorporated had been in service a short while, it was determined that a radical change in the conventional tank maintenance procedure must be effected to insure satisfactory service from them. It was found that the seam compound in these tanks was especially troublesome if not properly cared for in service and that they would leak if they were completely drained and allowed to stand empty for any length of time, due to the evaporation of the volatiles in the material. This was corrected by keeping the tanks filled with gasoline even when they were not installed in the airplanes as the action of the gasoline had a tendency to swell the seam material and prevent shrinkage of the material.

Corrosion of such tanks was also discovered early in their life. Although it appeared serious at first, the trouble has been practically eliminated by observing certain precautions in the handling of the fuel to insure that only clean, water-free fuel is pumped into them. The interior seams of integral tanks not in use are coated with a preservative to prevent shrinkage of the seam filler. The overhaul of integral tanks which did corrode called for considerable ingenuity on the part of maintenance personnel and in working out the solution an effective scheme for cleaning and anodically treating such tanks in place was developed. By following these and other precautions, it has been the Navy's experience that integral fuel tanks are highly satisfactory as used in its flying boat equipment.



Annual overhauls involve complete stripping of wings of huge patrol boats

PBY



Navy's excellent safety record is built around exacting care of engines and accessories.

NEW MONIKERS FOR PBY UNITS

All Groups Effected By New Numbering

Union 7-12-39

Aviation

Sun - 7-11-39

The familiar designations by which the Navy's patrol squadron of giant airboats have been known in recent years have been abandoned, it was learned today.

San Diego's three 12-plane units of Consolidated PBY flying boats—Patrol Squadrons 7, 9 and 18—in the future will be referred to as Patrol Squadrons 11, 12 and 13 in a new system of identifying aircraft.

PATROL WING ONE

All squadrons of San Diego's Patrol Wing 1, will be designated by the numeral "one" followed by a digit indicating their seniority. Thus, should another bomber squadron be commissioned in this wing, it will be known as Patrol Squadron 14.

The five patrol units in Hawaii's Patrol Wing 2, formerly given the scattered designations—Patrol Squadron 1, 4, 6, 8 and 10—have been renamed Squadrons 21, 22, 23, 24 and 25. In the same manner, the numeral "three" will be used for Patrol Wing 3, at Coco Solo, Canal Zone—Squadrons 31, 32 and 33. Patrol Wing 4 at Seattle, which consisted of VP-16, VP-17, VP-19, VP-20 and VP-21, now comprises Squadrons 41, 42, 43, 44 and 45. Norfolk's Patrol Wing 5 has been expanded from two squadrons—VP-14 and VP-15—to four units, Squadrons 51, 52, 53 and 54.

LAND PLANES TOO

The same method is used in identifying land planes based on aircraft carriers. For instance, the Lexington's four squadrons have the "number two" designation—Bombing Squadron 2, Fighting Squadron 2, etc. The Saratoga's planes are the "number 3" group, the Ranger's "number 4," the Yorktown's "number 5," and the Enterprise's "number 6."

No more delivery flights of Consolidated planes from San Diego to Pearl Harbor or the Canal Zone are planned in the near future, it was reported at North Island today.

AN DIEGO UNION: WEDNE

Head Winds Halt S. D. Flying Boat At Buffalo

Union 7-12-39

Beset by strong head winds that cut down his flying speed and reduced the gasoline supply beyond the safety point, the Consolidated plane piloted by Russell Rogers, which left San Diego at 8:23 a.m. Monday bound for England via Botwood, Newfoundland, landed at Buffalo at 3:30 a.m. (Pacific time), yesterday, The Associated Press reported.

Rogers said he would remain at Buffalo overnight before continuing the flight to Botwood and Felixstowe, England, today. The 15-ton plane had flown 2400 of the 3300 miles on a projected nonstop flight from San Diego to Botwood when it landed.

SECOND DELAY

It marked the second time that Rogers attempted to keep a dinner engagement in a swank London hotel scheduled for tonight. Sunday morning he took off for England only to meet with disapopintment when the failure of the automatic pilot forced him to return here after being aloft less than three hours. He announced at Buffalo the dinner, as far as he was concerned, was off.

The plane is to be delivered to the British Royal flying corps at Felixstowe.

ROUTE SAFETY PROVED

The landing proved the ability of the San Diego-built flying boats to make emergency stops on transcontinental flights. The planes are equipped only for water landings, but before taking off Rogers said no apprehension was felt on a flight across the continent because of the numerous rivers and lakes.

Rogers piloted Richard Archbold's plane Guba on the recent New Guinea expedition, where many landings were made on rivers and lakes of the island.

AIRCRAFT, May 1, 1939. Page Twenty.

Indian Ocean Survey

Capt. P. G. Taylor (right), who has been appointed by the Commonwealth Government to take charge of the Indian Ocean flight survey, with J. Percival, Junr., a member of the expedition, and official newspaper correspondent in charge of special organisation.

NEGOTIATIONS for the charter of Mr Richard Archbold's Consolidated P.B.Y. flying boat, the *Guba*, for a flight survey of the Indian Ocean from the west coast of Australia to the east coast of Africa, by way of the Cocos Islands, the Chagos Archipelago and the Seychelles Islands, commenced last year, when the aircraft was flown from Port Moresby to Sydney and Melbourne for instrument and general overhaul.

Before the *Guba* crossed the Pacific from the United States to Dutch New Guinea to ferry scientific personnel, soldiers, labor and supplies from Hollandia to an inland lake, 11,000 feet above sea level, Captain P. G. Taylor had made a special journey to England and the United States in an effort to secure, preferably, a British craft with sufficient range to fly the distances between the island bases. When this was found to be impossible he tried to secure an American craft.

Sufficient capital, however, was not forthcoming from private sources to purchase a twin-engined flying boat, and there was, in addition, the necessity to lay down fuel dumps and other supplies at the various stopping places.

A proposal, however, was put before the late Prime Minister, Mr Lyons, which included the purchase or charter of, preferably a British flying boat, or, failing this, an American aircraft.

Messrs Short Bros., however, were so busy in supplying craft to Imperial Airways Ltd. and its subsidiary-companies, and Imperial Airways Ltd. and Qantas, in turn, were fully occupied in inaugurating the flying boat scheme; so it was apparent that a British flying boat could not be obtained.

After an interview in Melbourne with Captain Yancey and Mr Russell Rogers, Mr Archbold's navigator and first pilot, it was decided by Captain Taylor that a concrete proposal could be placed before the Government for the charter of the *Guba*. This proposal was prepared, and it included, on one side, revenues obtainable from a special air mail, sale of newspaper, broadcasting, film and other rights, and, on the other side, a small deficit which the Government was asked to guarantee, although it is expected that this deficit will be covered by private enterprise.

The proposal was sponsored by the Federal Treasurer, Major R. G. Casey, and after it was submitted and approved by Cabinet, Captain Taylor was authorised to negotiate with Mr Archbold.

Captain Yancey flew to Sydney from Papua in a W. R. Carpenter 86B, and a contract was drawn up which was signed on behalf of the Federal Government by Mr Thorby, and by Captain Yancey, Mr Archbold's fully accredited representative. Thus ended five years' dogged, and, at times, heart-breaking efforts by Captain P. G. Taylor to secure suitable equipment to make a survey of what has become known on maps of the world air routes as "The Reserve Empire Air Mail Route."

Mr Richard Archbold (left), owner of the Guba, and Messrs. R. Rogers and L. Yancey (right) respectively. Archbold Expedition's chief pilot and navigator.

Vulnerability of Empire Route

FREQUENTLY Captain Taylor has pointed out the vulnerability of the present air mail route to Australia, which is dependent on clear air corridors along the Mediterranean and through the East. During the crisis last December the flying boat service was interrupted when there was a threat of hostilities, and some of the craft did not proceed further towards Australia than France until the international atmosphere was cleared.

In the event of war involving the Mediterranean and the near East, Captain Taylor pointed out, flying boats could proceed to Australia by way of the west coast of Africa and the Indian Ocean. Nature has divided the Indian Ocean into flying distances within the range of modern commercial aircraft.

The total flying distance across the Indian Ocean by the route to be surveyed is approximately 4,674 nautical miles, but this distance, of course, is dependent upon the site of the base which will be selected by Captain Taylor on the west coast of Australia. At this stage it cannot definitely be stated from where the survey flight will be started.

The distances between the Indian Ocean air bases are as follows:— The Cocos Islands to Diego Garcia, 1172 nautical miles; Diego Garcia to the Seychelles, 1022 nautical miles; and the Seychelles to Mombasa (Kenya) 950 nautical miles. The distance from the west coast of Australia to the Cocos cannot be given until it is definitely decided which will be the jumping off position.

During the flight across the Indian Ocean the *Guba* will stay at each of the islands for a week, when Captain Taylor, assisted by Mr J. Percival, will make a survey to determine the most suitable flying boat bases and the suitability of the islands for the establishment of landplane aerodromes.

Mr Archbold, who is a research associate of the American Museum of Natural History, in addition to being a pilot of skill, will pursue scientific studies at each of the islands which have not yet been visited by an expert biologist.

The flight is scheduled to commence at a date to be decided upon between the Commonwealth Government, Captain Taylor and Captain Yancey—any time between June 10 and August 1.

The *Guba* will be flown from Port Moresby to the Rose Bay flying boat base on about May 20, when it will

(*Continued on page* 52)

INDIAN OCEAN SURVEY—

(*Continued from page* 20)

be hauled up the slipway and thoroughly inspected. Before flying south two new Pratt & Whitney engines will be slung into the bearers, and they will be gently worked in while the flying boat ferries the expedition's personnel, wireless equipment and other appurtenances from the inland lake to the coast.

The laying down of 2500 gallons of 87 octane fuel at each of the islands has been commenced by the Vacuum Oil Co., and the petrol, oil and other supplies will be shipped from Capetown, Singapore and Fremantle.

The crew for the flight will be Mr Richard Archbold, owner of the *Guba;* Captain P. G. Taylor, in charge of the flight survey for the Commonwealth Government; Captain L. A. Yancey, navigator; Mr R. Rogers, first pilot; Mr J. Percival, the Commonwealth Government's second representative, who will also act as official newspaper correspondent and be in charge of special organisation; Mr R. Booth, radio operator; and Messrs. G. Brown and S. Berrinka, mechanics.

Received 7-12-39.

Metalen vliegtuigen

DOOR J. STEYNIS.

De laatste jaren treden in den ontwikkelingsgang van den vliegtuigbouw twee grondslagen sterk op den voorgrond, eerstens de ver doorgevoerde gunstige aerodynamische vormgeving (zie fig. 1) welke langzamerhand algemeen toepassing vindt bij alle moderne, meermotorige landvliegtuigen en tweedens de geheel gewijzigde inzichten betreffende de constructie van romp en vleugels. De gemengde bouwwijze — hout, staal en aluminium — heeft bij alle moderne groote vliegtuigen het veld moeten ruimen voor de uitsluitende metaalconstructie, waardoor een nieuw tijdperk in den vliegtuigbouw is ingetreden. De jaren, waarin de ontwikkeling van het vliegtuig zoo snel ging, dat zelfs gedurende den bouw van één enkel vliegtuig, dikwijls in de plannen ingrijpende wijzigingen noodzakelijk worden, liggen daarmede achter ons. Bij den tegenwoordigen stand van zaken, nu alle krachten, welke onder normale omstandigheden op het vliegtuig kunnen werken, van te voren nauwkeurig berekend kunnen worden en een juist inzicht in de verschillende aerodynamische problemen is verkregen, is een zekere mate van standaardiseering mogelijk geworden. De practijk leert echter dat slechts geheel metalen vliegtuigen voor massafabrikatie in aanmerking komen. Nog andere problemen drongen de fabrikanten van groote vliegtuigen op den weg naar het geheel metalen vliegtuig. Slechts enkele houtsoorten, welke dan nog zorgvuldig moeten worden gesorteerd, zijn geschikt voor den vliegtuigbouw. Hierdoor beschikt men slechts over stukken van beperkte afmetingen, welke dan bij den bouw van groote vliegtuigen aan elkander moeten worden gevoegd, wat de constructie zwaar en duur maakt.

Metaal daarentegen laat zich vrijwel in elke gewenschte afmeting fabriceeren, de sterkte is nauwkeurig bekend en ondervindt geen nadeelige invloeden van vochtigheid en temperatuur, zooals het hout.

Om dezelfde reden, waarom groote bruggen lichter kunnen worden gemaakt van ijzer dan van hout, is ook het groote vliegtuig uit metaal aanzienlijk lichter dan die uit hout. Zooals bekend mag worden verondersteld, is het van het grootste belang, het eigengewicht van het vliegtuig zoo laag mogelijk te houden. Elke besparing van gewicht aan het vliegtuig zelf, beteekent een vermeerdering van de nuttige last, welke het vliegtuig kan meevoeren.

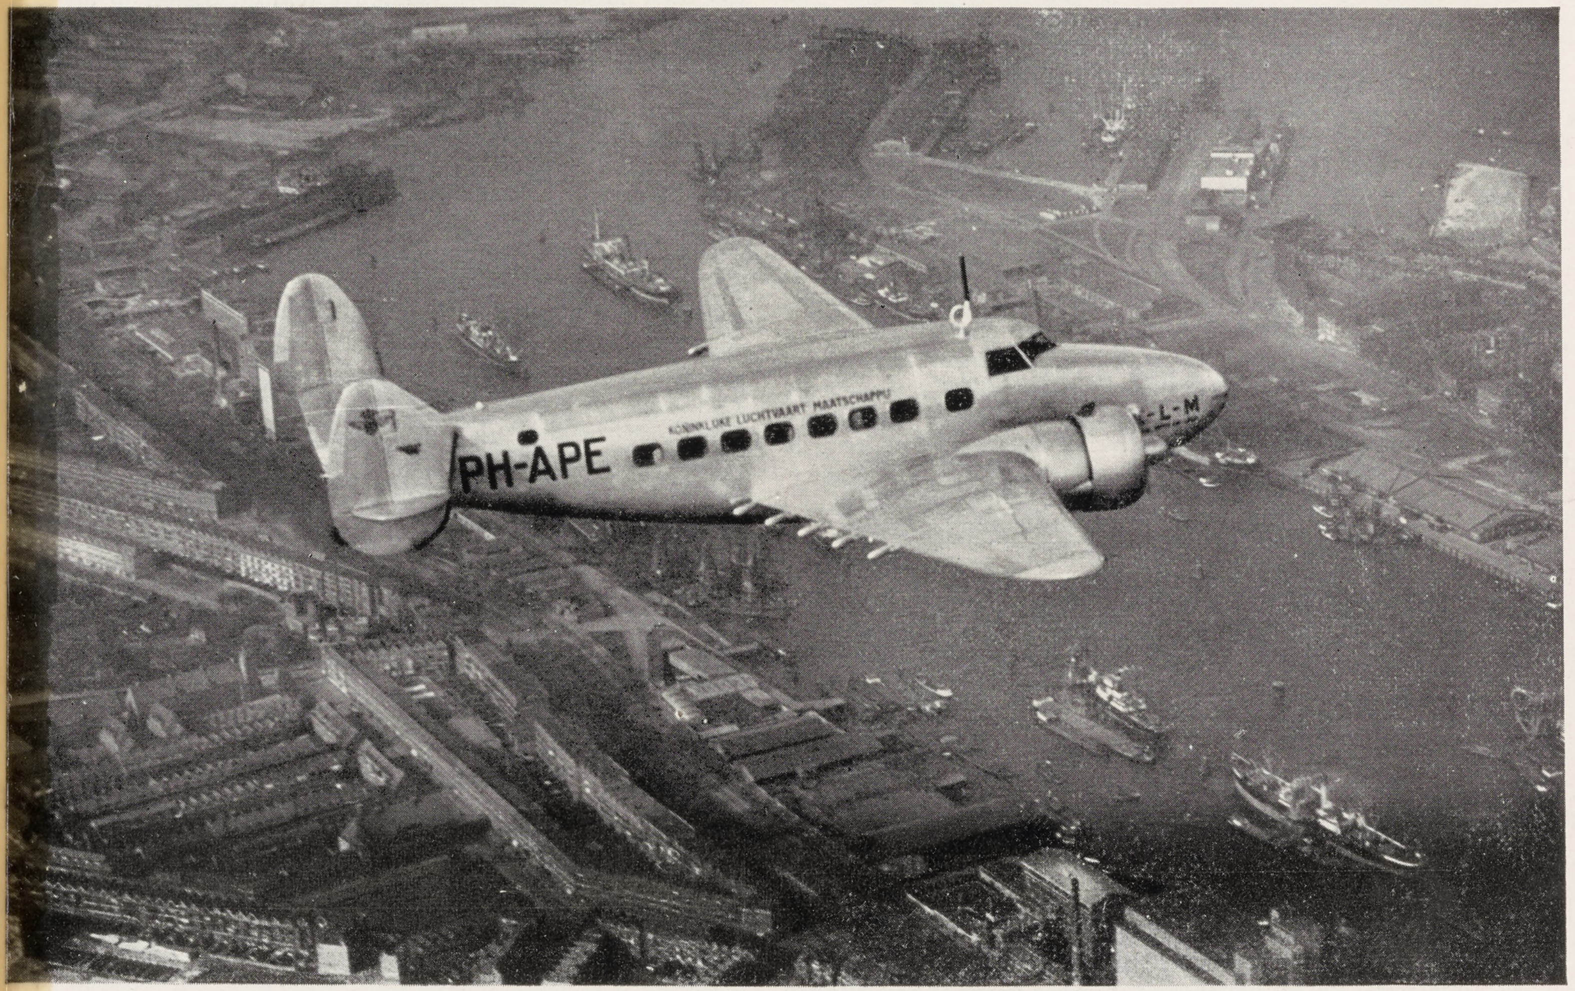


Fig. 1: de „Ekster", een Lockheed „14" zooals de K.N.I.L.M. die op de Australië-lijn gebruikt.

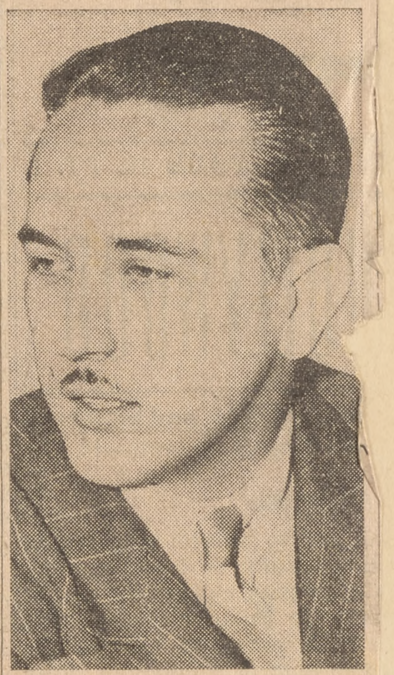
★ L.A. Times July 12-39 JULY 1

Aircraft Company Awarded Judgment From Engineer

Expert Who Refused to Stay in Russia Must Repay Expenses



LOSES SUIT — Gilbert A. Henry, sued by company.

Judgment of $1910.55 in favor of Consolidated Aircraft Corp. of San Diego was returned by Superior Judge Thurmond Clarke yesterday against Gilbert A. Henry, young airplane engineer, in a lawsuit arising from Henry's refusal to work in Soviet Russia.

The corporation brought the action on the ground that it was entitled to recover transportation expenses advanced Henry on sending him to Tagenrog, U.S.S.R., to work at building airplanes for the Soviet government under a contract.

STAYS ONLY WEEK

Henry, the concern complained, reached Moscow, remained there a week, and then turned back without even seeing the plant at Tagenrog.

In a cross-complaint for $2747.23, Henry contended that the corporation had misrepresented living conditions in Russia in sending him there. He argued that life in Moscow had been enough to convince him that sanitary conditions were not adequate and he could not send for his wife and 2-year-old son, who would have been forced to remain with him for the two years called for by his contract.

RECOVERY DENIED

Judge Clark denied Henry any recovery on the cross-complaint through which the engineer sought reimbursement for his expenditures in returning to the United States and his loss of salary after his return.

Tribune 7-12-39

Sued for Refusal Of Job in Russia

Refusal of Gilbert Henry, aircraft engineer, to accept an assignment in Soviet Russia, was cited in Los Angeles superior court by Consolidated Aircraft Corp. in its successful suit to recover $1910.55 advanced Henry in traveling expenses.

Henry, the company complained, reached Moscow, remained there a week and returned without even seeing the aircraft plant at Tagenrog, where he was to work on planes for the Soviet government under contract.

In a cross-complaint for $2747.23, Henry contended the company had misrepresented living conditions in Russia.

NEW MONIKERS FOR PBY UNITS

All Groups Effected By New Numbering

~~Union 7-12-39~~

Aviation

SUN - 7-11-39

The familiar designations by which the Navy's patrol squadron of giant airboats have been known in recent years have been abandoned, it was learned today.

San Diego's three 12-plane units of Consolidated PBY flying boats—Patrol Squadrons 7, 9 and 18—in the future will be referred to as Patrol Squadrons 11, 12 and 13 in a new system of identifying aircraft.

PATROL WING ONE

All squadrons of San Diego's Patrol Wing 1, will be designated by the numeral "one" followed by a digit indicating their seniority. Thus, should another bomber squadron be commissioned in this wing, it will be known as Patrol Squadron 14.

The five patrol units in Hawaii's Patrol Wing 2, formerly given the scattered designations—Patrol Squadron 1, 4, 6, 8 and 10—have been renamed Squadrons 21, 22, 23, 24 and 25. In the same manner, the numeral "three" will be used for Patrol Wing 3, at Coco Solo, Canal Zone—Squadrons 31, 32 and 33. Patrol Wing 4 at Seattle, which consisted of VP-16, VP-17, VP-19, VP-20 and VP-21, now comprises Squadrons 41, 42, 43, 44 and 45. Norfolk's Patrol Wing 5 has been expanded from two squadrons—VP-14 and VP-15—to four units, Squadrons 51, 52, 53 and 54.

LAND PLANES TOO

The same method is used in identifying land planes based on aircraft carriers. For instance, the Lexington's four squadrons have the "number two" designation—Bombing Squadron 2, Fighting Squadron 2, etc. The Saratoga's planes are the "number 3" group, the Ranger's "number 4," the Yorktown's "number 5," and the Enterprise's "number 6."

No more delivery flights of Consolidated planes from San Diego to Pearl Harbor or the Canal Zone are planned in the near future, it was reported at North Island today.

be hauled up the slipway and thoroughly inspected. Before flying south two new Pratt & Whitney engines will be slung into the bearers, and they will be gently worked in while the flying boat ferries the expedition's personnel, wireless equipment and other appurtenances from the inland lake to the coast.

The laying down of 2500 gallons of 87 octane fuel at each of the islands has been commenced by the Vacuum Oil Co., and the petrol, oil and other supplies will be shipped from Capetown, Singapore and Fremantle.

The crew for the flight will be Mr Richard Archbold, owner of the *Guba;* Captain P. G. Taylor, in charge of the flight survey for the Commonwealth Government; Captain L. A. Yancey, navigator; Mr R. Rogers, first pilot; Mr J. Percival, the Commonwealth Government's second representative, who will also act as official newspaper correspondent and be in charge of special organisation; Mr R. Booth, radio operator; and Messrs. G. Brown and S. Berrinka, mechanics.

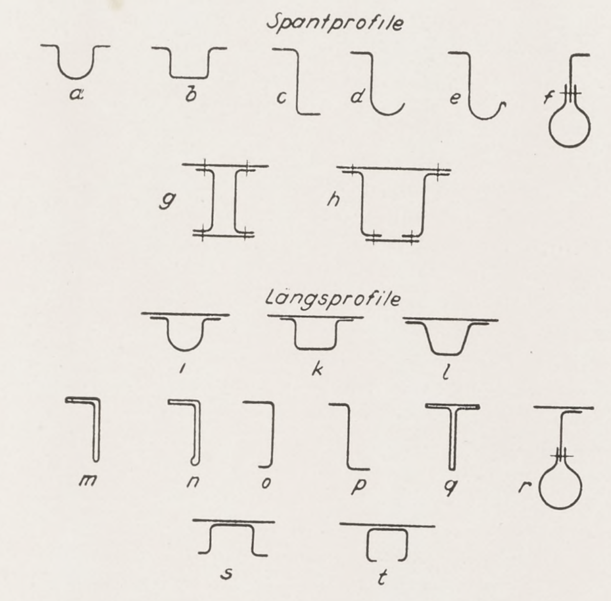

Fig. 2. Profielvormen voor spanten en langsverstijvingen.

Ook is het metalen vliegtuig, zooals reeds is opgemerkt, ongevoelig voor vochtigheid en temperatuur. Het is dus niet noodzakelijk dat het vliegtuig ten alle tijde in groote en dure vliegtuighallen moet worden ondergebracht. Het kan zoo noodig buiten in alle weer en wind worden verankerd, wat vooral voor groote watervliegtuigen van belang is, daar het transport van deze vliegtuigen op het land dikwijls niet eenvoudig is.

Het oplossen van de verschillende problemen, welke zich bij het construeeren van geheel metalen vliegtuigen voordeden, waren kostbaar en zeer tijdroovend.

In het bijzonder heeft zich het duraluminium voor het vervaardigen van metalen vliegtuigen als een zeer geschikt materiaal doen kennen. Duraluminium is een legeering van aluminium, koper en magnesium. Ofschoon dit duraluminium toch nog altijd 3 à 4 maal zwaarder is dan hout, is dit voordeel van geringer gewicht slechts schijnbaar. Voor de lichtheid van een constructie is niet alleen het soortelijk gewicht van het gebruikte materiaal van belang, ook de sterkte hiervan spreekt een woordje mee. Van groot belang is dan ook de z.g.n. ,,specifieke vastheid'' van het materiaal. Hieronder verstaat men de verhouding :

$$\frac{\text{toelaatbare materiaalspanning}}{\text{soortelijk gewicht}}$$

In onderstaande tabel is ter vergelijking voor enkele materialen de specieke vastheid vermeld.

Materiaal	Specifieke vastheid	S.G.
Zacht staal	3,85	7,8
Chroom-nikkelstaal	12,8	7,8
Duraluminium	10,—	2,3
Spruce hout	10,6	0,5

Wij zien hieruit dat het hoogwaardig chroom-nikkelstaal eigenlijk voor een vliegtuig de lichtste bouwstof is, m.a.w. dat men, door een bepaald constructiedeel in dit materiaal uit te voeren, met minder gewicht zou kunnen volstaan, dan bijvoorbeeld bij gebruik van duraluminium of hout. Om constructieve redenen geeft men echter in de meeste gevallen de voorkeur aan duraluminium, omdat uit staal vervaardigde onderdeelen dikwijls te klein uitvallen of van zoo geringe wanddikte zouden worden, dat praktische moeilijkheden zouden ontstaan.

Zooals reeds is opgemerkt, gemakkelijk is de overgang van de gemengde bouwwijze naar het geheel uit metaal vervaardigde vliegtuig niet geweest. Het bewerken van het zilver glanzend duraluminium stelt geheel andere eischen dan staal of koper. Alleen al de bescherming van aluminiumlegeeringen tegen oxydeerende invloeden van buiten, bijvoorbeeld tegen zeewater, is een wetenschap op zichzelf geworden, waarmede men nog lang niet gereed is. Zeer veel bittere ervaringen moesten worden opgedaan en zeer vele proefnemingen verricht, voor men gekomen was op de hooge trap van ontwikkeling, waarop de tegenwoordige metaalvliegtuigbouw staat.

Verschillende legeeringen zijn op de markt verschenen, welke alle ten doel hebben, de sterkte te vergrooten en zoodoende materiaal te kunnen uitsparen. En nog steeds wordt in deze richting verder gezocht.

Een ander belangrijk punt is het doelmatig gebruik van het materiaal bij de constructie van het vliegtuig. Daar de verschillende duraluminiumlegeeringen slechts verkrijgbaar zijn in strippen, platen, staven en dunwandige buizen, is de constructeur gedwongen, de verschillende deelen, waaruit het vliegtuig wordt samengesteld, hieruit te vervaardigen. Wanneer men dan ook een geheel uit metaal vervaardigd vliegtuig van binnen bekijkt, ziet men dat dit geheel is samengesteld uit platen en uit plaat vervaardigde profielen van alle mogelijke vormen. Enkele van deze profielen zijn weergegeven in fig. 2.

Vooral de laatste jaren ziet men constructies toegepast, waarbij de plaatbekleeding van romp en vleugels zeer veel tot de sterkte van het vliegtuig bijdragen. Hierbij kan men eigenlijk niet meer spreken van vakwerkconstructies, die door opgeklonken platen verstijfd worden (meedragende huid) zooals bij de meer conservatieve bouwwijzen. Bij de nieuwere constructies, zooals bij de Douglasvliegtuigen en andere, moeten romp en vleugel in zijn geheel meer als doosliggers beschouwd worden, met de gewenschte aerodynamische vorm, zie fig. 3. De huidplaten worden hierbij door langs- en dwarsschotten verstijfd. Tengevolge van de belastingen ontstaan in dergelijke verstijfde plaatcylinders trek- of drukspanningen. Waar drukspanningen kunnen optreden, zullen de platen, die meestal heel dun zijn (0,5 — 2 mm) willen uitknikken. Deze moeten dus door profielen verstijfd worden.

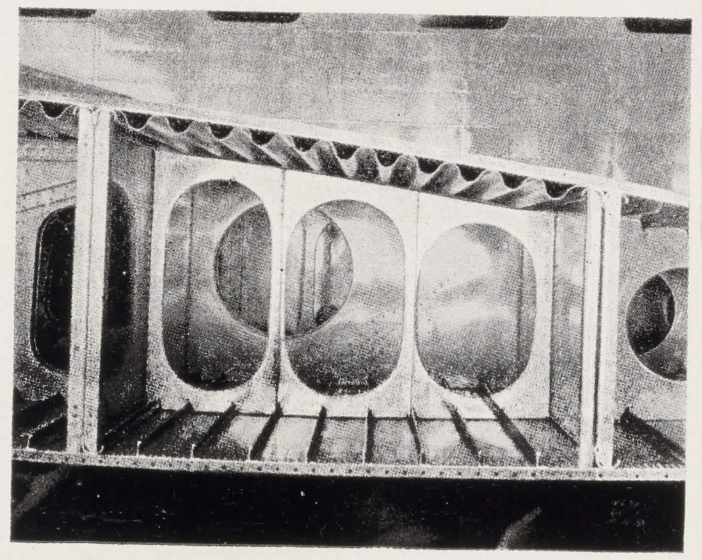

Fig. 3. Vleugelconstructie van de Douglas D.C. 3 De constructie van de ribben wijkt geheel af van de vroegere vakwerksconstructie, zooals bij hout gebruikelijk was, en in de eerste metalen vleugels werd overgenomen.

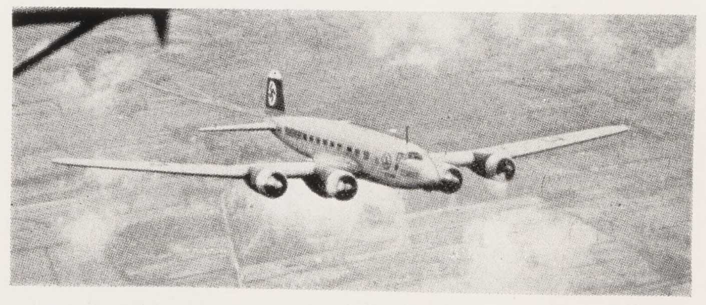

Fig. 4. Verkeersvliegtuig ,,Condor F.W. 200'' voor 26 passagiers.

Reeds in den wereldoorlog werden dergelijke constructies, z.g.n. ,,schaalconstructies'' in hout uitgevoerd. In latere jaren werden door de Lockheed fabrieken dergelijke vliegtuigen de ,,Lockheed Vega's'' in serie vervaardigd. Ook de beroemde ,,Panderjager'' was als zoodanig gebouwd. Lange jaren werd deze constructie echter zelden toegepast. Slechts voor zeer snelle vliegtuigen, wanneer men bijzonder vloeiende vormen wenschte, bracht de schaalconstructie voordeelen.

Door het toenemend luchtverkeer is het in serie vervaardigen van geheel metalen vliegtuigen mogelijk geworden, waarvoor de schalenbouwwijze zich uitstekend leent.

Deze heeft verder nog het voordeel, dat de ruimte binnen in het vliegtuig veel minder in beslag genomen wordt door spanten, schoren en verspanningen, wat voor verkeersvliegtuigen een voorname factor is.

Als voorbeeld van een modern verkeersvliegtuig, gebouwd volgens de nieuwste inzichten, kan het groote verkeersvliegtuig van de Duitsche Lufthansa, de ,,Condor F.W.200'' dienen, welke in Augustus in precies 25 uur, met 4 man, zonder tusschenlanding, van Berlijn naar New-York is gevlogen.

Dit vliegtuig is een 4-motorige laagdekker voor 26 passagiers en een bemanning van 4 personen. De maximumsnelheid is 430 km per uur kruissnelheid 400 km per uur.

De romp is als schaalconstructie uitgevoerd, m.a.w. de huidplaten zijn door langsprofielen en spanten verstijfd. Vleugels en staartvlakken zijn met duraluminium platen bekleed. De roeren zijn met doek bespannen. Motorbokken, intrekbaar landingsgestel en staartwiel zijn van hoogwaardig staal. Het landingsgestel wordt naar voren ingetrokken, waardoor bij weigeren van het mecanisme toch de wielen naar buiten kunnen worden gebracht, daar het eigengewicht en de vliegwind dan het mecanisme vervangen. Speciale aandacht is geschonken aan de mogelijkheid, de motoren snel te kunnen verwisselen, wat vooral voor verkeersvliegtuigen van het grootste belang is. Volgens mededeelingen van den fabrikant kan dit door 3 man binnen de 15 minuten geschieden. Aan de wenschen van den vlieger is in ruime mate tegemoet gekomen. Hoogte-richtingsroeren en vleugelklappen zijn voorzien van electrisch bedienbare trimvlakjes. Zelfs bij het uitvallen van beide stuurboord of bakboord motoren, blijft hierdoor het vliegtuig licht bestuurbaar.

Een bijzondere inrichting is aangebracht, die er voor zorgt, dat wanneer geland wordt met vol uitgeslagen landingsklappen, deze geleidelijk in den stand voor ,,starten'' worden gebracht, wanneer bijvoorbeeld op het laatste moment blijkt, dat er niet geland kan worden. Hierdoor kan de vlieger zonder bezwaar plotseling weer ,,vol gas'' geven, zonder dat hij bang behoeft te zijn, dat het vliegtuig doorzakt.

De hoofdligger van de vleugel, welke door de romp heenloopt, verdeelt de passagiersruimte in een ,,rooken'' en een ,,niet rooken'' cabine. Hier vindt de meest eischende passagier alle denkbare comfort. Voor iedere zitplaats is een klaptafeltje, een leeslampje en een schakelknopje voor het seinlampje voor de steward aangebracht en in de rookcabine nog een electrische aansteker en een asbakje.

Amerika verrast ons bijna elken dag met iets nieuws op luchtvaartgebied en veel is er thans werkelijkheid geworden, dat men niet lang geleden in Europa nog als een utopie beschouwde. Dit heeft zoowel betrekking op het bouwen van bijzonder sterke motoren, verstelbare luchtschroeven met constante prestatie, als op het verbeteren van de constructiemethoden van den vorm der vliegtuigen.

Duitschland stond vroeger aan de spits wat betreft het maken van geheel metalen vliegtuigen, in de laatste jaren is hierin echter een groote verandering gekomen en vooral Amerika heeft in dit opzicht buitengewoon uitgeblonken. In de eerste plaats moet genoemd worden

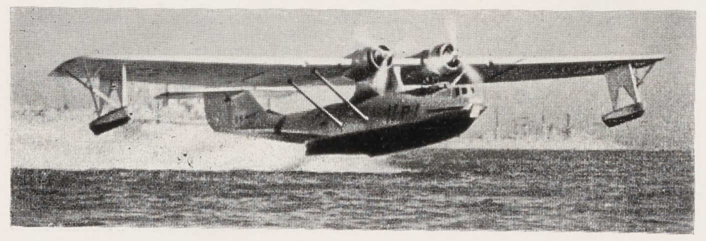

Fig. 5. Consolidated vliegboot voor de Amerikaansche Marine.

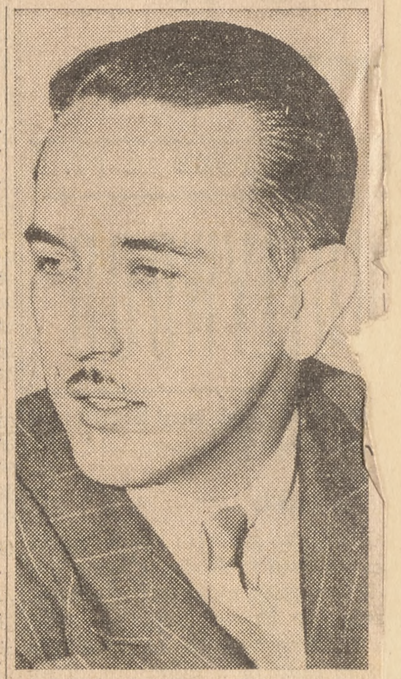
Aircraft Company Awarded Judgment From Engineer

Expert Who Refused to Stay in Russia Must Repay Expenses



LOSES SUIT — Gilbert A. Henry, sued by company.

Judgment of $1910.55 in favor of Consolidated Aircraft Corp. of San Diego was returned by Superior Judge Thurmond Clarke yesterday against Gilbert A. Henry, young airplane engineer, in a lawsuit arising from Henry's refusal to work in Soviet Russia.

The corporation brought the action on the ground that it was entitled to recover transportation expenses advanced Henry on sending him to Tagenrog, U.S.S.R., to work at building airplanes for the Soviet government under a contract.

STAYS ONLY WEEK

Henry, the concern complained, reached Moscow, remained there a week, and then turned back without even seeing the plant at Tagenrog.

In a cross-complaint for $2747.23, Henry contended that the corporation had misrepresented living conditions in Russia in sending him there. He argued that life in Moscow had been enough to convince him that sanitary conditions were not adequate and he could not send for his wife and 2-year-old son, who would have been forced to remain with him for the two years called for by his contract.

RECOVERY DENIED

Judge Clark denied Henry any recovery on the cross-complaint through which the engineer sought reimbursement for his expenditures in returning to the United States and his loss of salary after his return.

Tribune 7-12-39

Sued for Refusal Of Job in Russia

Refusal of Gilbert Henry, aircraft engineer, to accept an assignment in Soviet Russia, was cited in Los Angeles superior court by Consolidated Aircraft Corp. in its successful suit to recover $1910.55 advanced Henry in traveling expenses.

Henry, the company complained, reached Moscow, remained there a week and returned without even seeing the aircraft plant at Tagenrog, where he was to work on planes for the Soviet government under contract.

In a cross-complaint for $2747.23, Henry contended the company had misrepresented living conditions in Russia.

NEW MONIKERS FOR PBY UNITS

All Groups Effected By New Numbering

Union 7-12-39

Aviation

SUN - 7-11-39

The familiar designations by which the Navy's patrol squadron of giant airboats have been known in recent years have been abandoned, it was learned today.

San Diego's three 12-plane units of Consolidated PBY flying boats—Patrol Squadrons 7, 9 and 18—in the future will be referred to as Patrol Squadrons 11, 12 and 13 in a new system of identifying aircraft.

PATROL WING ONE

All squadrons of San Diego's Patrol Wing 1, will be designated by the numeral "one" followed by a digit indicating their seniority. Thus, should another bomber squadron be commissioned in this wing, it will be known as Patrol Squadron 14.

The five patrol units in Hawaii's Patrol Wing 2, formerly given the scattered designations—Patrol Squadron 1, 4, 6, 8 and 10—have been renamed Squadrons 21, 22, 23, 24 and 25. In the same manner, the numeral "three" will be used for Patrol Wing 3, at Coco Solo, Canal Zone—Squadrons 31, 32 and 33. Patrol Wing 4 at Seattle, which consisted of VP-16, VP-17, VP-19, VP-20 and VP-21, now comprises Squadrons 41, 42, 43, 44 and 45. Norfolk's Patrol Wing 5 has been expanded from two squadrons—VP-14 and VP-15—to four units, Squadrons 51, 52, 53 and 54.

LAND PLANES TOO

The same method is used in identifying land planes based on aircraft carriers. For instance, the Lexington's four squadrons have the "number two" designation—Bombing Squadron 2, Fighting Squadron 2, etc. The Saratoga's planes are the "number 3" group, the Ranger's "number 4," the Yorktown's "number 5," and the Enterprise's "number 6."

No more delivery flights of Consolidated planes from San Diego to Pearl Harbor or the Canal Zone are planned in the near future, it was reported at North Island today.

Head Winds Halt S. D. Flying Boat At Buffalo

Union 7-12-39

Beset by strong head winds that cut down his flying speed and reduced the gasoline supply beyond the safety point, the Consolidated plane piloted by Russell Rogers, which left San Diego at 8:23 a.m. Monday bound for England via Botwood, Newfoundland, landed at Buffalo at 3:30 a.m. (Pacific time), yesterday, The Associated Press reported.

Rogers said he would remain at Buffalo overnight before continuing the flight to Botwood and Felixstowe, England, today. The 15-ton plane had flown 2400 of the 3300 miles on a projected nonstop flight from San Diego to Botwood when it landed.

SECOND DELAY

It marked the second time that Rogers attempted to keep a dinner engagement in a swank London hotel scheduled for tonight. Sunday morning he took off for England only to meet with disapopintment when the failure of the automatic pilot forced him to return here after being aloft less than three hours. He announced at Buffalo the dinner, as far as he was concerned, was off.

The plane is to be delivered to the British Royal flying corps at Felixstowe.

ROUTE SAFETY PROVED

The landing proved the ability of the San Diego-built flying boats to make emergency stops on transcontinental flights. The planes are equipped only for water landings, but before taking off Rogers said no apprehension was felt on a flight across the continent because of the numerous rivers and lakes.

Rogers piloted Richard Archbold's plane Guba on the recent New Guinea expedition, where many landings were made on rivers and lakes of the island.

Indian Ocean Survey

NEGOTIATIONS for the charter of Mr Richard Archbold's Consolidated P.B.Y. flying boat, the *Guba*, for a flight survey of the Indian Ocean from the west coast of Australia to the east coast of Africa, by way of the Cocos Islands, the Chagos Archipelago and the Seychelles Islands, commenced last year, when the aircraft was flown from Port Moresby to Sydney and Melbourne for instrument and general overhaul.

Before the *Guba* crossed the Pacific from the United States to Dutch New Guinea to ferry scientific personnel, soldiers, labor and supplies from Hollandia to an inland lake, 11,000 feet above sea level, Captain P. G. Taylor had made a special journey to England and the United States in an effort to secure, preferably, a British craft with sufficient range to fly the distances between the island bases. When this was found to be impossible he tried to secure an American craft.

Sufficient capital, however, was not forthcoming from private sources to purchase a twin-engined flying boat, and there was, in addition, the necessity to lay down fuel dumps and other supplies at the various stopping places.

A proposal, however, was put before the late Prime Minister, Mr Lyons, which included the purchase or charter of, preferably a British flying boat, or, failing this, an American aircraft.

Messrs Short Bros., however, were so busy in supplying craft to Imperial Airways Ltd. and its subsidiary-companies, and Imperial Airways Ltd. and Qantas, in turn, were fully occupied in inaugurating the flying boat scheme; so it was apparent that a British flying boat could not be obtained.

After an interview in Melbourne with Captain Yancey and Mr Russell Rogers, Mr Archbold's navigator and first pilot, it was decided by Captain Taylor that a concrete proposal could be placed before the Government for the charter of the *Guba*. This proposal was prepared, and it included, on one side, revenues obtainable from a special air mail, sale of newspaper, broadcasting, film and other rights, and, on the other side, a small deficit which the Government was asked to guarantee, although it is expected that this deficit will be covered by private enterprise.

The proposal was sponsored by the Federal Treasurer, Major R. G. Casey, and after it was submitted and approved by Cabinet, Captain Taylor was authorised to negotiate with Mr Archbold.

Captain Yancey flew to Sydney from Papua in a W. R. Carpenter 86B, and a contract was drawn up which was signed on behalf of the Federal Government by Mr Thorby, and by Captain Yancey, Mr Archbold's fully accredited representative. Thus ended five years' dogged, and, at times, heart-breaking efforts by Captain P. G. Taylor to secure suitable equipment to make a survey of what has become known on maps of the world air routes as "The Reserve Empire Air Mail Route."

Mr Richard Archbold (left), owner of the Guba, and Messrs. R. Rogers and L. Yancey (right) respectively. Archbold Expedition's chief pilot and navigator.

Capt. P. G. Taylor (right), who has been appointed by the Commonwealth Government to take charge of the Indian Ocean flight survey, with J. Percival, Junr., a member of the expedition, and official newspaper correspondent in charge of special organisation.

Vulnerability of Empire Route

FREQUENTLY Captain Taylor has pointed out the vulnerability of the present air mail route to Australia, which is dependent on clear air corridors along the Mediterranean and through the East. During the crisis last December the flying boat service was interrupted when there was a threat of hostilities, and some of the craft did not proceed further towards Australia than France until the international atmosphere was cleared.

In the event of war involving the Mediterranean and the near East, Captain Taylor pointed out, flying boats could proceed to Australia by way of the west coast of Africa and the Indian Ocean. Nature has divided the Indian Ocean into flying distances within the range of modern commercial aircraft.

The total flying distance across the Indian Ocean by the route to be surveyed is approximately 4,674 nautical miles, but this distance, of course, is dependent upon the site of the base which will be selected by Captain Taylor on the west coast of Australia. At this stage it cannot definitely be stated from where the survey flight will be started.

The distances between the Indian Ocean air bases are as follows:— The Cocos Islands to Diego Garcia, 1172 nautical miles; Diego Garcia to the Seychelles, 1022 nautical miles; and the Seychelles to Mombasa (Kenya) 950 nautical miles. The distance from the west coast of Australia to the Cocos cannot be given until it is definitely decided which will be the jumping off position.

During the flight across the Indian Ocean the *Guba* will stay at each of the islands for a week, when Captain Taylor, assisted by Mr J. Percival, will make a survey to determine the most suitable flying boat bases and the suitability of the islands for the establishment of landplane aerodromes.

Mr Archbold, who is a research associate of the American Museum of Natural History, in addition to being a pilot of skill, will pursue scientific studies at each of the islands which have not yet been visited by an expert biologist.

The flight is scheduled to commence at a date to be decided upon between the Commonwealth Government, Captain Taylor and Captain Yancey—any time between June 10 and August 1.

The *Guba* will be flown from Port Moresby to the Rose Bay flying boat base on about May 20, when it will

(*Continued on page* 52)

INDIAN OCEAN SURVEY—

(*Continued from page* 20)

be hauled up the slipway and thoroughly inspected. Before flying south two new Pratt & Whitney engines will be slung into the bearers, and they will be gently worked in while the flying boat ferries the expedition's personnel, wireless equipment and other appurtenances from the inland lake to the coast.

The laying down of 2500 gallons of 87 octane fuel at each of the islands has been commenced by the Vacuum Oil Co., and the petrol, oil and other supplies will be shipped from Capetown, Singapore and Fremantle.

The crew for the flight will be Mr Richard Archbold, owner of the *Guba;* Captain P. G. Taylor, in charge of the flight survey for the Commonwealth Government; Captain L. A. Yancey, navigator; Mr R. Rogers, first pilot; Mr J. Percival, the Commonwealth Government's second representative, who will also act as official newspaper correspondent and be in charge of special organisation; Mr R. Booth, radio operator; and Messrs. G. Brown and S. Berrinka, mechanics.

de vroegere Russische constructeur Sikorsky, die het meeste succes had met zijn vliegboottypen met één tot vier motoren.

Verder Martin, die veel leger-vliegtuigen maakt, Douglas, Grumman en Consolidated.

Daar is bijvoorbeeld de vliegboot welke de Consolidated aan de Marina van de Vereenigde Staten levert. Deze tweemotorige eendekker schijnt alle records te slaan wat duur, afstand en mede te nemen last bedreft. Deze vliegboot welke geheel van metaal is gemaakt, wordt door de Amerikaansche Marine voor de bescherming van de kust en als patrouilleboot gebruikt en heeft 2 Wright Cyclone motoren van 1000 P.K. welke twee verstelbare metalen Hamilton schroeven met 3 schroefbladen drijven. Deze vliegboot heeft een scherpe kiel, de achtersteven loopt erg op, de doorsnede van de boot is van onder vlakker d.w.z. meer afgeplat dan gewoonlijk. Vóór aan den boeg en achter de vleugels aan de bovenzijde van de boot zijn de mitrailleurs opgesteld. Door middel van een verbindingskoker kan men van de kajuituit de daarboven gelegen vleugels bereiken.

Ondanks de betrekkelijk groote vleugels schijnen de anders gebruikelijke bootvormige ondersteuningen aan de uiteinden van de vleugels te ontbreken. In werkelijkheid zijn ze echter wel aanwezig, alleen heeft men hun bevestiging aan de vleugels zeer veranderd.

Als ze gebruikt moeten worden, d.w.z. bij het vertrek en bij het neerdalen, worden ze hydraulisch naar buiten gedrukt om later, als ze geen dienst meer behoeven te doen, even snel weer te worden ingetrokken, of liever omgeklapt; want tijdens het vliegen zouden ze te veel weerstand bieden aan de lucht en zoodoende de snelheid van de vliegboot verminderen.

Om deze gemakkelijk te kunnen omklappen heeft men aan den onderkant van de vleugels nabij de uiteinden M-vormige insnijdingen gemaakt, waarin het raamwerk van de ondersteuningen na het omklappen precies past. Het schuitje van de ondersteuningen vormt dan slechts een dikke knobbel aan het uiteinde van de vleugel.

Het vastzetten van de ondersteuningen bij het gebruik hiervan, geschiedt door middel van hefboomen en een kniegewricht van stalen buizen (zie fig. 6).

Ook heeft de Consolidated een ontwerp gemaakt, dat de constructie van een vliegboot, welke meer dan 100 ton weegt, beoogt.

Deze reusachtige vliegboot zal met zes motoren, elk van 2000 P.K. worden uitgerust en een snelheid van 480 mijl per uur in de substratosfeer, dus boven 6000 meter, kunnen ontwikkelen.

Ofschoon de ontworpen vliegboot zes motoren zal bezitten, zullen er slechts vier noodig zijn gedurende het vliegen. De beide overige motoren zullen worden gebruikt om het opstijgen te vergemakkelijken en gedurende de eerste uren van de vliegreis totdat de vliegboot tengevolge van het verbruik der bedrijfsstoffen lichter geworden is. Deze beide motoren worden dan uitgeschakeld en de luchtschroeven in vaanstand gezet, zoodat zij niet blijven doordraaien en dus de snelheid nadeeling beïnvloeden. Door de besparing op het bedrijfsstoffen-verbruik van deze twee beide motoren wordt het vliegbereik vergroot.

Er is berekend dat een dergelijke Consolidated-vliegboot een vervoerscapaciteit heeft van 300 passagiers, exclusief bagage, luchtpost en vrachtgoed. Het vliegbereik is ruimschoots voldoende om den Atlantischen Oceaan of den Stillen Oceaan over te steken met een ruime reserve aan bedrijfsstoffen. Veel ruimte zou worden verkregen in den vleugel, die van groote doorsnede is. Daar zijn de verblijven voor passagiers ontworpen benevens de bedrijfsstoffen-tanks en de vrachtruimen.

Het systeem van zgn. druk-kajuiten voor het vliegen op groote hoogte in de ijle luchtlagen zal natuurlijk worden toegepast.

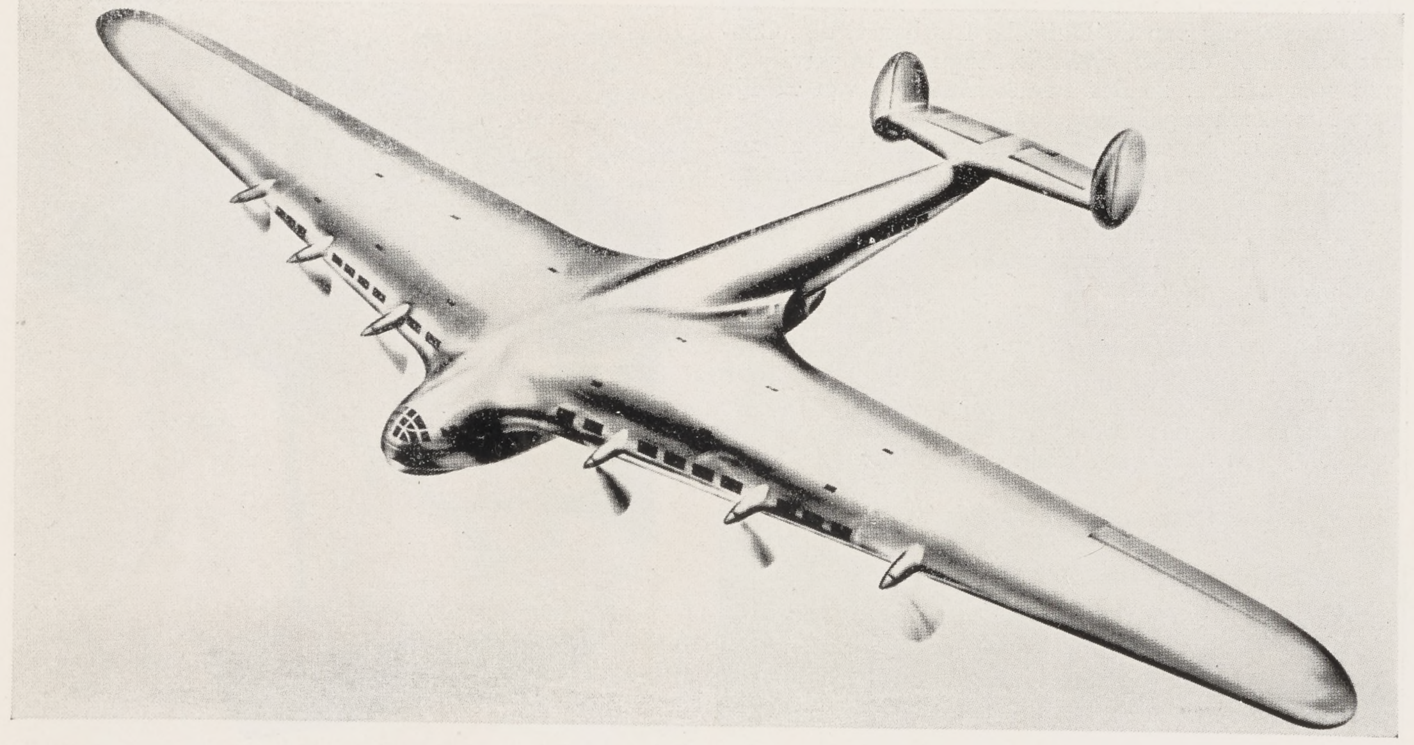


Fig. 7. Plan voor een 100 tons vliegboot voor 300 passagiers.

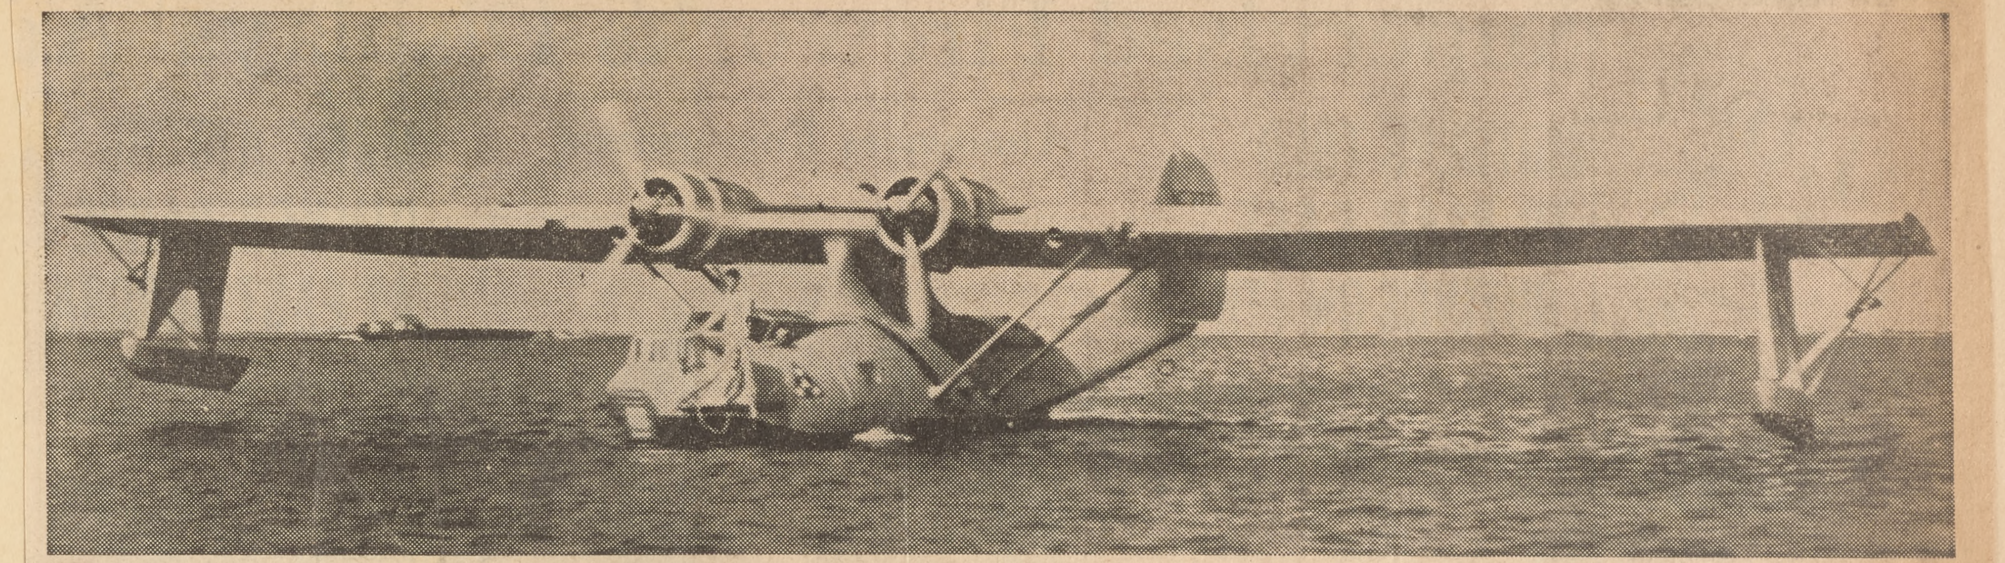
BUFFALO COURIER-EXPRESS, MONDAY, JULY 3, 1939



FROM DOWN UNDER—The fourteen-ton flying boat Guba is shown as it came to rest in Jamaica Bay at New York Saturday, ending an 18,000-mile pioneering flight from Australia by way of Africa and the Virgin Islands with the six-man Archbold-New Guinea expedition aboard.

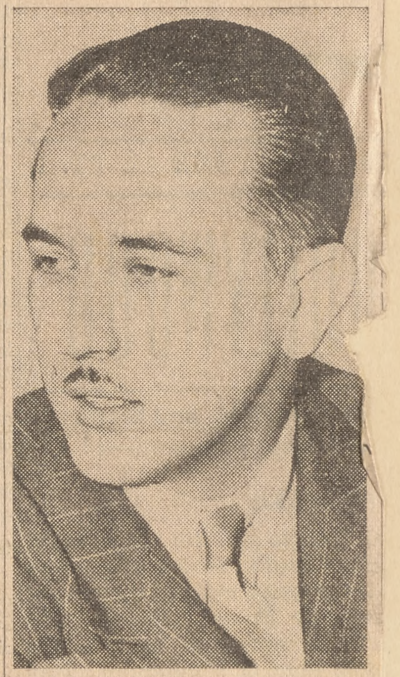
Aircraft Company Awarded Judgment From Engineer

Expert Who Refused to Stay in Russia Must Repay Expenses



LOSES SUIT—Gilbert A. Henry, sued by company.

Judgment of $1910.55 in favor of Consolidated Aircraft Corp. of San Diego was returned by Superior Judge Thurmond Clarke yesterday against Gilbert A. Henry, young airplane engineer, in a lawsuit arising from Henry's refusal to work in Soviet Russia.

The corporation brought the action on the ground that it was entitled to recover transportation expenses advanced Henry on sending him to Tagenrog, U.S.S.R., to work at building airplanes for the Soviet government under a contract.

STAYS ONLY WEEK

Henry, the concern complained, reached Moscow, remained there a week, and then turned back without even seeing the plant at Tagenrog.

In a cross-complaint for $2747.23, Henry contended that the corporation had misrepresented living conditions in Russia in sending him there. He argued that life in Moscow had been enough to convince him that sanitary conditions were not adequate and he could not send for his wife and 2-year-old son, who would have been forced to remain with him for the two years called for by his contract.

RECOVERY DENIED

Judge Clark denied Henry any recovery on the cross-complaint through which the engineer sought reimbursement for his expenditures in returning to the United States and his loss of salary after his return.

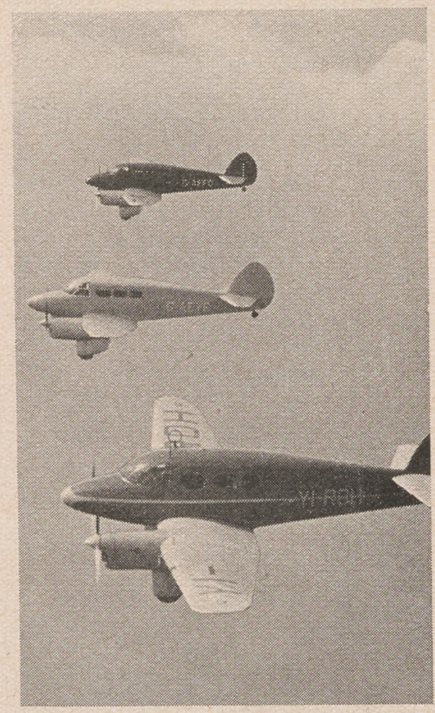
Transatlantic Air Service

The Pan American Airways flying boat *"Yankee Clipper,"* which carried out a transatlantic survey flight in March last, inaugurated an air service over this route on 20th May, when she took off from Port Washington, Long Island, with nearly a ton of mail on board. Calls were made and mails delivered at the Azores, Lisbon, and Marseilles, and the flying boat then continued to Southampton, where she arrived on 23rd May. The total flying time for the full journey was just under 32½ hrs.



A trio of Percival Q.6 monoplanes. Photograph by courtesy of "Flight."

After an overnight stay at Southampton the *"Yankee Clipper"* set off on the return trip, and reached Port Washington on 27th May. On the same day the sister aircraft *"Atlantic Clipper"* began the second of the transatlantic mail flights to Marseilles, and she arrived back at Port Washington on 3rd June.

The certificate authorising this service and granted to Pan American Airways by the U.S. Civil Aeronautics Authority prohibits the transport of passengers over the route until five return mail flights have been accomplished. There are heavy bookings for the passenger flights.

R.A.F. Vacancies for Apprentice Clerks

The Air Ministry announce that a substantial number of boys of School Certificate or approximately equivalent educational standard will be required this month to fill vacancies for apprentice clerks under the Royal Air Force new recruiting programme.

Candidates must be between 15½ and 17½ years of age on 1st July, and those who are successful will undergo a thorough course of training in clerical duties during their first 18 months' service. They will be attested for 12 years' regular Air Force service from the age of 18 years. The work on which Service Clerks are employed is varied, and includes administrative duties, shorthand, and accounting for pay and equipment.

A limited number will be permitted to re-engage to complete 24 years' service and so qualify for an R.A.F. pension. Those who return to civil life after completing only the first period of 12 years' service will be given an opportunity of entering the R.A.F. Reserve and of drawing a gratuity of £100.

All Apprentice Clerks have an opportunity to volunteer for training as airman pilots, and those who are selected become Sergeant Pilots when they have completed their training, and are employed on flying duties for six years. Airman Pilots who are specially qualified may be recommended for permanent commissions in the General Duties Branch, and a limited number of permanent commissions may be granted also in the Accountant and Equipment Branches to ex-apprentice clerks.

The conditions of entry are given in A.M. Pamphlet 9, a copy of which may be had upon application from The Inspector of Recruiting, Royal Air Force, Victory House, Kingsway, London W.C.2.

New American Flying Boat

The lower illustration on this page shows an interesting new twin-engined flying boat built by the Consolidated Aircraft Corporation, of San Diego, California. It is known as Model 31 and can be produced either as a civil or military aircraft. As a commercial air liner it will have a capacity of 52 passengers for day flying and sleeper accommodation for 28 at night. On transatlantic service it would be equipped to seat 28 passengers.

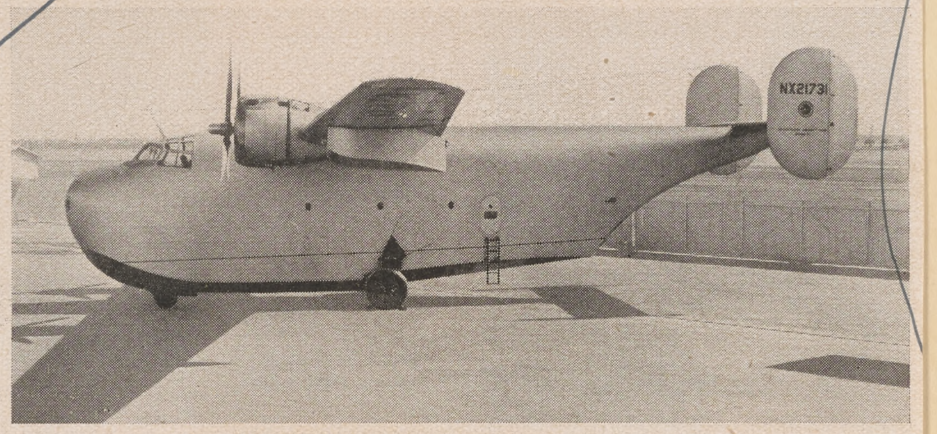
Model 31 was designed and built in 10 months, something of a record for an aircraft of this class. It is of metal construction, and has a wing span of 110 ft. Outboard floats, one on each side of the hull, help to steady the flying boat on the water, and they are drawn up to the underside of the wing during flight. The deep hull has two decks, and the control cabin is in the front part of the upper one. An interesting feature is the hydraulically operated beaching gear. When not in use the nose wheel is retracted into a recess in the underside of the hull and the two side wheels are drawn up into recesses in the sides of the hull. The openings are then closed by doors.

The two engines of this flying boat are of a new Wright type called the "Duplex-Cyclone" and rated at 2,000 h.p. They are said to give the aircraft a top speed of about 300 m.p.h.

Australia-Africa Survey Flight

A possible alternative to the present England-Australia Empire air route through Karachi, Calcutta, and Singapore, is being investigated by the Australian Commonwealth Government. The route under consideration is from western Australia to Mombasa, in Kenya, by way of the Cocos Islands, Diego Garcia, in the Chagos Islands, and Mahe, in the Seychelles, and involves flying across the Indian Ocean.

A 4,670-miles survey flight over this proposed route began on the 4th June. The twin-engined long-range flying boat *"Guba,"* used by Professor Archbold on a recent scientific expedition to New Guinea, was chartered for the survey by the Government, and it took off from Port Hedland, in Western Australia, on the first stage of the flight, a 1,230-miles "hop" to the Cocos Islands. It was piloted by Capt. P. G. Taylor, who was navigator to the late Sir Charles Kingsford-Smith on one of that famous airman's long flights. The crew of nine includes Professor Archbold.



This broadside view of the Consolidated Model 31 flying boat shows the unusual "cut" of the deep hull, and one of the outboard floats drawn up to the wing. Photograph by courtesy of Consolidated Aircraft Corporation, U.S.A.

Flying boat returns from Australia by way of Africa and Virgin Islands

July 2-39

New York, July 1 (AP)—An 18,000-mile pioneering flight from Australia by way of Africa and the Virgin Islands ended last today when the $250,000 flying boat Guba sat down on Jamaica Bay.

The fourteen-ton craft, carrying the six-man Archbold-New Guinea expedition of the American Museum of Natural History, had flown non-stop from the Virgin Islands about 1500 miles to the southward, the last lap of an odyssey that had carried over territory never before seen by white men.

Scientific Explorations

Before that venture, the plain had participated in scientific explorations in Dutch New Guinea, covering a total of 40,000 miles since it took off from San Diego, Cal., June 3, 1938.

Heading the party was Richard Archbold, owner of the "Flying Laboratory" and research associate of the museum. With him were Russell B. Rogers, first pilot; Lewis A. Yancey, who flew the Atlantic to Rome in 1929, navigator; Gerald D. Brown, flight engineer; Stephan Barrinka, assistant flight engineer, and Ray Booth, radio operator.

After docking at Jamaica Bay, the group was flown to flushing airport and tendered a formal reception at the New York World's Fair.

There Archbold reviewed the journey and said both the survey flight and the scientific expedition had untold value.

The survey flight, he said, proved that Great Britain in time of war could reach Australia by air by flying over only its own territory, "presumably friendly" French and Belgian territory and several water hops the longest being the 1,400-mile trip over the Indian Ocean.

Flying Big Advantage

Of the science side, he said the plane proved a "tremendous advantage over all other expeditionary methods" because explorers in the past "could not have reached the territories that came under our scrutiny and would have starved on the way to the most fertile fields of our investigation."

He said that about 20 per cent of the specimens of plant and animal life obtained by the expedition in New Guinea were entirely new to science and that 6,000 specimens of plant life and 350 species of mammals were gathered for return to this country.

The expedition was "treated in a very friendly manner by all the primitive tribes encountered," he said, adding:

"I'd rather deal with primitive man than any modern civilized or semi-civilized man because he sticks to his word."

Mombasa Times
MOMBASA, KENYA, AFRICA.
Thursday, June 22, 1939.

The New Route To Australia

Mombasa has taken a very lively interest in the progress of Dr. Archbold's flying-boat "Guba," chartered by the British and Australian Governments to survey the alternative Empire air route from London to Australia via Mombasa, the Seychelles, and Cocos Keeling Islands. When the "Guba" touched down at Shimanzi yesterday, after encircling the town, she at once became the central topic of interest; and everybody was glad to welcome the crew of the flying-boat after their successful journey accomplished, as such flights usually are, with a quiet competence which is a welcome contrast to the freak flights which so often end in disaster. The "Guba" has winged her way across the Indian Ocean with the serious purpose of testing out the suitability of the new route, so that it may be used in time of war instead of what would then become the impossible eastern route via the Mediterranean and the Near East. In Captain Taylor's words, which are quoted elsewhere, the flight has proved beyond doubt the entire suitability of the route and the fact that it can be utilised at once.

This is important because it means that even in time of peace the alternative across the Indian Ocean is a practical and attractive way to fly. It is clear, since the route can be brought into operation now, that no extensive and costly arrangements are required which would take a very long time to bring into being, and once more the wisdom of utilising the flying boat for Imperial air communications is amply vindicated. Where there is suitable water the flying boat can "land," whereas the land 'plane requires an extensive ground organisation, and suitable aerodromes which can be used in all weathers. The Empire flying boats have already proved their worth, and the ill-luck of recent weeks, culminating in the barge fire which spread to the Connemara the day before yesterday, has not been a feature of the work done on the Imperial routes since they were operated by flying boats.

"Guba" is taking off this morning at 8 a.m. on her journey to Kisumu and thence to the West Coast, but Captain Taylor and his Australian Government colleague have done their work and a survey is completed. In fact it was completed when the "Guba" left Seychelles yesterday morning, for of course the facilities of Mombasa for flying boats are already well-known and require no further exploration. Members of the crew who took part in this memorable flight are pioneers in a very real sense, and it was interesting to note that among them were several American citizens including the owner of the aircraft, Dr. Archbold, whose name is already well known for his scientific exploration and for his exploits with the "Guba" in New Guinea. It is to be hoped that it will not be war which will cause the utilising of the new Indian Ocean route to Australia. Mombasa would welcome the operation of the route by Imperial aircraft, but in times of peace rather than only as a war-time measure. The economics of this aspect of the case will doubtless change as time goes on and it may well be that events will prove it commercially worth while to fly along the Mombasa-Seychelles-Cocos route long before war compells the flying boats to quit the vicinity of Italy. In the air progress is rapid, and what a few years ago seemed impossible is to-day commonplace so it may be in the case of this route.

In Mombasa we are interested because of the influence which the introduction of such a schedule might wield upon the importance of the Island as an air base. If Mombasa should become the axis of several routes it would become necessary to increase the protection afforded to Mombasa and in that way the development of the town might be set ahead very rapidly indeed. Mombasa would have an additional strategic value under such circumstances, which could not help exercising a lively influence upon the growth of the town and the prosperity of its inhabitants.

"U. S. Four Years Ahead With Its Flying Boats"

The Consolidated Aircraft-built airboat Guba, and its history-making aviation feats, have proved that the United States Navy is equipped with the type of seaplanes that can travel swiftly to or from this country's most distant dependencies in time of emergency.

C. A. Van Dusen, vice-president of Consolidated Aircraft Corp., made this observation at a luncheon given in honor of the crew of the Guba, recently here following a 25,000-mile circuit of the world.

"The Guba has shown that large airboats can be delivered over any ocean to any part of the world without interference from surface vessels," Van Dusen said.

"Should America be engaged in a war requiring immediate transfer of the hard-hitting flying equipment the Navy now possesses in its Consolidated PBY's, this could be done in a few days between such widely separated points as New York and the Philippines. The United States is four years ahead of the rest of the world in its flying boats," he stated.

MOMBASA TIMES

PHOTOGRAPHERS BUSY

MOMBASA, KENYA AFRICA

THE arrival of the "Guba" yesterday attracted a considerable amount of interest from visitors to Mombasa and also local residents. Down at Shimanzi there was quite a collection of amateur photographers busy with their cameras on the jetty and they had some wonderful opportunities as the "Guba" landed almost in front of them.

MOMBASA TIMES.

"GUBA" IN MOMBASA: OCEAN ROUTE SATISFACTORY

WHEN THE FLYING BOAT GUBA ALIGHTED AT KILINDINI HARBOUR AT 09.40 HRS. G.M.T. YESTERDAY CAPTAIN P. G. TAYLOR COMPLETED HIS SURVEY OF THE INDIAN OCEAN AIR ROUTE FROM THE WEST COAST OF AUSTRALIA TO MOMBASA, BY WAY OF THE COCOS ISLANDS, DIEGO GARCIA AND THE SEYCHELLES, FOR THE BRITISH AND AUSTRALIAN GOVERNMENTS.

The route surveyed has been known in Great Britain and Australia for a number of years as "The Reserve Empire Air Mail Line." It has been pointed out that in the event of a war involving the Mediterranean and the East the present air line to India, Malaya and Australia might be severed in several places. The Indian Ocean air route passes through British territory from the west coast of Africa to Australia.

Those who arrived in the Guba at Mombasa yesterday were Captain P. G. Taylor, in charge of the survey for the British and Australian Governments; Mr. R. Archbold, American scientist and owner of the Consolidated PBY 2 flying boat used for the flight; Captain L. A. Yancey, navigator; Mr. R. R. Rogers, pilot; Mr. J. Percival, second representative of the Australian Government and official newspaper correspondent; Mr. R. Booth, radio operator; and Messrs. S. Barrinka and G. Brown, engineers.

The Guba departed from Rose Bay flying boat base, Sydney, on June 3, and flew non-stop across Australia to Port Hedland, a distance, by the route taken, of 2,600 miles. Immediately on arrival at Port Hedland the aircraft was fuelled and a start was made for the Cocos Islands. Because the thick cloud prevented the navigator from fixing position by astromical navigation it was decided to fly to Batavia when only a few miles from the Cocos. After a few days' stay at Batavia the Guba took off for Cocos, and following an uneventual passage by way of Christmas Island, which was surveyed from the air, Cocos Island was sighted through a rain squall and the aircraft alighted on the lagoon.

Several days were spent at the Cocos during which Captain Taylor made a survey of suitable sites for the operation of flying boats and landplanes.

A Fine Lagoon

On arrival at Diego Garcia from the Cocos it was apparent that the lagoon there was a fine natural flying boat base. H.M.S. Manchester was based there in case it could be of assistance for radio bearings.

A short stay was made at Diego Garcia during which Captain Taylor fully satisfied himself about the suitability of the lagoon for flying boat operation. A take-off was then made for the Seychelles.

On arrival at the Seychelles it was obvious that Port Victoria at Mahe fulfilled Captain Taylor's anticipations. At this island the Indian Ocean survey flight really terminated as there is already at Mombasa an excellent flying boat base.

The flying boat Guba, was employed in Hollandia, Dutch New Guinea, for about 12 months as a unit of the Archbold scientific expedition for the New York Museum of Natural History. It ferried hundreds of tons of equipment and food supplies to inland posts and to a lake 11,000 feet above sea level. It was due in a large measure to Mr. Archbold's co-operation that Captain Taylor's efforts to have the Indian Ocean route surveyed came to a head. Captain Taylor yesterday expressed the keenest appreciation for the co-operation of Mr. Archbold and his crew during the 5,000 miles ocean flight.

"Can be used now"

"The Indian Ocean air route is practical," said Captain Taylor.

"It will be a valuable acquisition to the Empire in the future. All the island bases fulfilled my expectations, and there is no reason why an air service should not be immediately started over the route. The island bases are beautiful and should appeal immensely to air travellers. I am fully satisfied with the results of the flight, and I will deal fully with other aspects in my report to the British and Australian Governments."

THE MONTREAL DAILY STAR, MONDAY, JULY 10, 1939

R.A.F. Plane Starts San Diego to Botwood Hop

Giant Plane To Fly Over Montreal

After a brief delay due to a faulty gyroscopic pilot, the mammoth 15-ton bomber ordered for the Royal Air Force took off from San Diego, California, at noon today bound for England via Newfoundland. The giant flying boat will fly non-stop to Botwood, Newfoundland, the machine's route taking it north over Toronto, Ottawa and Montreal. The non-stop flight from San Diego to Botwood is 3,300 miles, and the hop from Newfoundland to Felixstowe, England, where the machine will be delivered, 2,450 miles. Montrealers should be able to see the big ship pass over the city tomorrow morning.

The photo shows the crew aboard the ship. From left to right, they are: Raymond Booth, radio operator, Russell Rogers, pilot, Lewis A. Yancey, co-pilot and Gerald Brown, flight engineer.

Flying Boat To Pass Over City

Craft To Make 3,300-Mile Trip Non-Stop

SAN DIEGO, Calif., July 10—(A.P.) — A 15-ton flying boat for the Royal Air Force took-off this morning for England via Newfoundland.

The first leg is a proposed non-stop flight to Botwood, Newfoundland, 3,300 miles. Captain Russell Rogers, chief pilot, and his crew of three, made an easy take-off. A defective gyroscopic pilot, which caused return on the first attempt of the delivery flight, was repaired. Weather reports indicated favorable conditions most of the way eastward.

The plane's route will take it north of Detroit over the Canadian Airways course, across Lake St. Clair, over Toronto, Ottawa and Montreal and then over Quebec to Botswood.

The plane has American registration No. NRP9630 and British No. P9630, as well as British insignia on wing and hull.

Officials said that from the Chicago area onward the plane could always glide from the planned flight altitude of 12,000 feet and reach some body of water in case of trouble.

Built by the Consolidated Aircraft Company here, the model 28-5 flying boat, which has a cruising speed of 115 miles an hour, is to be delivered to the R.A.F. at Felixstowe, England. The Newfoundland-England hop will be 2,450 miles.

Rogers and Lewis A. Yancey, co-pilot-navigator, Raymond Booth, radio operator, and Flight Engineer Gerald Brown, took off in ideal weather conditions yesterday but turned back upon reaching the Salton Sea in California's Imperial Valley.

Rogers said failure of the automatic pilot would have required hand-steering of the plane for 41 hours.

Y MORNING, JULY 14, 1939 S.D. Union

CONSAIR BIDS FOR ARMY ORDERS AS S. D. PLANE INDUSTRY 'BOOMS'

Consolidated Aircraft Corp.'s recent $3,400,000 order for planes for the army air corps constitutes the first army business accorded the local firm since it was established in San Diego and has led to the hope that additional army orders will be forthcoming, Edgar N. Gott, Consolidated vice president, told fellow chamber of commerce directors at a session yesterday.

Gott, reporting on his activities in Washington, D. C., where he spent eight months in the interests of the local aircraft firm, told of preliminary work incident to final approval of a measure fixing 5500 planes as the maximum air strength of the air corps.

AWAIT DECISION ON BIDS

Consolidated officials are awaiting decision on bids submitted for building of giant four-motored bombers for the army but Gott declined to comment on present prospects for Consolidated obtaining any of this business.

Chamber directors were provided a summary of aviation advancement in San Diego through reports given by Gott, Earl Prudden, representing Ryan Aeronautical Co., and Ed Price, Solar Aircraft president and general manager.

Completion of Consolidated's $500,000 modernization program, construction of Ryan's $150,000 factory on Lindbergh field and completion of a $35,000 structure housing $20,000 in new equipment at the Solar plant were among recent improvements mentioned to indicate progress in the aviation industry here.

Arthur Wells, chamber federal projects committee chairman, reported that bills calling for governmental acceptance of lands transferred by San Diego and National City for navy expansion have been approved by 11th naval district officials and are en route to Washington, D. C., with a request that they be enacted during the current session of congress.

Wells said that in a recent report by Comdr. J. T. Mathews, 11th naval district public works officer, it was stated $7,000,000 has been expended in this area on federal projects during the last fiscal year.

Archbold expedition ends brilliant circling of globe.

One of the most remarkable flights in aviation history, and incidentally one of the least adequately publicized, ended July 6, as the big Consolidated flying boat Guba, bearing the Archbold New Guinea expedition of the American Museum of Natural History landed at San Diego. June 3, 1938, it had headed across the Pacific to Honolulu. Thence two non-stop flights carried it to Wake Island and Hollandia in Dutch, New Guinea, a distance of some 7,224 miles. For almost a year the Guba transported supplies from Hollandia to various scientific ground parties in the mountainous interior of that island. Thousands of plant specimens, birds and mammals were collected, many of them new. A number of villages with entire populations which had never before seen white men were visited and studied. Thousands of miles of unknown territory were investigated and mapped. A direct return homeward by the outward route after such successes would have been enough for most expeditions. Not for this one.

This spring the crew of the Guba (see page 51) flew to nearby Australia. Then, chartered by the Australian government to survey an alternate route to England via the Indian Ocean and Central Africa, it took off on another adventure.

Accompanied by a Captain Taylor as a representative of the Australian government, the ship made its leisurely way across the Indian Ocean. Setting out during the first week in May it called at Batavia, flew over Christmas Island, stopped at Cocos Island, hopped to the Chagos group, then pushed on to Mahé, principal island of the Seychelles group approximately 1,000 miles from the east coast of Africa. June 21, it arrived at Mombassa, Kenya Colony, East Africa. By this time it had crossed 9,820 miles of open ocean since leaving Sydney. June 27, the plane arrived at Dakar on the west coast of Africa. A few days later it struck out over a new route, crossing to the Virgin Islands in the Caribbean. July 2, the crew was home in New York for an elaborate reception at the New York World's Fair. In all, the expedition had completed some 700 hours of the sheerest type of pioneering flight without a single serious untoward incident.

SAN DIEGO UNION: THUR

Union July 13-39

Flying Boat Will Hop Today For England

Completing the second leg of a 5000-mile flight from San Diego to England for delivery to British Royal Air force, the big Consolidated flying boat which left here Monday, landed smoothly at Botwood, Newfoundland, at 12:40 p.m. (P.S.T.), The Associated Press reported.

Consolidated officials received the following message from crew members:

"Will hop 5:30 a. m. (P.S.T.) for Felixstowe, England. Excellent service here. Everything going well. Ship fine. Weather looks good for tomorrow."

Members of the crew told The Associated Press they would take off this morning for the 2400 mile hop to Felixstowe, England. Originally it had been planned that Pilot Russell Rogers and his three-man crew would leave tonight after refueling the 15-ton ship.

The big craft settled down on Exploits river after an eight-hour flight from Buffalo, N. Y., where it landed Tuesday in adverse weather, breaking a planned non-stop flight from San Diego to Botwood.

Besides Rogers, crewmen aboard are Lewis A. Yancey, navigator and relief pilot; Raymond Booth, radio man; and Gerald Brown, engineer.

CONSAIR BOMBER SPANNING OCEAN

S.D. SUN 7-13-39

Three days out of San Diego a Consolidated patrol bomber today was spanning the North Atlantic from Botwood, Newfoundland, to Felixstowe, England, 2450 miles away, the United Press reported.

At noon (PST), the airboat, averaging approximately 190 miles per hour in perfect flying conditions, was half way across. The crew radioed Barney F. Boyd, local amateur wireless operator, that they expected to reach England at 7 p. m. (PST).

The 13-ton plane, with a four-man crew, arrived at Botwood at 12:40 p. m. (PST) yesterday, after an 1100-mile flight from Buffalo, N. Y., where it was forced down Tuesday when its fuel supply fell below the safety factor on an attempted 3300-mile non-stop hop from San Diego to Newfoundland.

The bomber is being delivered to the British Royal Air Force. In the crew are Chief Pilot Russell Rogers, Navigator and Co-Pilot Lewis Yancey, Engineer Gerald Brown and Radioman Raymond Booth.

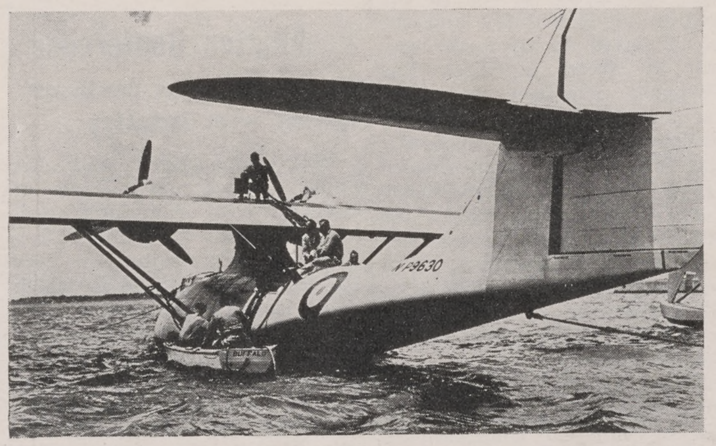
Aviation Aug/39

Flyaway Factory

Consolidated makes first trans-Atlantic delivery

Twenty-two years ago, a lot of high-pitched crowing was going on in this country about (1) How many tens of thousands of combat planes the U. S. was about to build and deliver to Europe. (2) How the biggest of these were going to be delivered by flying them across the Atlantic. Cynics on the subject of war-time propaganda as dished out for home consumption may therefore relish the facts that (1) The U. S. has already this year delivered more combat planes to England and France than it did during the entire war period. (2) That just last month the first military aircraft ever to be delivered by air across the Atlantic arrived in England.

Not that the delivery on July 14, of the Royal Air Force's new fifteen-ton Consolidated patrol-bomber was not a brilliant enough feat of airmanship. The crew was no amateur one. Russel Rogers was pilot; Lewis A. Yancey, navigator and relief pilot; Raymond Booth, radio man; and Gerald Brown, engineer. All of them were just returned from the brilliant Archbold round-the-world flight described in another column. First plans were to make the first stop out of San Diego at Botwood, Newfoundland, but the first leg of the trip, which started July 10, was ended at Buffalo after the ship had run into severe headwind conditions while crossing the Middle West. The next day, the big ship pushed on toward Botwood. The day after that with no more fanfare than as if they were ferrying their big Consolidated across San Francisco Bay, Rogers and his crew crossed over to land at Felixstowe, England.



DELIVERY SERVICE PLUS: The R.A.F.'s new Consolidated pauses at Buffalo.

Union 7-14-39

S. D. Flying Boat Lands in England

After a 2400-mile hop from Botwood, Newfoundland the giant Consolidated flying boat which left here Monday for delivery to British Royal Air force, yesterday completed its journey to England. Bernard F. Boyd, local amateur radio operator, received a message from the crew stating they landed at Felixstowe, England, at 8:56 last night.

The flight from Botwood took more than 15 hours. The crew had planned a non-stop voyage from San Diego to Botwood, but the craft was forced to land in Buffalo, N. Y., Tuesday because of adverse weather. Crew members are Russell Rogers, pilot; Lewis A. Yancey, navigator and relief pilot; Raymond Booth, radio man, and Gerald Brown, engineer.

U.S. Guards New 52-Passenger Plane Able to Fly 10,000 Miles Non-Stop

Military Chiefs Study Craft as Possible Bomber

Paris Edition N.Y.

Huge Flying Boat Expected To Make Boston-Azores Run in About 15 Hours

HEROLD TRIBUNE.

Censorship Clamped Down

5-30-39

Government Action Follows Series of Secret Tests

By United Press

SAN DIEGO, Calif., May 29.—Day and night guards watch the secret 52-passenger flying boat developed by Consolidated Aircraft to cross the Atlantic in less than 15 hours and said to be capable of a 10,000-mile cruising range.

Trial flights of the twin-motored "commercial" airboat revealed military possibilities of the giant craft so significant that government and company officials immediately clamped a rigid censorship on the craft's performance.

Sole comment relative to the ship's possibilities was made by William Wheatley, chief test pilot, only man to whom the half-million dollar plane has been intrusted for trials. The veteran test pilot merely remarked he was "well pleased" with the first test flights.

Since its construction began behind locked doors on August 1, 1938, Consolidated has refused to divulge information regarding the plane, denying until its launching that such an airboat was being built.

U. S. Asks Secrecy

Although officials described the plane as a "commercial experimental" ship and not of military design, U. S. military officials were given access to the plans, and Navy Department attachés evidenced great interest in its possibilities as a long-range bomber, asking that construction details be kept secret.

Several new principles of design are included in the radically constructed ship. Two of these, the 110-foot Davis "perfect curve" wing and the two, 2,000 horsepower Wright 18-cylinder engines, are closely guarded secrets.

The "perfect" wing was invented by David R. Davis, former partner of Donald Douglas, plane manufacturer, from a formula evolved after 10 years of experimenting.

Speed increases of 20 per cent are attributed by engineers to the use of the Davis wing, which is capable of lifting and carrying the 25-ton plane at an estimated 275 miles an hour for non-stop distances up to 10,000 miles.

Two Giant Propellers

Pulling the plane through the air are two, three-bladed propellers 16 feet in diameter and powered by the Wright twin-row radial engines, largest ever installed in an airliner.

Although not an amphibian, the huge airboat carries hydraulically-operated retractable floats and tricycle landing gear which will enable it to be beached largely under its own power.

Twin fins and rudders feature the tail assembly, constructed to maintain stability at high speeds, the builders said.

A maximum of 52 passengers can be accommodated in the steep-hulled craft, with sleeping compartments berthing 28. The ship is double-decked and carries a crew of five: pilot, co-pilot, flight engineer, radio operator and navigator.

Fuel capacity of the model 31 is estimated at 5,000 gallons, giving it a cruising range of 10,000 miles.

Its predecessors, the PBY Navy bombers, famed for their non-stop flights from San Diego to Hawaii and Panama, have a fuel capacity of only 1,760 gallons.

Suited for Military Use

For military use, it can quickly be converted into an aerial arsenal, with a minimum of eight machine guns or small cannon mounted on all sides of its narrow, extremely steep hull. At its launching, however, it had no armament.

Consolidated engineers refused to comment on plans for mass construction of the new ship until air tests have been completed late this summer. Trials will continue for the next few weeks to "clean out" construction flaws as fast as they are found.

A possible buyer for the big ships is American Export Airlines, competitor of Pan American Airways for commercial air transportation across the Atlantic.

American Export was said to be interested in purchasing a fleet of the ships if trials prove them to be capable of transporting heavy pay loads economically over long distances.

The builders said the big ship would be expected to make the Boston to Azores run in approximately 15 hours. Pan American's Yankee Clipper flew the 2,880-mile route from Baltimore to the Azores in 17 hours and 33 minutes on March 26, 1939.

May 20

U.S.A. AIRPLANES TO DO BIG JOBS FOR BRITAIN

London Evening Standard

By ROBERT WALLING

Evening Standard Aviation Correspondent

WITH the start of Britain's Atlantic air mail service seriously delayed there comes news to-day that two American flying boats, of a type of which 230 are being supplied to the United States navy, will take a prominent part in aviation in this country in July.

Meanwhile, it is reported to-day that the American air-mail service across the Atlantic starts to-day. The destination is Marseilles.

The first American flying boat has been bought by the Air Ministry. It will be flown direct to Felixstowe, where Government experts will discover its secrets.

The aircraft will fly 2450 miles across the Atlantic from Botwood, Newfoundland, after a still longer non-stop flight of 3300 miles from the Consolidated Aircraft Factory at San Diego, California. The total distance of this "delivery flight" will therefore be 5750 miles, with one stop. It will arrive during the first week in July.

The second flying boat, from the same factory, is to be employed on a survey flight on a new British Empire route.

The Government want to survey a new route across the Indian Ocean from East Africa to Australia, with landings at groups of British islands on the way.

START FROM AUSTRALIA

The object is to provide a safe Empire route as an alternative, in case of war, to the present route across the Mediterranean.

Apparently no British flying boat capable of the journey is available.

In Australia Captain Richard Archbold, a wealthy young American, is now preparing this American flying boat for the survey flight. He has been commissioned by the Australian Government and will be making it in the reverse direction—to Africa.

Only a few days ago it was announced that Britain had agreed to pay £3500 towards the expense of this flight.

I am told officially that the British Government placed the entire arrangements, including the supply of the aircraft, in the hands of the Australian Government.

New Military Orders

Pratt & Whitney, awarded $929,074 by Navy for engines and spare parts.

Elgin National Watch, awarded $13,597 for aircraft clocks.

K. E. Parker Company, awarded $845,221 for store house and power plant buildings at Naval Air Station, Alameda, Calif.

Fairchild received a tentative Army award of $1,579,338 for light training planes Model M-6-2, two place tandem low wing, with Ranger engine, following a design competition.

Ryan got a tentative award of $19,350 for a number of STA-1 wire-braced low wing tandem fabric-covered training planes, with Monasco engines, following design competition.

General Electric was awarded $2,678,852 for radio transmitting equipment for heavy and medium bombardment planes, including $417,643 for radio for short range liaison planes. Also $25,400 for superchargers.

Pratt & Whitney, $56,250 for engines.

Pioneer Instrument, $506,710 for indicator assemblies and venturi tubes, War Department.

Kollsman Instrument, $494,940 for altimeter assemblies, War Department.

Wright Aeronautical, $50,824 for engine parts.

Curtiss Airplane, tentative award of $5,000,000 for high-wing-strut-braced monoplanes, P. & W. Wasps, following design competition.

Sperry Gyroscope, $1,765,157, for sound locators.

Consolidated Aircraft, about $8,485,000 for four-engine bombardment planes, similar to Consolidated Type B-24.

Boeing Aircraft, about $8,090,000 for four-engine bombardment, similar to B-17B, which established the Los Angeles-New York course record with crew and passengers at 263.8 mph.

Glenn L. Martin, about $15,815,000, for medium bombers.

North American, about $11,771,000 for medium bombers. Also $1,326,000 for advanced training planes of type used at Randolph Field. Also $2,707,000 for basic trainers similar to BC-1.

Vultee, about $2,986,000, for trainers not described.

Boeing Airplane, Stearman Division, about $668,000 for primary trainers, modern versions of PT-13, the standard trainer in Texas.

Lockheed Aircraft, $4,845,000 for twin-engined interceptor pursuits, similar to Lockheed P-38, twin engines.

A $21,000,000 order of engines for War Department planes will be divided among four manufacturers approximately as follows:

United Aircraft, $12,320,000; Wright Aeronautical, $7,000,000; Allison Engine, $2,275,000; Aviation Corporation, Lycoming, $270,000.

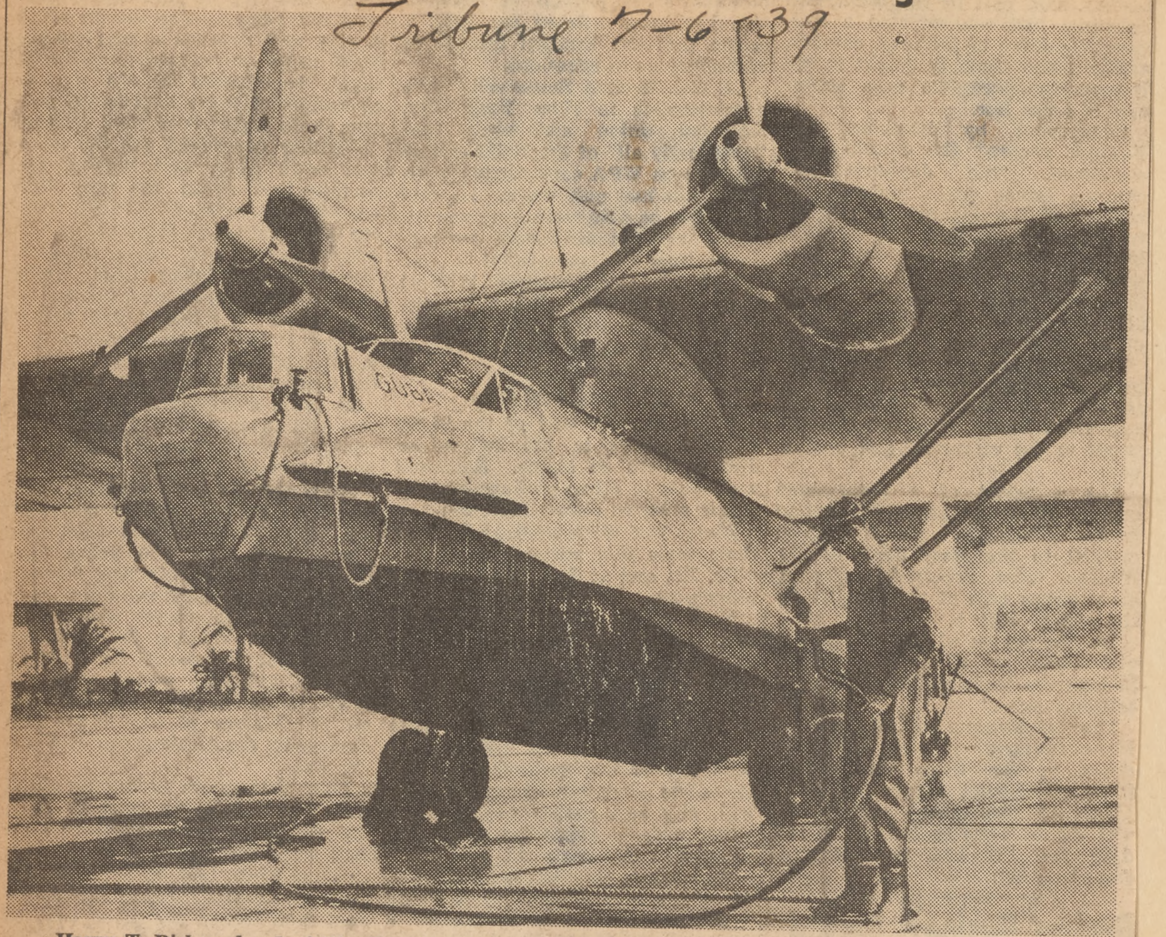
Seversky Aircraft, $3,478,000 for single engine interceptor planes.

Bell Aircraft, $2,839,000, for single engine interceptors.

Aviation 10/39

Guba Gets San Diego Bath After Round-World Flight

Tribune 7-6-39



Harry T. Bishop, head of The Evening Tribune art and photographic department, found the answer today to the question of what happens to airplanes right after they make a round-the-world flight. Soon after he Guba alighted on San Diego bay, Bishop went to Lindbergh field and found the big plane getting a bath from a Consolidated Aircraft Corp. employe. A few minutes later the plane was towed from the ramp to the Consolidated plant for a check

TAKING NEW PLANE TO ENGLAND ON WEEK-END FLIGHT

Speeding up the return flight to San Diego, Russell Rogers, pilot of Richard Archbold's $250,000 Consolidated-built flying boat Guba, which has completed a round-the-world flight, brought the Guba down on San Diego bay at 5:15 a.m. today. Rogers and other crew members left New Orleans at 8 p.m. yesterday, four hours ahead of schedule.

Archbold is remaining in New York, where the Guba arrived Saturday after a flight from the Virgin islands. Rogers and the crew of the Guba will remain in San Diego until this week-end, when they take off for England in a Consolidated PBY plane built for the British government, flying from here via Botwood, N. F.

For Lewis A. Yancey, navigator of the Guba, this week is memorable in that it marks the return of the Guba to San Diego from a flight around the world and also the 10th anniversary of the start of his flight with Roger O. Williams, to Rome. Yancey and Williams left New York for Rome, July 8, in the plane Pathfinder, and landed at Littorioi airport, Rome, July 10. Among those who welcomed the America nairmen, first to make a New York-Rome flight, were Italo Balboa, then Italian under-secretary for aviation, and Francesco de Pinedo, Italian air hero. Yancey later made more aviation history when he was the first flier to pilot an autogiro to Cuba and Mexico in 1932.

In the Guba when it landed here were Rogers, Lewis B. Yancey, navigator; Gerald D. Brown, flight engineer; Stephen Barrinka, assistant flight engineer, and Ray Booth, radio operator. Harold Ramm, radioman during the 10½ months' stay of the Guba in New Guinea, where Archbold carried on scientific work for the American Museum of Natural History, of which he is a research associate, returned here by steamer a few weeks ago.

Welcomed by Few

Because of its early arrival, only a few persons were on hand to welcome the Guba. These included: Ramm and Mrs. Ramm, Barney Boyd, San Diego radio amateur who maintained radio contact with the plane from San Diego, and Mrs. Boyd; William Anderson, Boyd's brother-in-law; Jack Kline, Consolidated assistant final assembly foreman, and Frank Learman jr., assistant to the president, Consoli-

dated. The Guba's crew will be honored tomorrow at a luncheon to be given at the Cuyamaca club by the aviation committee of the chamber of commerce.

"There were no highlights to our flight," declared Rogers. "Ever since leaving San Diego more than a year ago we have had just a

(Continued on Next Page, Col. 4)

Guba Returns With Crew

CONTINUED FROM PAGE ONE

series of pleasant air trips, and the Guba did not give us one second's trouble."

All flights in New Guinea from Hollandia, on the coast, to the interior were made according to set schedules, carried out to the minute, said Rogers. He reported the Guba made 165 flights in New Guinea, covering approximately 50,000 miles and transporting approximately 40,000 specimens of birds, mammals and plants, which were shipped by steamer to New York. He voiced praise for the cooperation shown by the government of The Netherlands in the expedition's work.

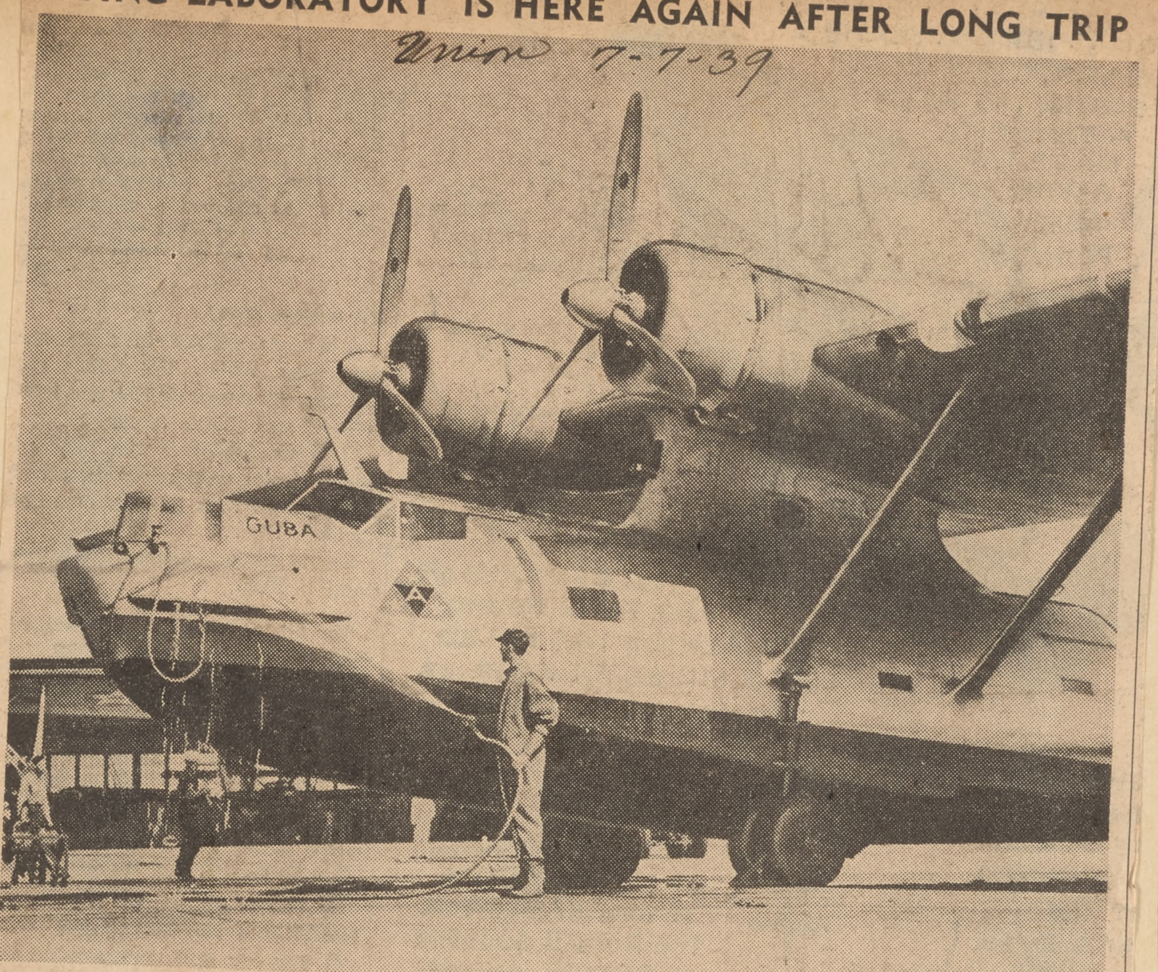
SAN DIEGO, CALIFORNIA, FRIDA

'FLYING LABORATORY' IS HERE AGAIN AFTER LONG TRIP

Union 7-7-39



Back home at Lindbergh field after writing another brilliant chapter in aviation history. Richard Archbold's "flying laboratory," the Guba, is getting a bath after its record flight from Sydney to San Diego via Africa, the West Indies, New York and New Orleans.

* * *

Guba Returns to San Diego

Archbold Plane Makes Records in Science, Aviation

Taking its place in America's aviation hall of fame along with Lindbergh's Spirit of St. Louis and Kelly and Macready's famed T-2, the Guba, Richard Archbold's $250,000 "flying laboratory," returned to San Diego yesterday from a 120,000-mile flight. The Guba landed at 5:15 a.m. after an 11-hour flight overland from New Orleans. It started its homeward voyage from Sydney, Australia.

Since the Consolidated-built boat left San Diego June 2, 1938, it engaged in a scientific mission for the American Museum of Natural History in Netherlands New Guinea; blazed new airways over the Indian ocean to Africa, spanned the African continent and flew more than 15,000 miles over the Atlantic and Pacific oceans.

ARCHBOLD STAYS EAST

The huge flying boat made the last lap of its flight manned by Russell Rogers, pilot; Capt. Lewis Yancy, navigator; Raymond Booth, radioman; Gerald Brown and Stephen Barrinka, engineers. Archbold remained in New York.

Within the next 72 hours Rogers, Yancey, Booth and Brown will leave Lindbergh field on another epochal flight. As members of a crew of a Consolidated-built flying boat to be delivered to the British Royal air force at Felixstowe, England, they will take to the air either Saturday or Monday on the 5750-mile transcontinental, transoceanic flight.

The flight track will be from San Diego to Botwood, Newfoundland, via Wichita and Detroit, over the Canadian airways to Montreal and Quebec, thence to Botwood, 3300 miles airline. It will be the longest overland flight ever attempted by a flying boat.

TO FOLLOW CIRCLE

The great circle route over the Atlantic will be followed to the coast of Ireland, thence over the Irish channel to Cardigan bay, where a course will be set for Felixstowe.

Rogers reported the Guba made about 150 flights while in Netherlands New Guinea. Most of these were with supplies from the main base at Hollandia to Lake Habbema, 125 miles in the interior, and to Mt. Wilhelmina.

Specimens obtained by the expedition for the American Museum of Natural History included a number of small birds with bluish-black body and brilliant red hued throats which live only at high altitudes in the Mt. Wilhelmina region; three climbing kangaroos, four of which are en route to the local zoo from Sydney aboard the liner Mariposa; huge rats described as being four feet long and eight inches high, and beautiful birds of paradise.

WILL BE OVERHAULED

The Guba is to be overhauled at Consolidated and made ready for further air adventures by Archbold.

Among the few persons who greeted the returned airmen when they landed at Lindbergh field at dawn was Barney Boyd, local radio amateur, who kept in almost constant touch with the Guba during its 13 months of flying over the airways of three continents.

PILOT OF BOMBER SEEKS ADVENTURE IN JUNGLES AGAIN

Buffalo

Capt. Rogers Will Return to New Guinea, Where Failure of Motor Means Death at Hands of Head Hunters.

about 7-11-39

Capt. Russell R. Rogers, who was roaring through the skies today toward Newfoundland and England in his giant Consolidated Aircraft Corporation flying boat, is looking forward to the return to his tropic base in New Guinea "where flying's really dangerous."

It was shortly before the big patrol bomber took off at 7:29 o'clock this morning from the Niagara River that Capt. Rogers recounted some of his adventures in the tropics. The flying boat remained in Buffalo overnight after being forced down here to refuel.

Rugged, river-cut jungles and snow-capped mountain ranges give motor trouble in New Guinea "the thudding of death drums." Because if the crash doesn't kill you, there are always the head-hunting natives to contend with.

Eleven Months in Jungle.

For 11 months Capt. Rogers and Lewis Yancey, his navigator, ferried equipment and supplies inland there for the American Museum of Natural History. On July 1 they arrived back in New York City after circling the globe.

"We're on leave of absence from the museum now," Capt. Rogers explained Tuesday night. "Richard Archibold, head of the museum's field staff, is in Java now making arrangements for another New Guinea expedition to start in eight months. Yancey and I are anxious to get back."

The two fliers left San Diego June 2, 1938, in a plane similar to the one they are taking to England. A week later, after stops at Honolulu and the Island of Wake, they arrived in Dutch New Guinea.

Base in Hollandia.

Hollandia, a small town on the northern coast of the island, which is north of Australia, formed their base.

During their stay they transported 290 tons of scientific equipment, food, and supplies 225 miles inland to Lake Habbema, knocking the seats out of the plane to provide more baggage space.

"We also ferried in the entire pary of 186 men, including 80 native Dyak carriers, eight museum naturalists, and Dutch soldiers for protection," Capt. Rogers said.

"The natives are cannibals and head hunters, still in the wood and stone age, and fierce fighters. And proud! We wanted to make a temporary base on one of the rivers. We negotiated for days. Finally they made us buy the giant camphor trees on the banks before we could cut them down."

Currency of Shells.

Cowrie shells are currency there, with 6 or 8 shells the price of a full-grown tree.

"Because they have 125 inches of rain a year, the natives are planting trees to prevent erosion of the soil," the captain said. "They have an elaborate drainage system, consisting of small canals. The banks are coated with a clay similar to our cement."

Lake Habbema, their inland base, is 11,342 feet above sea level—one of the highest altitudes from which a flying boat has ever operated, Capt. Rogers believes. Though only 250 miles from the equator, a skim of ice forms over open water every night. Circling mountain ranges rise to 17,000 feet.

"Luckily, the plane never coughed or got us into tight spots where a forced landing was necessary," Capt. Rogers said.

40,000 Specimens Collected.

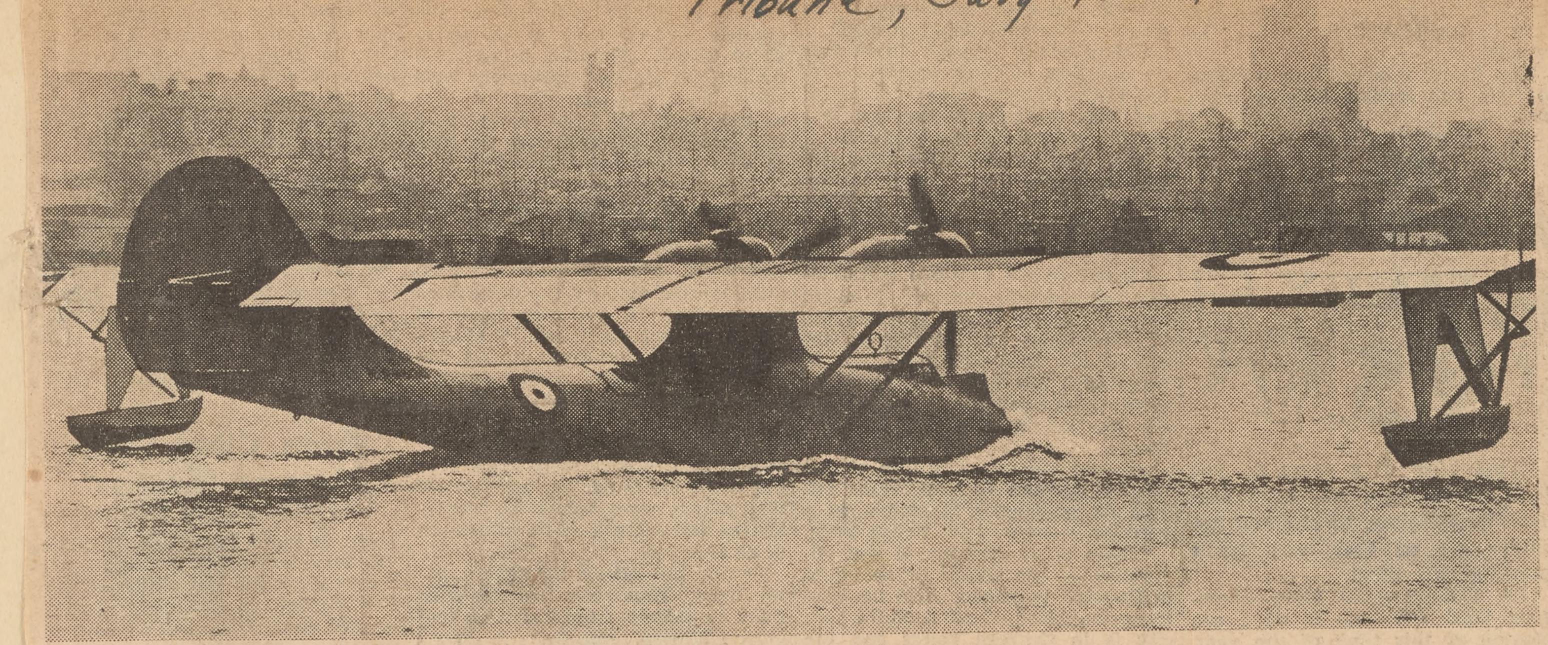
Spare motors and triple-bladed propellors were kept at the Hollandia base. Because travel on foot was impossible, the entire expedition was transported out of the jungle by plane. They brought out 40,000 specimens—plants, flowers, small animals and caged parrots, bower-birds and the famed birds of paradise.

On the return trip, which pushed their year's travel over the 100,000-mile mark, the fliers visited Cocus Island, Dago Garcia, Seychelles and Mombasa in the Indian Ocean while mapping out an alternate route to the continent for the Australian Government.

The flight to New York City was made by way of Lake Victoria and Cocquilhatville in the Belgian Congo.

Consair Airboat Speeding East on Delivery Hop to Britain; 'All Well,' Radio Message

Tribune, July 10-39



Consolidated's Model 28-5 as it made its second take-off for England today.

TAKES OFF AGAIN AFTER RETURN HERE AS DEFECT FOUND

Consolidated's Model 28-5, twin-engined flying boat built for the British government, made its second take-off for England at 8:23 a.m. today after returning here yesterday morning because of trouble with the craft's automatic pilot when the plane was over Salton sea. It is expected to land at Botwood, N. F., tomorrow for refueling, and depart immediately for the flight across the north Atlantic to Felixtowe, Eng., 5750 miles from San Diego.

At 10:30 a.m. the plane was 230 miles east of San Diego, according to a message received from the craft by Barney Boyd, local radio amateur. Those on the plane reported "everything going nicely." Noon contact with the plane was not made, but by mid-afternoon Boyd said he expected to have another report on the airboat's position.

Gyro Fails To Function

The delivery flight began yesterday under auspicious circumstances, with the plane functioning perfectly and excellent weather forecast for the 3300-mile flight to Botwood. Over the Salton sea the Sperry gyro failed to function, and rather than deliver the craft to British authorities with a broken piece of equipment, Russell Rogers, captain and chief pilot, brought the plane back to San Diego, landing here at 9:15 a.m.

Repairs to the automatic pilot were made by an expert from the naval air station, and Rogers took the plane aloft shortly before dusk yesterday for a short trial flight. Weather conditions for the flight today were declared equally as good as those yesterday, and the flight across the continent is expected to be made without incident, Consolidated officials reported. They pointed out the craft could have been flown to England without the use of the automatic pilot, but wished it to be delivered with all parts in good condition.

Like Archbold's Guba

Model 28-5, a commercial development of the navy PBY planes and similar to Richard Archbold's Guba, which returned here last week from New Guinea, is being flown by the crew of the Guba. With Rogers are Lewis A. Yancey, co-pilot and navigator; Raymond Booth, radio operator, and Gerald Brown, flight engineer.

From San Diego to Newfoundland the plane is scheduled to fly over Phoenix, Albuquerque, Amarillo, Wichita and Kansas City, near Chicago and Detroit, and over Lake St. Clair, Toronto, Ottawa and Montreal. Had yesterday's flight been completed, Rogers said he and the other crew members expected to make only a two-hour stop-over

(Continued on Next Page, Col. 6)

Consair Plane Off For Britain Delivery

CONTINUED FROM PAGE ONE

this morning at Botwood before continuing to Felixtowe. After the plane is delivered, the crew members will return to this country on the liner Washington July 27, coming to San Diego for further flight duty with the Guba.

"The purpose of the flight is to deliver Model 28-5 to the British Air Ministry," states a Consolidated announcement. "The plane is owned by Consolidated Aircraft Corp. until completion of the delivery flight."

Totes Full Equipment

Unlike the many over-water "routine delivery flights" which the navy has made with Consolidated PBY planes, Model 28-5 will cross the Atlantic without benefit of surface ships stationed over the route of the flight. The craft, however, carries complete navigational equipment, a seven-man life raft, life jackets, parachute flares, signal equipment, water supply, a still, and emergency rations, the equipment in general being similar to that used by the navy department for long distance flights. In the navy's over-water delivery flights, made from San Diego to Honolulu and from here to Panama, 12 planes or more have been flown at a time, and to date no forced landings on the high seas during the delivery flights have been necessary.

Model 28-5 is powered with two Pratt and Whitney twin-row Wasp engines, and two Hamilton standard constant speed propellers. It is equipped with Sperry gyro and blind flying instruments. It has American registration No. NRP9630 and British No. P9630, as well as British insignia on the wing and hull. Radio installtion includes two Bendix transmitters, operating on frequencies selected for transcontinental and north Atlantic route operation; two Bendix all-wave receivers, having a tuning range of from 150 to 1500 kc. and 1800 to 15,000 kc., capable of receiving telephone and c.w. signals, and one Bendix radio direction finder.

AIR GIANT HALTS HERE TO REFUEL, STAYS 24 HOURS

Huge flying boat, on hop from West Coast to England, finds facilities lacking here

Buffalo was an unexpected and unprepared host to a famous giant of the air yesterday, when a fifteen-ton Consolidated Aircraft patrol bomber, en route to England, nosed down into Buffalo Harbor "just to refuel" and remained for 24 hours.

First of the huge planes to visit Buffalo, the big flying boat was an immediate center of attention. Crowds began flocking to the foot of Georgia Street early in the afternoon to see a plane which was on its way to a new distance and time record until it bumped into the snag of the complete lack of facilities constituting this city's so-called Marine Airport.

Pilot Annoyed

Capt. Russell R. Rogers of New York City, pilot of the huge plane, was decidedly annoyed at the "various unexpected circumstances" that transformed the projected one-stop flight from San Diego to Felixstone, England, into a two-stop journey with a 24-hour "interesting but irritating" stopover in Buffalo. The delay was caused because of a mix-up in ordering gas to refuel the plane, because of a delay caused by Rogers' disappearance for several hours yesterday morning, and because of temporary difficulty in locating enough of the right kind of gasoline for the big plane.

All of these incidents, however, hinged on and were directly related to the complete lack of facilities for such emergencies at the marine air base.

by 1.30 o'clock yesterday afternoon, but Pilot Rogers decided against taking off at that hour for the trip to Botwood, Bay of Exploits, Newfoundland. Instead, the ship will leave for Botwood, its original first-stop destination, at dawn today. This will eliminate any possibility of the big plane landing in the unfamiliar Newfoundland territory after dark.

R. Leslie (Doc) Marsden of the Buffalo Aeronautical Corporation was in charge of refueling the big plane, in accord with the current procedure of that company gas-

FLYING BOAT
Continued on Page Twenty

FLYING BOAT

Continued from Page Eleven

servicing all planes at Buffalo Airport other than Curtiss and Bell craft, which have their own private supplies. This service formerly was operated by the city, but was turned over to the private company on July 1st. Marsden reported receiving a call from New York City, asking that the plane be refueled at 7.30 o'clock yesterday morning. The fifteen-ton plane landed in Buffalo harbor at 6.45 a. m.

Capt. Rogers was under the impression that refueling arrangements had been made and expected a gas truck to meet the big boat, but none was on hand. He reported to New York and the New York office of the flight in turn called the Buffalo Aeronautical Company.

Marsden promptly hastened to locate a supply and made arrangements for refueling the plane. He arrived at the marine air base at 8.30 o'clock, but it was 10.30 before he could find the pilot and have the big plane towed close to the concrete "apron."

The plane was fueled from the big army truck based at the Buffalo Airport, by use of an extra 100 feet of hose. Into its tanks went 965 gallons of gasoline. The refueling took 55 minutes.

Wanted to Be "Sure"

Capt. Rogers said that the ship's fuel capacity was 1,750 gallons and stated his belief that he had had enough to reach Botwood, but that he had "just wanted to be sure." On the flight from San Diego the plane bucked heavy head winds.

The flight delay blasted the flight captain's plan to dine at Claridge's in London, England, this evening.

Welcome as the unexpected visitors were, the emergency landing of yesterday is expected to "bust wide open" the old Marine Airport situation which has been a center of many Council fights and much civic propaganda. It is a subject that reached fever pitch in the days of the famous Balbo flight from Italy to Chicago five years ago, when Buffalo was skipped because it had no place to house flying boats.

It was pointed out then, as it was yesterday, that although the city spent $123,000 for a Marine Airport, it has at the foot of Georgia Street a vast expanse of concrete, and nothing more. There is no building of any kind at the base. There is no telephone or any means of communication with the Municipal Airport. There are no gas tanks, not even a rowboat, in fact not even a tow rope. No effort is made to keep the water near the airport free of logs or other floating objects that might endanger flying boats.

The Marine "Airport" is a concrete platform 300 feet wide by 460 feet long, with a ramp into the water 90 feet wide by 149 feet long. It is reached by climbing over railroad tracks and after coming to the impasse of a dead end street. Many citizens have been unable to find it at all. In recent years it has been used as a "swimming hole" for citizens, disastrously so on Monday.

"Capt. Rogers evidently contacted the Coast Guard on arrival and was rowed to shore," Marsden said in reviewing the refueling delay. "We had no advance information of his stop here. He called his New York office and they called us. I went immediately to the marine base, hired a boat and went out to the plane, but the pilot was not on board and we spent the next three hours trying to locate him. I tried all the hotels, clubs and restaurants and finally thought of the Coast Guard base, where I found him. I made arrangements for him to move the plane in, and got the truck down. The whole maneuver then took less than an hour."

The crew of the big plane includes Capt. Rogers, Lewis A. Yancey, navigator; Raymond Booth, radio man, and Gerald Brown, engineer. The four fliers returned July 1st from a round-the-world flight for the American Museum of Natural History.

Brief Stop at Botwood

In discussing continuation of his flight last night, Capt. Rogers estimated the plane will travel at a cruising speed of 125 miles an hour today and should make the 1,150-mile hop from here to Botwood in eight or nine hours. Rogers said he would stop at Botwood only to refuel and check his ship, and then take off for England immediately.

Capt. Rogers planned to spend the night as the guest of George Cobb, aeronautical engineer, with whom he flew for Pan-American Airways several years ago. The remaining members of the crew, with the exception of the mechanic, who spent the night on the plane, stopped at Hotel Statler.

Unexpected Visitor Finds City Unprepared

Buffalo. 7-12-39

N P9630
BUFFALO

Dropping in at Buffalo's Marine Airport for a refueling stop, the huge Consolidated flying boat pictured above remained for 24 hours because of the city's lack of facilities at its harbor air base. The huge patrol bomber was on what was scheduled to be a one-stop flight from San Diego, Cal., to Felixstowe, England.

American Export Line's twin-motored plane which has just completed a trans-Atlantic survey flight. Capt. P. J. Byrne is in command of a crew of six.

U. S. Boat Line Takes to Air In Trans-Atlantic Service

By a Staff Correspondent of The Christian Science Monitor

NEW YORK, July 12—Completion of the first round-trip survey flight to Europe of the American Export Airlines this week brings a steamship company into international aviation—a notable innovation for one of the world's oldest businesses.

Decision of the steamship company to take to the air proved another case of progress being spurred by competition.

Severe Competition

For a number of years the American Export Steamship Lines has been running a fleet of standard 10,000-ton passenger and freight combination boats to the Mediterranean. But the Company had severe competition from the large, good looking, and fast vessels of the Government-operated Italian Line.

Under his policy of "not spending money you haven't got," William H. Coverdale, President of the American concern, saw no chance of building rival luxury liners. But he did recognize the opportunity of resorting to the air, and asked his competitor to help him.

Competition between the two companies already was friendly both using the same wharfs, etc. The Italian airplane service, Ala Littoria, likewise Government-run, lent its co-operation, because of the possibility of its using the same facilities when setting up its own flying service across the Atlantic.

Unique Equipment

With 14 ships between them, the two fleets had a unique surface equipment for weather reports and other messages.

The trial flight just finished found the ship-plane tie-in working effectively, according to Capt. P. Y. Byrne of the American Export Airlines' twin-motored plane Transatlantic. He flew over reporting ships about every 200 miles across the entire route.

Wednesday, July 12, 1939 —— THE SAN DIEGO SUN

TINY ISLES NOW KEYS TO CANAL ZONE DEFENSE

American Planes Using Islands Could Spot Enemy Carriers

National Defense

War correspondent, Thomas M. Johnson gave special attention to air defense when NEA Service and The Sun sent him to the Canal Zone to get the thrilling story of the race to make the Big Ditch "safe-plus." Below, in the third of six articles, he gives a first-hand report of plans and preparations for repelling aerial invasion. — The Editor.

By THOMAS M. JOHNSON
War Correspondent and Author

ANCON, Panama Canal Zone, —"Smash that Canal at any cost! Even if none of you comes back—smash it!"

Those are the orders (grimly realistic American officials here told me) that an enemy leader would give to the pilots of his bombing planes in the event of war against the United States.

In the present vulnerable state of the Panama Canal, a hostile power would think nothing of losing a hundred or two hundred planes in a desperate effort to seal this vital waterway.

Planes might attack the Canal either in small raiding parties or in vast armadas.

Whence would they come?

A startling, threatening answer is given in the words of an American authority:

"We know that Germany has 3000 airplanes that can fly the South Atlantic."

And how could those airplanes or others menace the Panama Canal?

Perhaps from secret bases or nearby Central and South American coasts. Perhaps from potentially hostile islands like the Spanish Canaries, or undefended islands like the Portuguese Cape Verdes or Azores; or the many small islands that dot the Caribbean Sea.

And perhaps from airplane carriers. For instance, avoiding the regular Pacific ship lanes, enemy carriers might slip up and arrive some nightfall within 500 miles of the Canal Zone. Steaming all night, they would be close enough by dawn to launch planes. And one bomb — a 1000-pound bomb, perhaps—dropped on a lock that was built when airplane bombs were something H. G. Wells wrote about . . .

PACIFIC ISLES IMPORTANT TO CANAL

And look! About where that carrier started its final, thrusting dash, 480 miles out, is a dot on the map — Cocos Island, storied treasure-trove of pirate gold. Costa Rica owns it but no one has developed it, and the island lies deserted, inviting the invader.

"Come ashore," it says. "Establish your base. Fly over the Canal. Drop your bombs. Come back for more—and back—and back—until the Canal is a ditch full of junk. The Americans didn't want me—now you take me."

"Us, too," cry out Ecuador's Galapagos Islands, southwest and 875 miles out from Panama.

Those tiny isles, keys to the air defense of the Canal, invite the burglar's grasp. The Japanese know that. Their spy fishing boats have been there, taking observations and soundings.

Attention has been called to the islands' importance and it is hoped Congress will vote to lease or buy either the entire islands or the right to establish there warning stations whence our planes could patrol in great arcs 500 miles farther out to sea.

AIR DEFENSE NEEDS STRENGTHENING

"The Canal should be impregnable," said Maj. Gen. G. V. Strong, chief of the War Plans Division of the General Staff, concurring in the estimate of Maj. Gen. David I. Stone, commanding here.

To make it impregnable will take years at the present rate, depending on the money available.

Resources here for air defense need strengthening until this is a great aviation base like that just begun at Puerto Rico. The Canal wants 600 first rate airplanes. It is hoped that by autumn the air force here will at least be in a better position than it is now to put up a good fight.

It may be much longer before there are fully enough planes. The best here now are equal to the best of Germany and Italy.

The planes that recently gave a demonstration off the Fortified Islands on the Pacific Ocean side were very good planes. Later arrivals will be still better as the Army swings from the earlier 2320 airplane program into the 5500 airplane schedule. There is good authority for saying that Panama will get an ample share.

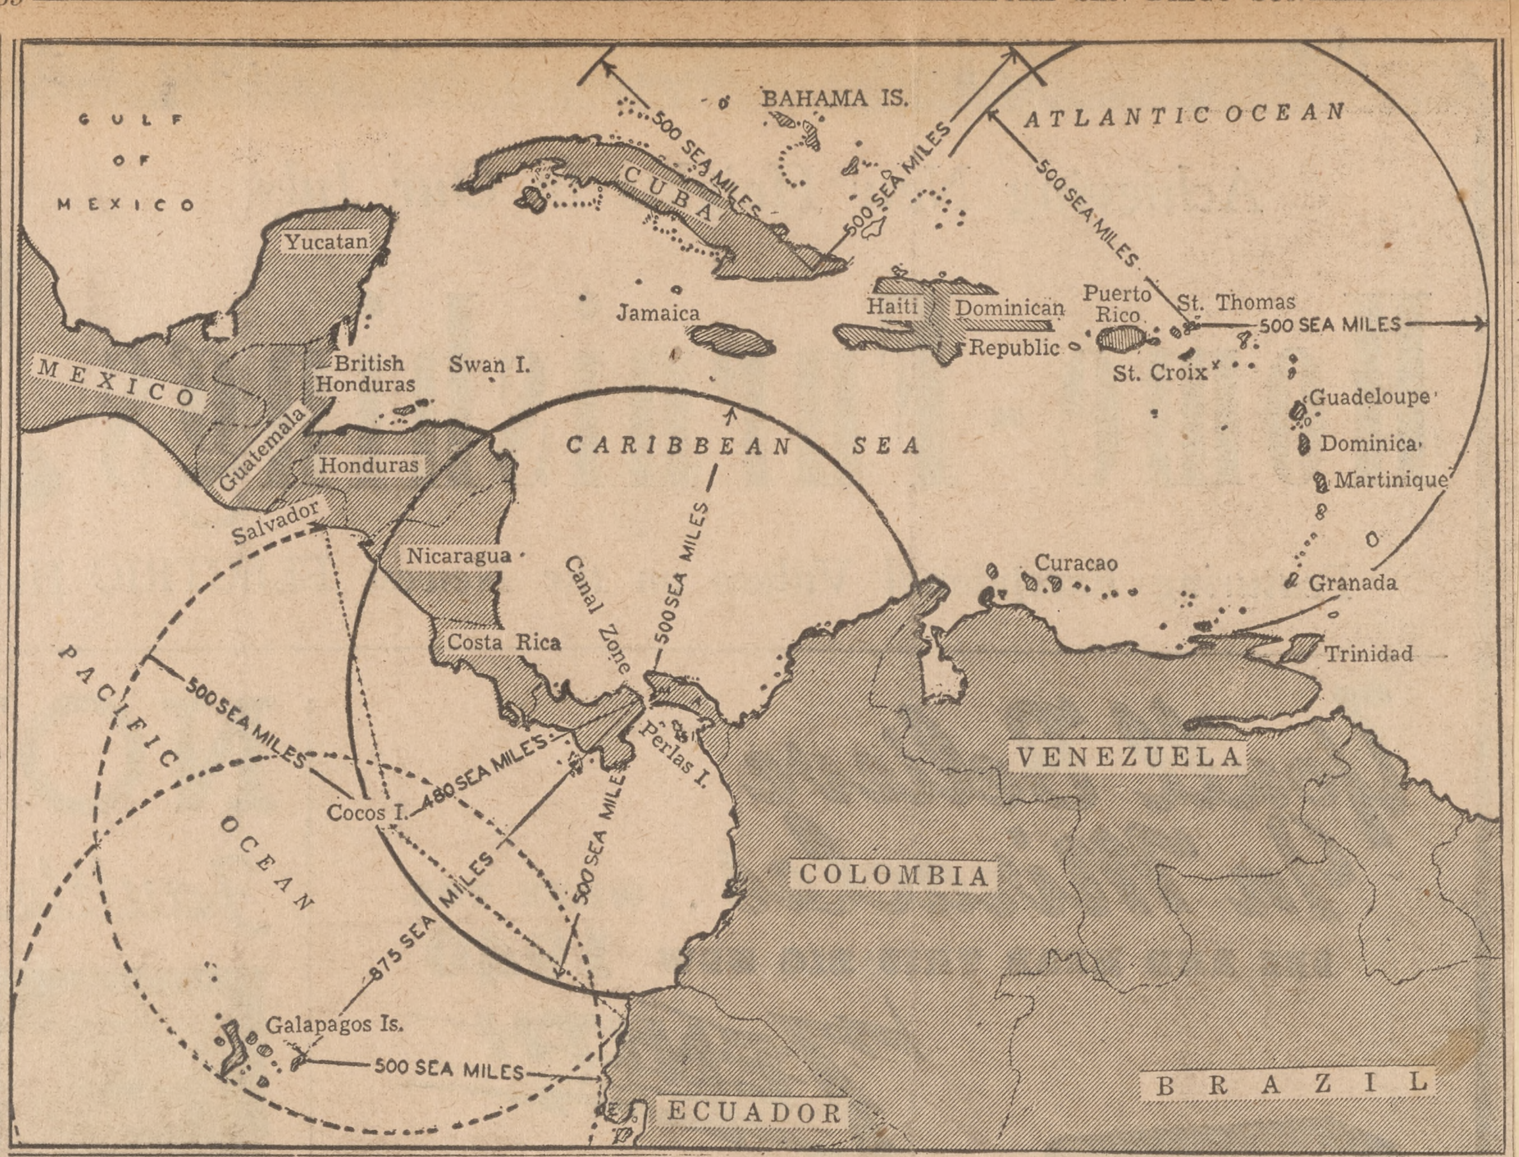
As jumping-off places, U. S. military planes now have two fields: at the Atlantic end, France Field; at the Pacific end, Albrook Field, whose runway has recently been concreted at a cost of $500,000. And $1,500,000 has been received to begin an air depot. The Pacific side also will get two more fields—one at a yet unchosen site, the other on 19,000 acres leased from the Republic of Panama at Rio Hato.

RAINS HAMPER DEFENSE PROGRAM

"If only war doesn't come this summer!" That is the prayer of everyone here, especially of those in charge of the anti-aircraft defense program.

The rainy season has stopped construction of roads that lead to a network of recently constructed anti-aircraft stations. From these stations bombing airplanes that managed to get near the Canal might be spotted by sound-locators and searchlights and brought down by anti-aircraft guns. To help equip these stations, the General Staff asked Congress for nearly a half-million.

Some equipment is coming in now, but little can be done with it until January, for the stations—many out in the jungle—are being marooned in mud



THE AERIAL DEFENSE OF THE CANAL ZONE—Air patrols are effective within a radius of 500 miles. The arcs or circles drawn in SOLID lines on the map above show the areas within which U. S. battle planes—operating from the Panama Canal itself, from St. Thomas and Puerto Rico, and from our base on the southeastern tip of Canada—could fly out to resist the approach of invaders. Thus, the Atlantic gateway to the Canal would seem to be well grounded. . . . On the Pacific side the situation is not so good. Enemy aircraft carriers could slip up to the edge of the 500-mile patrol zone without being detected and dispatch their bombers over the Canal . . . U. S. authorities urge, therefore, that we obtain bases on Cocos Island and the Galapagos Islands, so that our air patrols could operate over the Pacific within the 500-mile arcs indicated by the dotted lines.

Buffalo?

"ALL ABOARD FOR ENGLAND."—In completely casual fashion three fliers just returned from a round-the-world flight are shown preparing to go out in the rowboat at San Diego to the huge new flying boat in the distance which they will deliver in England. Sun 7-14-39

Colonel Ryan In San Diego On Aircraft Inspection

On a special tour of inspection of U. S. aircraft production facilities, Col. William Ryan of the Army Air Corps was to leave today after a visit to the Consolidated Aircraft Corp. and Ryan Aeronautical Co. plants.

Col. Ryan is on assignment by the Secretary of War, according to Consair officials.

Of special interest during his local stay were the four-motored bombers under construction at Consolidated for the Army Air Corps in a $2,800,000 contract, and the small single-engined training and observation planes being built at Ryan.

Edgar Gott, assistant to the president at Consolidated, reported today that the concern's bids on large-scale production of two and four-motored Army bombers now are being compared by the War Department in Washington with estimates of other companies.

Results of the competitive bidding may be announced within the next two weeks, Mr. Gott said. Maj. Reuben H. Fleet, Consolidated president, "stood by" in Dayton, O., last week when bids for eight different types of planes were opened in Wright Field, the Army Air Corps' research center.

CONSAIR BOMBER IN ENGLAND

Sun 7-14-39

A Consolidated bombing plane, built at San Diego for the British Royal Air Force, arrived at Felixstowe airport, England, today, adding a new chapter in aviation history.

Twenty years and one month ago, two young Royal Air Force aviators took off from St. Johns, N. F., under orders to fly the Atlantic to the first landfall on the English side. They set their plane down in a bog near Cliffden, Ireland, June 15, 1919.

Today, Russell Rogers landed the two-motored flying boat, which he had flown 5750 miles from San Diego, in 50 minutes short of four days with stops at Buffalo, N. Y., and Botwood, N. F. He handed over the plane to the Royal Air Force officers for its final tests.

The first British bombing plane which flew the Atlantic was a wartime Vickers-Vimy. The fliers were the late Sir John Alcock, pilot, and Sir Arthur Whitten-Brown, navigator. They received a Daily Mail $50,000 prize for the first non-stop trans-Atlantic flight.

$700,000 SPENT ON S. D. AIR PLANTS

Sun 7-14-39

Improvements to local aircraft plants totalling more than $700,000 within the past few months were described to the Chamber of Commerce board of directors by Earl Prudden, vice-president of Ryan Aeronautical Co.

Included in his report was the $500,000 plant modernization program of Consolidated Aircraft Corp., featuring installation of giant drop hammer equipment; the $150,000 plant addition of Ryan, and the $55,000 expansion, consisting of a new building and equipment, of Solar Aircraft Co.

Edgar N. Gott, assistant to the president at Consolidated, told the directors his concern was hoping for additional Army business in the near future, based on bids recently opened in Wright Field, Dayton, O., on two and four-motored bombers.

Approximately $7,000,000 was spent on Navy projects during the fiscal year, according to a report by Comdr. J. T. Mathews, 11th Naval District public works officer, revealed by Arthur Wells, Federal projects committee chairman of the Chamber.

Union 7-15-39

Aircraft Factories Weed Out Aliens

Aircraft manufacturers are weeding out aliens from their employes as a move to insure safeguarding of aviation secrets, The Associated Press reported from Washington yesterday.

Locally, aircraft manufacturers said only citizens are employed at present.

A number of foreign technicians have been discharged or transferred to non-military work by direction of war and navy departments.

Disclosure of the ban on aliens was made after a Hartford, Conn., arms firm announced all aliens in its machine-gun division would be let out at once.

What's Up in the Air?

Trans-Ocean Deliveries.
Waiting For It To Burn.
Noted Squadron Revived.

By Flight Commander A. H. Sandwell

THE passage through Canada this week of the large flying boat built by Consolidated Aircraft for the British Air Ministry signalized the first delivery by air across the North Atlantic of a heavier-than-air machine. The German-built Zeppelin airship commonly known as the Los Angeles was, of course, the first aircraft in the world to be flown to its new owners across this ocean away back in October, 1924. To forestall a flood of corrections, I might state that I am well aware that the British airship R-34 made a double crossing of the Atlantic in July, 1919, but neither of these trips was really a delivery flight.

One of the striking features of all the recent Consolidated boats is the retractable wing-tip float. Whether this will find favour at Felixtowe remains to be seen; but it has always seemed a very bright idea to me, for several reasons. There can be no doubt that the retracted float, forming as it does an excellent wing-tip, with its supporting struts completely housed within the structure of the wing, presents much less resistance to the passage of the machine through the air than the permanent (but not so very) wing floats which dangle from the planes of the Empire boats and their successors.

The ability to retract these floats as soon as the machine is moving fast enough, during the take-off, to answer its ailerons must facilitate the process of unsticking considerably. Likewise the ability to leave the floats retracted while landing until the machine is well on the water and has lost most of its speed might be valuable under some circumstances. Had "Cambria" been equipped with these floats she would probably not have been nearly lost while landing at Toronto in 1937. This little catastrophe, incidentally, was a near thing and caused a lot more structural damage than many people realized. And even should the crew forget, or be unable, to lower the floats when slowing down after landing, the results are not likely to be serious, as they still form part of the wing-tips and would prevent the latter from dipping below the surface.

Bigger Boats, Engines And Propellers Coming

HARDLY have the Boeing Super Clippers, with their 6,000 h.p. and their 82,500 lbs. of weight, been put into service by Pan American, and hardly have Imperial Airways taken delivery of the new 31½-ton 5,500 h.p. "Golden Hind' from Short Brothers, than the technical press gets busy again with discussions of the next step. It may be remembered that Pan American called for tenders for a 100-passenger, 5,000-mile-range plane, for which several American manufacturers submitted specifications. I do not believe any prices were quoted, and there is no record of Pan American having handed out any orders so far. But there is little doubt that flying boats with wing spans of 175 to 200 feet and weighing up to 90 tons, will be on the stocks shortly, probably within a year. Three manufacturers, Sikorsky, Douglas and Boeing, expect to require six engines for such a craft; Consolidated hope to get by with four.

You remember the DOX, with its 12 engines perched on a forest of struts? Well, engines have increased in power since those days, but they, and the propellers they drive ,are still the limiting factors in the design of really large flying boats. The bottle-neck really seems to be the propeller, for with increase in diameter and of the power which it has to absorb, its weight goes up alarmingly. And it is not good to have such large and heavy objects rotating at such high speeds in a structure so comparatively flimsy as a heavier-than-air machine must be. The centrifugal and gyroscopic forces involved become terrific. Hence the frantic search for strong yet light materials for the blades of these airscrews, which are likely to require diameters as great as 21 feet in order to absorb the more than 2,000 h.p. which will flow into them.

There seems no great difficulty in producing an engine of 2,000 h.p. and upwards. Junkers have been working on designs of a Diesel unit of this power for some time past. One of the manufacturers of radial air-cooled engines has got mighty close. The makers of the Allison have a V-12 liquid-cooled engine which is used in the Bell "Airacuda" and other U.S. military aircraft. By bolting two of these V-12's together, and gearing the two crankshafts to a separate propeller shaft, they have produced an engine which will give something like 2,300 h.p. at the take-off. Though slightly heavier per horsepower than some of the smaller engines, it is hoped that these will permit a fuel consumption considerably lower, so that the net result on long flights will be a gain, despite the heavier engine.

Estimated Alighting Speed Far Too High

POINT is given to the recent remarks of C. B. Allen mentioned in this column some months ago about the coming necessity for something along Autogiro lines in the near future by the anticipated landing speeds of these projected boats. They are already talking airily of landing at 80 m.p.h. "Because of the large size of the boats, a landing speed in the neighborhood of 80 m.p.h. would not be dangerous," writes Robert C. Morrison in a recent issue of "Flight." It seems to me that exactly the opposite is the case. Any one who speaks glibly of hurling a mass weighing 90 or 100 tons at 80 m.p.h. at any kind of water—let alone the waves of an Atlantic storm—might as well take his car out and drive it into a stone wall at the speed he talks about. If he likes that I am willing to listen to him afterwards.

Connemara Fire Means More Atlantic Delays

THE loss by fire at Southampton of "Connemara", one of the new Cabot type boats with which Imperial Airways were planning to conduct experimental Atlantic flights this summer, seems to have been an extraordinary affair. It is reported that the fire started in the engine room of the refuelling barge. Though the flames did not spread to the flying boat for fully 15 minutes after the first outbreak, the barge and the boat were still connected to each other by the fuel hose all that time, and it was along the hose that the fire spread to the flying boat. There were seven men aboard the two craft, all of whom jumped overboard, one of hem to his death. Frankly, for the life of me, I do not see how such an event can be blamed on "sheer bad luck". It has looked for a long time as if what Imperial Airways needs is a professional pessimist to spend his days and nights expecting and anticipating simple little things like gasoline catching fire and carburettors icing up before these things happen. Such a person might goad the management either into taking steps to see that they did happen or to provide trained crews and adequate equipment to deal with them if they cannot be avoided. To sit around for a quarter of an hour waiting for fire to spread from a barge to a flying boat, and to have no means available to extinguish the fire or to tow the boat out of harm's way is not worthy of a heavily subsidised corporation one of the main objects of which is avowedly to uphold Britain's prestige among the nation's of the world.

My old "pen pal" Robert Brenard, Imperial Airways Press Officer, wth whom, as you may readily guess, I have exchanged "warmish" but always good tempered views about the running of an air line, retired from that position at the beginning of this month to specialize in aviation journalism.

The new press officer is the distinguished journalist and author, J. R. Glorney Bolton, who joined the editorial staff of the Yorkshire Post in 1923; became assistant editor of the Times of India in 1927; returned to England as leader writer for the Yorkshire Post in 1931, and served on the London Daily Mail from 1933 to 1935. Since that time he has been engaged in authorship and general journalism. His publications include "The Tragedy of Gandhi", "Peasant and Prince", "Two Lives Converge" and "The Dome of Devotion"'. All of which, as you might say, must have given him a first-class background in aviation and fitted him admirably for his new post.

Famous Royal Air Force Squadron Is Re-Formed

ONE of the most famous wartime units of the R.F.C. and R.A.F., No. 85 Squadron, has recently been re-formed at Debden, Essex. Once more it is a fighter squadron, equipped with Hurricanes, and forms part of the London Air Defences. There were several reasons for 85 Squadron's distinguished standing in the annals of Britain's war-time campaign in the air. Its record of hostile aircraft destroyed was phenomenal. I do not know whether the full record is available; at any rate I regret I do not have it. Among its famous members was Elliott White Springs, the American author who edited "The Diary of an Unknown Aviator" and wrote numerous books on his adventures and those of the advance guard of sporting Americans who served in the Royal Flying Corps. And last but not least, this Squadron had two very famous Commanding Officers, Major Edward "Mickie" Mannock, V.C., who was killed in action on July 26, 1918, and Major (now Air Marshal) W. A. Bishop, V.C., D.S.O., Canada's most famous fighter pilot, who survived the war and is today wit us in Montreal.

Just how much war-time record mean to a fighter squadron i evidenced by the reverence accord ed a few historic documents obtained from the Air Ministry and now mounted in glass frames in the pilots' room. These include a combat report of Major Bishop's dated June 19, 1918; the recommendation for Major Mannock's V.C., with His Majesty the King's signature approving it, and a flight combat report for August 22, 1918.

The new Commanding Officer of 85 Squadron is rather a famous individual himself, none other than R. L. R. Atcherley, Schneider Trophy race pilot, winner of the King's Cup race in 1929 and one of the most popular and respected British pilots in America, where his exhibition flying at the Cleveland Air Races while on leave one year had the spectators standing on their seats.

Because so many past members of the Squadron were Americans, and in honor of its Canadian C.O., a tomahawk has been provisionally

Sea Spanned By Consair Flying Boat

Trib. 7-14-39

Transatlantic delivery of Consolidated's Model 28-5 flying boat was completed today when the 15-ton plane, which left here Monday morning, landed at Felixtowe, England, after a two-stop flight over the 5750-mile route.

In a message to Consolidated officials telling of the landing at 8 a.m. (PST), Russell Rogers, pilot, said: "All well; very nice trip, as usual with Consolidated equipment."

The flying boat left San Diego at 8:23 a.m., Monday, and after encountering strong head winds, landed at Buffalo, N. Y., at 3:30 a.m. Tuesday to refuel. It left Buffalo for Botwood, N. F., to refuel before starting the flight across the Atlantic, and took off from Botwood early yesterday morning. With Rogers are Lewis A. Yancey, navigator; Raymond Booth, radioman, and Gerald Brown, engineer. The four will return to the United States by liner, and are expected back at San Diego early next month.

Inspects S. D. Cadets

Tribune 7-18-39

LOUIS A. JOHNSON

JOHNSON LEAVES FOR L. A. ON TOUR OF AIR SCHOOLS

Louis A. Johnson, assistant secretary of war, completing a quick review of young fliers in training at the Ryan school of aeronautics for the army air corps, left San Diego in his special plane at 9:15 a.m. today, bound for Los Angeles. Johnson arrived here at 9:35 p.m. yesterday, when he was met at Lindbergh field by T. Claude Ryan, head of the school, and Capt. J. C. Horton and Lt. L. P. Hopwood, army officers in charge of the flight cadet training school.

In addition to reviewing the fliers, Johnson also inspected Ryan Aeronautical Co. and Consolidated Aircraft Corp. plants. Purpose of his nation-wide tour, he explained, is to view "field operations" of the war department's plane expansion and flight training program.

"We had the aircraft manufacturers in Washington for discussion of aviation expansion," he said. "Now we're checking on factors in the field."

Johnson's inspection came less than 24 hours after Brig. Gen. Barton K. Yount, assistant chief of the army air corps, reviewed fliers at the Ryan school and approved progress of the 35 cadets in their first three weeks here. He said 2200 are to receive training at nine flying schools the next two years.

Yount left San Diego for Santa Maria to inspect cadets in training there. Before returning to Washington, D. C., he will make similar inspections at Lincoln, Neb., St. Louis and Chicago. He has made inspections at Tuscaloosa, Ala.; Dallas and Tulsa.

Louis Johnson Here From East

Aviation Plants To Be Inspected

Louis A. Johnson, assistant secretary of war in charge of the army's air expansion program, arrived last night by plane from Washington via Helena, Ark., for an inspection of the Ryan aviation school and the Ryan and Consolidated aircraft plants.

"I want to look over the Ryan school," he said. This school is one of the civilian schools giving primary training to army aviation cadets.

An article featuring Louis Johnson appears on Page 2, Section B.

"We had the aircraft manufacturers in Washington on the 10th for discussion of aviation expansion. Now we're checking on factors in the field. I expect to look over the Ryan plant and Maj. Fleet's plant, the Consolidated, tomorrow. The inspection will start at 7:30 in the morning, and I'm leaving for Los Angeles at 9:30."

PLANE IS OFFICE

The war chief left Washington Sunday in his special plane fitted up as a traveling office. He arrived at Helena, Ark., Sunday night, and yesterday morning addressed the Arkansas convention of the American Legion. He is a former national commender of the Legion.

Accompanying Johnson on his inspection tour are Col. Burns of the army general staff, who is acting assistant secretary of war; Capt. Vance, also of the general staff, and Lt. Auton, who pilots the plane in which the party is making the tour.

HAD GOOD TRIP

"We had a delightful trip from Helena this afternoon and evening," Johnson said. "Everything was clear until we ran into a haze about eight miles from San Diego. But we got through without any trouble."

Johnson said he was glad to be able to visit San Diego, of which he has heard much. When his plane landed at Lindbergh field last night at 9:35 he was met by T. C. Ryan and the army officers in charge of the cadet training school at Ryan school — Capt. J. C. Horton and Lt. L. P. Hopwood.

Brig. Gen. Barton K. Yount and other air corps leaders were here yesterday. See Page 1, Section B.

San Diego Pilot Classes Win Approval

From 2500 to 3000 American youths seeking second lieutenant commissions in the army air corps will receive preliminary flight training in the nine technical schools throughout the U. S., Brig. Gen. Barton K. Yount, assistant chief of the army air corps, announced here yesterday.

Gen. Yount, with the following group of officers, landed at the municipal airport from Washington Sunday: Col. A. W. Robins, air corps training center commander; Col. A. B. McDaniel, attached to office of Maj. Gen. Henry H. Arnold, air corps chief; Col. E. B. Lyon, in charge of primary flight training; Maj. J. R. Morgan, director air corps training center; Capt. W. T. Hefley, on duty at the army experimental depot, Wright field; Capt. K. McNaughton, district supervisor of elementary flight training; Lt. C. R. Storey, training center adjutant, and Lt. L. Raney of the army air post at Bolling field, Washington.

America's air defense activities are stressed by Louis Johnson of the war department. Page 2-B.

WILL VISIT 9 SCHOOLS

The officers are making a tour of the nine training schools in three new army bombers.

Gen. Yount complimented T. C. Ryan on the splendid progress made by the 35 cadets who have been undergoing flight training at the Ryan school. The 12-week course includes 65 hours flying and 225 hours technical instruction. On completion of the course at Lindbergh field the cadets go to Randolph field, San Antonio, Tex., for three months basis training and then to Kelly field for a final course in combat flying. The attrition list is reported extremely heavy in the last rigorous phases of the instruction period. Only 2200 are to receive commissions.

A new class of students will report at the Ryan school in August and additional classes every three months until 1941.

LEAVE FOR GLENDALE

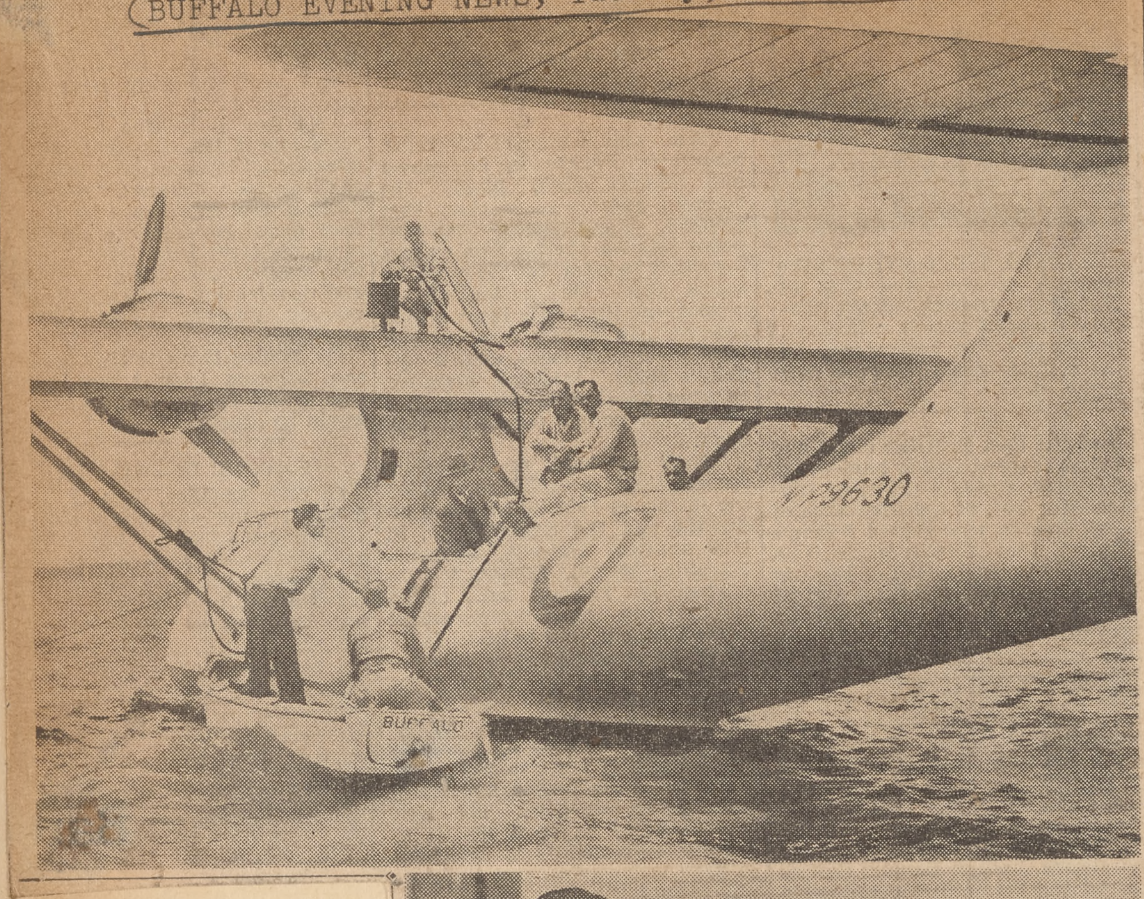
Before arriving here the army air officers visited training schools at Tuscaloosa, Ala.; Dallas, Tex., and Tulsa, Okla. They left yesterday for Glendale, and before returning to Washington will inspect cadets at Santa Maria, Lincoln, Neb., St. Louis and Chicago.

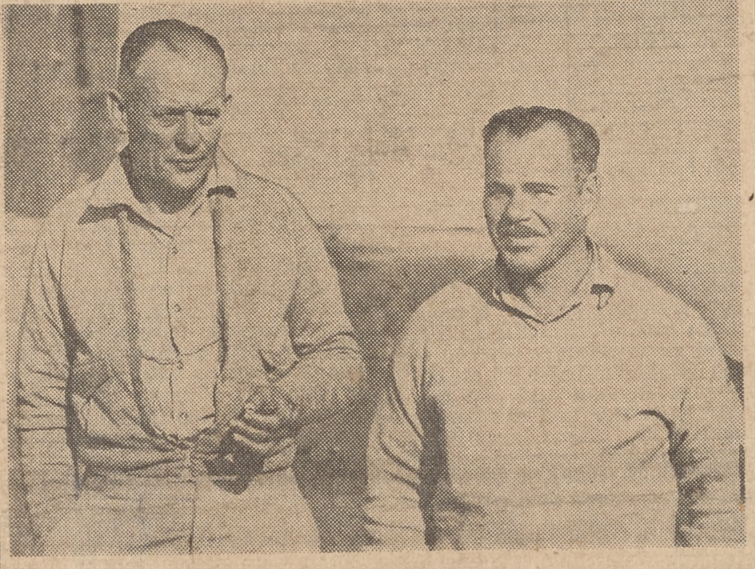
Gen. Yount said that Gen. Arnold will not leave Washington for an inspection trip of western air posts until after adjournment of congress.

Gens. Arnold and Yount are former commanders of Rockwell field, North Island, abandoned last year and turned over to the navy.

Plane Refueling After Forced Landing and 2 of Crew

BUFFALO EVENING NEWS, Tuesday, July 11, 1939





Members of the crew and Coast Guardsmen began refueling operations this afternoon on the Consolidated Aircraft Corporation flying boat forced down here this morning from lack of gasoline on a flight from San Diego to England. The refueling is shown at top. Below are two members of the four-man crew—Lewis A. Yancey, left, navigator, and Pilot Russell R. Rogers.

England-Bound Flying Boat Delayed Here by Refueling

First U. S. Military Plane to Be Delivered by Air Abroad Will Remain Overnight.

After a six-hour delay in getting gasoline needed for refueling, four fliers bound from San Diego with the first Amercian military plane to be delivered by air to Great Britain were compelled today to postpone until tomorrow at daylight their takeoff for Botwood, Newfoundland, en route to Felixstowe, England.

Fearing a fuel shortage before they could reach Botwood, the fliers alighted here early this morning at the Marine Airport after an overnight hop from the plant of the Consolidated Aircraft Corporation at San Diego, where the plane, a navy patrol bomber, was made.

The airmen planned to take off again for Botwood, which had been their only scheduled stop on their 5900-mile flight to England, as soon as the plane was refueled, but they had to abandon this idea when it took so long to get gas.

Left San Diego Monday.

Piloting the plane is Capt. Russell R. Rogers. Lewis A. Yancey is navigator and relief pilot; Raymond Booth, radioman, and Gerald Brown, engineer.

Capt. Rogers said he took off from San Diego at 8:30 o'clock Monday morning (12:30 P. M., Buffalo time), but bucked heavy headwinds virtually all the way.

"We flew over Chicago a little after 4 o'clock this morning, about two hours behind schedule," Capt. Rogers said. "We figured we had enough fuel to reach Botwood if conditions were favorable but we didn't want to take any chances on fog as we neared the coast. So we decided to come down at Buffalo and take on more gas."

Alighted In Harbor.

The 15-ton ship was brought down just outside the Buffalo Harbor gap about 6:45 o'clock.

Plenty of difficulty then arose over the problem of refueling. Capt. Rogers said he had wired New York headquarters of the Shell Oil Company to arrange for gasoline here, but there was none on hand when he landed.

F. Leslie Marsden, manager of the Buffalo Aeronautical Corporation, said he was called from the Shell Company in New York at 7:30 and asked to refuel the plane. He found the ship but did not locate the crew at the Coast Guard Station until 10 o'clock. Then he sent a special driver out to the airport to get the airport gasoline truck and bring it to the foot of Georgia st.

965 Gallons Pumped Aboard.

The truck finally reached the airport at 11 o'clock, but then it was discovered the gasoline was in bulk, not in drums. Coast Guard Capt. John J. Daly and his men finally hauled the plane within reach of a 100-foot hose and the refuelling began at 1 o'clock, ending at 1:55 o'clock. In all 965 gallons were pumped aboard, 495 gallons in the left wing tank and 470 in the right.

Capt. Rogers had planned to be in England in time to keep a dinner engagement at Claridge's tomorrow evening. This is out of the question now. He said he would finish the trip to Botwood, refuel and take off for Felixstowe, about 60 miles north of London.

The plane in which the men are flying is a new twin-motored flying boat, model PBY-4. It has been sold to the British Air Ministry.

The four fliers just got back to New York July 1 after a round-the-world flight for the American Museum of Natural History under the leadership of Richard Archibald of the museum staff.

Sun 7-18-39

SECRETARY OF WAR ENDS VISIT TO S. D.

Hustling through a tight schedule of inspection and official visits with local aviation offcials, Assistant Secretary of War Louis Johnson left by plane for Los Angeles this morning after a 12-hour stay.

Mr. Johnson inspected the Ryan School of Aeronautics, where 35 Army cadets are receiving primary flight training, and the Ryan and Consolidated [illegible]ies. He interviewed T. Claude Ryan and Maj. Reuben H. Fleet, president of the concerns.

The assistant secretary of war, who flew here yesterday from Helena, Ark., where he addressed the Arkansas convention of the American Legion, said that he wished to observe at first hand the facilities for expansion of American aircraft factories.

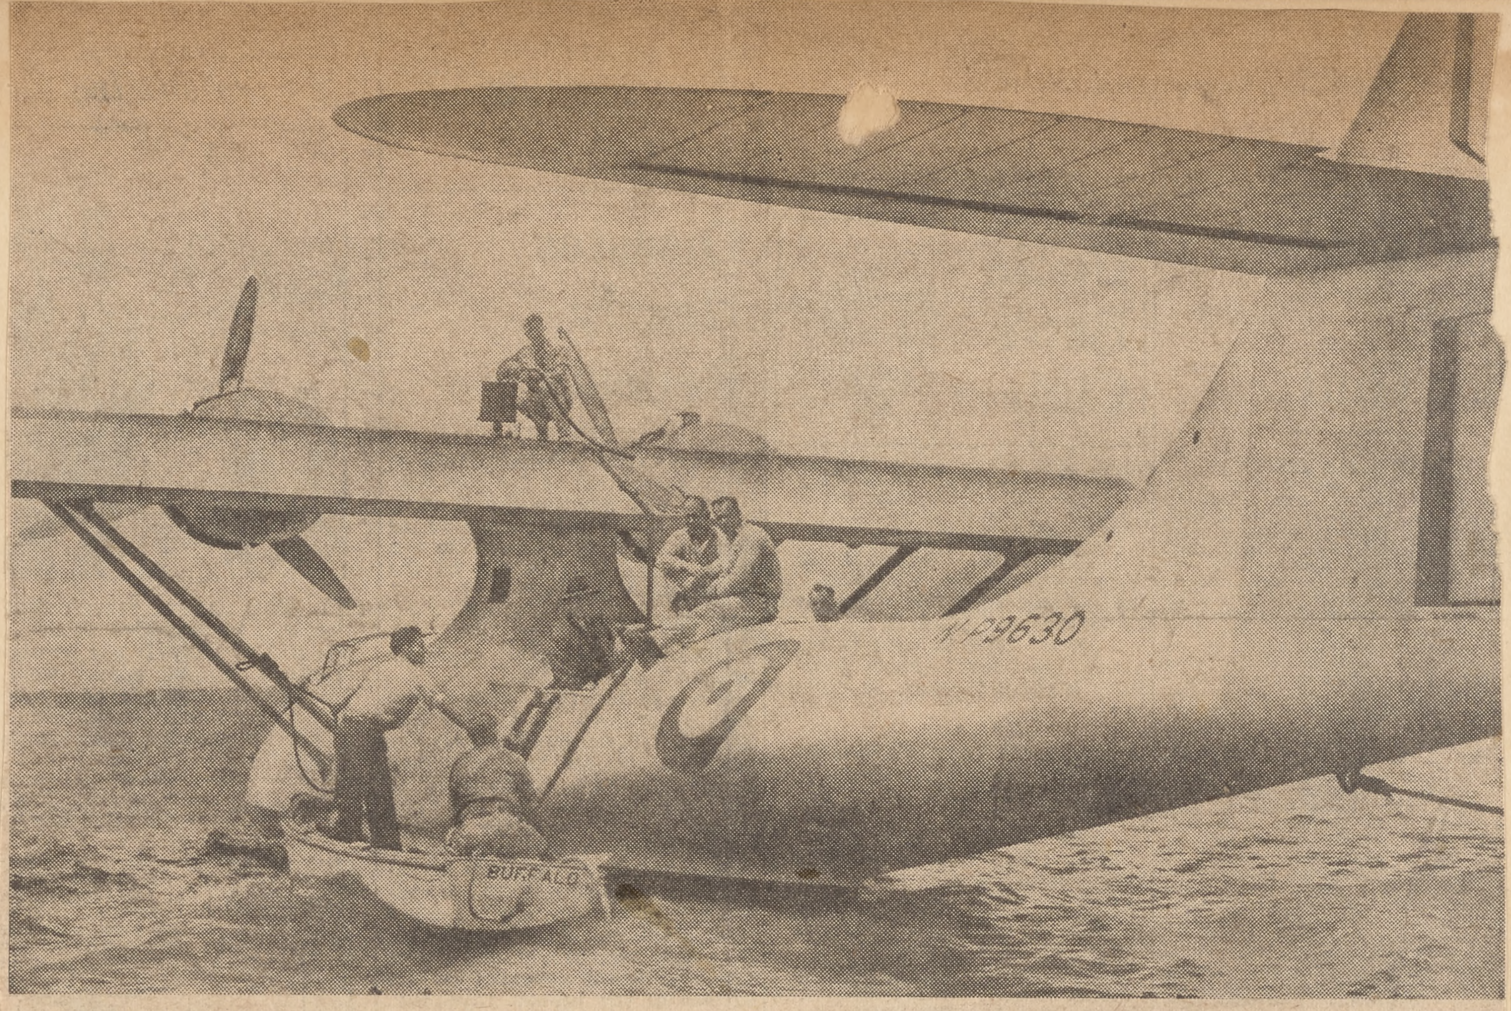
The War Department is checking on bids by the nation's leading manufacturers for contracts to build eight different types of Army planes. Consolidated Aircraft Corp. submitted estimates on two and four-motored bombers.

Mr. Johnson is accompanied by three Army officers of his staff and travels in a specially fitted Douglas DC-2 transport.

7-20-39 Sun

CONSAIR PLANE LANDS FOR FUEL IN HALIFAX

HALIFAX, N. S. — A twin-engined flying boat of the American Export Lines landed at the Royal Canadian Airforce base today to refuel. The ship was completing an experimental round trip to Europe. The plane was built by Consolidated Aircraft Corp. of San Diego.



TRANS-ATLANTIC PLANE STOPS HERE.—Shown refueling late Tuesday in Buffalo harbor is the Consolidated Aircraft Corporation navy patrol bomber bought by the British Air Ministry. The plane, short of gasoline on its flight from San Diego to Botwood, N. F., stopped here 25 hours when a misunderstanding concerning fuel made it impossible to leave Tuesday. It left early Wednesday morning. The final destination is Felixstowe, Eng.

War Secretary Visits Plants At San Diego

Completing a brief inspection of the Consolidated and Ryan aircraft plants at Lindbergh field, Louis A. Johnson, assistant secretary of war, left by military plane at 9:20 a. m. yesterday for Los Angeles.

Johnson landed at the municipal airport Tuesday night from Washington via Helena, Ark., where he addressed the Arkansas convention of the American Legion. He is accompanied on his tour of air corps training centers by Col. J. H. Burns of the army general staff.

From Los Angeles Johnson traveled by plane to Hamilton field, San Rafael, where he inspected plane building and training schools and remained over night as guest of Col. John F. Curry, commanding officer of the field, The Associated Press reported.

Yount Continues Trip

LOS ANGELES, July 18 (A.P.)—Brig. Gen. Barton K. Yount, assistant chief of the army air corps, and party left for Santa Maria today after inspecting the civilian flying school at Burbank today and the Ryan school at San Diego yesterday. He is inspecting nine similar schools recently established over the country.

"This new chapter in aviation training," he said, "is proving civilian flying schools can work with the government.

"We know now that in case of emergency, all we would have to do would be to notify such school its assignment of cadets would be increased. There would be none of the delay in organization that held us back for six months when the World war created a sudden demand for military fliers."

7-19-39 Sun

GOTT IN L A. WITH WAR SECRETARY

Edgar Gott, assistant to the president of Consolidated Aircraft Corp., accompanied Asst. Secy. of War Louis Johnson to Los Angeles when he left San Diego after a short inspection visit here.

Others with Mr. Johnson were Maj. J. L. Stromme, chief of the procurement section of the Army Air Corps' western division; Col. J. H. Burns, executive assistant to Mr. Johnson; Capt. R. F. C. Vance, and Maj. Lowell Smith, former Rockwell Field aviator who led the Army's famed round-the-world flight. The group's Douglas transport plane was piloted by Lieut. Jesse Auton.

After a tour of factories of North American Aviation Co., the El Segundo and Santa Monica divisions of Douglas Aircraft Co., Vultee and Lockheed Aircraft Cos., and the Army cadets' new primary training school at Grand Central Air Terminal, Mr. Johnson and the Army officers flew to San Francisco.

Gets Higher Rank

BRIG. GEN. D. C. McDOUGAL . . . promoted by President Roosevelt.

Union 7-19-39

Gen. McDougal Wins Promotion

Acting on the recommendation of a selection board headed by Rear Adm. W. R. Sexton, President Roosevelt yesterday approved promotion of Brig. Gen. Douglas C. McDougal, now in command of the marine base at Parris Island, S. C., to major general.

Gen. McDougal relinquished command of the fleet marine force here May 18, 1937, going to duty as temporary commander of the department of the Pacific, then to Parris island. Prior to that he was for two years in command of the local marine base.

Gen. McDougal was born April 23, 1879, at San Francisco. Prior to entering the marine corps he served at the naval academy as a midshipman. He was a volunteer ensign in the navy in the Spanish-American war and saw service as a cadet in the revenue cutter service. He was commissioned a second lieutenant in the marine corps March 12, 1900, and has served continuously.

He participated in the following expeditions: China relief expedition, 1900; Philippine insurrection; occupation of Vera Cruz; Haitian and Santo Domingo expeditions. He was with the 13th regiment of marines in France from September, 1918, to August, 1919. He commanded the Gendarmerie d'Haiti from 1921 to 1925 and was in command of the Guardia Nacional in Nicaragua from 1929 to 1931.

Maj. Gott Returns From Capital Stay

7-19-39

Predicting a slowly improving market in the aircraft business generally, Maj. Edgar V. Gott, vice president of Consolidated Aircraft, returned to San Diego last week after a winter in Washton where he contacted government officials regarding the service's contracts for Consair planes.

War talk infests Washington, he said, but he expressed the hope it gets no further than talk, at least as far as this nation is concerned.

Consolidated is working on new contracts for the Navy and Army, details of which are not being divulged.

Maj. Gott is a prominent member of The San Diego Club.

BOMBER'S ATLANTIC TRIP

London Times 7-15-39

CALIFORNIA TO ENGLAND WITH ONE STOP

FROM OUR AERONAUTICAL CORRESPONDENT

The Consolidated flying-boat, of the type used as a long-range bomber by the United States Navy, which has been bought by the Air Ministry, left Botwood, in Newfoundland, at 2.29 B.S.T. on Thursday afternoon and, flying non-stop, reached Felixstowe, 2,450 miles distant, at 6 a.m. yesterday. The boat has been delivered by air, with only one intermediate descent, from San Diego, California. It was flown the 3,300 miles from San Diego to Botwood some days ago and is the first military aircraft to be delivered by air across the Atlantic.

This twin-engined flying-boat has been bought, as other foreign aircraft have been bought by the Air Ministry, in order that the outstanding products of other lands might be tested and examined in British conditions of service. The type is reported to have a range with a fair military load of 4,200 miles. One of its interesting features is a type of wing-tip float which can be retracted during flight.

AIR GIANT HALTS HERE TO REFUEL, STAYS 24 HOURS

Huge flying boat, on hop from West Coast to England, finds facilities lacking here

Buffalo was an unexpected and unprepared host to a famous giant of the air yesterday, when a fifteen-ton Consolidated Aircraft patrol bomber, en route to England, nosed down into Buffalo Harbor "just to refuel" and remained for 24 hours.

First of the huge planes to visit Buffalo, the big flying boat was an immediate center of attention. Crowds began flocking to the foot of Georgia Street early in the afternoon to see a plane which was on its way to a new distance and time record until it bumped into the snag of the complete lack of facilities constituting this city's so-called Marine Airport.

Pilot Annoyed

Capt. Russell R. Rogers of New York City, pilot of the huge plane, was decidedly annoyed at the "various unexpected circumstances" that transformed the projected one-stop flight from San Diego to Felixstone, England, into a two-stop journey with a 24-hour "interesting but irritating" stopover in Buffalo. The delay was caused because of a mix-up in ordering gas to refuel the plane, because of a delay caused by Rogers' disappearance for several hours yesterday morning, and because of temporary difficulty in locating enough of the right kind of gasoline for the big plane.

All of these incidents, however, hinged on and were directly related to the complete lack of facilities for such emergencies at the marine air base.

The refueling was accomplished by 1.30 o'clock yesterday afternoon, but Pilot Rogers decided against taking off at that hour for the trip to Botwood, Bay of Exploits, Newfoundland. Instead, the ship will leave for Botwood, its original first-stop destination, at dawn today. This will eliminate any possibility of the big plane landing in the unfamiliar Newfoundland territory after dark.

R. Leslie (Doc) Marsden of the Buffalo Aeronautical Corporation was in charge of refueling the big plane, in accord with the current procedure of that company gas-

FLYING BOAT
Continued on Page Twenty

servicing all planes at Buffalo Airport other than Curtiss and Bell craft, which have their own private supplies. This service formerly was operated by the city, but was turned over to the private company on July 1st. Marsden reported receiving a call from New York City, asking that the plane be refueled at 7.30 o'clock yesterday morning. The fifteen-ton plane landed in Buffalo harbor at 6.45 a. m.

Capt. Rogers was under the impression that refueling arrangements had been made and expected a gas truck to meet the big boat, but none was on hand. He reported to New York and the New York office of the flight in turn called the Buffalo Aeronautical Company.

Marsden promptly hastened to locate a supply and made arrangements for refueling the plane. He arrived at the marine air base at 8.30 o'clock, but it was 10.30 before he could find the pilot and have the big plane towed close to the concrete "apron."

The plane was fueled from the big army truck based at the Buffalo Airport, by use of an extra 100 feet of hose. Into its tanks went 965 gallons of gasoline. The refueling took 55 minutes.

Wanted to Be "Sure"

Capt. Rogers said that the ship's fuel capacity was 1,750 gallons and stated his belief that he had had enough to reach Botwood, but that he had "just wanted to be sure." On the flight from San Diego the plane bucked heavy head winds.

The flight delay blasted the flight captain's plan to dine at Claridge's in London, England, this evening.

Welcome as the unexpected visitors were, the emergency landing of yesterday is expected to "bust wide open" the old Marine Airport situation which has been a center of many Council fights and much civic propaganda. It is a subject that reached fever pitch in the days of the famous Balbo flight from Italy to Chicago five years ago, when Buffalo was skipped because it had no place to house flying boats.

It was pointed out then, as it was yesterday, that although the city spent $123,000 for a Marine Airport, it has at the foot of Georgia Street a vast expanse of concrete, and nothing more. There is no building of any kind at the base. There is no telephone or any means of communication with the Municipal Airport. There are no gas tanks, not even a rowboat, in fact not even a tow rope. No effort is made to keep the water near the airport free of logs or other floating objects that might endanger flying boats.

The Marine "Airport" is a concrete platform 300 feet wide by 460 feet long, with a ramp into the water 90 feet wide by 149 feet long. It is reached by climbing over railroad tracks and after coming to the impasse of a dead end street. Many citizens have been unable to find it at all. In recent years it has been used as a "swimming hole" for citizens, disastrously so on Monday.

"Capt. Rogers evidently contacted the Coast Guard on arrival and was rowed to shore," Marsden said in reviewing the refueling delay. "We had no advance information of his stop here. He called his New York office and they called us. I went immediately to the marine base, hired a boat and went out to the plane, but the pilot was not on board and we spent the next three hours trying to locate him. I tried all the hotels, clubs and restaurants and finally thought of the Coast Guard base, where I found him. I made arrangements for him to move the plane in, and got the truck down. The whole maneuver then took less than an hour."

The crew of the big plane includes Capt. Rogers, Lewis A. Yancey, navigator; Raymond Booth, radio man, and Gerald Brown, engineer. The four fliers returned July 1st from a round-the-world flight for the American Museum of Natural History.

Brief Stop at Botwood

In discussing continuation of his flight last night, Capt. Rogers estimated the plane will travel at a cruising speed of 125 miles an hour today and should make the 1,150-mile hop from here to Botwood in eight or nine hours. Rogers said he would stop at Botwood only to refuel and check his ship, and then take off for England immediately.

Capt. Rogers planned to spend the night as the guest of George Cobb, aeronautical engineer, with whom he flew for Pan-American Airways several years ago. The remaining members of the crew, with the exception of the mechanic, who spent the night on the plane, stopped at Hotel Statler.

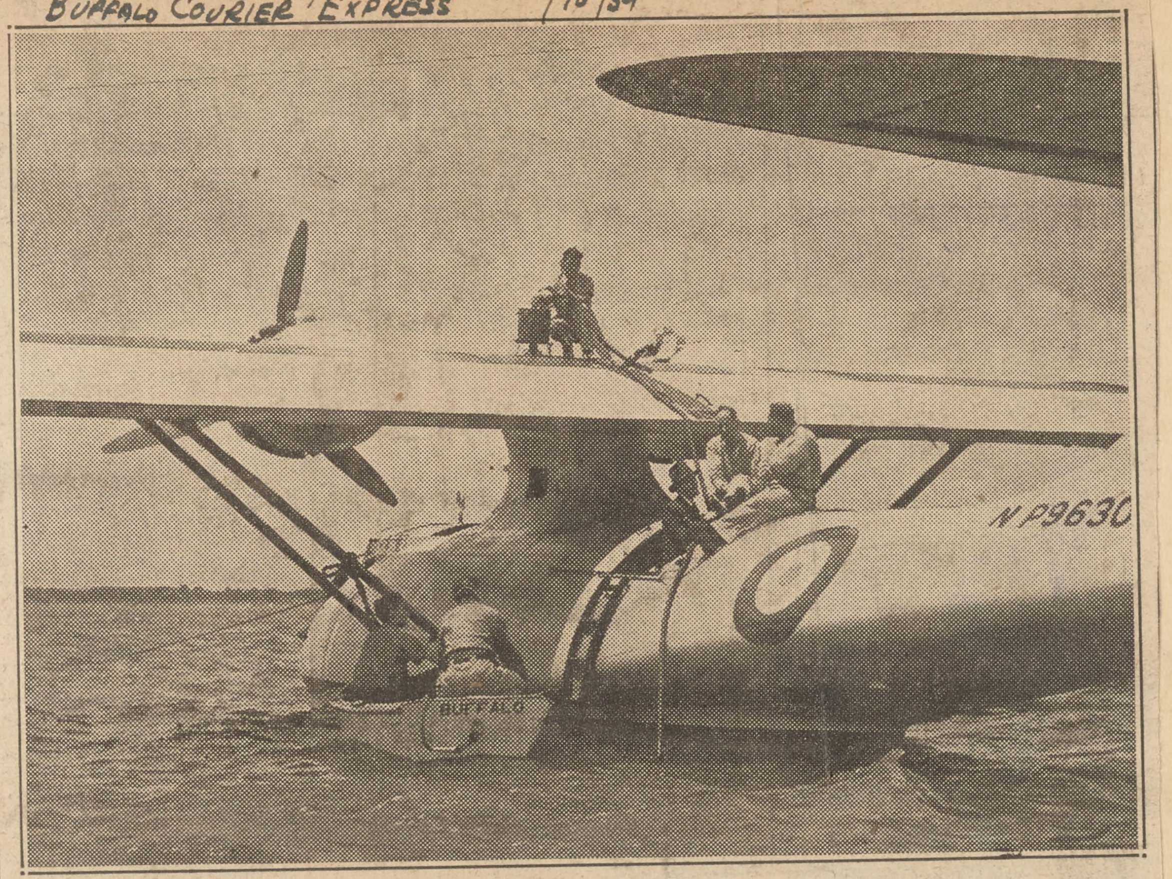
Unexpected Visitor Finds City Unprepared

Buffalo Courier 'Express 7/10/39



Dropping in at Buffalo's Marine Airport for a refueling stop, the huge Consolidated flying boat pictured above remained for 24 hours because of the city's lack of facilities at its harbor air base. The huge patrol bomber was on what was scheduled to be a one-stop flight from San Diego, Cal., to Felixstowe, England.

July 28-39

Aeronautical Group To Meet Tomorrow

Union

The Women's National Aeronautical association will meet tomorrow night at the home of Mrs. Ray Booth, 3319 Tennyson st. The association meets once a month to discuss and enjoy talks on aviation.

Members of the group are Mmes. Ray Booth, George Benter, Cynthia Crettenden, Georgia Murray, Grace Prescott, Olive Rucker, Shirley Rohr, Evelyn Speer, Ethel Stout, Genevieve Westhave, E. Stackhouse, Adrian Clark, Kathleen Rooks, Lucille Goodale, Beatrice Kaiser, Helen Nelson, Kae Griffith; Misses Kay Fiedeke, Catherine Gnozzo, Mildred Fleming, Helen Mannix, Jessie Ostrander, Helen Walker, Aneita West, Catherine Applewhite, Sally Wescott, Bernice Minucci and Dr. Sunya Underhill.

No.43. July 1939.

Consolidated passenger flying boat. (AIR). The Consolidated Aircraft Co. still surrounds its new passenger flying boat with a veil of secrecy. The flying radius is given as 10,000 miles(!), so that a trans-oceanic flight would be possible in 15 hours. The trial flights are said to have shown the possibilities of military uses, In this case the 52 passenger flying boat would become a long range bomber. New constructional principles involved are stated to be the 110-ft. long Davis "Perfect-curve" wing and the 2000 H.P. Wright 18 cylinder engines. The air screws are three-bladed with a diameter of 16-ft. The fuel capacity of the type 31 is given as 5000 gals. Its predecessor, the P.B.Y. Navy Bomber could only take 1760 gals. A possible purchaser is the American Export Air Lines.

Towing equipment for marine aircraft.
------------------------------------(AIR). The British Air Ministry is arranging that all marine aircraft in British aviation shall be fitted with equipment which will make it possible for them to be taken in tow by vessels. In this way it is hoped to reduce the number of total losses.

WEDNESDAY MORNING, JULY 19, 1939.

L.A. TIMES

Army Air Plans Year Ahead of Schedule

Louis A. Johnson, War Secretary Aide, Visits Plants Here

Illustrated on Page B

Assistant Secretary of War Louis A. Johnson, the husky, bespectacled reserve colonel who controls the $300,000,000 purse for building America's Army Air Corps to 6000 ships, yesterday stood beside a formidable-looking bomber in a Los Angeles factory and announced:

"Our program is exactly one year ahead of schedule."

In an exclusive interview with The Times Col. Johnson disclosed that the War Department's race to strengthen its present fleet of 2300 aircraft has surpassed gloomy predictions of generals who last fall said two years must elapse before the nation could reach satisfactory production levels.

BUSY — Louis A. Johnson, aide of War Secretary, shown in "flying office."

Wide World photo

ORDERS ARRANGED

"Ordinarily," Col. Johnson explained, "it would take six months before plans could be prepared, bids accepted and contracts let for such a huge complement of machines. Today we have completed arrangements for all but two of 10 major orders.

"My trip to Los Angeles is a last-minute check-up before final awards are made."

Col. Johnson was interviewed at the Lockheed Aircraft Corp. plant at Burbank, scant hours after he had descended on Los Angeles in his "flying office" transport. Like a whirlwind the War Department executive tore through Douglas, North American and Vultee factories, then sped to Burbank before departing in his private ship for San Francisco and Seattle.

MISSES OFFICER

He missed by a few minutes greeting his staff officer in charge of training 2200 Army pilots before 1941—Brig. Gen. B. K. Yount—who had flown into Los Angeles in a twin-engined bomber.

"In June," Col. Johnson said, "we started with $50,000,000. This was the forerunner of the larger program. With this I went out and 'bought' airplanes.

"Bids were let for educational orders at once. The Army knew exactly what type of machine it wanted; factories were ready to serve us; everything was prepared. We spread the $50,000,000 pretty evenly over the industry."

BUY FAST PLANES

These ships, he said, the Army has bought: four-engined bombers that fly faster than 250 m.p.h., carry six to nine men, fire five machine guns; pursuit ships, powered with liquid-cooled in-line engines, that surpass 300 m.p.h.

At Lockheed, Col. Johnson announced, he ordered the Model XP-38 "interceptor pursuit" ship, twin-engined, which can fly "much faster than 350 m.p.h."

"But," Col. Johnson interjected, "we need men and ground equipment as well as airplanes. Our two-year $300,000,000 program is threefold. You can't use ships unless you have pilots to fly 'em and mechanics to service 'em.

"I'm interested in all these phases."

VISITS TRAINING SCHOOL

Thirty minutes earlier he had whisked through the Army Air Corps' primary training school—maintained through contract with Curtiss-Wright Technical Institute at Glendale—and pronounced it "a grand setup."

He added: "In September the Civil Aeronautics Authority's project of developing 15,000 private flyers will begin. This we regard as our 'backlog.' It'll help supply men for our forces. You see, we plan to train 2200 Air Corps men during the same months we are building 6000 airplanes."

FIVE IN PARTY

Col. Johnson was accompanied by his aide, Col. J. H. Burns; B. H. Simpson, West Virginia highway official, and his two pilots, Capt. R. F. C. Vance and Lieut. Jesse Auton.

In an all-metal bomber, earlier, Gen. Yount had arrived for a brief conference with Maj. C. C. Moseley, president of Curtiss-Wright, and the officers who are currently engaged in giving neophyte airmen—in staggered batches of 35—three months of intensive primary training preparatory to basic and advanced military flying at Army fields in Texas.

Gen. Yount said 4400 young men will start the course. From these will come the eventual 2200 second lieutenants who will help staff the increased air force.

POTENTIAL FORCE

Enlisted for a three-year hitch, they will "constitute a strong potential force in the event of a national emergency," Gen. Yount explained. On the waiting list today are 1300 names, enough to carry the program until Jan. 1, 1939, he said.

Last night Gen. Yount, with his squadron of three bombers, left for similar inspection tours of training centers at Santa Maria, Lincoln, Neb.; East St. Louis and Chicago. They have already visited Tuscaloosa, Dallas, Tulsa and San Diego bases.

Gen. Yount's party includes Col. A. W. Robins, commanding officer of the training schools at Randolph and Kelly fields at San Antonio, Tex., and Cols. A. B. McDaniel and E. B. Lyon, War Department training officers from Washington, D.C.

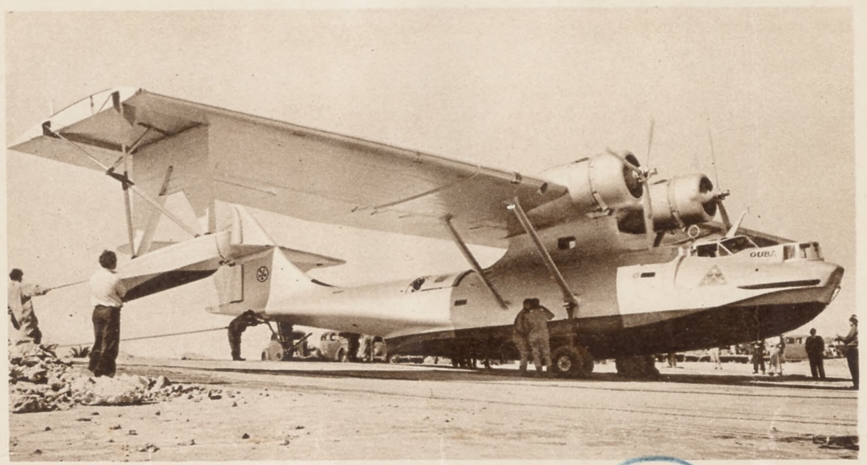
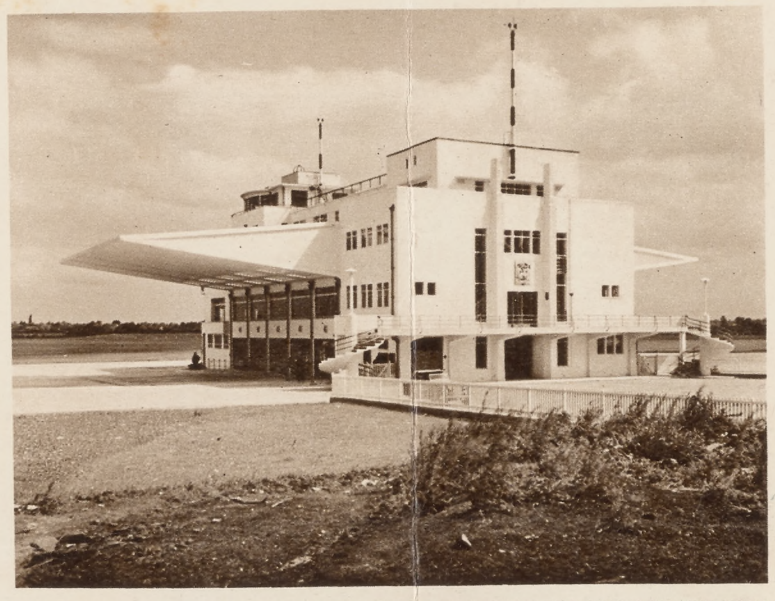
NEWS FROM TWO CONTINENTS—

INCLUDING THE CENTENARY ROYAL SHOW AT WINDSOR, AND AN AMERICAN TORNADO DISASTER.



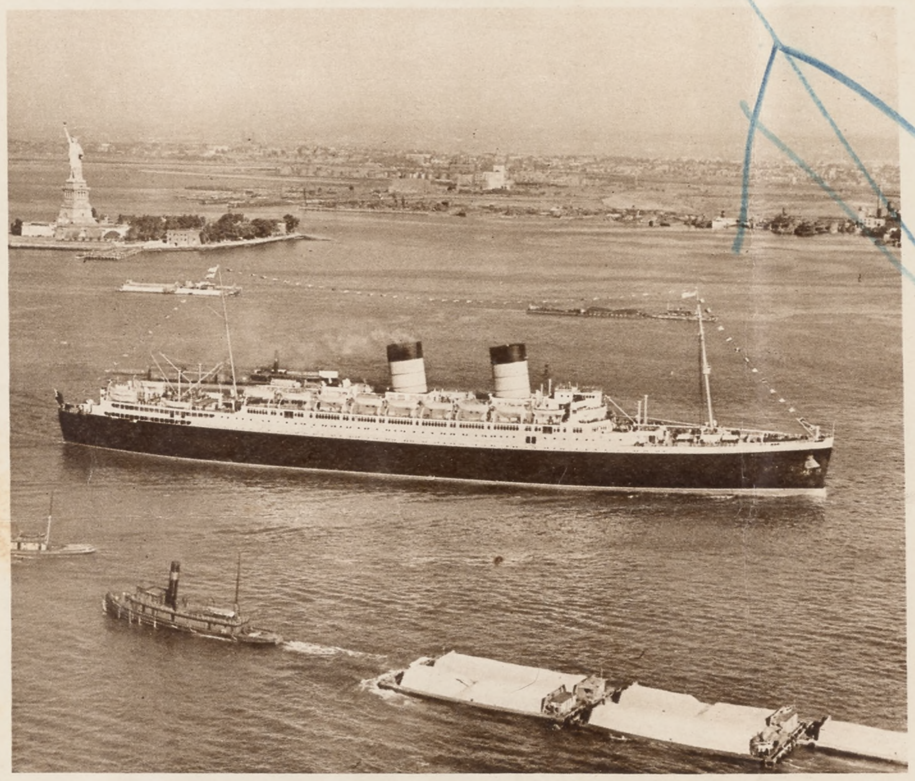
THE GREAT FLIGHT OF AN AUSTRALIAN FLYING-BOAT: THE "GUBA," WHICH HAS NOW CROSSED BOTH THE INDIAN AND ATLANTIC OCEANS, AS WELL AS AFRICA.

The American flying-boat "Guba," chartered by the Australian Government, arrived at St. Thomas, Virgin Islands, on June 30, after a 3200-mile non-stop flight across the Atlantic from Daccar, Senegal. It will be recalled that the "Guba" had just completed a survey flight across the Indian Ocean from Port Hedland, Western Australia, to Mombasa, Kenya. After refuelling at St. Thomas, the "Guba" flew on to New York. (*A.P.*)



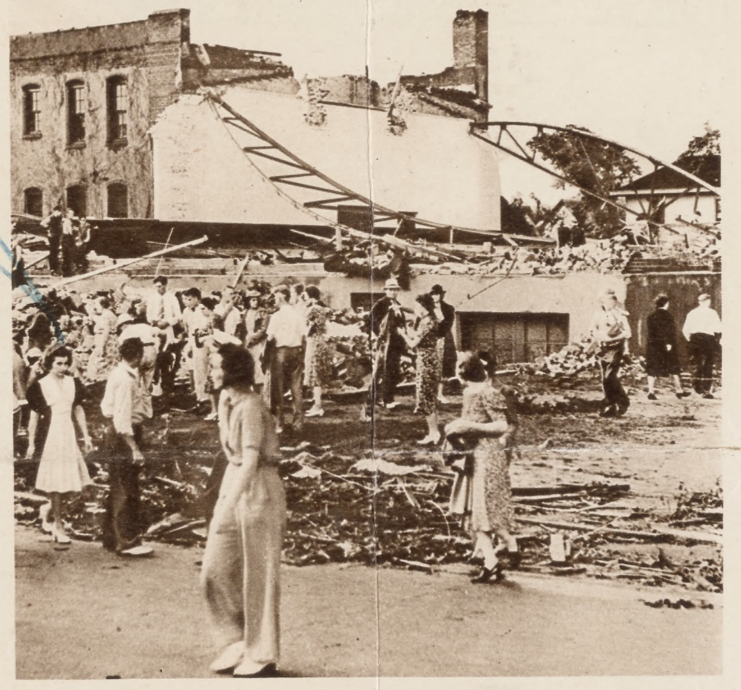
THE FIRST CIVIL FLYING FIELD TO BE OPENED BY ROYALTY: THE NEW AIR PORT AT BIRMINGHAM, WHICH THE DUCHESS OF KENT ARRANGED TO INAUGURATE.

The Duchess of Kent arranged to perform the opening ceremony of Birmingham's new air port at Elmdon, on the Coventry Road, to-day, July 8. This has been constructed at a cost of £350,000. It is believed to be the first time that any member of the Royal Family has opened a civil flying ground. Mr. Chamberlain, Sir Kingsley Wood, and Air Marshal C. L. Courtney have also arranged to be present at this function.



THE NEW "MAURETANIA" MAKES HER FIRST VISIT TO NEW YORK: PASSING THE STATUE OF LIBERTY AT THE END OF HER MAIDEN VOYAGE.

The new Cunard White Star liner "Mauretania" was given a great welcome when she entered New York for the first time on June 24. Her maiden voyage from Liverpool had been made at an average rate of 20·6 knots, though 25 knots is well within her capacity; and from dock to dock her time was 6 days, 19 hours. Sir Percy Bates, Chairman of the Cunard White Star Line, who crossed in the ship, expressed himself as highly pleased with her performance. (*Keystone.*)



THE DISASTROUS EFFECTS OF THE TORNADO IN MINNESOTA: AN ARMOURY WHICH WAS WRECKED, THE OCCUPANTS NARROWLY ESCAPING DEATH.

Ten deaths and many casualties were caused by a tornado which swept Anoka, Osseo, Maplegrove, and other towns near Minneapolis in Minnesota, on June 18. The tornado cut a path two blocks wide and between two and three miles long through the towns, levelling dozens of buildings. Heavy rain accompanied it. National Guardsmen had to be sent to the afflicted areas to help maintain order and extricate the dead and injured from wrecked buildings. (*Planet.*)

PREPARATIONS FOR THE CENTENARY SHOW OF THE ROYAL AGRICULTURAL SOCIETY AT WINDSOR: HORSES BEING LED TO THE EXHIBITION STANDS PAST WINDSOR CASTLE.

THE CENTENARY ROYAL AGRICULTURAL SHOW ATTAINS A RECORD IN EXTENT: A GENERAL VIEW OF THE HUGE EXPANSE OF SHEDS AND STANDS.

The centenary show of the Royal Agricultural Society, which opened on July 4 in Windsor Great Park, is the largest agricultural show ever held in this country. Covering 120 acres, on which 4000 tons of timber have been used for stands and sheds, it illustrates a century of farming progress. Final entries of livestock totalled 4548, compared with 4014 in the Windsor Show of 1889, and 2958 at Cardiff last year. Among them are 32 animals entered by the King from the royal farms at Windsor, Sandringham, and Stoke Climsland, Cornwall. The King and Queen arranged to visit the Show on July 5 and again on July 7, when it was understood they would be accompanied by Princess Elizabeth and Princess Margaret. Queen Mary arranged to attend on July 6. Among the 430 stands is one erected by the Ministry of Labour showing the services which the Ministry provides for farmers, and in co-ordinating labour. Bomber Fails To Equal Old World Marks

WASHINGTON, July 26 (A.P.)—Air corps officers today held the belief American military planes are at least the equal of the best abroad despite the failure of the army's prized "flying fortress" bombers to equal German and Italian records. They hinted that higher standards might be expected from faster and more powerful planes nearly ready for initial tests.

Carrying a load of 11,023 pounds, one of the big bombers yesterday averaged 204 miles an hour for one lap over an official test course. On the second 1000-kilometer (621.4 miles) lap, it made 200.9 miles an hour. Under the same conditions, an Italian plane last year averaged just under 251 miles an hour for both laps.

Three days earlier another of the 16-ton four-motor army bombers carried the same load to an altitude of 23,800 feet, contrasted with the international record of 30,551 feet set with a German Junkers plane last year.

Further, though there was no direct comparison, several score British army Blenheim bombers averaged some 250 miles an hour in a flight over France which almost coincided with the American speed trials.

Without undertaking to apologize for the performance of the planes, which last year made a spectacular round trip to Buenos Aires, aviation experts noted:

The flights were under "routine service conditions" to test planes that were not prepared in any way for an assault on records. There is widespread belief among American fliers that some of the foreign records were hung up by special racing planes which could not be classified as strictly service types.

LONDON TEL. & POST.

A SIGNIFICANT FLIGHT

As she touched the waters of the Orwell yesterday, in what is described as "a beautiful landing," the bombing aircraft flown from America added a new page to the accumulating history of flying. She was the first military machine to fly the Atlantic, but the crossing of the ocean was only the final episode in a journey of over 5,000 miles from California under her own power. To the makers of a great machine capable of such performance congratulations are due, as well as to the four British officers who acted as pilots and crew. Together they have enlarged the boundaries of imagination regarding the possibilities of military aviation in the near future.

This vessel is the first of six, of a type now working with the American Navy, bought for experimental purposes on this side of the Atlantic. Splendidly successful as has been the flight, it has been treated by all concerned as an episode in the process of delivery. Yet it demonstrates the practicability of maintaining across the Atlantic a great reserve of machines remote from dangers of attack, and its performance is convincing evidence of the possibility of reinforcing within a few hours the more distant corners of the Empire should they be subjected to assault. Much of the progress made in military aviation must remain secret, but the landing of Consolidated Model 26 at Felixstowe yesterday enables the least expert to appreciate the new power that is made available when 15-ton bomber flies from the West Coast America with less of incident than attend rossing of the Channel 25 years ag

ARRIVAL OF U.S. FLYING-BOAT FOR R.A.F.

London Telegraph & Post July 15 1939

NON-STOP FLIGHT OVER ATLANTIC

FIRST MILITARY 'PLANE TO CROSS

LANDING DELAYED BY MANŒUVRES

From Our **SPECIAL CORRESPONDENT**
FELIXSTOWE, Friday.

Secret Air Force manœuvres over Suffolk early this morning, in which machines were flying without lights, held up the arrival here of the 15-ton American flying-boat bought by the British Government for the Air Ministry by 2½ hours.

The twin-engined flying-boat, the latest type of the Consolidated Aircraft Co.'s Model 28, had flown from San Diego, California, in three hops, a total distance of 5,750 miles. It is the first military aircraft to fly non-stop across the Atlantic.

From Botwood, Newfoundland, which was left yesterday afternoon, the machine had maintained a speed of about 180 m.p.h. for 1,800 miles with the aid of a following wind. It flew through a storm at 13,000ft with ice forming on its wings.

Two hundred miles from the Irish coast the flying boat encountered a cross wind which reduced its speed. Even then it was passing over England 11 hours after leaving Botwood.

LANDING LIGHTS PREPARED

As reported in later editions of THE DAILY TELEGRAPH this morning, it crossed the Irish coast at Foynes at two a.m.

At the R.A.F. Experimental Station at Felixstowe, where it will undergo tests, a group of officers were awaiting its arrival. Preparations for placing landing lights on the water were put in hand.

Messages of the machine's progress had been received hourly by radio, via Croydon, and her course had been plotted in the offices of the station. Then, when it was believed to be but half an hour's flight away, there came a message from Capt. Russell Rogers, the pilot, "Vicinity of Felixstowe, 4.15 G.M.T., 5.15 B.S.T."

There followed a series of somewhat mystifying messages giving the boat's progress as follows: 4.25 a.m., near Norwich; 4.30, Pulham; 4.45, Nottingham; 5.0, near the Wash; 5.15, off Hunstanton.

STORM OVER ATLANTIC

By this time the sun was rising, and at 5.53 a.m. the flying-boat was suddenly seen approaching at a high speed from the north-west, following the course of the River Orwell. Her symmetrical proportions were clearly outlined in the clear sky.

Capt. Rogers circled the town at 1,000 feet and as he came round again the retractable floats came down, and the flying-boat swept down to the water three minutes after being sighted. An R.A.F. officer standing by my side exclaimed, "A beautiful landing."

Capt. Rogers explained to me afterwards that the reason why he did not make straight for Felixstowe was that he had heard there were machines flying without lights in the neighbourhood and he thought it better to wait for daylight.

"We had an uneventful flight," he said. "With a following wind we made excellent progress, although we met one storm."

BENEFITS OF WIRELESS

He illustrated the benefits of wireless when he added: "We were able to keep to our course across the Atlantic.

"Mr Booth, our radio operator, was in constant communication with Botwood, Foynes and Croydon, and every now and then an amateur from Georgia broke in with a little chat."

Capt. Rogers had the same crew of three who took part with him, under Capt. P. G. Taylor, in the Indian Ocean survey by the flying-boat Guba a month ago. It consisted of Capt. Lewis A. Yancey, co-pilot and navigator; Mr. R. Booth radio operator; and Mr. G. Brown, mechanic.

The flying-boat has a radius of at least 4,000 miles, but the actual figure is still a secret. More than 200 similar machines have been sold to the United States

Tribune 7-31-39

Flight, Dinner To Be Features Of Army Air Corps Birthday Fete

Thirtieth anniversary of the start of the United States army air corps will be observed here Wednesday in a flight of army planes over the city and at a dinner at 6:30 p.m. in Casa Del Rey Moro, Balboa park, sponsored by the Aero club, the chamber of commerce military affairs and aviation committees, the city and county and the Air Reserve association.

At the same hour as other army craft take off in similar flights all over the nation, the planes will leave March field at 2 p.m. Exact arrival time was not known here today, but an announcement concerning this was expected later from March field.

The observances will commemorate the formal approval, Aug. 2, 1909, by Brig. Gen. James Allen, then chief signal officer of the army, the recommendation of a board of officers that the army purchase a plane built by Orville and Wilbur Wright.

Earl Prudden, Aero club president, said that among celebrities expected to attend the dinner are Brig. Gen. Jacob E. Fickle, commanding first wing, GHQ, March field; Col. Robert Guthrie, commanding Ft. Rosecrans; Maj. Lowell H. Smith, leader of the first round-the-world mass flight, and Maj. Oakley Kelley, who completed the first nonstop flight from New York to San Diego.

San Diego's part in the development of this nation's army air corps constitutes a thrilling chapter in the progress of aviation. The first aero squadron of the army, comprising 16 officers, 77 enlisted men and eight planes, was organized Sept. 1, 1914, in this city. Three years later at this station situated on North Island, the army air corps commissioned one of its members a junior military aviator. He was just 30 at the time and destined to play a large part in air corps affairs. He was Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp.

Lt. Roy T. Kirtland, at College Park, Md., in 1912 piloted a plane taking aloft a machine gun for the first time in army history. Today Kirtland, a retired colonel, resides in San Diego. This historical flight came one year after congress for the first time specifically appropriated money for aviation. After this allocation of $125,000 the air corps began to grow and in 1913 it boasted 17 planes with a personnel of 23 officers and 91 enlisted men.

Notables Invited

Among other air corps officers residing in San Diego who played important roles in army aviation history and who will attend the dinner include Col. Edward L. Hoffman, who developed the air corps parachute and who issued orders for all pilots and passengers to wear 'chutes; Maj. T. C. Macauley, who made the first night flight in 1913 and who broke many other national and world records, and Col. H. A. Erickson, who made the first aerial photos in 1911.

Prudden yesterday announced the names of others to whom invitations have been extended to participate in the San Diego celebration. They are Col. Rush B. Lincoln, commanding post, March field; Col. Benjamin Weis, executive officer, March field; Col. Harvey Burwell, commanding bombardment group; Col. Carlyle Wash, commanding attack group; Maj. Frank H. Hackett, engineering department head; Maj. Joe Stromme, Pacific coast air corps representative in charge of procurement division; Maj. Leland Hurd, Pacific coast chief of air corps traffic inspection; Capt. W. W. Gross, commanding air reserve base here; Maj. E. N. Gott, Consolidated vice president, and more than 50 active, reserve and retired officers of army, navy and marine corps aircraft divisions.

Daily Telegraph and morning Post. Sat. July 15.

ARRIVAL OF U.S. FLYING-BOAT FOR R.A.F.

(London)

NON-STOP FLIGHT OVER ATLANTIC

FIRST MILITARY 'PLANE TO CROSS

From Our **SPECIAL CORRESPONDENT**
FELIXSTOWE, Friday.

Secret Air Force manœuvres over Suffolk early this morning, in which machines were flying without lights, held up the arrival here of the 15-ton American flying-boat bought by the British Government for the Air Ministry by 2½ hours.

The twin-engined flying-boat, the latest type of the Consolidated Aircraft Co.'s Model 28, had flown from San Diego, California, in three hops, a total distance of 5,750 miles. It is the first military aircraft to fly non-stop across the Atlantic.

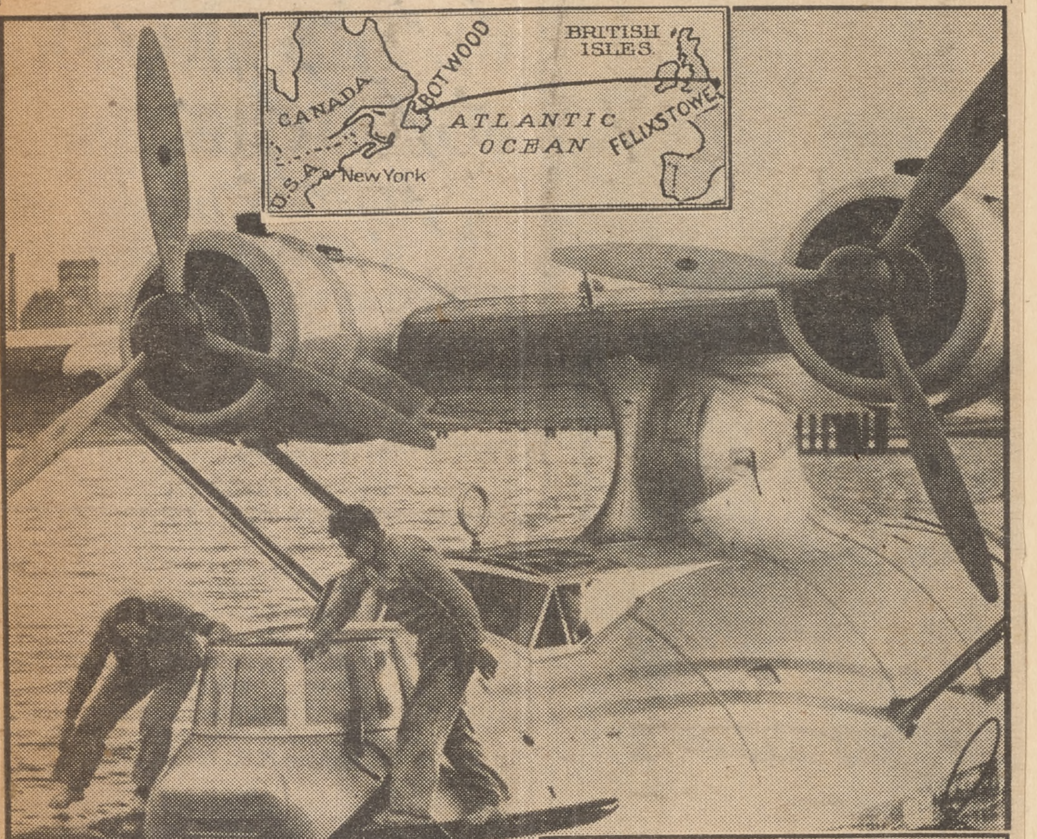
The flying-boat has a radius of at least 4,000 miles, but the actual figure is still a secret. More than 200 similar machines have been sold to the United States.

Evening Standard, Friday, July 14, 1939

Bomber Flies Atlantic in Fifteen Hours



THE first giant bomber flying boat ever to be flight-delivered across the Atlantic arrived at Felixstowe to-day from Botwood, Newfoundland.

She is the first of six of similar-type machines, built by the Consolidated Aircraft Company at San Diego, California, to be delivered to the Air Ministry for experimental purposes.

The flying boat took off from Botwood yesterday at 2.30 p.m. (B.S.T.) and made Felixstowe at 6 a.m. to-day.

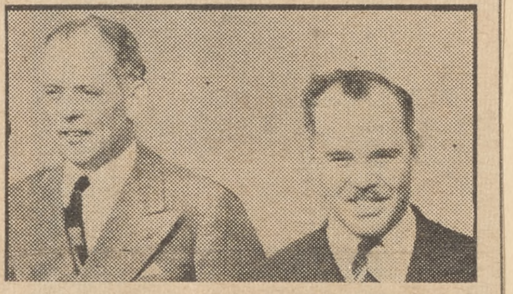
She is a 15-ton machine, has a cruising radius of 4000 miles and will be tested by the R.A.F.

This type of flying boat has now replaced destroyers in the U.S.A. navy for scouting and reconnaissance duties.

The pilots of the bomber were Captain Russell Rogers and Captain Lewis A. Yancy, with Flight-engineer G. B. Brown and Radio-engineer Raymond Booth.

Captain Rogers's first words on coming ashore were: "Good morning, glad to meet you, folks."

Radio-engineer Booth and Flight-engineer G. B. Brown.



Captain Russell Rogers and Captain Lewis Yancy.

The flying boat could have arrived at Felixstowe at 3.30 a.m., but while it was speeding across England Captain Rogers received a message advising him that aircraft without lights were flying in the vicinity of Felixstowe. He then altered his course and cruised along the coast for two and a half hours until all was clear.

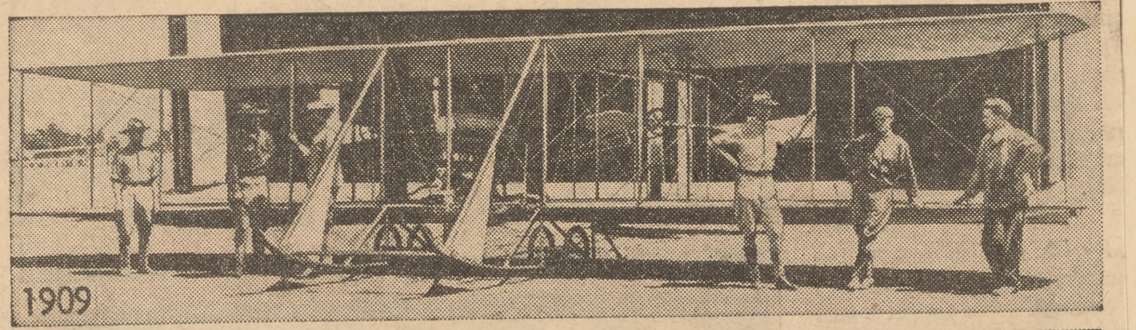
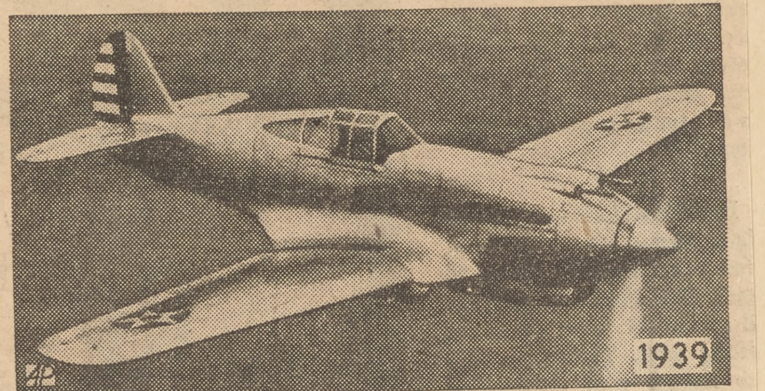
Observing Anniversary of First Flight in 1909

Tribune Aug 1 1939





On Aug. 2, 1909, the army bought from Orville and Wilbur Wright the flying machine pictured above. That was the beginning of United States and world military aviation. Now the army has more than 2000 fighting aircraft and building of 3500 more has been authorized. The 1909 ship took off with two passengers, hit 42 miles an hour and set a world endurance record of 1 hour, 12 minutes. The new army pursuit ship, lower, Curtiss P-40, equipped with two machine guns, carries oxygen apparatus for high altitudes and is said to do better than 400 m.p.h.

San Diegans tomorrow will be given an opportunity to observe two phases of Army Air corps activities when "open house" periods will be held at the air corps reserve base, Lindbergh field, from 9 a.m. to 4 p.m. and at the Ryan School of Aeronautics, where 35 young men are being trained for the air corps, from 8 a.m. to 11 a.m. The open house periods are part of the program commemorating the 30th anniversary of the start of the Army Air corps.

In addition to the invitation to the public to visit the Lindbergh field activities, citizens here also will be afforded an opportunity to view army planes from March field, according to plans announced for a nation-wide army flight program. Promptly at 11 a.m. (E.S.T.) planes from all air bases in the United States will take off for a national demonstration of America's military aviation power. The March field

(Continued on Next Page, Col. 4)

PLAN OPEN HOUSE FOR SAN DIEGANS AT FIELD, SCHOOL

Trib 8-1-39

CONTINUED FROM PAGE ONE

planes will take off from the Riverside base at 2 p.m. (P.S.T.), and after a flight over the Los Angeles area, are scheduled to fly to San Diego, air corps authorities report.

Climaxed by Dinner

Tomorrow's ceremonies will be climaxed here by an aviation dinner at the Casa del Rey Moro cafe, Balboa park, to which the public is invited. Reservations may be made at the chamber of commerce. The dinner is sponsored by the Aero club, the chamber of commerce military affairs and aviation committees, the city and county and the Air Reserve association. Many persons prominent in local and national aviation will attend.

Work of training the army's fledgling pilots at the Ryan school is progressing rapidly. The enrollees began their training period just a month ago, and the present class has two weeks more of training before its members are transferred to Texas for advanced training. Another class will convene in mid-August.

Visitors to the air corps reserve base, located on the south end of Lindbergh field near the coast guard air base, will find air corps reservists in active duty training. The two-week active duty period is packed with an intensive program which includes formation flying, cross-country flying, radio work, night flying, etc., carried on under the direction of Capt. W. W. Gross, unit instructor and commanding officer of the station. H. B. Duckworth, formerly on duty here with the department of air commerce, has reported for a year's duty as assistant to Gross.

San Diego's 91st group, air corps reserve, now has approximately 50 pilots. Its planes includes three BT-9s and one BT-2, and a Martin bomber has been assigned for use by Gross, Maj. E. R. MacReynolds, army inspector for the Consolidated, Ryan and Solar aircraft plants, and Capt. J. C. Horton, in charge of the training of new army pilots at the Ryan school. Eleven enlisted men are on duty. San Diego has had an air corps reserve group since 1924, and it has been based at Lindbergh field, where two hangars now are in operation for its planes and equipment, the last four years.

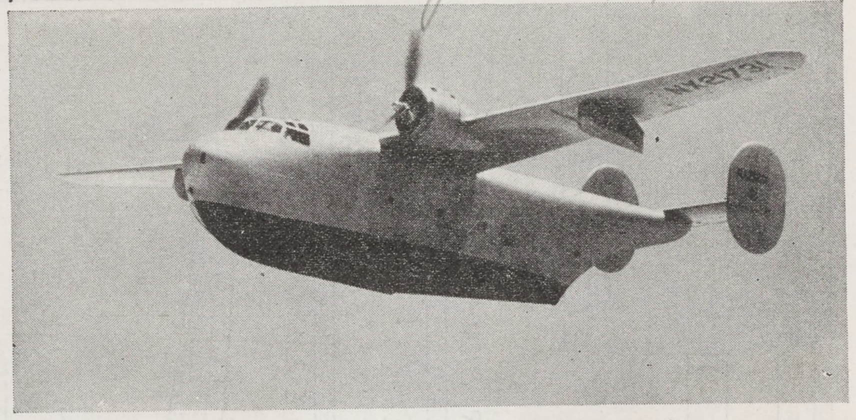
Ocean Spanning Razor Blade

The Plane On The Cover



The Consolidated 31 shaving the air at 275 m.p.h.

By ROBERT McLARREN

HE IS not a tall man. He is thin, suave, now middle-aged. He is an aviation pioneer for he furnished young Donald Douglas with financial backing for his first airplane factory: a tiny room next door to a barber shop in Los Angeles, almost twenty years ago. He was wealthy, young and handsome; but he was never a playboy. And he has made money, lots of it, from his original inheritance; for he is a hard worker, a clear thinker and above all a courageous man. For the courage of David Richard Davis has made this story possible: the story of our Plane on the Cover, the Consolidated Model 31 Flying Boat.

No other single ship in modern aviation history has represented such a complete abandonment of conventionality. As new as the dawning sun which glanced with a dazzling radiance off its sleek metal sides, this astounding sea-going hotel was unveiled a few short weeks ago with the smell of salt sea air from San Diego Bay mingling with the rhythmic staccato bark of the rivet guns at work on another of its kind in the mammoth factory of its birthplace. It is such an unparalled aviation triumph that those of us who witnessed its debut gasped in awed astonishment at first sight of the monsterous yet lithe creation.

David R. Davis had waited ten years for that morning. Years, not of idle anticipation, but a decade of hard, nerve-wracking toil on a formula for a wing section. Aviation needed that set of coordinates, has needed them for a long time. For since Col. V. E. Clark's famous "Y" airfoil was introduced in the middle twenties, few designers have dared use anything which departed too much from its basic principles. But now they need wait no longer for Consolidated has dared to prove that an aerodynamically "perfect" wing is not completely theoretical; it is practical and sensible.

Fundamentally, Davis' wing is a practically perfect wing curve. Its maximum lift is developed at its minimum positive angle of attack which means two things: the wing will fly at a minimum drag and the hull will take off and alight horizontally on the water, not bucking and pitching with its nose high in the air as to-day's seacraft are prone to do.

And what does having this "perfect wing" mean to aviation? Consolidated has answered that question with their twenty-five ton model 31: a greater lifting power

Leahy Sees U. S. Navy Supremacy

Beat Any Fleet, Admiral Asserts

WASHINGTON, July 30 (A.P.) — Plain-spoken Adm. Wiliam Leahy predicted in his final annual report today that the reinforced fleet the United States is building would be able "to defeat the fleet of any single naval power wherever it can be brought into action."

"The battle efficiency of our fleet and the training and morale of our men are believed to be unequaled by any major naval power," said the chief of naval operations, who ends a 46-year career by retirement Tuesday.

With the proviso that other nations do not accelerate their pace in the race for sea power, he expressed belief that the expanded navy and new bases authorized by congress "will provide sufficient protection for the vital sea frontiers of the United States."

Leahy observed that "while the naval policy of the United States is defensive, it is imperative in the event war is forced upon us that we limit the damage from an enemy to a minimum and that our fleet bring the enemy to terms as quickly as possible and at a safe distance from our shores."

"If peace can not be preserved our broad naval strategy must be offensive and the U. S. fleet should engage and defeat the enemy fleet wherever it can be brought to action," he continued.

"To accomplish this mission, our navy must be sufficiently strong in every essential element and it must be adequately trained." Top - (OVER)

As his foremost recommendation,

REBELLIOUS CON

GUBA'S LAST HOP

(Continued from Page 1.)

MELBOURNE "HERALD", 21/6/39.

Petrol For Double The Distance

From J. Percival, Junr., Official Press Correspondent aboard the Guba.

MAHE, Seychelle Islands, Wednesday.—When the flying-boat Guba took off from Port Victoria, Mahe, in the Seychelles, for Mombasa, she took with her sufficient fuel for twice the distance to be flown.

This was because of the possibility of headwinds due to the proximity of large masses of the African continent.

Before the departure a favorable weather report was received from Mombasa, and Captain Taylor expected the flight to take approximately eight hours.

The flight personnel was astir at 4.15 a.m. (local time), and after breakfast equipment and luggage were stowed aboard the aircraft.

The Gub was taxied over the runway to warm up the engines, and after a comparatively short run its great wing was circling Mahe and the surrounding islands, where broad pieces of eight, gold chalices and crosses and ingots of gold and silver were buried by pirates years ago.

Radio Link

During the Guba's stay, several families showed treasure charts which they were unable to decipher, and during a visit to the north island pirate signs were found cut in the rocks. These, too, are undecipherable.

In the last six months of 1808, it is recorded in Mahe, Corsairs frequenting the Seychelles and Hauritius captured 22 English merchant ships, and their sale returned 8,000,000 francs.

As the first rays of the morning sun illuminated these pirate islands, the Guba was lined up on the course for Mombasa. Its wing was dipped in salute as it passed over H.M.S. Liverpool, anchored in the stream.

During the flight an endeavor will be made to maintain wireless communication with Sydney and Perth.

OCEAN SURVEY COMPLETED

MELBOURNE "SUN", 23/6/39.

Result Considered Satisfactory

(From J. Percival, jun., official correspondent aboard the flying boat Guba)

MOMBASA, Thursday. — When the Guba arrived at Mombasa yesterday the survey flight across the Indian Ocean was completed with satisfactory results.

It is now believed that the Indian Ocean will become the most logical fast line between Britain and Australia.

Captain P. G. Taylor said the Guba had behaved excellently throughout the entire flight, the most impressive feature being the reliability of the Pratt and Whitney engines.

Captain Taylor thanked Mr. R. Rogers, pilot; Captain Yancey, navigator, and Messrs. R. Booth, radio operator, G. Brown and S. Barrinka, flight engineers, for their parts in the flight.

He also thanked Mr. Richard Archbold, owner of the Guba, for making the plane available to the expedition.

GUBA'S LAST STAGE IN OCEAN FLIGHT

MELBOURNE "HERALD",

The flying-boat Guba left the Seychelles Islands at noon (Melbourne time) today on the last stage of Captain P. G. Taylor's Indian Ocean flight.

21/6/39.

When the eight men step ashore at Mombasa, Kenya, tonight, after a mere 1100 miles of flying toward a target as big as Africa, the last ocean in the world will have been crossed by air.

In 18 days, most of which have been spent at the island stepping-stones on the route from Port Hedland to Mombasa, the Guba will have flown almost 10,000 miles.

Stages have been:—

	Miles.
June 3-4—Sydney-Port Hedland	2600
June 4-5—Pt. Hedland - near Cocos-Batavia . . . . (approx.)	2200
June 7—Batavia-Cocos	1000
June 13-14—Cocos-Chagos	1720
June 16—Chagos-Seychelles	1200
June 21—Seychelles-Mombasa . .	1100
Total Distance	9820

Dakar-New York

Captain Taylor, satisfied with the accomplishment of a flight he has planned for years, will wait in Africa for a week or two for a ship to bring him to Australia with Mr J. Percival, jun., press correspondent on the flight.

It is expected that he will have completed his report on the suitability of the various islands for use as flying-boat bases before his return.

Dr. Archbold and his crew will leave as soon as possible for Dakar, West Africa, probably the first stopping-place on their way to New York.

Because they are anxious to reach San Diego before July 1, if possible, they will probably attempt to fly non-stop from Dakar to New York, more than 4000 miles.

At San Diego, Captain Russell Rogers (chief pilot), Commander Lewis Yancey (navigator), and the other members of the Guba's crew, will take over a flying-boat similar to the Guba and fly it to England for the British Air Ministry, which has bought it.

Dr. Archbold and the crew expect to fly back to New Guinea in the Guba, or another flying-boat, to continue the research carried out on previous expeditions.

Guba's Flight

Continued from Page One

FLYING ABOVE CLOUDS

MELBOURNE "ARGUS", 14/6/39.

Messages from Guba

The progress of the Guba on her long flight across the Indian Ocean, from Cocos Island to the Chagos Archipelago, was told in messages received from Mr. J. Percival, jun., official correspondent aboard the flying-boat.

The messages were (the times given being Melbourne times):—

9.15 p.m. — Aircraft's dead-reckoning position, 78 miles, 281deg. true, from Direction Island. Weather fine.

9.21 p.m.—Flying in still air, with clear sky, over top of scattered cumulus clouds, typical of fine weather, south-east trade wind; altitude 6,700 feet, air speed 97 knots.

9.45 p.m.—Position 133 miles 281deg. true from Cocos. Flare just dropped on sea for drift observation.

10 p.m. — Just dark. Perfectly clear night, still air, all well. Two flares dropped on sea and sighted through telescope over rotable plate marked in degrees. Drift estimated at 3deg. to port.

10.25 p.m.—First sights of stars taken. Dead-reckoning position, 188 miles 281deg. true from Cocos.

11.10 p.m.—Position by observation at 12.12 GMT 11 degrees 45 minutes south, 93 degrees 40 minutes east. Distance run from Cocos, 190 nautical miles; speed, 112 knots; altitude, 8,500 feet. Both just in communication with Barney Boyd Station, W6LYY, San Diego, California.

11.30 p.m. — At 1,300 GMT course changed to 283 degrees true, as it was found from observation that the wind had shifted to north-east. There is cloud below, but as there is no moon it is impossible to tell how thick it is. Dead reckoning position at G.M.T., 13.15 latitude, 11 degrees 26 minutes south, longitude, 92 degrees 00 minutes east.

12.7 a.m.—More sights just taken for another position, which is now being worked out in the chart room. Dead reckoning position at 11.45 p.m., latitude, 11deg. 15min. south; longitude, 91deg. 05min. east.

12.45 a.m.—Position, latitude 10deg. 46 min. south; longitude, 89deg. 20min. east.

MELBOURNE "HERALD", 16/6/39.

GUBA'S 1192-MILE HOP TO ISLAND

By Radio from J. PERCIVAL, jun., Official Correspondent aboard the Flyin-boat, Guba.

DIEGO GARCIA, Friday. The survey at Diego Garcia having been completed, the Guba took off in the semi-darkness of 5.40 a.m. (10.40 a.m. Melbourne time) on the last island hop of the trip—1192 miles—to Seychelles.

It was decided to fly at a speed calculated to reach Port Victoria, in the Seychelles Group, after noon.

Soon, the pear-shaped coral enclosure was only a dark smudge on the surface of the sea.

After a few minutes in the air, the sun came up. The Guba was flying in clear air over a smooth sea on a course of 270 true from Diego Garcia.

FLYING-BOAT BASE

The possibilities of Diego Garcia as a flying-boat base were realised after a short inspection.

It was apparent from the nature of the narrow ring of land which encloses Diego Garcia lagoon that similar conditions existed as at Cocos for the preparation of a land aerodrome.

The coral rock and sand, which would form the basic foundation of runways, is easily obtained from certain portions of the shore, which have been examined for the purpose.

A small lagoon, about 200 yards in diameter, lies half a mile from the selected mooring site, the bottom of which consists of coral sand which could easily and cheaply be pumped out to gave adequate depth, as a sheltered mooring site.

IDEAL SITE

Diego Garcia can be described as an ideal natural flying-boat base, says Captain Taylor.

Practically no preparation, beyond the placing of slipways, mooring and any shore facilities required, would be necessary.

BIGGEST "TARGET"

The Seychelles Group, with its 10 islands of a total area of 156 square miles, are the biggest "target" in the Indian Ocean.

Once the Guba has reached them, she will have to fly only 1100 miles to Mombasa, Kenya—the African terminus of the proposed reserve air route.

GUBA HAD BIG TARGET

MELBOURNE "ARGUS",

Flight To Africa

MOMBASA (Kenya), Wednesday.

22/6/39.

Completing her survey flight across the Indian Oceon, the flying-boat Guba arrived here at 12.32 p.m. (local time) from the Seychelles Islands.

It was 6 a.m. at Mahe (Seychelles) when the Guba set out on her flight of 1,100 miles, with the coast of the African continent as her target.

Since she left Sydney 18 days ago the Guba has flown nearly 10,00 miles. Captain P. G. Taylor, chie Commonwealth representative c the flight, and Mr. J. Percival, ju official correspondent, will retu to Australia by ship. The Gu with her American crew, will fly Dakar, West Africa, on her way New York. A non-stop flight 4,000 miles from Dakar to N York may be ttempted.

(Message from Guba—Page 13

Guba's Flight

Fro Page

LEFT MAHE AT DAWN

MELBOURNE "ARGUS", 22/6/39.

Flew Above Clouds

(Message from J. Percival, Official Correspondent aboard the Guba.)

MOMBASA (Kenya), Wednesday.

While the beautiful island of Mahe still slumbered the Guba took off at dawn to-day on the last leg of the Indian Ocean survey flight.

As the first light of dawn came over the horizon the flying-boat's motors burst into life, and as soon as the aircraft reached the end of its runway the 2,100 horse-power of engines was unleashed, and in 26 seconds the Guba was in the air. Assisted by a slight following wind, she was soon under way at 128 knots.

The aircraft flew most of the time over scattered cumulus cloud. Weather conditions remained constant to within 200 miles of Africa, when the Guba was flying in cloud for about 50 miles, but this broke up again to scattered cumulus at a flying level of 8,000ft.

Soon after the Guba left Mahe the wireless operator exchanged signals with V.I.P., Perth, but later attempts to communicate with this station and V.I.S., Sydney, were unsuccessful. Continuous wireless watch, however, was kept by the station at Mombasa, which reported any changes in the weather there.

GUBA OFF AGAIN

MELBOURNE "ARGUS", 14/6/39.

OCEAN FLIGHT AT NIGHT

1,700-MILE JOURNEY

(Messages received by the Commonwealth Government from J. Percival, jun., official correspondent aboard the Guba.)

Flying above clouds, the flying-boat Guba was speeding last night across the Indian Ocean on her flight of 1,700 miles from the Cocos Islands to Diego Garcia.

At 10.12 p.m. Melbourne time the Guba was 190 nautical miles from Cocos.

This journey is the longest stage of the Guba's survey flight, and the flying-boat's destination is an island in the Chagos Archipelago.

It was 5 p.m. at Cocos (8.30 p.m. Melbourne time) when the Guba took off from the clear waters of the lagoon after a run of 600 yards. The Governor (Mr. Clunies Ross) and the wireless and cable staff farewelled members of the crew at the jetty before they were taken out to the flying-boat in a motor-launch.

Fine Weather Ahead

Before the Guba left Captain P. G. Taylor received a message from the naval wireless station at Aden stating that a forecast from H.M.S. Manchester, stationed at Diego Garcia, promised fine weather.

A 24-hour forecast from Diego Garcia stated that the weather was continuing fine. At 2,000ft. visibility was 15 miles and the sea was calm.

With a south-east trade wind behind her the aircraft was lined up on a course 280deg. true from Cocos at an estimated speed of 112 knots.

When the Guba left Cocos she had a south-east trade wind behind her, but later it changed to the north-east, necessitating a slight alteration in her course.

(Messages From Guba — Page 2.)

GUBA MAKES COCOS IS. IN 8½ HOURS

MELBOURNE "SUN", 8/6/39.

Australian Associated Press

COCOS ISLAND, Wednesday. —Just 8½ hours out from Batavia, the flying-boat Guba, in which a survey of the Indian Ocean air route is being made, alighted under Direction Island at 3 p.m. today.

Flying into thick weather, the Guba passed over Christmas Island, a British possession about 275 miles from Java Head, where the population had turned out to greet the expedition.

At the jetty a small steamer was moored and nearby were tiny figures waving to the first aeroplane seen from the island.

In the final stages of the flight the weather closed in and visibility was only two miles. The plane was brought to within a few miles of Cocos by dead reckoning.

It has not yet been decided when the next stage to Chagos Islands (1500 miles) will begin.—From J. Percival, Jun., official correspondent aboard the Guba.

(Report of Flight — Page 47)

MELBOURNE "SUN".

CLOUDS AND RAIN GREET FLYING-BOAT AT COCOS

From J. Percival, Jnr., Official Correspondent Aboard the Guba

COCOS ISLAND, Wednesday.—The descent to Cocos Island was made through clouds. The sea was not seen until we reached 1000 ft., when visibility was still very short.

THE wireless-direction finding equipment was then used to bring the plane into the islands which appeared immediately ahead as the machine drove through a squall of rain.

The Guba was flown low over the island and the circular lagoon to select an alighting run free from coral outcrops.

The water in the lagoon was very clear and it was not difficult to see from the air any coral which might hole the hull.

When the Guba had alighted a launch from Direction Island showed us the way to close inshore, where the machine was moored a few yards from the jetty.

It is riding at its own anchor under a corner of the island.

The Guba made an excellent flight from Batavia to Christmas Island, picking it out of the ocean

Christmas Island was surveyed from the air and its possibilities as a flying base will be dealt with by Captain Taylor in his reports to the British and Australian Governments.

Reasonably clear weather followed, but later the ocean was blanketed by cloud and was not visible again except through occasional breaks until we descended for Cocos Island.

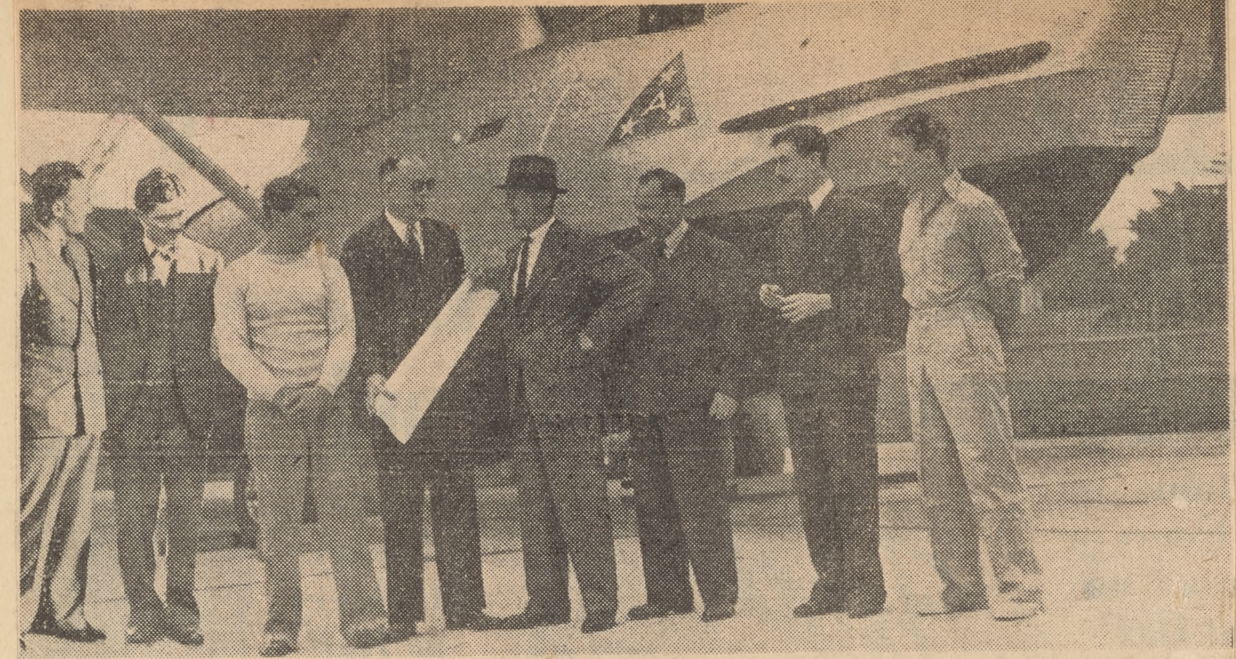
Captain Taylor will begin a survey of the island today and probably will thoroughly examine the lagoon.

WHY GUBA

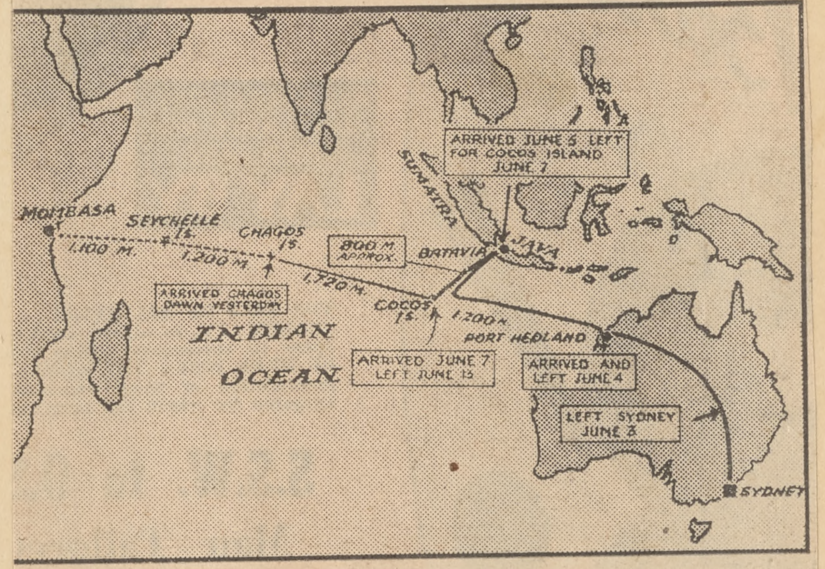
GUBA is the native name for a severe tropical windstorm of the sort that capsized the Guba's predecessor, also owned by Dr. Archbold, on an expedition to New Guinea in 1936.

MELBOURNE.

THE ARGUS, THURSDAY, JUNE 15,



GUBA SAFE.—After a long silence during the day news reached Melbourne last night that the survey flight flying-boat Guba had landed at Chagos Island, in the Indian Ocean, at dawn yesterday. Above are the members of the crew. (From left) R. Booth (radio engineer), R. Archbold (owner of the plane), J. Brown (mechanic), Captain L. A. Yancey (navigator), Captain P. G. Taylor (in charge of the survey for the Commonwealth Government), R. Rogers (pilot), J. Percival, jnr. (second representative of the Commonwealth Government and official newspaper correspondent), and S. Barrinka (wireless operator).



MAP showing the route taken by the Consolidated flying-boat Guba since it left Sydney on June 3 on a survey flight of the Indian Ocean for the Commonwealth Government.

GUBA MAY FLY ON TO-DAY

MELBOURNE "ARGUS", 7/6/39.

800 Miles to Cocos

Messages received by the Commonwealth Government from J. Percival, jun., Official Correspondent aboard the Guba.

BATAVIA, Tuesday.

If the weather permits, the flying-boat Guba will leave here tomorrow for the Cocos Islands, 800 miles away, in continuation of its Indian Ocean survey flight.

Captain P. G. Taylor communicated with the Cocos Islands tonight, and found that the weather was unpromising. A further report will be sought at 4.30 a.m. If it leaves at 6.30 a.m. (Java time), it is expected to reach the Cocos Islands at 2.30 p.m.

The wave lengths most suitable for the reception and transmission of messages between the ship, the City of Manchester, which will stand by at the Chagos Archipelago, the island base after Cocos Islands, and the Guba have been notified to the commander-in-chief, East Indian station, Colombo. The Guba will maintain contact on the flight with the coastal radio stations VIS and VIP at Perth and Sydney.

When the Guba takes off to-morrow, her tanks will be full, giving her a range of about 4,000 miles. Stores and water sufficient for a fortnight will be carried. Probably the Guba will remain for three or four days at the Cocos Islands before tackling the longest ocean stage of 1,470 miles to the Chagos Archipelago.

GUBA SAFE AT CHAGOS

MELBOURNE "ARGUS", 15/6/39.

Longest Stage Completed

DAWN ARRIVAL

Anxiety about the flying-boat Guba, from which no message was received between 11 a.m. Melbourne time and 9 p.m. yesterday, was allayed by a message received by the Director-General of Civil Aviation (Mr. Corbett) last night, stating that the Guba had arrived safely at the Chagos Group.

The Civil Aviation Department received a cable message from Aden stating that H.M.S. Manchester, which was waiting for the Guba at Diego Garcia, in the Chagos Archipelago, had announced the arrival of the flying-boat from Cocos Islands shortly after dawn. The Guba was unable to use her radio while she was on water.

At 11 a.m. (Melbourne time) yesterday, the Perth radio station reported that a request had been picked up asking the station to request the Manchester to play her searchlights into the sky. The Guba's radio operator suggested also that the Manchester be asked to work on a wave length of 600 metres.

Radio Interruptions

Interruptions to radio communications had occurred on earlier stages of the Guba's 1,725-mile flight from Cocos, when the flying-boat was in touch with naval vessels.

After leaving Cocos, according to early messages received from J. Percival, jun., official correspondent, the Guba made steady progress in relatively favourable conditions. It was still dark when a message at 6 a.m. (Melbourne time) said that the flying-boat had broken through the clouds at 10,000 feet, enabling the navigators to fix their position by star-observation.

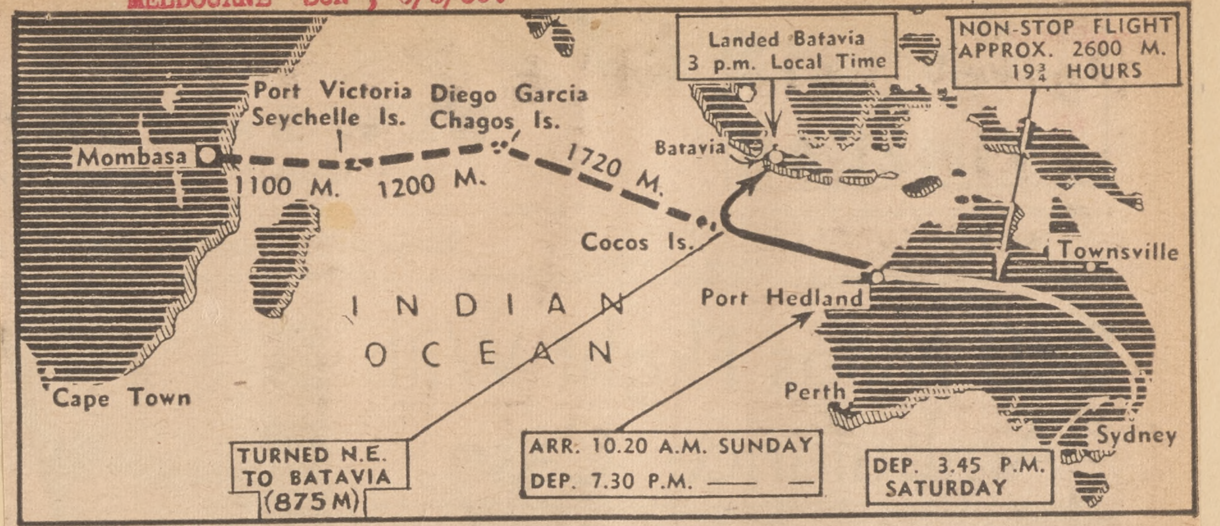
Mr. Percival's message at 9 a.m. (Melbourne time) was:—"We are now 170 miles from the Chagos. Throttled back to 100 knots as we wait for dawn. Navigators are getting a 'fix' now while the rest of us are having our hot chocolate."

At 10 a.m. (Melbourne time) Mr. Percival sent a message reporting the safe landing of the flying-boat. He added:—"The lagoon at Diego Garcia has basic requirements fo the operation of existing flyin boats and those of the proba future. The foresight of the A tralian Government in suppor the survey of the Indian Ocean's serve route has, therefore, fully justified in both group islands already visited."

(Picture and Map on Page 3)

GUBA TURNS BACK TO BATAVIA

MELBOURNE "SUN", 6/6/39.



RESUMPTION OF FLIGHT EXPECTED TOMORROW

Australian Associated Press

BATAVIA, Monday. — Unable to reach the Cocos Islands, in the Indian Ocean, the first stage of its flight to Africa, because of thick clouds and bad weather, the Guba flying boat turned off its course and alighted at Batavia at 3 p.m.

The commander of the expedition (Capt. P. G. Taylor) said they expected to leave Batavia in another attempt to reach the Cocos Islands on Wednesday.

(From Mr. Jack Percival, jun., official correspondent aboard the Guba)

BATAVIA, Monday. — After flying through Sunday night, the Guba alighted at Batavia this afternoon, 22 hours after leaving Port Hedland.

Cloud and weather conditions, which made determination of position by astronomical methods extremely difficult, placed the aircraft in a situation early this morning when it was considered advisable to alter the course for Batavia, in the Netherlands Indies.

Star Observations

ON departure from Port Hedland, the Guba proceeded on a course for Cocos Island, climbing above the scattered trade wind cloud to enable the navigator to fix position from star observations.

Flying at 13,000 feet the Guba ultimately passed into cloud, rain and turbulent air conditions. The machine was able to maintain perfectly normal flight but it had to be navigated on dead reckoning right through to the early morning when better conditions were experienced after sunrise.

Sights of the sun were taken and the aircraft placed on position lines which resulted from them. The single line obtainable, however, from the sun, as opposed to the intersection of lines taken from several stars, does not give an actual position but merely places the aircraft on a line.

Right Decision

IT was necessary, therefore, to consider the advisability of remaining in the air in an endeavor to locate Cocos Island in adverse conditions of cloud and visibility or using the remainder of the aircraft's fuel range to reach Batavia. The latter decision was obviously the right one in the circumstances and was accordingly made. At 6.25 (Greenwich) the Guba alighted in Batavia Harbor.

It is proposed to refuel tomorrow, and if weather reports from Cocos Island are satisfactory, to proceed there on Wednesday.

Captain Taylor said today that Captain Yancey, the navigator of the Guba, made the very best of extremely adverse conditions and a difficult situation. He brought the machine from a position, which was necessarily of some uncertainty, straight into Batavia.

Safety Factor

"THE long range of the Guba," added Captain Taylor, "has already proved itself of great value as a safety factor on a flight over an unknown route where unreported weather conditions must inevitably be encountered."

"Already Mr. Richard Archbold's co-operation and the conduct of his aircraft indicates a satisfactory carrying-out of the expedition."

(Flyers' Messages—Page 43)

REMARKABLE FEAT, SAYS MINISTER

CANBERRA, Monday.—The Minister for Civil Aviation (Mr. Fairbairn) said tonight that, although he was disappointed that the Guba did not locate Cocos Islands at the first attempt, the crew had performed a remarkable feat of navigation in later placing themselves accurately and landing successfully at Batavia.

The flight was also a striking example of the possibilities of long-range flying boats on trans-ocean flights.

It was interesting to note that the Guba was in the air for 22 hours during the flight towards Cocos Islands and the dash to Batavia. On the preceding day th Guba had crossed Australia in hours and within another seven hours had set out for Cocos Islands. The crew was therefore in the air 41 hours in the 48 hours.

The Sun News-Pictorial MELBOURNE. *Tuesday, June 6, 1939—Page 43*

GUBA'S SILENCE CAUSED SOME ANXIETY

CONTINUED FROM PAGE 2

WAS OUT OF RADIO COMMUNICATION FOR SEVERAL HOURS

OUT of touch with Australia and unable to make contact with Indian Ocean shipping or Cocos Island radio station, the flying boat Guba caused anxiety in official circles for some hours yesterday.

At that time the flying boat was cruising at a high altitude, attempting to get an astronomical bearing on the islands, but at no time were the flyers in any danger, as an immense reserve of fuel was still available.

Cocos Island, replying to a wireless message from the Civil Aviation Department finally removed anxiety when it reported that it had been in touch with the expedition.

WHEN it became evident that the weather would not clear, it was decided not to risk an attempt to land at Cocos Island, and the Guba was headed for Batavia, where good anchorage and a plentiful supply of fuel were assured.

About 4.30 a.m. (local time) the Guba got into radio communication with the Cocos station and spoke to it at intervals.

At 9 a.m. the Guba stated that it required cross-bearings from any ship in the neighborhood. Cocos endeavored to make contact with such a vessel, but apparently without success, which was unexpected as there should have been several vessels in the vicinity.

Cocos radioed Australia that the position then of the Guba was unknown to it. Later Cocos stated that the Guba was changing its course and was not far away.

Messages From Flying-Boat

ESSAGES received by the Commonwealth Government from Mr. Jack Percival, Jnr., official correspondent aboard the Guba, were:—

.14 a.m. Greenwich Mean Time (9.14 p.m. Sunday, Melbourne time): The Guba is making 117 knots and has run into turbulent air conditions. There seems to be some rain ahead.

2.35 G.M.T. (12.35 a.m. Monday, Melbourne time): We have run about 420 nautical miles from Port Hedland. Russell Rogers just came down from the cockpit to report that the rain has cleared and it looks fine ahead. The ship is heavily loaded so the engines are being run at 1800 to 1900 rev. Yancey has a splitting headache and has turned in for an hour. Steve Barrinka, engineer, who has had little rest since the Guba left Rose Bay, and had a busy day fuelling at Port Hedland, is also in his bunk. Brown, the other engineer, will wait for Barrinka to wake before going off duty. By the time the Guba arrives at the Cocos early in the morning it will have flown well over 4000 miles since the take-off from Sydney on Saturday afternoon. We are flying at about 10,000ft. between drifting, scattered clouds below and a thicker layer above, although we can see the stars through breaks. The air is still turbulent.

Untimed Message: We have run into a severe tropical rainstorm. There has been no sight of the stars for two hours. Our course is 292 deg. true, speed 116 knots, height 10,000ft. It is very bumpy and cold. As I write, the cloud has just broken and the moon is showing through.

3.25 p.m. G.M.T. (1.25 a.m. Melbourne time): Russell Rogers is climbing the ship, endeavoring to get above the clouds so that the navigators can get a sextant shot of the stars. Height 15,500ft.; air speed, 106 knots.

Untimed Message: The Guba is now flying through light haze, with enough breaks for Yancey to take sights of Vega and Riegal. He has just returned from the galley hatch and reports success.

Untimed Message: During the night communication has been maintained by Ray Booth (the Guba's St. Kilda-born radio operator) with Stations VHPD, Port Hedland; VIO, Broome; VIS, Sydney, and VIP, Perth. Early in the evening he had a hunt for a loose wire in the transmitter which, of course, he found. He may have to use the Guba's own direction-finder on the wireless station at Cocos in the morning. The Cocos station has a range of 300 miles.

4.36 p.m. G.M.T. (2.36 a.m. Melbourne time): Our distance from Cocos is 530 nautical miles (about 640 land miles), and the distance run 830 nautical miles (about 1000 land miles). Our position is 14 deg. 10 min. South, 105 deg. 20min. East. The ship is again in smooth air.

Untimed Message: The Guba is now flying on a course of 32 degrees for Sunda Strait, between Java and Sumatra, in conditions which, at the aircraft's position, are overcast with considerable haze. This procedure is in accordance with the decision to proceed to Batavia rather than use surplus fuel in an endeavor to reach Cocos Island in the existing conditions.

Change Of Plans

MR. PERCIVAL explained the change of plans in this message:—

"Because of cloud obscuring the stars and turbulent air conditions at a critical time, which made the fixing of position from star sights impossible, it has been decided to fly to Batavia and await conditions which will enable the Guba to be navigated to Cocos Island by astronomical methods. The long range of the machine makes this possible."

GUBA FLIGHT MELBOURNE "HERALD", 3/6/39. FROM PAGE 1

EMERGENCY RATIONS OF TINNED FOOD

Enough To Last For Month

SYDNEY, Saturday. — Emergency rations, consisting of a month's supply of ordinary tinned foods, are stored in the American Flying Boat Guba, which left this afternoon for Port Hedland (W.A.), from where she leaves tomorrow on an airmail survey flight of the Indian Ocean.

In addition to bacon and other food easily cooked on the Guba's range, a hamper containing food specially designed to tickle jaded palates on the long 19-hour flight to Port Hedland, was taken.

The personnel of the Guba is:—Captain P. G. Taylor (in charge); Captain R. Rogers, pilot; Dr. Richard Archbold, scientist-owner of the Guba; Messrs S. Barrinka and G. Brown, flight engineers; L. A. Yancey, navigator; R. E. Booth, radio operator; Jack Percival, Jnr., official correspondent.

Arrangements have been made for the maintenance of constant radio communication between Guba and stations in Australia throughout the entire flight.

Amalgamated Wireless (Aust.) will provide special watches at its Sydney transmitting centre, Pennant Hills, and at receiving stations at La Perouse (VIS) and Applecross, Perth (VIP).

Captain Taylor will spend up to a week at each landing point, carrying out exhaustive examinations of the harbors, possible landing areas, and sites for aerodromes for landplanes.

Copious notes will be taken of prevailing weather conditions. A long study of the conditions has led Captain Taylor to believe that he will find that a following wind at one altitude will be a head wind higher up.

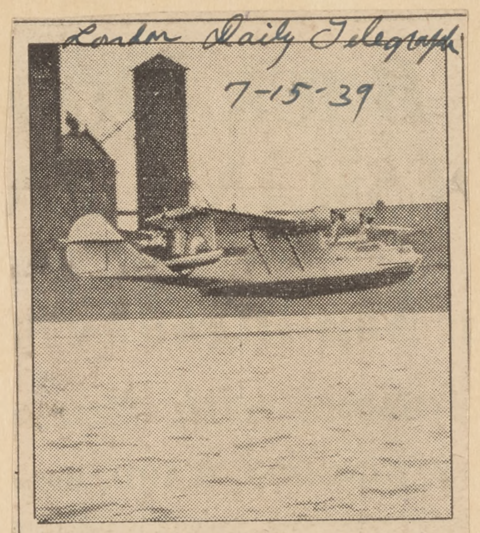
A long list of questions has been prepared by the Civil Aviation Department, which Captain Taylor will answer in the form of a report when he returns. Arrangements have been made for a complete cinematographic and "still" camera record of the trip.

From Mombasa, where the survey will end, the Guba will fly across Africa to Dakar (about 4000 miles), thence to the Virgin Isles (3400 miles) and then north to New York (1500 miles).

Given very favorable weather, she might fly non-stop from Dakar to New York. Her course from Sydney to New York will cover about 12,000 miles. There will be only seven intermediate stops.

Thus the average hop will be about 1700 miles. The whole trip will take about four weeks, giving an average daily mileage of 400 miles.

London Daily Telegraph
7-15-39



BOMBER FLIES ATLANTIC.—The first bomber ever to be flight-delivered across the Atlantic about to alight at Felixstowe yesterday after her journey from Botwood, Newfoundland.

Another record aircraft development achievement was presented in the second paper of the evening—the story of Consolidated Aircraft Corp.'s sensational Model 31 flying boat. The discussion was presented by B. W. Sheahan, engineer in charge of drafting and personnel at Consolidated and related the phenomenal 10-month progress from authorization to test flight.

The talk of the industry, Consolidated's Model 31 stood revealed by Mr. Sheahan as the first plane to use the new Davis airfoil in its wing; the first plane to fly the Wright 18-cylinder, double-row, 2000 h.p. engines; and far superior to the Consolidated PBY series in performance. A brief table of dimensions in his talk revealed the ship's weight empty as 25,000 pounds and "approximately" 50,000 pounds gross.

Much of Mr. Sheahan's paper discussed the development of the Model 31 in less than a year's span as compared to the two to three year development of big flying boats under the standard prototype procedures of government practice.

Motion pictures were shown of the Model 31's first test flight.

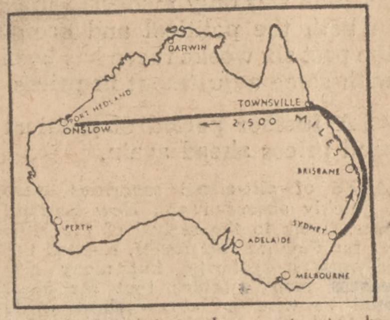
GUBA HOPS OFF ON GREAT FLIGHT

MELBOURNE "HERALD", 3/6/39.

Over Sea To Africa



MAP illustrating the route to be taken by the Guba on her flight to Port Hedland today.

SYDNEY, Saturday.—The American flying-boat Guba left Sydney at 3.45 this afternoon for Port Hedland (W.A.), from where she leaves tomorrow on an air mail survey flight of the Indian Ocean.

Captain P. G. Taylor, who is in charge of the flight, expects to reach Port Hedland at 11 a.m. tomorrow, and to leave for Cocos Islands (1200 miles away) shortly before dusk.

A crowd of several thousands gathered at Rose Bay and cheered as the Guba roared down to take off.

From Cocos Islands the Guba will be flown to Diego Garcia (1470 miles), Mahe, in the Seychelles Group (900 miles), and Mombasa (Kenya), where the survey ends.

From Sydney, the Guba will fly about 7000 miles to Mombasa. The ocean crossing from Port Hedland will be about 4500 miles.

All flying will be done at night and so timed as to make the arrival at each point coincide with sunrise or a little later.

EIGHT ON BOARD

The machine has been lent free of charge to the Federal and British Governments by her owner-pilot, Dr. Richard Archbold.

In a farewell message Dr. Archbold said that flying-boats were now being built that could fly from Port Hedland to Mombasa in one hop.

He was glad to be able to render a service to Australia in return for the many favors granted him during his stay.

The Guba has eight aboard, including two engineers.

Yesterday afternoon, the boat went on its last trial flight. The compass was swung and the wireless, one of the most powerful aircraft sets in the world, was calibrated.

Early today she was beached for the last time for more than a month and will take on a capacity load of nearly 2000 gallons of petrol.

Emergency rations—Page 3.

Transatlantic Progress.

MAIL AND PASSENGER SERVICES.

PAN-AMERICAN Airways last week inaugurated the North Atlantic service by the northern route, and at the same time carried paying passengers by the southern route viâ the Azores. These were the first paying passengers to be carried across the North Atlantic by a heavier than air machine, although the German airship company, Deutsche Zeppelin Reederei, maintained a regular Atlantic service for some considerable time. Details of Pan-American Airways' services, on both routes, have been included in the July issue of Bradshaw's International Air Guide. The passenger service, by way of Marseilles and the Azores, links Marseilles and Port Washington on a two-day schedule. There is one service weekly on each route in each direction. The inaugural service along the northern route was flown by the Yankee Clipper, and 16,000 lb. of mails were carried. In addition, there were 19 passengers and a crew of 12. Among the passengers were Mr. Juan T. Trippe, president of Pan-American Airways, and five other officials and representatives of the company, and also officials of the Civil Aeronautics Authority and of U.S. Government Departments. The other American company interested in transatlantic service, American Export Lines, made its first transatlantic flight this week. American Export Lines is a shipping concern, and the company proposes to use flying-boats, operating between New York and Marseilles, to supplement its shipping services. A Consolidated PB2Y flying-boat is being used at present for carrying mail and freight, but later passenger-carrying boats will be used.

The British Service.

That the United States was ready to open the North Atlantic service before this country is not really surprising, as the British aircraft industry has been so preoccupied with the rearmament programme. However, there should not be much delay now, and the British service is expected to become a fact early in August. This was announced by Sir Kingsley Wood, Secretary of State for Air, at a luncheon last week, when the Government officially welcomed the visitors who landed in England after crossing the Atlantic in the Yankee Clipper. Sir Kingsley said that the British service would begin with Short flying-boats developed from the standard Empire type. They had hoped to start alongside the U.S.A. service. He also hoped that next year we should have comparable equipment with the American company when the new Golden Hind class of flying-boats would be running alongside the Clippers.

Flying-Boats or Landplanes?

So far, development of the North Atlantic services has centred round flying-boats, but the possible use of landplanes has not been forgotten. In this country, Short Brothers have under construction a four-engined landplane designed for transatlantic service, while the French four-engined Farman 2231's are expected to make experimental flights this summer. In the United States, too, a landplane suitable for the North Atlantic service has been built. This is the Boeing Stratoliner, and it is now undergoing flying trials. Development of flying-boats for long sea routes is probably associated largely with passenger comfort, as a larger craft can be built than would be possible with a landplane, the limiting factor here being the length of airport runways. A landplane, however, would be considerably faster, and would be more adaptable to the use of a pressure cabin for high altitude flying. What is more, a landplane fitted with flotation gear would probably have as high a safety factor as a flying-boat, particularly as present day flying-boats cannot make a forced landing in heavy seas without sustaining considerable damage. The time is now rapidly approaching when a choice between landplanes or flying-boats for long sea routes will have to be made. Both types of aircraft are valuable, and on long ocean crossings it may be found more economic to use rapid landplanes for mail services and large flying-boats for passenger flights.

GUBA'S 2,600 MILE FLIGHT

MELBOURNE "ARGUS", 5/6/39.

SYDNEY—PORT HEDLAND IN 19¾ HOURS

NOW ON WAY TO COCOS

By J. PERCIVAL, Jun., Official Representative Aboard the Flying-boat Guba.

Alighting yesterday at Port Hedland (W.A.) at 9.20 a.m. West Australian time (11.20 a.m. Melbourne time), the Indian Ocean survey flying-boat Guba completed its 2,600-mile flight from Sydney in 19 hours 45 minutes.

At 5.30 p.m. the Guba, after taking aboard 1,245 gallons of fuel, took off for Cocos Islands, the first stage of the ocean flight. The distance is 1,200 miles, and the Guba is due at Cocos early this morning.

There was a thrill as the flying-boat took off, and it appeared for some moments that she would not rise from the water in time to clear Sandy Island. After a run of about 50 seconds, however, she rose, circled over the harbour, and roared out over the ocean to the westward.

Radio reports received by the radio operator on the Guba (Mr. R. Booth) at 7.14 p.m. (W.A. time) indicated that the conditions at Cocos were good. The weather over the route is expected to be generally favourable, though there may be some rain. The Guba is making 117 knots.

Flight Across Australia

Throughout Saturday night, on the flight from east to west across Australia, the stars were used for navigation, and they were standing out of the moonlit sky as if to invite sextant sights.

With its great load of more than 30,000lb., the Guba had to be flown farther north than was at first planned, because she would have ncountered severe headwinds if course had been laid direct to Hedland. The longer the was in the air, however, it sed its load pro rata with the al consumption of fuel and Its all-up weight decreased e air at the rate of approxi- ly 500lb. an hour.

though it was in the air for t 19 hours there was still an ample margin of fuel left in the tanks when it alighted at Port Hedland.

Intensely cold conditions were experienced during the night. On several occasions the temperature was well below zero in the cockpit, and full-length wool and fur-lined flying suits and sheepskin boots could not keep the biting cold out.

For hours on end Mr. Booth sat cramped in his chair endeavouring to maintain radio contact with numbed fingers. The cold was so intense that it was impossible to sleep under three blankets over a flying suit. Captain Yancey shivered at his work in the navigation cabin. When Captain Taylor opened the hatch in the galley to secure a number of sextant shots the chilly blast was almost unbearable. Even hot coffee and chocolate and food did not relieve the severity of the cold.

Rising Sun Welcomed

The first warm rays of the morning sun were welcomed by all. They seemed to thaw out the aircraft.

Mr. Rogers cooked breakfast about an hour after sunrise. He prepared a welcome meal of fried sausages and bacon, after having first to thaw out the sausages in the pan before they could be removed from their container.

(Log of Flight—Page 2. Pictures on Page 9)

GUBA'S FLIGHT *Continued From Page 1*

CROWDS WAIT AT PORT HEDLAND

MELBOURNE "ARGUS", 5/6/39.

THRILL IN DEPARTURE FOR COCOS

MACHINE JUST CLEARS ISLAND

PORT HEDLAND (W.A.), Sunday.—The shore and jetty were lined with people this morning to witness the arrival of the flying-boat Guba after its non-stop flight of 2,600 miles from Sydney.

A great crowd also witnessed the Guba's take-off at 5.30 p.m for Cocos Island on the first stage, 1,200 miles, of the Indian Ocean survey flight. There was a moment of anxiety when it was feared that the heavily laden Guba would not clear the low shores of Sandy Island.

However, daylight eventually appeared between hull and water, and the Guba climbed easily. It must have been as alarming to those aboard the flying-boat as it was to the dozen Royal Australian Air Force, commercial, and civil pilots who gathered on the deck of the motorship Koolama to watch the beginning of the historic flight. They held their breath as the Guba swept past, still sitting heavily on the water, and their relief was evident as the Guba at last lifted.

The Guba circled the town in a wide sweep, and then turned into the setting sun on its 1,200-mile hop to Cocos.

On the Guba are Mr. Richard Archbold, the owner, Captain Taylor, and Captain L. A. Yancey (navigator), Mr. Russell Rodgers (pilot), Mr. R. Booth (radio operator), Messrs. Barrinka and Brown (mechanics), and Mr. J. Percival, junior (newspaper representative).

Little Warning of Arrival

There was little warning early this morning of the Guba's approach to Port Hedland. Although elaborate arrangements had been made for radio contact between the flying-boat and the various radio stations between the terminals, the Guba's radio was directed towards Sydney almost throughout the flight, while static badly affected reception of the signals at the western end of the route until early this morning.

While the signals of airliners operating on various air services were easily heard, the signals of the rapidly approaching Guba were comparatively weak, and the first indication of her arrival was when the roar of her engines was heard.

Presently the great yellow and silver flying-boat was circling overhead, and turning into the stiff easterly breeze, the Guba swept in over Sandy Island, which is the western boundary of the harbour, and alighted.

Cold, Weary Fliers

In a few moments the Guba was moored 500 yards from the jetty. The first to come ashore in an outboard motor dinghy were the owner, Mr. Richard Archbold, Captain P. G. Taylor, the Commonwealth Government's representative; Captain L. Yancey, the navigator and the official newspaper representative, Mr. J. Percival.

No ceremony attended their landing at the jetty. Fatigued and still bitterly cold and unkempt, they climbed from the landing stage and waited to be directed to an hotel.

"No sleep for 20 hours, and I've never been so cold for so long," said Captain Yancey.

Soon they were breakfasting, and in a few minutes more Captain Yancey and Mr. Booth (radio operator) were asleep in the hotel.

Captain Taylor and Mr. Percival dealt with official business, and the chief pilot and two flight engineers remained aboard the flying-boat to begin as soon as possible the refuelling.

Refuelling Task

Refuelling proved simpler than was expected by the oil company. Two dinghies with outboard motors took out from the wharf relays of four-gallon drums, returning with the empties, and in this way 1,245 gallons were taken into the Guba's capacious tanks in about six hours.

The refuelling had not long been finished when the drone of engines was heard in the air, and three Avron Ansons, in perfect formation, came out of the south, dipped over the Guba's anchorage, and flew inland to the aerodrome.

Crowd Waits All Day

Despite the great interest taken locally in the flight, the flying-boat, and its distinguished personnel, no one could obtain exact information about the proposed time of departure. It was reported that part of the personnel were in favour of continuing the flight as soon as fuelling was done, and that the others argued in favour of delaying until to-morrow.

However, the residents were taking no chance of missing the spectacle, and all day the jetty was thronged with people, many of whom prevailed on those in charge of the fuelling dinghies to take them to view the Guba at close quarters.

At 5 p.m. the personnel left their hotel and boarded the dinghies. Soon after the engines sprang to life, and after they were warmed up and the crew slipped the moorings the engines roared and the Guba swung into the take-off channel. The Guba's path lay parallel to the jetty, and provided the onlookers with a fine view. With a full normal load the Guba takes off in 38 seconds. To-day, however, well over 50 seconds elapsed before there was sufficient lift.

OVER CONTINENT BY NIGHT

Graphic details of the flight from Sydney to Port Hedland are contained in messages received by radio from the Guba while in flight.

The following messages were received from Mr. Percival, all the times given being Melbourne time:—

4.15 p.m.—Guba's performance in becoming airborne after run of only 36½sec. remarkable for a craft loaded with 1,750 American gallons of fuel, in addition to oil, a personnel of eight, and equipment. We are now flying at 4,000ft., and steadily climbing.

4.48 p.m. — Flying on automatic pilot at 8,500ft. and making air speed of 120 miles an hour. The route is within easy distance of the coast. Mr. Archbold and Mr. Rodgers, who handled the take-off, are now aft, Mr. Rodgers supervising the arrangement of cabins in preparation for the night shakedown. Captain Yancey, the Guba's navigator, is in the chartroom with Captain Taylor. Mr. Booth is in radio communication with the United States.

6.25 p.m.—Now 260 nautical miles north from Sydney. We expect to see lights of Moree soon. Altitude 5,300ft. and air speed 120 miles an hour. The engines are trailing sheets of blue incandescent flame. The lights of farm houses present an intriguing sight. The brilliant golden sunset was followed by an equally attractive rising moon. The evening meal is now being prepared on the three-ring stove in the galley.

7.30 p.m. — We are now 50 nautical miles from Roma (Q.). The Guba will be flown north for 150 nautical miles to get the advantage of winds from the east for the night flight across Australia. The weather is bitterly cold at an altitude of 6,500ft. Mr. Archbold, Captain Taylor, and Captain Yancey are in full-length wool and fur-lined flying suits. Mr. Rodgers is asleep in his bunk in a leather flying suit, and also covered with blankets. In about 70 minutes the Guba's course will be laid toward the west coast, and she will begin her long overland flight. The clear moonlight makes conditions ideal for sextant shots.

8.45 p.m. — We have run into slightly turbulent air. Captain Yancey has just turned in, giving instructions to be called in an hour. Captain Taylor in the chartroom and Mr. Archbold at the controls. Mr. Rodgers awoke, got out of his bunk, and fully awakened himself by eating ice-cream so hard that the block had to be slightly thawed on the stove.

9.50 p.m.—Mr. Booth has received the wind reports for levels up to 13,000ft. from Rockhampton and Townsville, and because of the westerlies it has been decided to fly farther north than originally intended. The Guba is now flying on a course which passes close to Blackall, Longreach, Winton, and Cloncurry, and will be headed on a direct course to Port Hedland from Cloncurry. Port Hedland is 2,600 land miles from Sydney by our route, and unless there is assistance from a tail wind we will arrive at about noon to-morrow. Mr. Archbold has turned in for a sleep.

11.15 p.m. — Blackall was in sight at 10.30 p.m. We are now flying at 6,400ft. at a ground speed of 106 knots. Captain Yancey awoke at 10 p.m. local time and Mr. Archbold got up at 11 p.m. It is still intensely cold.

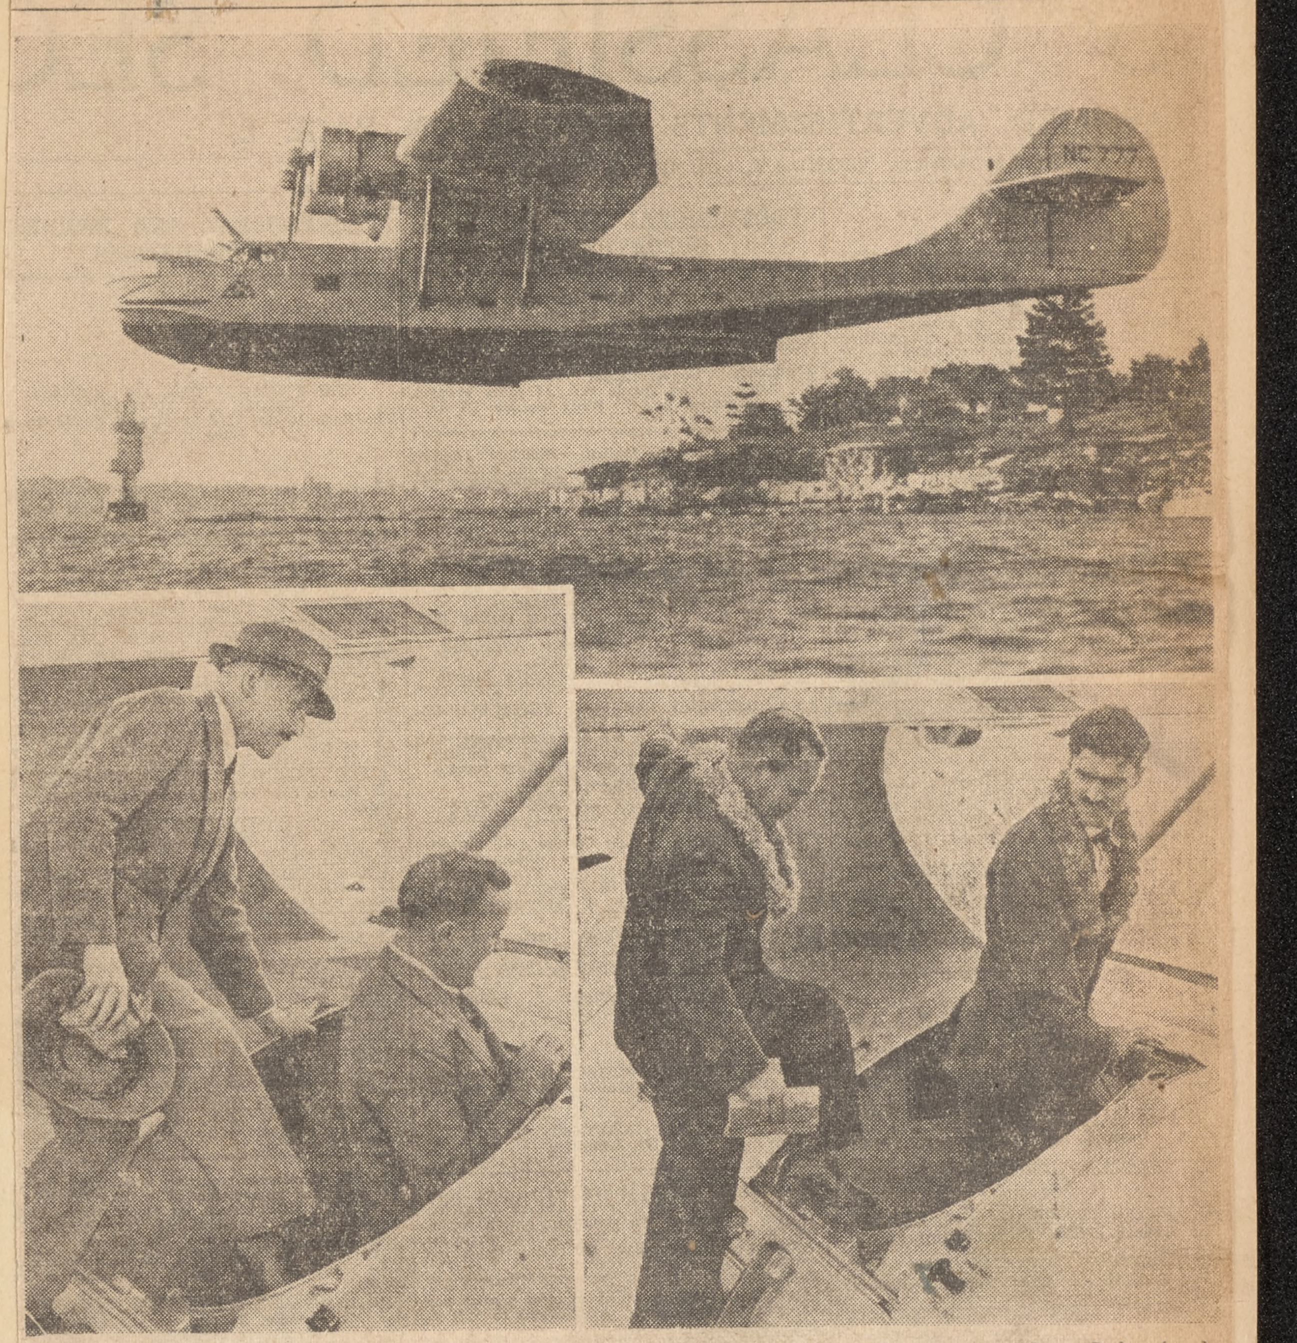
12.15 p.m.—We were 50 nautical miles, 270deg. true, from Longreach at midnight. Mr. Booth has been requested to obtain a wind report from Darwin. Captain Yancey took sextant shots of Altair and Vega, two bright stars, through the starboard hatch in the galley.

12.50 p.m.—The Guba is now flying in slight easterly winds, for which the machine was flown north beyond Roma. It is expected that favourable winds, between south-east and north-east, will be held through to Port Hedland. At the height at which the Guba is flying, above 6,000ft., the force of the favourable winds decreases, and at higher altitudes there is a reversal to west.

4.30 a.m. (Sunday).—At 3.40 a.m. we were still at 6,000ft., and the cabin temperature was two degrees above zero.

6.15 a.m. — The time of our probable arrival at Port Hedland is 11 a.m. (Melbourne time). The speed is now 112 knots.

MELBOURNE. THE ARGUS, MONDAY, JUNE 5, 1939.



ON THE FIRST STAGE of the airmail survey flight across the Indian Ocean, the flying-boat Guba (top) took off from Sydney on Saturday afternoon for Port Hedland (W.A.). (Bottom, left) Captain P. G. Taylor, the Commonwealth Government's representative, and Mr. R. Booth (right), the radio operator, boarding the machine. (Bottom, right) The owner of the Guba (Mr. R. Archbold), right, and the chief pilot (Mr. R. Rogers) were decorated with leis before they stepped aboard.

BOMBER'S FLIGHT FROM NEWFOUNDLAND

Exeter Express & Echo.

Breakfast Arrival at Felixstowe

7-4-39

ONLY 15 HOURS IN THE AIR

The first giant bomber flying boat ever to be flown across the Atlantic arrived at Felixstowe to-day, from Botwood, Newfoundland.

She is the first of six of similar type machines built by the Consolidated Aircraft Company at San Diego, California, to be delivered to the Air Ministry for experimental purposes.

The machine took off from Botwood on Thursday at 2.30 p.m. (B.S.T.) and made Felixstowe before 6 a.m. to-day.

Our special reporter was told that the arrival was "O.K."

Known as the model 28, this twin-engined flying boat is similar to the long-range patrol bombers, of which 200 are already in service with the United States Navy.

She is a 15-ton machine, has a cruising radius of 4,000 miles, and will be tested by the R.A.F.

The machine was brought over by the same crew that recently flew a sister 'plane on Captain Richard Archbold's Indian Ocean survey. The pilots were Captain Russell Rogers, and Captain Lewis, A. Yanky, with Flight-Engineer G. B. Brown, and Radio Engineer Raymond Booth.

Officers at Felixstowe were ready waiting on the pierhead at three a.m. when news came through that the boat was over England.

The bomber shifted her course and delayed landing to avoid 'planes flying in the vicinity. The P.B.Y. came into sight from the north-west over the River Orwell. The sun picked out

(Continued in Next Column.)

(Continued from Preceding Column.)

her splendid lines in clear relief as she circled overhead, and then taxied to a buoy.

"It was a splendid trip, and although we had some rough weather we were only 15 hours in the air, when we expected to be at least 17," said Captain Rogers.

The crew of the flying boat went straight to the R.A.F. Officers' Mess at Felixstowe.

"The crew were very, very tired when they came in, and are now sleeping soundly," said an official later.

Trib. 8-3-39

Fleet Sees Aviation as Peace Factor; Park Fete Honors Army Air Corps

Honoring early day fliers and voicing tribute to the men who have developed aviation since 1909, more than 150 persons attended a dinner last evening in the Casa del Rey Moro cafe, Balboa park, in commemoration of the 30th anniversary of the army air corps.

Those present heard Maj. Reuben H. Fleet, head of the Consolidated Aircraft Corp., declare that aviation progress during the next 30 years will make for world peace.

Sees Boon in Plane

"If we should enter into a world peace pact, we shall do so because of the airplane," declared Fleet. "I firmly believe that I am engaged in a line of endeavor which will bring to mankind the boon of enduring peace."

Col. Harvey S. Burwell, who was in command of Rockwell field during the World war and who is commander of the bombardment group stationed at March field, paid tribute to Maj. T. C. Macaulay, chamber of commerce executive secretary; G. Aubrey Davidson, civic leader; Col. Ed Fletcher; and the late George Burnham; for the aid they gave him while he was in command of Rockwell field. He also discussed the development of accident prevention in the army air corps.

Pioneers Present

Other army aviation pioneers present were Col. E. L. Hoffman, who developed the air corps parachute; Maj. Macaulay, who made the first night flight in 1913 and flew the first twin-motored seaplane; Maj. Fleet, who learned to fly at Rockwell field; Col. Roy C. Kirtland, U. S. A. ret., who was the first graduate of the signal corps aviation school at College Park, Md., and who flew the tractor plane in 1912 for the first time; Col. H. A. (Jimmy) Erickson, who took the first aerial photograph in 1911, and Maj. Harry A. Sutton, who won the distinguished flying cross and McKay trophy through his investigation of spinning characteristic of bombers.

Herbert E. Fish, vice mayor, and T. Leroy Richard, chairman of the board of supervisors, brought greetings from the city and county, and Jackson L. Hicklin, chairman of the chamber of commerce aviation committee, brought greetings from the chamber of commerce. Others seated at the speakers' table were Col. Robert E. Guthrie, U. S. A., commandant of Ft. Rosecrans; Adm. Joseph R. Defrees, commandant of the 11th naval district; Maj. Edgar N. Gott, vice president of Consolidated Aircraft Corp.; John Robinson, famous soaring pilot; Capt. J. C. Horton, air corps supervisor of cadet instruction at the Ryan Aeronautical school.

Capt. H. B. Porter, air corps flight surgeon at the Ryan school; Lt. Lloyd Hopwood, assistant to Capt. Horton; Capt. W. W. Gross, commanding air corps base, and unit instructor, 91st group, air corps reserve; Maj. E. R. McReynolds, air corps inspector for Consolidated, Ryan and Solar aircraft companies; Maj. Joseph L. Stromme, Pacific coast chief in charge of procurement planning division of the air corps, and Col. S. J. Heidner, unit instructor of the organized reserves of San Diego and Imperial counties, of the 35th general hospital in San Diego, the Los Angeles mobilization center and all other army reserve units, except the air corps, in San Diego.

Earl Prudden, Aero club president, was master of ceremonies.

The dinner was given by the Aero club of San Diego, the city and county and the chamber of commerce.

Clipper Crew Back After England Hop

Trib. 8-3-39

Crew members of a Consolidated Aicraft Corp. flying boat, which last month was flown from San Diego to Felixstowe, England, returned to the United States today by liner, The Associated Press reported from New York. They are Russell Rogers, pilot; Lewis Yancey, navigator; Gerald Brown, engineer, and Raymond Booth, radioman.

U.S. 'PLANE FOR R.A.F. CROSSES ATLANTIC

London
Daily Telegram & MORNING POST 7-14-39

NON-STOP FLIGHT

The twin-engined Consolidated Aircraft Co.'s flying boat, which was built in California and acquired by the British Government for the R.A.F., crossed the Irish coast near Foynes at two a.m. to-day.

It had flown non-stop across the Atlantic from Botwood, Newfoundland.

No stop was made at Foynes, but the 'plane maintained a speed of 190 m.p.h. towards Felixstowe, where it is to undergo tests.

When the 'plane passed over the Irish coast it was the first military aeroplane ever to have Atlantic.

DAILY TELEGRAPH, LONDON 7-11-39

BOMBER ON WAY TO ENGLAND

BOUGHT FOR R.A.F.

A fifth giant air liner, the new Consolidated Aircraft Co.'s flying-boat recently purchased by the British Government for the R.A.F., was about to start on a delivery flight direct to England, but stopped for adjustments to her gyroscopic pilot.

She left San Diego, California, at 4.23 p.m., G.M.T., to-day to fly 3,000 miles direct to Botwood, Newfoundland, where she is expected to land at 2 p.m. to-morrow. After refuelling she will take off immediately for Felixstowe.

The personnel is that of the seaplane Guba which recently completed a survey flight of the Indian Ocean, including Mr. Russell Rogers, pilot; Capt. Lewis A. Yancey, co-pilot and navigator; Mr. Raymond Boothe, radio operator; Mr. Gerald Brown, engineer.

Squadron Leader Addams, of the British Air Ministry, who has been superintending delivery of American aircraft in California for six months, had hoped to be in the 'plane, but was unable to leave his duties.

The flying boat, a 15-ton patrol bomber, has a cruising radius of 4,000 miles. It will be rigorously tested by the R.A.F. and if found suitable a large order may be placed, or possibly the design purchased for construction in Britain.

At 8 a.m. to-morrow, Mr. Norman Lee, a New York broker, will arrive here in the Atlantic Clipper, and will be the first man to fly round the world by commercial aeroplanes.

He will have circled the world in approximately 20½ days, all but 1,428 miles of the 24,694 being flown in American-built 'planes. 11-7-39

An Air Dream Come True—Page 16

DAILY TELEGRAPH, LONDON 15/7 7-15-39

A SIGNIFICANT FLIGHT

As she touched the waters of the Orwell yesterday, in what is described as "a beautiful landing" the bombing aircraft flown from America added a new page to the accumulating history of flying. She was the first military machine to fly the Atlantic, but the crossing of the ocean was only the final episode in a journey of over 5,000 miles from California under her own power. To the makers of a great machine capable of such performance congratulations are due, as well as to the four British officers who acted as pilots and crew. Together they have enlarged the boundaries of imagination regarding the possibilities of military aviation in the near future.

This vessel is the first of six bought for experimental purposes. Successful as has been the flight, it has been treated by all concerned as an episode in the process of delivery. Yet it demonstrates the practicability of maintaining across the Atlantic a great reserve of machines remote from dangers of attack, and its performance is convincing evidence of the possibility of reinforcing within a few hours the more distant corners of the Empire should they be subjected to assault. Much of the progress made in military aviation must remain secret, but the landing of Consolidated Model 28 at Felixstowe yesterday enables the least expert to appreciate the new power that is made available when a 15-ton bomber flies from the West Coast of America with less of incident than attended a crossing of the Channel 25 years ago.

THE DAILY TELEGRAPH AND MORNING POST, SATURDAY, JULY 15, 1939

SALVAGE DRAMA—WI

ARRIVAL OF U.S. FLYING-BOAT FOR R.A.F.

NON-STOP FLIGHT OVER ATLANTIC

FIRST MILITARY 'PLANE TO CROSS

From Our SPECIAL CORRESPONDENT
FELIXSTOWE, Friday.

Secret Air Force manœuvres over Suffolk early this morning, in which machines were flying without lights, held up the arrival here of the 15-ton American flying-boat bought by the British Government for the Air Ministry by 2½ hours.

The twin-engined flying-boat, the latest type of the Consolidated Aircraft Co.'s Model 28, had flown from San Diego, California, in three hops, a total distance of 5,750 miles. It is the first military aircraft to fly non-stop across the Atlantic.

From Botwood, Newfoundland, which was left yesterday afternoon, the machine had maintained a speed of about 180 m.p.h. for 1,800 miles with the aid of a following wind. It flew through a storm at 13,000ft with ice forming on its wings.

Two hundred miles from the Irish coast the flying boat encountered a cross wind which reduced its speed. Even then it was passing over England 11 hours after leaving Botwood.

LANDING LIGHTS PREPARED

As reported in later editions of THE DAILY TELEGRAPH this morning, it crossed the Irish coast at Foynes at two a.m.

At the R.A.F. Experimental Station at Felixstowe, where it will undergo tests, a group of officers were awaiting its arrival. Preparations for placing landing lights on the water were put in hand.

Messages of the machine's progress had been received hourly by radio, via Croydon, and her course had been plotted in the offices of the station. Then, when it was believed to be but half an hour's flight away, there came a message from Capt. Russell Rogers, the pilot. "Vicinity of Felixstowe, 4.15 G.M.T., 5.15 B.S.T."

There followed a series of somewhat mystifying messages giving the boat's progress as follows: 4.25 a.m., near Norwich; 4.30, Pulham; 4.45, Nottingham; 5.0, near the Wash; 5.15, off Hunstanton.

STORM OVER ATLANTIC

By this time the sun was rising, and at 5.53 a.m. the flying-boat was suddenly seen approaching at a high speed from the north-west.

Capt. Rogers circled the town at 1,000 feet and as he came round again the retractable floats came down, and the flying-boat swept down to the water three minutes after being sighted. An R.A.F. officer standing by my side exclaimed, "A beautiful landing."

Capt. Rogers explained to me afterwards that the reason why he did not make straight for Felixstowe was that he had heard there were machines flying without lights in the neighbourhood and he thought it better to wait for daylight.

"We had an uneventful flight," he said. "With a following wind we made excellent progress, although we met one storm."

He illustrated the benefits of wireless when he added: "We were able to keep to our course across the Atlantic.

"Mr Booth, our radio operator, was in constant communication with Botwood, Foynes and Croydon, and every now and then an amateur from Georgia broke in with a little chat."

The flying-boat has a radius of at least 4,000 miles, but the actual figure is still a secret. More than 200 similar machines have been sold to the United States.

Maj. Fleet Sees Peace Via Air Lanes

Union 8-3-'39

150 Attend S. D. Dinner on Corps Anniversary

Within the next 30 years the airplane will become the greatest instrumentality for preservation and guarantee of world peace, Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp., predicted last night at a dinner commemorating the 30th anniversary of the establishment of the army air corps.

More than 150 persons, including army aviation pioneers, city and county officials, military and commercial aviation leaders and chamber of commerce officers, attended the dinner in Casa del Ray Moro, Balboa park. The dinner was given by the Aero club of San Diego, the city and county and the chamber of commerce.

LAUDS 30-YEAR ADVANCE

After praising advance of army aviation in the last 30 years, Maj. Fleet said: "If we should enter into a world peace pact, we shall do so because of the airplanes. I firmly believe that I am engaged in a line of endeavor which will bring to mankind the greatest boon-enduring peace."

Col. Harvey S. Burwell, who was in command of Rockwell field during the World war and who is commander of the bombardment group stationed at March field, paid tribute to Maj. T. C. Macaulay, chamber of commerce executive secretary; G. Aubrey Davidson, civic leader; Col. Ed Fletcher; and the late George Burnham; for the aid they gave him while he was in command of Rockwell field. He also discussed the development of accident prevention in the army air corps.

PIONEERS PRESENT

Other army aviation pioneers present were Col. E. L. Hoffman, who developed the air corps parachute; Maj. Macaulay, who made the first night flight in 1913 and flew the first twin-motored seaplane; Maj. Fleet, who learned to fly at Rockwell field; Col. Roy C. Kirtland, U. S. A. ret., who was the first graduate of the signal corps aviation school at College Park, Md., and who flew the tractor plane in 1912 for the first time; Col. H. A. (Jimmy) Erickson, who took the first aerial photograph in 1911, and Maj. Harry A. Sutton, who won the distinguished flying cross and McKay trophy through his investigation of spinning characteristic of bombers.

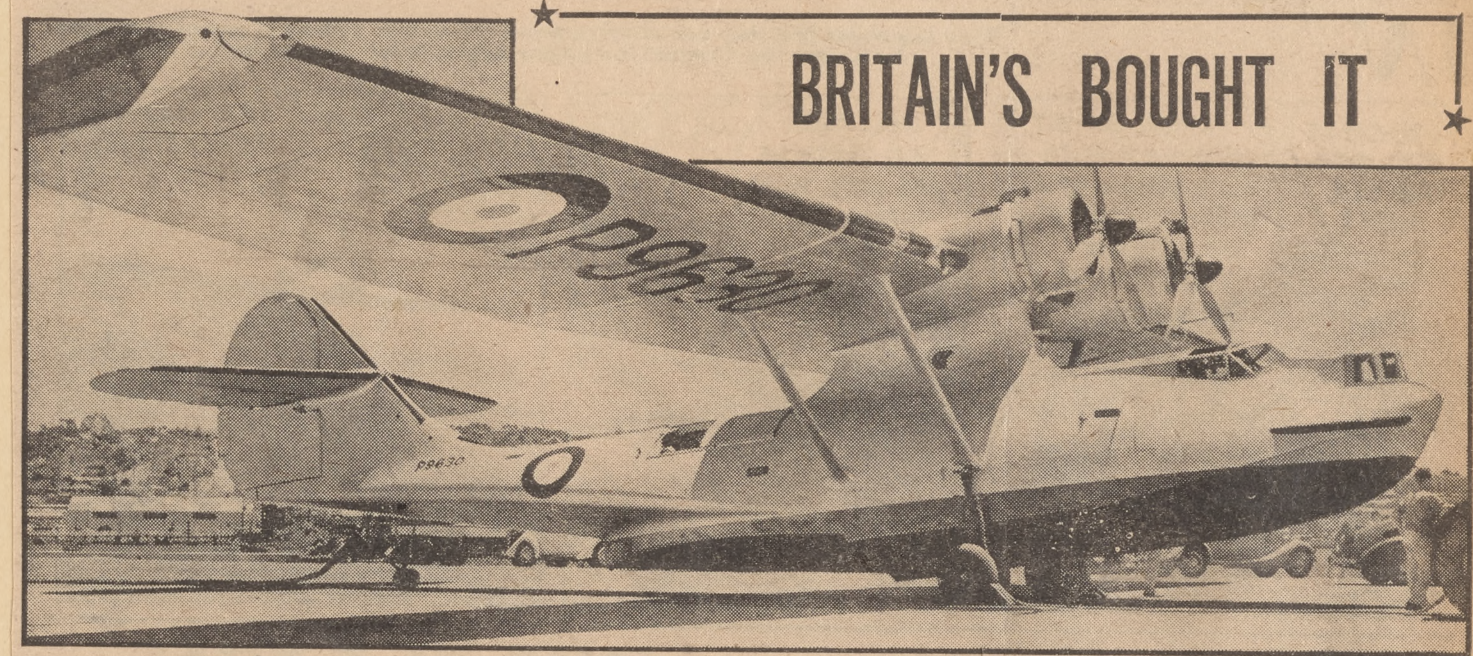
Herbert E. Fish, vice mayor, and T. Leroy Richard, chairman of the board of supervisors, brought greetings from the city and county, and Jackson L. Hicklin, chairman of the chamber of commerce aviation committee, brought greetings from the chamber of commerce. Others seated at the speakers' table were Col. Robert E. Guthrie, U. S. A., commandant of Ft. Rosecrans; Adm. Joseph R. Defrees, commandant of the 11th naval district; Maj. Edgar N. Gott, vice president of Consolidated Aircraft Corp.; John Robinson, famous soaring pilot; Capt. J. C. Horton, air corps supervisor of cadet instruction at the Ryan Aeronautical school.

Capt. H. B. Porter, air corps flight surgeon at the Ryan school; Lt. Lloyd Hopwood, assistant to Capt. Horton; Capt. W. W. Gross, commanding air corps base, and unit instructor, 91st group, air corps reserve; Maj. E. R. McReynolds, air corps inspector for Consolidated, Ryan and Solar aircraft companies; Maj. Joseph L. Stromme, Pacific coast chief in charge of procurement planning division of the air corps, and Col. S. J. Heidner, unit instructor of the organized reserves of San Diego and Imperial counties, of the 35th general hospital in San Diego, the Los Angeles mobilization center and all other army reserve units, except the air corps, in San Diego.

Earl Prudden, Aero club president, was master of ceremonies.

Thursday, June 29, 1939 THE DAILY MIRROR (London)

BRITAIN'S BOUGHT IT



Purchase of this giant American flying boat by Britain has been announced in Los Angeles.

Looks an awkward parcel to pack, doesn't it? But there won't be any freight charges.

Because Squadron-Leader J. R. Addams, of the Air Ministry, is to fly it from San Diego, California, to Felixstowe (Suffolk), next month.

AVIATION SEEN AS PEACE AID

Fleet Cites Goal At Aero Club Dinner

Aviation

Another 30 years of aviation history will see the airplane used to preserve world peace, instead of to threaten war, Maj. Reuben H. Fleet, Consolidated Aircraft Corp. president, told an audience of distinguished Army fliers and local civic leaders on the 30th anniversary of the Air Corps.

A dinner sponsored by the San Diego Aero Club in Cafe del Rey Moro, Balboa Park, was attended by 150 persons, and featured talks by Major Fleet; Col. Harvey S. Burwell, Rockwell Field commander during the World War; Vice-Mayor Herbert E. Fish; Chairman T. Leroy Richards of the Board of Supervisors, and Jackson Hicklin, chairman of the Chamber of Commerce aviation committee.

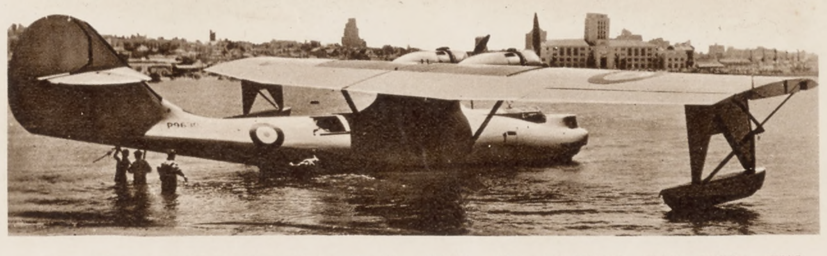
REVEALS GOAL

"I firmly believe that I am engaged in an endeavor which will bring to mankind enduring peace," Major Fleet said. "A world peace pact, if made, would be entered into because of airplanes."

Among veteran aviators present were Col. E. L. Hoffman, retired, pioneer in parachute development; Maj. T. C. Macaulay, who made the first night flight in 1913 and flew the first twin-engined Army plane; Col. Roy C. Kirkland, retired, first graduate of the Signal Corps aviation school, College Park, Md.; Col. H. A. Erickson, reserve, who made the first aerial photograph in 1911; and Maj. Harry A. Sutton, holder of the Distinguished Flying Cross and McKay Trophy as result of his studies of spinning characteristics of bombers.

MOCK RAIDS ENDING

A three-day simulated war on Southern California cities by waves of Army planes from March Field was to end today. Civilian observers, led here by the sheriff's office, tested a communication network warning adjacent cities of impending arrival of the attackers.



THE FIRST MILITARY FLYING-BOAT TO CROSS THE ATLANTIC, NON-STOP: THE CONSOLIDATED AIRCRAFT CO.'S "28-5" MODEL, BOUGHT BY THE BRITISH GOVERNMENT.

This machine, which has been bought by the British Government, left Botwood, Newfoundland, on July 14, and arrived at Felixstowe, Suffolk, on July 15, passing over England eleven hours after leaving Newfoundland. For 1800 miles a speed of 180 m.p.h. was maintained, and the 'plane flew through a storm at 13,000 ft., with ice forming on its wings. Our photograph is of particular interest as showing the retractable wing-tips used as floats for landing purposes.

Admiral Gets Giant Bomber As 'Flagship'

Union 8-9-39

One of the world's largest and most powerful long-range patrol bombers, a four-motored craft designed and built by Consolidated Aircraft Corp. and officially known as PBY-2, has been designated as the aerial flagship of Rear Adm. Arthur B. Cook, commander of scouting force aircraft.

Adm. Cook is to use the plane on inspection trips of patrol wings of his command, which extends from Panama to Alaska and Hawaii and along the Atlantic seaboard from New York to the Florida keys.

Assigned to command the PBY-2 is Comdr. Andrew Crinkley, pioneer naval flier and for the last two years assistant operations officer at Naval Air station. Comdr. Crinkley has been detached from the air station and attached to the U.S.S. Wright for special duty with the four-motored bomber. The plane is to be officially turned over to the navy today.

It is equipped with the latest safety flying appliances including hydromatic propellers and wing de-icers.

Comdr. Crinkley has been relieved as assistant operations officer by Comdr. Morton Seligman of the aircraft carrier Ranger.

Aircraft Chief To Inspect New Plane Bases

Union 8-9-39

By HOWARD MORIN

On a tour of inspection of new aircraft operating bases at Alameda and Sitka and patrol wings in the Puget-Sound-Alaska-Hawaii sector, Rear Adm. Arthur B. Cook, commander of scouting force aircraft, will sail aboard the flagship Memphis at midnight tonight.

The Memphis is due at Seattle Aug. 19 and will leave Aug. 23 for Sitka. From Alaska the cruiser is to proceed to Pearl harbor, returning here about Oct. 15.

Adm. Cook announced that 27 patrol bombers of Patrol Wing 1, in command of Capt. Charles P. Mason, which flew from San Diego to Seattle Monday, will return here early next week. The tender Wright, plane-guard ship, now at San Francisco, also will return here as soon as the patrol bombers wing their way southward.

No further mass flights of navy bombers to Hawaii, Panama or Alaska are scheduled this year.

Battle force aircraft squadrons of the carriers Saratoga, Lexington, Yorktown and Enterprise will continue to base at North island until next spring. Naval authorities said they have not been advised where or when the next fleet problem will take place, indicating that the fleet will remain in the San Diego-San Pedro area until spring.

Army Air Corps Birthday To Be Observed In S. D.

San Diego, the city where 19 "firsts" in aviation history were made, Wednesday will join in a nation-wide observance commemorating the 30th anniversary of the Army Air Corp's founding.

It is a far cry from the $25,000 Wright plane purchased by the Army in 1909 to the modern high speed bombers which will fly over San Diego as a part of the observance.

A veritable "Who's Who" in Army aircraft history will be represented when a dinner sponsored by the San Diego Aero Club, the Chamber of Commerce, the city, the county and the Air Reserve Association is held in Cafe del Rey Moro, Balboa Park, Wednesday at 6:30.

Earl Prudden, Aero club president, said that Brig-Gen. Jacob E. Fickel, commanding first wing GHQ, March Field; Col. Robert Guthrie, commanding Fort Rosecrans; Maj. Lowell H. Smith, leader of the first round-the-world mass flight, and Maj. Oakley Kelley, who completed the first non-stop flight New York to San Diego, are among Army dignitaries who will be here for the celebration.

S. D. OFFICERS TO ATTEND

Among Air Corps officers residing in San Diego who played important roles in Army aviation history and who will attend the dinner, include. Col. Ed. L. Hoffman, who developed the air corps parachute and who issued orders for all pilots and passengers to wear 'chutes; Maj. T. C. Macaulay, who made the first night flight in 1913 and who broke many other national and world records; Col. H. A. Erickson, who made the first aerial photos in 1911; Maj. Reuben H. Fleet, Consolidated Aircraft Corp. president, who was assigned to establish the first air-mail route while he served as an air corps officer; and Col. Roy C. Kirtland, USA, ret., who piloted a plane in 1912, taking aloft a machine gun for the first time in Army history.

ORGANIZED IN S. D.

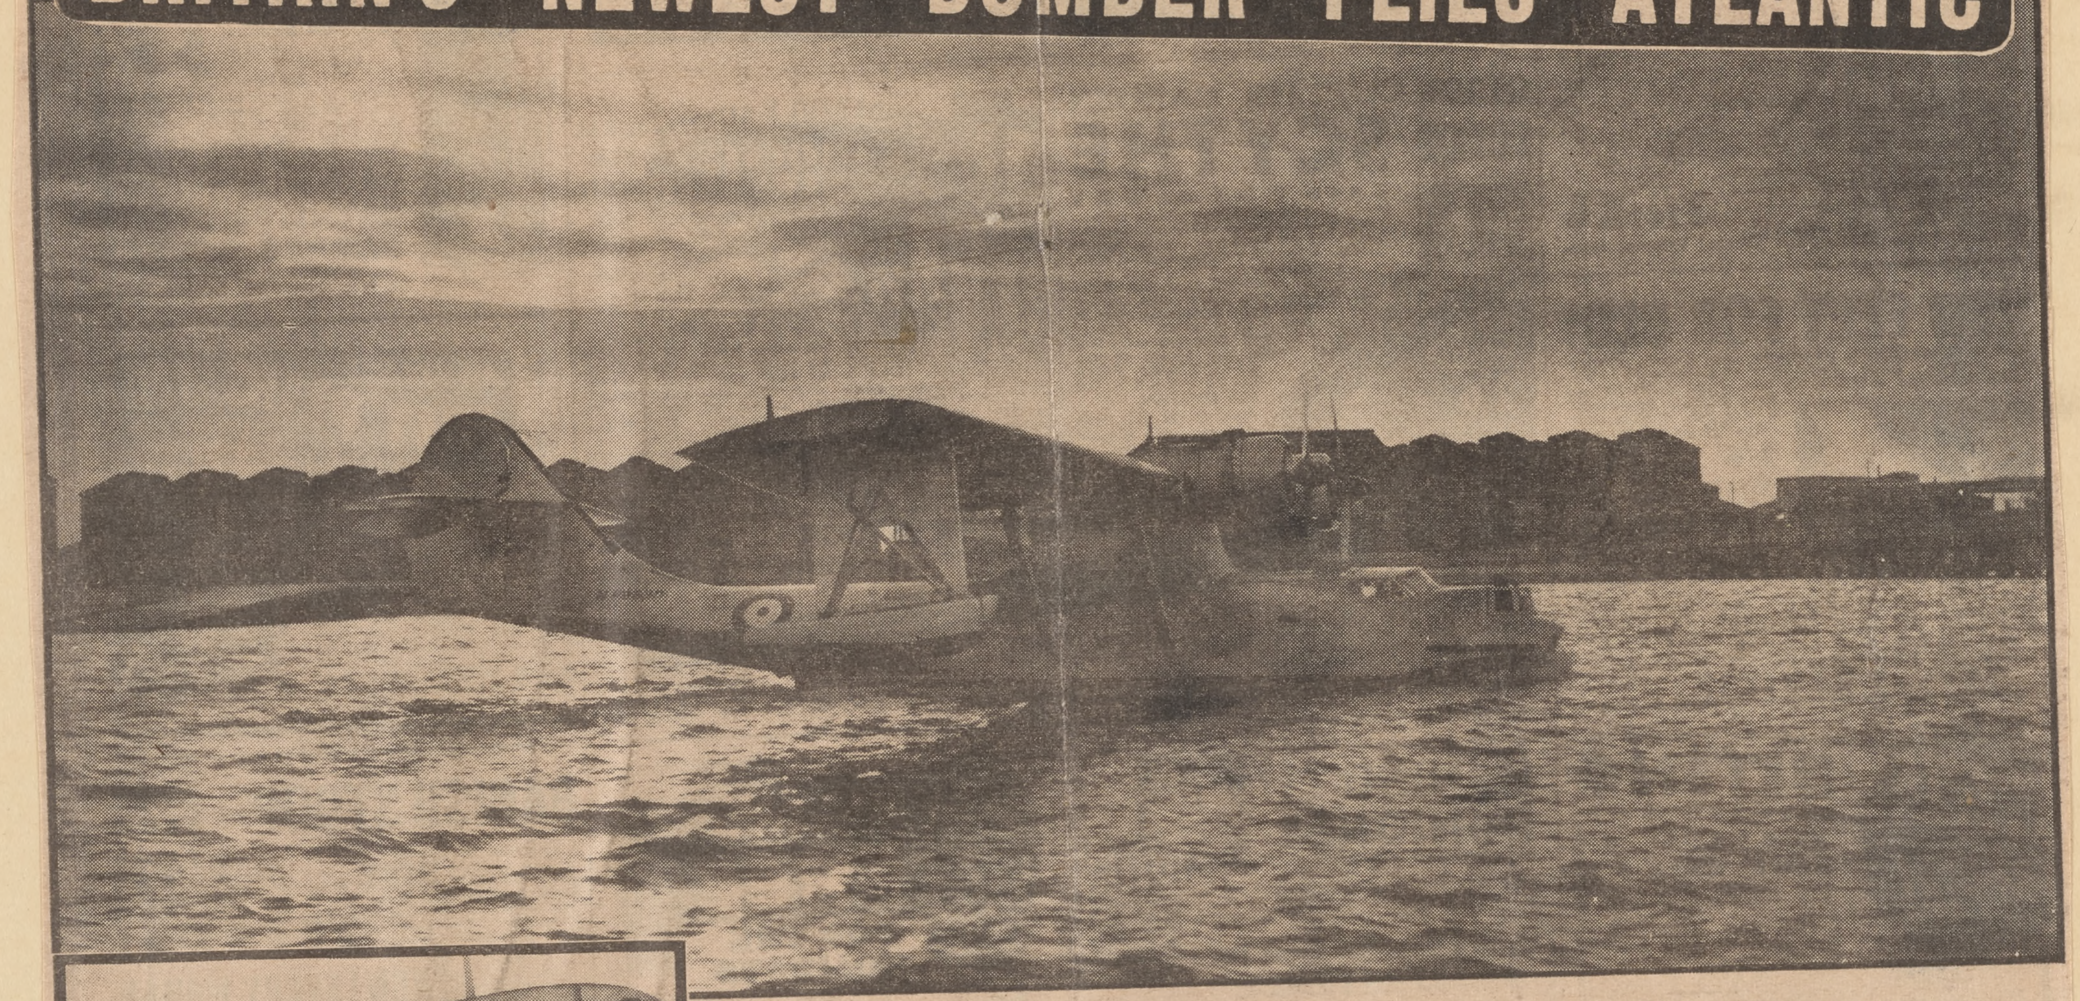
San Diego's part in the devlopment of the Army Air Corps constitutes a thrilling chapter in the progress of aviation. The first aero squadron of the Army, comprising 16 officers, 77 enlisted men and eight planes, was organized Sept. 1, 1914, in this city.

Mr. Prudden yesterday released a list of those to whom invitations have been extended to participate in the San Diego celebration. They are Col. Rush B. Lincoln, commanding post, March Field; Col. Benjamin Weis, executive officer, March Field; Col. Harvey Burwell, commanding bombardment group; Col. Carlyle Wash, commanding attack group; Maj. Frank H. Hackett, engineering department head; Maj. Joe Stromme, Pacific coast air corps representative in charge of procurement division; Maj. Leland Hurd, Pacific coast chief of air corps traffic inspection; Capt. W. W. Gross, commanding air reserve base here; Maj. E. R. McReynolds, air corps inspector, Consolidated Aircraft; Maj. E. N. Gott, Consolidated vice president; and more than 50 active, reserve and retired officers of Army, Navy, Marine Corps aircraft divisions.

Dinner reservations may be made by calling M-0124.

7-15-39

BRITAIN'S NEWEST BOMBER FLIES ATLANTIC



At dawn, the sleek bomber came to rest at Felixstowe.

FIRST bomber to be flight-delivered across the Atlantic arrived at Felixstowe yesterday from Botwood, Newfoundland.

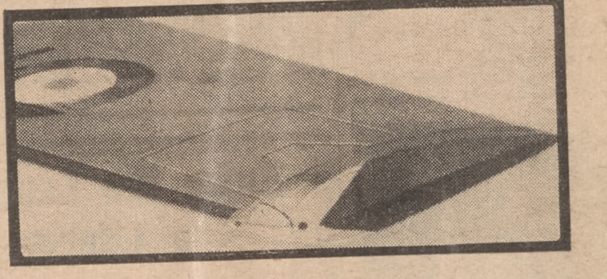
The giant 15-tonner is one of six Consolidated P.B.Y. 'planes, built at San Diego, California, to be delivered to the Air Ministry for tests.

The 'plane crossed the Atlantic in 15 hours. It had been pleasure cruising along the coast for three hours before landing. Four hours' petrol supply was still in the tanks.

Cruising speed of this war-bird is between 180 and 200 m.p.h. Range is 4,000 miles. Its twin engines develop 2,000 h.p. Construction is all metal.

Most notable feature is its clean lines. Wing span is 104ft., length 62ft. 6in., height 18ft. 6in.

● Float to stabilise 'plane in water and used for landing, retracts in flight becoming . . .



. . . a neat, streamlined wing tip.

SIMILAR machines are replacing the U.S. Navy destroyers for scouting and reconnaissance. Twelve P.B.Y.s recently flew from California to Honolulu.

The Captain said of this 'plane: "She made the Atlantic look silly." He flew it all the way.

Load the boat will carry is either 40 passengers or thousands of pounds of bombs. Details of full military equipment are still secret.

Crew (left to right): Capt. L. A. Yancy, Capt. R. Rogers (1st Pilot), R. Booth (Radio), G. B. Brown (Engineer).

This same crew recently flew a sister ship on a survey flight over the Indian Ocean. Each man is an expert and an experienced ocean flyer.

27 S. D. Bombing Planes Land at San Francisco

Leaving here at 6:30 a. m., 27 navy bombing planes, on a maneuver flight from San Diego to the Pacific northwest, yesterday landed safely on San Francisco bay and anchored off Alameda, The Associated Press reported. Officers said the planes would leave for Seattle tomorrow.

Union 8-9-39

TREE-CLIMBING KANGAROOS SHOWN AT SAN DIEGO ZOO

Three kangaroos that climb trees, rare animals just arrived from New Guinea, may be seen at San Diego zoo—if you go within the next 10 days.

The animals, en route to New York headquarters of the American Museum of Natural History, are among the most valuable of hundreds of specimens acquired by the museum's expedition in Dutch New Guinea, led by Richard Archbold, who flew a San Diego-built craft.

William Richardson, young graduate of University of California, was a mammologist with the expedition and brought the kangaroos back to the United States. He will take them to New York when San Diegans have had an opportunity to view them.

Sun 8-7-39

27 BOMBERS ON MASS FLIGHT

Hop North Part Of Wing Maneuvers

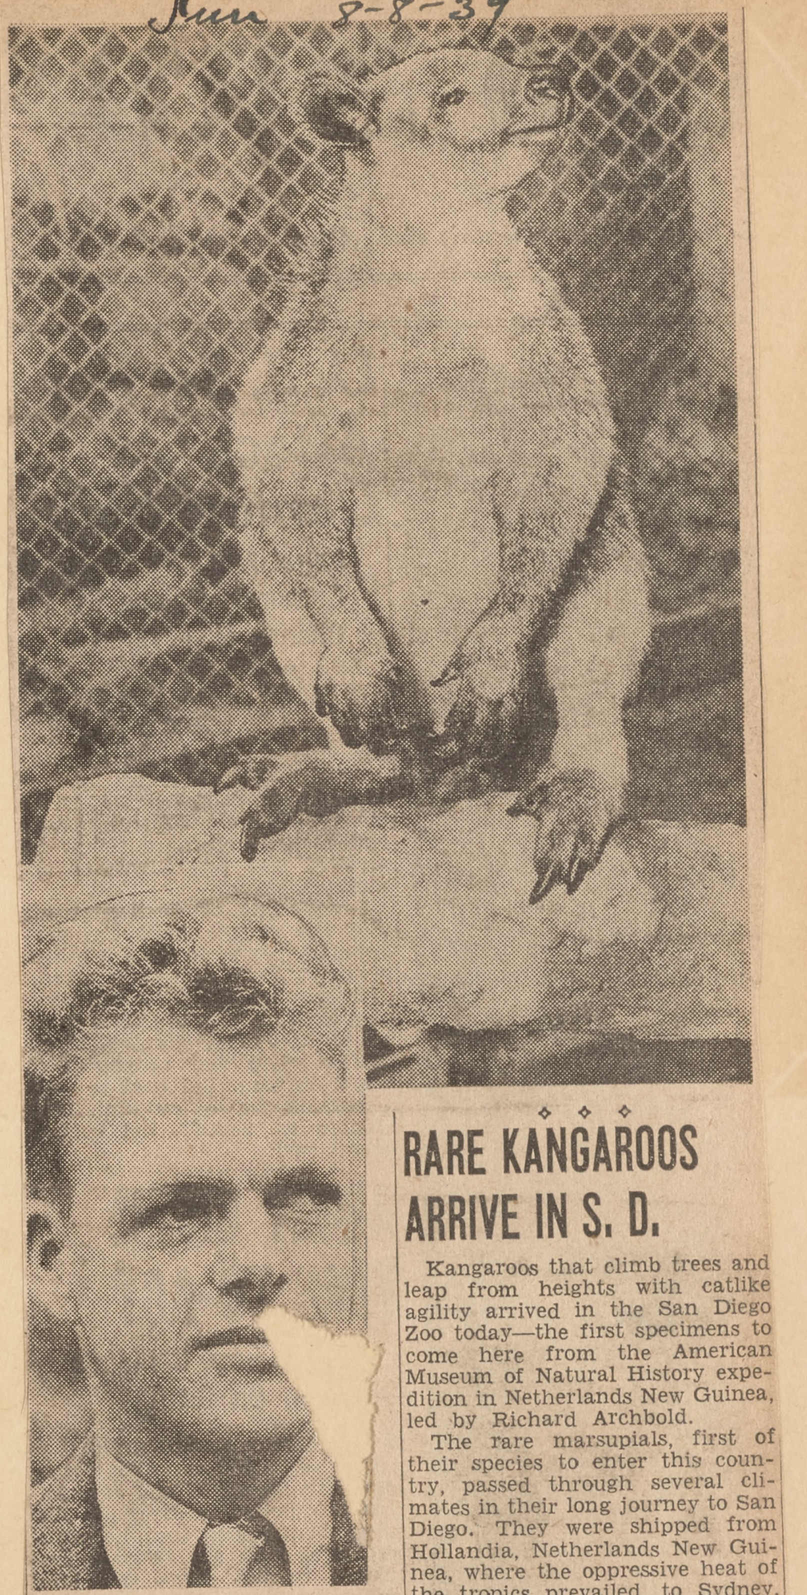
Twenty-seven Navy patrol bombers took off from San Diego harbor this morning on a mass flight to San Francisco and Seattle.

Known as wing maneuver, the hop was made by nine planes of each of the three squadrons of San Diego's Patrol Wing 1—VP-11, VP-12 and VP-13.

It was the first large scale flight operation of the wing under its new commander, Capt. Charles P. Mason, former executive officer of the aircraft carrier Yorktown. Capt. Mason, who received his commission as a four-stripe officer over the weekend in a promotion from the rank of commander, was sworn in by Rear Adm. A. B. Cook, head of the Aircraft Scouting Force shortly before the take-off. The admiral accompanied the planes as far as San Francisco and was to return here late today in a two-seater Navy plane, piloted by himself.

The boats will remain in San Francisco through tomorrow, proceeding to the Sand Point Naval Air Base in Seattle Wednesday. They will return to San Diego Saturday.

Sun 8-8-39



HOME WAS NEVER LIKE THIS . . . One of the three New Guinea tree-climbing kangaroos inspects the cage in which he will stay while visiting the San Diego Zoo. At left is WILLIAM RICHARDSON, mammologist with the Archbold expedition, who brought the animals back to the United States.

RARE KANGAROOS ARRIVE IN S. D.

Kangaroos that climb trees and leap from heights with catlike agility arrived in the San Diego Zoo today—the first specimens to come here from the American Museum of Natural History expedition in Netherlands New Guinea, led by Richard Archbold.

The rare marsupials, first of their species to enter this country, passed through several climates in their long journey to San Diego. They were shipped from Hollandia, Netherlands New Guinea, where the oppressive heat of the tropics prevailed, to Sydney, Australia, in the midst of the southern continent's winter.

GUARDED CLOSELY

Trans-shipped on the Matson Line Steamer Mariposa, the kangaroos' health had to be watched closely by their "guardian," Dr. William Richardson, the expedition's young mammalogist, to enable them to survive successive weather changes in proceeding from the southern to the northern hemisphere.

In Hollandia, the kangaroos, tame, gentle creatures, became virtually domesticated pets of the scientists at the base camp, Dr. Richardson reported. They had the freedom of the camp, roaming at will and causing little trouble.

The kangaroos, whose native habitat is the mountainous area near the Netherlands New Guinea coast, climb trees much like the East Indies aborigine, according to Dr. Richardson.

Dr. Richardson said he planned to ship the animals to New York as soon as they become acclimated.

MANY SPECIMENS

Hundreds of specimens and a few live animals have been sent by the expedition, which spent 11 months in the New Guinea wilderness, to the New York headquarters of the American Museum of Natural History. Due here late this month, according to Consolidated Aircraft Corp. officials, is Mr. Archbold, whose flights in a Consolidated airboat into inaccessible jungle country with supplies and equipment, enabled the scientists to penetrate areas never before seen by white men. The plane, known as the "Guba," is in the local plant undergoing overhaul.

U.S. FLYING-BOAT which is to leave San Diego, California, for Felixstowe shortly. It has been bought by the Air Ministry (note R.A.F. markings), and will be the first military aircraft to be "flight-delivered" across the Atlantic. A feature of the aircraft are the retractable floats, which become wing-tips in flight. The arrow shows one of the floats retracted; on the right, it is down.

CONSAIR GETS ARMY CONTRACT

Tribune 8-10-39

$8,485,000 In Order for Huge Bombers

The war department threw the expansion of air forces into high gear today with an award of $8,485,000 to Consolidated Aircraft Corp,. of San Diego, for construction of four-engine army bombers, part of a mass award of contracts through the United States totaling $85,978,000 for airplanes and engines, The Associated Press reported from Washington, D. C.

Consolidated officials, while confirming the report, stated they were forbidden by war department regulations to discuss the number or general characteristics of the planes. The Associated Press, however, stated that the new 4-motored bombers would be able at least to approach a speed of 300 miles an hour.

Another order for four-engined planes for the army also was placed with the Boeing Aircraft Co., of Seattle, for $8,090,000. In addition options were taken both with Consolidated and Boeing for possible future orders totaling $4,400,000.

The new order is the third for

Halt Japan Aid At Once, Plea As Pact Cited

WASHINGTON, Aug. 10 (A.P.)—Sen. Schwellenbach (D-Wash), a member of the senate foreign relations committee, today urged the state department to take immediate steps to halt the flow of American war materials to Japan.

In a letter to Secy. Hull, Schwellenbach said this could be accomplished either by invoking an old wartime statute empowering the president to ban the export of any war materials in violation of law or by obtaining voluntary agreements of shippers to halt such exports.

"The object of this letter," Schwellenbach wrote, "is to suggest to you that there is available to the executive department of the government at any time the machinery by which the shipment of war supplies to Japan may be stopped."

Treaty Violation Charged

He referred to an argument which he made in the senate last week that the United States was violating the nine-power treaty, which pledges respect of the territorial integrity of China, by "supplying 70 percent of the more important materials used by the Japanese in the prosecution of the war against China."

Since a treaty becomes law, Schwellenbach said, any exportation of arms that abets the viola-

Atlantic Flight Skipper Seeks Relatives

Irish Press 7-19-39

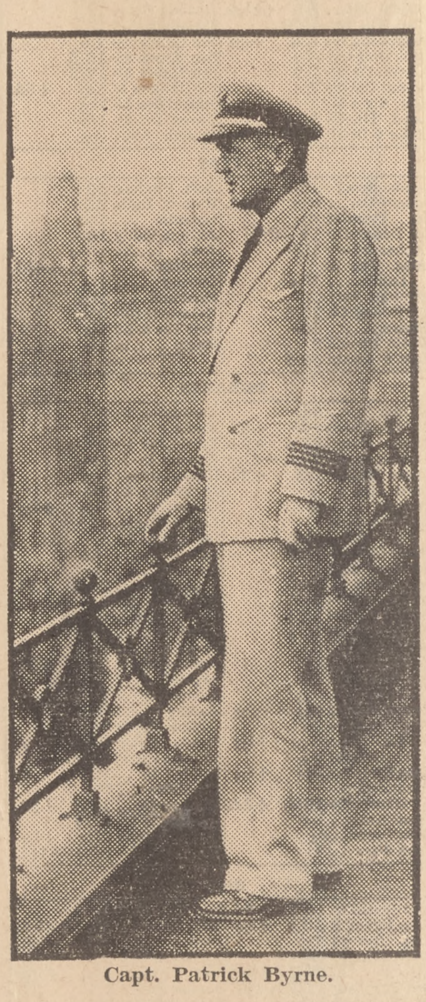
CAPTAIN PATRICK JOSEPH BYRNE, master of the American export seaplane, Transatlantic, left his vessel riding in Foynes Harbour, yesterday, and came to Dublin to search for relatives.

Seeking relatives also were two other Irish members of the crew of six—Chief Engineer Michael C. Doyle, Killarney-born, and "Mac," the radio operator—C. F. MacDonough, formerly of Galway.

The crew were received by the President at Arus an Uachtaráin.

Captain Byrne flew his plane from Botwood to Foynes on Saturday, took off on Sunday for Marseilles, and was back again in Foynes on Monday, flying along the Cork and Kerry coast.

He went to Ballygar, Co. Galway, to see his wife's uncle, Mr. Edmund Naughton. He was entertained very hospitably later, he said, by Superintendent Dunphy, Mr. Dick Kenny, Mr. O'Carroll and Mr. T. Flood, and yesterday drove to Dublin with his friend, Mr. M. J. Kelly, stopping at Athlone to attend Mass and see the new Cathedral.



Capt. Patrick Byrne.

Planning All-The-Year Atlantic Flights

The crew of the Transatlantic all belong to the United States Navy but Captain Byrne told an IRISH PRESS reporter that he is on leave from the Navy and that the present survey flights are on behalf of the American Export Line who are planning an all-the-year service to Europe to commence next spring—in the winter by the Azores route and in the summer by Foynes.

Captain Byrne's mother, who was Anna Fitzroy, came from Wexford, and his father from Ballygar. He was carrying a list of the Dublin relatives he was anxious to see: Patrick Byrne at the G.P.O.; Thomas Fitzroy, his mother's brother, of Churchtown, Dundrum; Thomas Byrne, c/o. George Dremmey, Booterstown; and Agnes Byrne, of Phibsboro' Road, Dublin.

He was preparing to make his round of visits by car. He had only a few hours to do it, he told the IRISH PRESS, because his plane would leave at 3 o'clock for Botwood and he wanted to get his quota of sleep before flying all through the night.

American firms were so busy with orders, he said, that it was impossible to get delivery of a mail plane for eight months or of a passenger plane for 18 to 20 months.

The Transatlantic, he said, could carry 16 passengers if equipped with seats and has a cruising range of 3,400 miles.

The Shannon was an ideal place for a base, he added. The Government was really looking to the future in their new scheme to make permanent air and land bases at Rhinanna. Foynes, he understood, was being used only until Rhinanna is ready.

Captain Byrne, who is 39, married Miss Margaret Howland, of Ballygar, and they have a daughter, Nancy Howland Byrne, aged 4. He is taking a copy of to-day's IRISH PRESS to give them in New York to-morrow.

Other members of the crew are; First Officer T. S. Tyrell, Third Officer W. W. Ehmer, and Fourth Officer Carlson.

SKYBRIDGE No. 1 IS GESLAGEN

Ook de Nederlandsche posterijen erkennen den nieuwen oceaandienst. Bijzonderheden over het Panair schema. American Export eveneens gestart.

rekend, en is ingericht voor nachtverblijf van 20 passagiers. Dit type moet den Oceaan in een nonstopvlucht Parijs—New-York overvliegen, en wel in geregeld dienstschema. Zoolang de groote marinebasis bij Versailles er nog niet is, leze men voor Parijs: Biscarosse. De ruk Frankrijk—Vereenigde Staten is een kleinigheid voor de Rochambeau, die immers een actieradius van 6000 km heeft.

De Franschen wagen zich echter nog niet zoo gauw aan een geregelden passagiersdienst over den Oceaan. Eerst wil men de kat, de Amerikaansche kat wel te verstaan, eens uit den boom kijken, dan zal men wel verder zien. En inmiddels zullen verschillende postvluchten gemaakt worden, waarvoor de nieuwe vloot van de kleine vliegbooten Flammarion, Jules Verne en Leverrier wordt ingeschakeld.

Stappen wij weer van de side line aan boord van de Amerikaansche clippers. Post en passagiers worden nu geregeld meegenomen. Het dienstschema is zoo ingekleed, dat men, in New York aan boord stappend in den middag, eerst aan boord luncht, het avondmaal gebruikt en den eersten nacht doorbrengt, na het horloge voor het slapen vier uur vooruit gezet te hebben. Wie getuige wil zijn van het landen bij de Azoren, moet vroeg opstaan, want om 7 uur meert de boot al in de baai van Horta. De clipper blijft hier net lang genoeg om te tanken en post af te leveren.

Wie vroeg is kan dan rustig ontbijten, wanneer de boot aan haar boei in den stralenden morgen ligt te schommelen, de lateren pellen hun ochtendeitje alweer op weg naar Lissabon. Daar moet het vliegtuig om 3 uur in den middag aankomen. Hier kan de reiziger op adem komen van den ren over den oceaan. Hij blijft overnachten in de Portugeesche hoofdstad, wat voorwaar geen kwaad werk is. Wij zijn echter geen reisbureau, maar een vliegblad, zoodat wij ons niet zullen laten gaan in beschrijvingen van het heerlijke Lissabon. Dat men hier zoolang blijft, heeft zijn goede redenen. In de eerste plaats om de reizenden niet al te zeer te vermoeien, daarbij wordt natuurlijk vooral aan de bemanning gedacht. Bovendien wordt Lissabon in de toekomst een knooppunt van aansluitende diensten op de Atlantische verbindingen. En om dergelijke aansluitingen goed te laten functionneeren, is een behoorlijke speling in het dienstschema noodzakelijk.

In den vroegen morgen, dus na een verdiende rust van rond 12 uur, vertrekt de vliegboot pas naar Marseille. Zij volgt hierbij de Spaansche kust, zoolang de regeering van generaal Franco nog geen toestemming heeft verleend om haar gebied recht over te vliegen. Dat zou een aanzienlijke besparing van tijd en van geld beteekenen, doch P.A.A. heeft gezegd: krijgen wij de vergunning nog niet, jammer, maar we vliegen toch door. En zoodoende heeft de passagier een prachtig reisje langs de Spaansche kust en in het gezicht van al de wondermooie steden langs de kust.

De terugweg duurt door den passaatwind, die in deze richting altijd tegenwind beteekent, acht uur langer. De dienst verlaat Marseille Zondagochtend vroeg, komt 's middags in Lissabon, om vandaar den volgenden morgen naar Horta te vertrekken. Daar strijkt de boot 's middags neer, blijft er maar even, en is Dinsdagochtend heel vroeg alweer in Port Washington terug.

Wie zin heeft in het reisje: enkele reis $ 375.—, retour $ 675.—, wat maar even meer is dan de eerste klas van een van de groote mailschepen.

Het eerste nieuws van American Export.

EINDELIJK is er dan nieuws van American Export! Wij hebben er lang op moeten wachten, r de Consolidated vliegboot van deze maatschappij los kwam, maar dat is dan eindelijk zoo ver. De Transatlantic, zooals deze boot heet, heeft reeds haar eerste reis volbracht. Kapitein Patrick Burne heeft de Consolidated (een zusterschip van de door ons uitvoerig beschreven Guba) van Jamaica Bay naar Biscarosse en Marseille gebracht. Het is nog niet heelemaal duidelijk, hoe de verdeeling wordt van de belangensferen der beide Amerikaansche maatschappijen. Zij zijn het er zelf nog niet over eens. Onze laatste berichten uit New York vermelden, dat American Export en Pan Air een soort status quo hebben aangegaan tot den herfst. Dan zal men de balans opmaken, want het is te gek, dat twee ondernemingen, die onder dezelfde vlag vliegen, een dienst al met concurrentie zouden beginnen. Op het oogenblik hebben zij immers beiden Marseille tot uitgangspunt. Onze berichtgevers meenen, dat het wel in de bedoeling ligt, dat American Export zich niet met passagiersvervoer zal inlaten, maar zich zuiver op vracht zal toeleggen. De post wordt dan voorloopig over beide maatschappijen gelijkelijk verdeeld, die dan tezamen twee vertrekdagen in de week zullen hebben.

Wij gelooven niet aan een zuiveren luchtvrachtdienst over een zoo groot traject; dat kan niet rendeeren, zelfs niet met een postcontract, waarvoor trouwens de Postmaster-General in New York nooit al te veel neerlegt. Dat schermen met een zuiveren vrachtdienst zal wel een manoeuvre zijn, om de publieke opinie af te leiden. Het is altijd ongewenscht, om veel gepraat uit te lokken voor een zaak in kannen en kruiken is, en het onschuldige motief van de vracht zal wel daarom gelanceerd zijn.

Het luchtbedrijf over den Atlantischen Oceaan is met dat al in volle gang. Amerikanen hebben de primeur van de ,,Sky Bridge'' en nu zij, als eerste ,,schapen'', over de brug zijn, zullen de Engelschen en de Franschen alras volgen.

De dienst van Pan American Airways is al ingeburgerd, hoe verwonderlijk het ook moge klinken. De Amerikanen hebben hem reeds vereerd met den naam: ,,Sky ferry to Europe''. Dat ,,inburgeren'' wordt altijd door de posterijen bepaald. Nu de Fransche en de Nederlandsche post den Pan Airdienst reeds officieel hebben ingeschakeld in haar vervoerssystemen, moet de luchtlijn New York—Marseille geaccepteerd worden. Zij is er.

AMERICAN
AIRLINES INC

Amerika's jongste luchtvaartmaatschappij, de American Export Airlines, kreeg onlangs van de Paramount filmonderneming het verzoek om haar nieuwe vliegboot te mogen leenen voor het maken van opnamen betreffende de nieuwe rolprent The Magnificent Froud. De Consolidated vliegboot diende als decor voor een scene waarin een internationaal bankier voet aan wal zet in de gefantaseerde republiek San Cristobal (zie onderste foto). Boven: een close-up van Miss Patricia Morison, de vrouwelijke hoofdfiguur uit deze film. Let op het breede luik in den romp, hetwelk ruim entree geeft tot het interieur van de vliegboot.

The flying boat on the water at Felixstowe after landing this morning.

Bomber Flies Atlantic in Fifteen Hours

BUILT IN U.S.A. FOR R.A.F.

THE first giant bomber flying boat ever to be flight delivered across the Atlantic arrived at Felixstowe to-day from Botwood, Newfoundland.

She is the first of six of similar type machines, built by the Consolidated Aircraft Company at San Diego, California, to be delivered to the Air Ministry for experimental purposes.

The flying boat took off from Botwood yesterday at 2.30 p.m. (B.S.T.) and made Felixstowe at 6 a.m. to-day. She had not been expected till about 7 a.m.

She is a 15-ton machine, has a cruising radius of 4000 miles and will be tested by the R.A.F.

Replacing Destroyers

This type of flying boat has now replaced destroyers in the U.S.A. navy for scouting and reconnaissance duties.

The pilots of the bomber were Captain Russell Rogers and Captain Lewis A. Yancy, with Flight-engineer G. B. Brown and Radio-engineer Raymond Booth.

"It was a splendid trip and although we had some rough weather we were only 15 hours in the air when we expected to be at least 17," said Captain Rogers.

CONSAIR GETS $8,485,000 ORDER; JOBS FOR 3000 SEEN BY JANUARY

Union 8-11-39

Bringing the total backlog of orders for army and navy bombers to $18,284,000, the war department yesterday awarded a contract to Consolidated Aircraft Corp. of $8,485,000 for construction of new-type four-motored planes which it is reported will have a speed in excess of 300 miles an hour.

NUMBER NOT DIVULGED

In awarding contracts totaling $85,978,000 for airplanes and engines to 11 American manufacturers, the war department announced options were taken with the Consolidated and Boeing companies for possible future orders amounting to $4,400,000.

While the number of planes involved was not divulged, military quarters believed it was more than 1500. Equipment to be provided by the government will increase their cost well beyond $100,000,000, the war department said.

New long range four-motor bombers to be made by Consolidated will attain speeds approaching 300 miles an hour, topping the performance of the "flying fortresses" already in service.

This is the third contract received by Consolidated this year from the war and navy departments. April 27 the Lindbergh field plant was awarded a $5,000,000 army contract for new bombers and March 22 the navy allocated $4,699,000 for the construction of long-range high-speed patrol bombers as replacements for existing PBY-type planes now in use in the various patrol wings.

3000 JOBS SEEN

Consolidated officials said a total of 1500 men are at work in the various departments. Due to difficulty in procuring material, they said it probably will be Jan. 1 before production will necessitate the employment of the maximum anticipated total of 3000 workers.

Reports from Washington are to the effect that the new army bombers will resemble the "flying fortresses" built by the Boeing plant at Seattle, but will be faster and even more heavily armed. They will be capable of flying great distances without refueling, carrying several tons of high explosive demolition bombs.

Louis Johnson, acting secretary of war, said the army's contracts awarded yesterday represent the largest peacetime arms order. Altogether the contracts represent purchases of more than 1000 planes of all types.

OTHER CONTRACTS

The largest single contract went to the Glenn L. Martin Co., of Baltimore, for two-engine bombers, costing $15,815,000.

For an undisclosed number of the same type plane, an $11,771,000 contract was awarded North American Aviation, Inc., of Inglewood, Calif.

Other orders were:

Advanced training planes—North American Aviation, Inc., Inglewood, $1,326,000.

Basic training planes — North American Aviation, Inc., Inglewood, $2,707,000; Vultee aircraft division, Aviation Manufacturing Corp., Downey, Calif., $2,986,000.

Primary training planes—Boeing Airplane Co., Stearman division, Wichita, $688,000, with option to buy $2,000,000 worth more.

Twin engine interceptor pursuit planes—Lockheed Aircraft Corp., Burbank, $4,845,000.

Orders for engines for these planes, aggregating $21,865,000 were: Pratt & Whitney division, United Aircraft Corp., Hartford, $12,320,000; Wright Aeronautical Corp, Paterson, N. J., $7,000,000; Allison Engine Corp., Indianapolis, $2,275,000; Aviation Corp, Lycoming division, Williamsport, Pa., $270,000.

BOMBER-BOAT IS IN FOR BREAKFAST

The Evening News
Northcliffe House, E.C.4

FIRST DELIVERED BY AIR ACROSS ATLANTIC

7-14-39

ALL IN 15 HOURS

"WE COULD HAVE DONE IT IN ELEVEN"

FROM OUR OWN CORRESPONDENT

FELIXSTOWE, Friday.

SHORT, stocky Captain Russell Rogers, pilot of the American bomber flying boat which left Botwood, Newfoundland, 2,450 miles away at 2.30 p.m. yesterday, stepped ashore at Felixstowe to-day and said, with a broad smile: "Good morning, glad to meet you folks."

Wide awake and well groomed, Captain Rogers appeared as if he had just finished a before-breakfast spin, instead of a trans-Atlantic flight.

The plane which he, with his co-pilot, Captain L. A. Yancy, had brought from San Diego, California, is the first military aircraft to make a trans-Atlantic delivery flight.

4,000-Mile Range

One of a new type, with a flying range of 4,000 miles, it is equipped with machine guns, and is specially adapted to take the place of destroyers for scouting and reconnaissance duties, and in addition it can be used as a bomber and for torpedo purposes.

The flying-boat crossed the East Coast of Ireland at 2.10 a.m. to-day and could have reached Felixstowe at 3.30 a.m., only 11 hours after leaving Botwood.

As the morning sun came out, those who had been waiting since 3 a.m. on the pierhead at Felixstowe saw the plane make one circuit overhead before a landing which drew admiration from experienced R.A.F. officers.

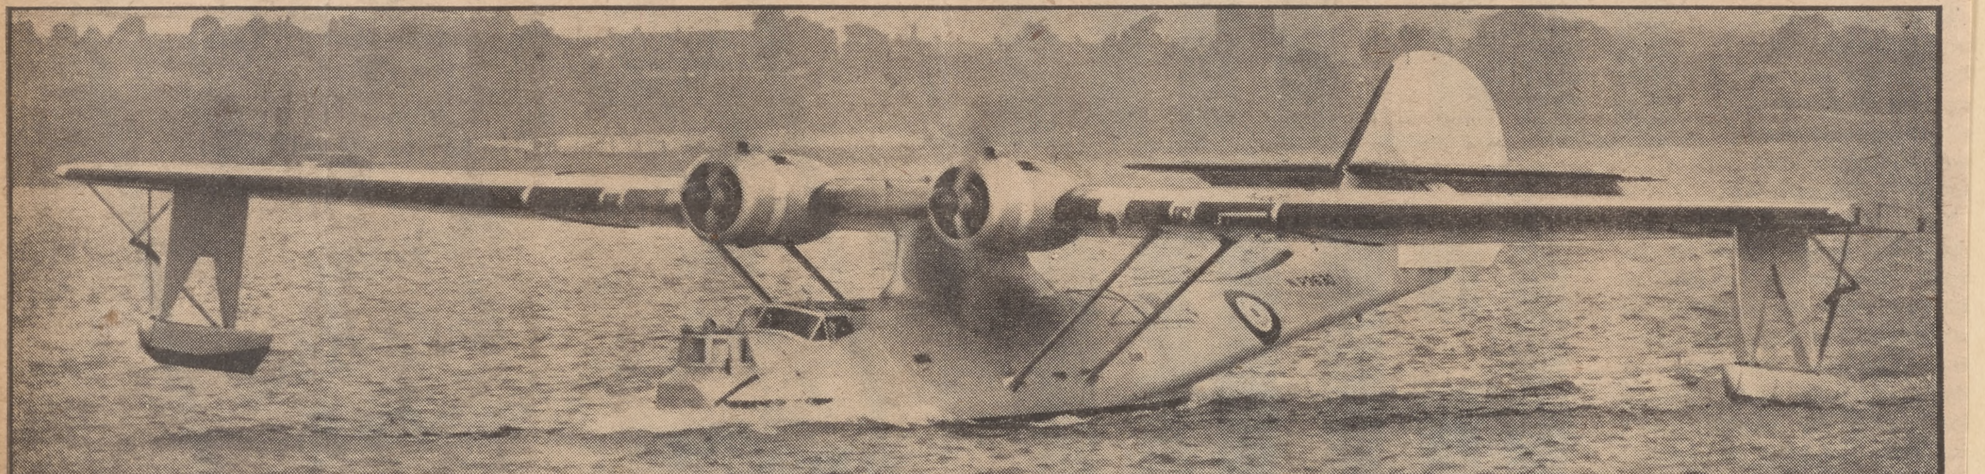
"It was a splendid trip and I am very pleased with the performance of the plane," said Captain Rogers. "She gave us no trouble at all, although we ran into one or two patches of bad weather.

"We expected to take 17 hours, but as it was we were in the air only 15 hours.

"Tired? No, but hungry, yes."

Page 24 England THE DAILY MIRROR Saturday, July 15, 1939

AMERICA DELIVERS THE GOODS



First military aircraft to make a transatlantic delivery flight. . . . The Consolidated 28-5 arriving at Felixstowe (Suffolk) early yesterday, having flown 2,450 miles from Botwood (Newfoundland) since the previous afternoon.

And she had to spend three hours cruising around the countryside before she could land because—she arrived four hours too early. Special R.A.F. exercises being carried out near Felixstowe prevented her from coming down at once.

One of six bomber flying boats which have been built for the R.A.F. in San Diego (California), this 15-ton ship has a cruising radius of 4,000 miles.

The Indian Ocean Sits and Smiles

The Aeroplane 7/19/39

BILL TAYLOR, officially Captain P. G. Taylor, late R.F.C. and R.A.F., unlike so many people who have had support from this paper, remembered as soon as he arrived in Africa after his voyage across the Indian Ocean, that THE AEROPLANE had supported his enterprise from the start. And, in his usual cheery way, he wrote from Nairobi on June 31, saying,—"Many thanks for your help and support of the job we have just done. I hope we have a chance to talk of it some day."

Unfortunately most of his letter is personal and confidential, chiefly, we imagine, because he is under contract either to the Australian Government or to the Australian newspapers not to publish anything essential about the voyage other than through agreed channels. In the meantime we can quote a few sentences which are Bill Taylor at his best.

He says of the Indian Ocean during the first stage across towards Cocos Island, thus:—

"During the day, when I *could* see it, I imagine the smile was a friendly one, and during the night, when I *couldn't*, it wasn't much use bothering about what sort of smile it was, if any. But generally the smile seems to have been one of welcome, even though at, or in the approximate vicinity of, Cocos it turned into a damned good laugh. I imagine that wasn't a bad thing, really.

"We had left Port Hedland just before sunset and ran through to midnight with good stars. Then it shut in and we got nothing worth while.

"We arrived, according to E.T.A. (estimated time of arrival) near Cocos and couldn't see much, climbed rather high and ultimately got the sun for a line. This helped, but with only one sun no source of information existed from which to fix position. We looked about for a bit in rotten visibility. Then I did some mental arithmetic, not unconnected with remaining fuel and distance to Batavia.

"The decision then had to be made whether we should go on looking for Cocos with a good chance of finding it but a possibility of further proof of the ineffectiveness of flying-boats in the open ocean if we didn't, or go to Batavia while we could. The latter seemed the right decision. Two days later when we did go to Cocos we didn't see the place till it was about two miles away."

And that, we think readers will agree, is a good enough explanation of why Bill Taylor's expedition went to Cocos by way of Batavia. Incidentally, of Cocos Island he says,—"It is an immensely interesting place, literally ruled by a King: Clunies Ross, whose great-grandfather first settled there. Their boatbuilding is the best I have ever seen for beautiful design and craftsmanship.

"We did a night run to Diego Garcia but had stars all the way. It is a marvellous natural flying-boat base. The next two runs were done in daylight, leaving in the early morning so as to bring the sun abeam for a run in from a hundred or two miles out.

"If you ever have a chance go to Mahé in the Seychelles. It is extremely beautiful, has a good climate, good health, and a comfortable place to stay." Bill Taylor makes some more interesting remarks about wind currents and climate, but they must not be quoted.

Like so many of the great feats in history the London papers have ignored this historical flight, which may in some future time save our Imperial communications, and in any case may be one of the World's great air routes.

A curious example of the lack of British thoughtfulness in contrast with the business acumen of other nations is seen in the fact that almost as soon as he arrived in Africa Bill Taylor received an invitation from the K.L.M. to fly with them to Singapore and on to Sydney by K.N.I.L.M. Could anybody refuse such a remarkable, if simple, courtesy?

Now we have to wait for Bill Taylor's book on this flight. It ought to be one of the best things that has happened for a long time.

---

8 1-2 MILLION JOB GIVEN BY U.S. TO CONSOLIDATED

Sun 8-10-39

Contract Part Of $100,000,000 Army Plane Allocation

Boosting the amount of unfilled orders at the Consolidated Aircraft Corp. to approximately $16,000,000, the War Department today awarded a $8,485,000 contract to the San Diego concern for construction of four-motored bombing planes, the United Press reported from Washington, D. C.

The award was part of a $100,000,000 allocation for expansion of the Army Air Corps—the largest for war equipment in the nation's peacetime history.

Together with previous contracts totaling $54,000,000, this is a major part of a $170,000,000 aviation development designed to bring the air corps' fighting strength to between 5500 and 6000 planes by July 1, 1941, an increase of 3000 over the present number.

BOOM DAYS RETURN

Boom days paralleling Consolidated's production peak in 1937 were anticipated at the plant. The $16,000,000 backlog was about $3,000,000 less than Consolidated's record work load since the plant was moved to San Diego from Buffalo four years ago. In May, 1937, when the factory was working night and day to keep pace with orders from the Navy for patrol bombers, 3840 employes were on the payroll.

Consolidated officials estimated that, when aluminum and other materials required for manufacture of the Army bombers are received from eastern mills, the number of employes will rise from its present total of 1600 to about 3000. It was emphasized, however, that no additional help will be needed before Jan. 1, 1940, when sufficient material has been obtained to begin production on the new contract.

TWO FORMER AWARDS

Last March Consolidated received a $4,700,000 contract to build six four-motored Navy patrol bombers. The following month the concern re-entered the Army field after several years' absence and was awarded a $2,800,000 order for an experimental prototype

LIBERATION HOUR FOR DANZIG HERE

Hitler Defense Against Poland Is Ready

By United Press

DANZIG—The "hour of liberation" is at hand when Danzig will be returned to Germany, Albert Forster, Danzig's Nazi leader, declared in a speech tonight after a conference at Berchtesgaden with Fuehrer Adolf Hitler.

Herr Forster gave assurance that Herr Hitler is ready to defend Danzig against Poland.

"Poland must understand clearly that Danzig will not stand alone and deserted in the world, but that the greater German Reich, our motherland, and our fuehrer, Adolf Hitler, are at all times determined to support and defend us in case of an attack from Poland," Forster said.

FIRMLY CONVINCED

"The Danzig population today is absolutely, clearly and firmly convinced that the hour of liberation is coming, and Danzig again will return to the Reich," Herr Forster said.

Herr Forster charged Poland with war threats and war agitation against Danzig, speaking at an open air mass meeting in the public square.

HOLD TOGETHER

In ending his speech, Herr Forster said:

"In this hour, we can do nothing better than to swear that we will hold together, come what may, and resist every attack on this holy German soil with all means at our disposal, and will carry out

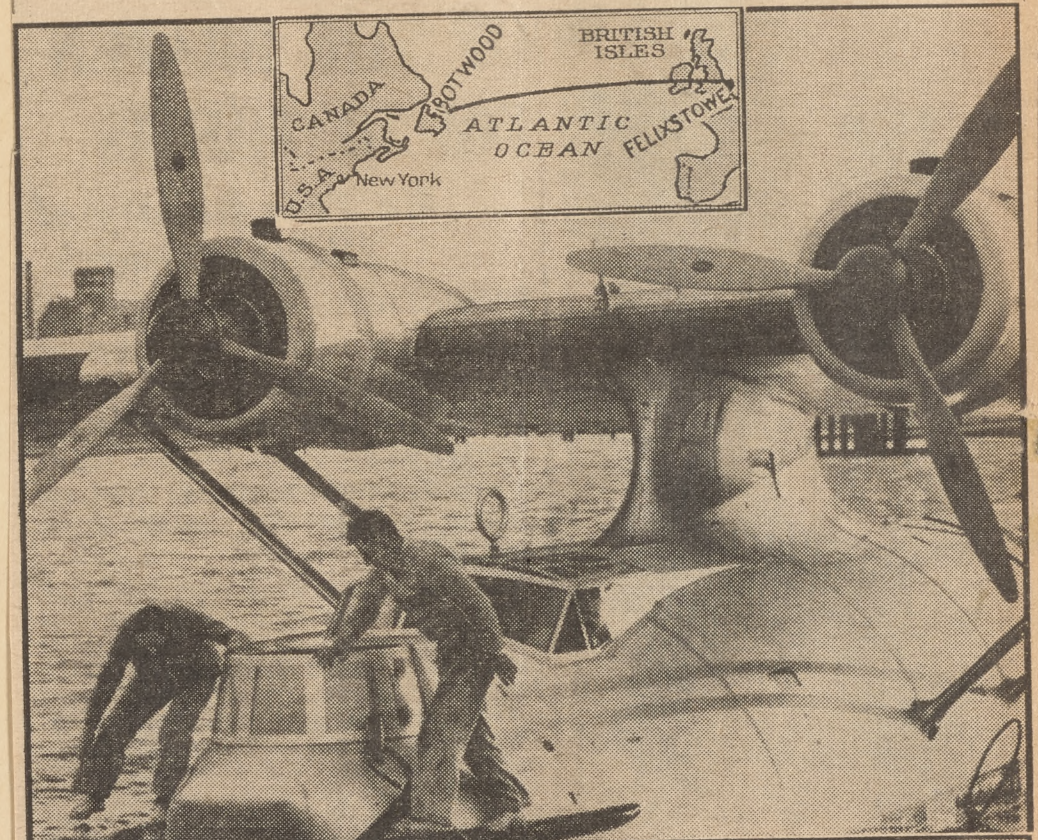
Bomber Flies Atlantic in Fifteen Hours

7-14-39



THE first giant bomber flying boat ever to be flight-delivered across the Atlantic arrived at Felixstowe to-day from Botwood, Newfoundland.

She is the first of six of similar-type machines, built by the Consolidated Aircraft Company at San Diego, California, to be delivered to the Air Ministry for experimental purposes.

The flying boat took off from Botwood yesterday at 2.30 p.m. (B.S.T.) and made Felixstowe at 6 a.m. to-day.

She is a 15-ton machine, has a cruising radius of 4000 miles and will be tested by the R.A.F.

This type of flying boat has now replaced destroyers in the U.S.A. navy for scouting and reconnaissance duties.

The pilots of the bomber were Captain Russell Rogers and Captain Lewis A. Yancy, with Flight-engineer G. B. Brown and Radio-engineer Raymond Booth.

Captain Rogers's first words on coming ashore were: "Good morning, glad to meet you, folks."

Radio-engineer Booth and Flight-engineer G. B. Brown.

Captain Russell Rogers and Captain Lewis Yancy.

The flying boat could have arrived at Felixstowe at 3.30 a.m., but while it was speeding across England Captain Rogers received a message advising him that aircraft without lights were flying in the vicinity of Felixstowe. He then altered his course and cruised along the coast for two and a half hours until all was clear.

S.D. Business Upswing Noted

Plane Orders, Tourist Tide Spur Activity

A really optimistic note is being sounded in local business circles, with aircraft factory backlogs building up rapidly, store sales climbing and a swelling tide of visitors setting out in this direction, according to a general survey made yesterday.

With recent government contracts, Consolidated Aircraft's backlog is now more than $18,000,000, far above the August, 1938, mark while Solar and Ryan factories also reported orders on hand substantially in excess of those of a year ago.

JULY INCREASE SHOWN

July business figures from the department of commerce showed a 7 percent increase above the same month last year, after the first six months of 1939 had shown slow business. August sales have tended to keep up the tempo.

The increase would be greater, business leaders pointed out, were it not for the fact that a score of naval vessels, assigned here last year, have been transferred to the Atlantic fleet.

Bank debits for the week of Aug.

S. D. Business Upswing Noted

Union 8-11-39

(Continued from Page 1)

2 to 9 were $11,126,000, slightly under the $11,170,000 mark for August, 1938, but with summer now well under way the 1938 figures for the 1939 month are expected to be exceeded.

INFLUX COMES LATE

The summer tide of visitors is setting in later this year but figures compiled for July by the San Diego-California club shadowed an increase of 11 percent in out-of-town motorists. Hotels, while holding the exact figures confidential, indicated that their business was on the upgrade, also. Tourist camps and apartments have felt the effect of the increased flow of visitors, many of whom have delayed their trips until summer to visit the two expositions.

One of the large tour companies operating all-expense tours reported that July travel exceeded that of July, 1938, by 68 percent and was the biggest local business it ever had done.

The summer tourist tide is expected to continue at flood until the end of the vacation season. The fall and winter tourists then are expected to start arriving.

MORE PAYCHECKS IN VIEW

Backlogs at the aircraft plants insure a steady flow of paychecks into the pockets of an increasing number of workmen. This is being reflected in all lines of business here.

Possible effect of Works Progress Administration lay-offs is being studied but no one hazarded a guess on this yesterday. Nationally, business leaders appear to feel the lay-offs will not slacken the upward surge.

Guba Pilot Returns From Atlantic Hop

Union 8-11-39

Russell Rogers, chief pilot of Richard Archbold's "flying laboratory," the Guba, will arrive here from Felixstowe, England, today.

Rogers, with three other members of the Guba's crew, Lewis Yancey, navigator; Ray Booth, radioman, and Gerald Brown, engineer, ferried a Consolidated plane last month on a 5750-mile flight from San Diego to Felixstowe, stopping at Buffalo and Botwood, Newfoundland, en route. The plane was turned over to the British Royal air force.

Yancey returned here Tuesday afternoon and after a brief conference with Consolidated officials, left for the east on an extended vacation. Booth, Brown and Archbold are to remain east several weeks before coming here to again take off the Guba which is being overhauled at the Lindbergh field plant.

Union 8-17-39

Big Navy Plane Going to Alaska

Bound for Alaska where it will be used in extended flights, the navy's four-motored long-range patrol bomber, XPB-2Y, aerial flagship of Rear Adm. Arthur B. Cook, will leave here Sunday for Sitka.

Admiral Cook, scouting force aircraft commander, is to use the aerial flagplane on inspection flights to the navy's new and projected air bases in the Gulf of Alaska and along the Aleutian islands. The bomber, which recently was fitted up as Adm. Cook's air flagship, will be commanded by Comdr. Andrew Crinkley.

The craft made a trial flight from San Diego to San Francisco Monday, returning yesetrday.

Union 8-12-39

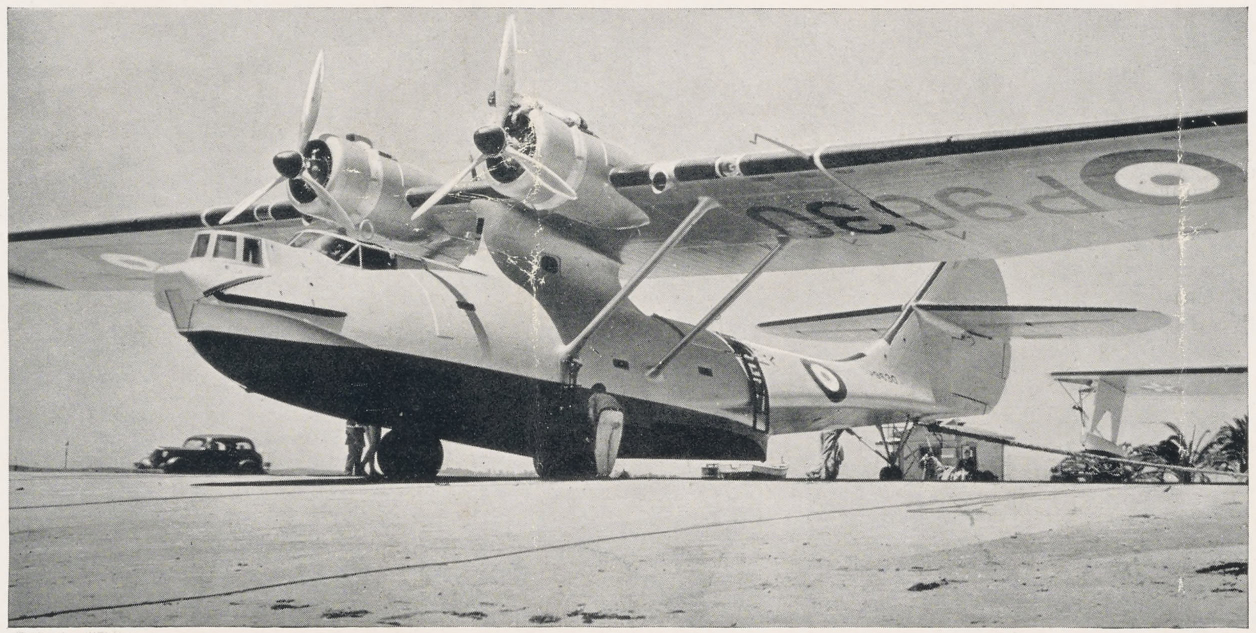
Consair Wins Contest For Bomber Designs

Brig. Gen. George H. Brett, chief of the air corps material division, announced yesterday that the Consolidated Aircraft Corp. had won a design contest for four-engine bombers conducted at Wright field, the Associated Press reported. Purchases of 2500 ships are expected to be based on results of the various contests.

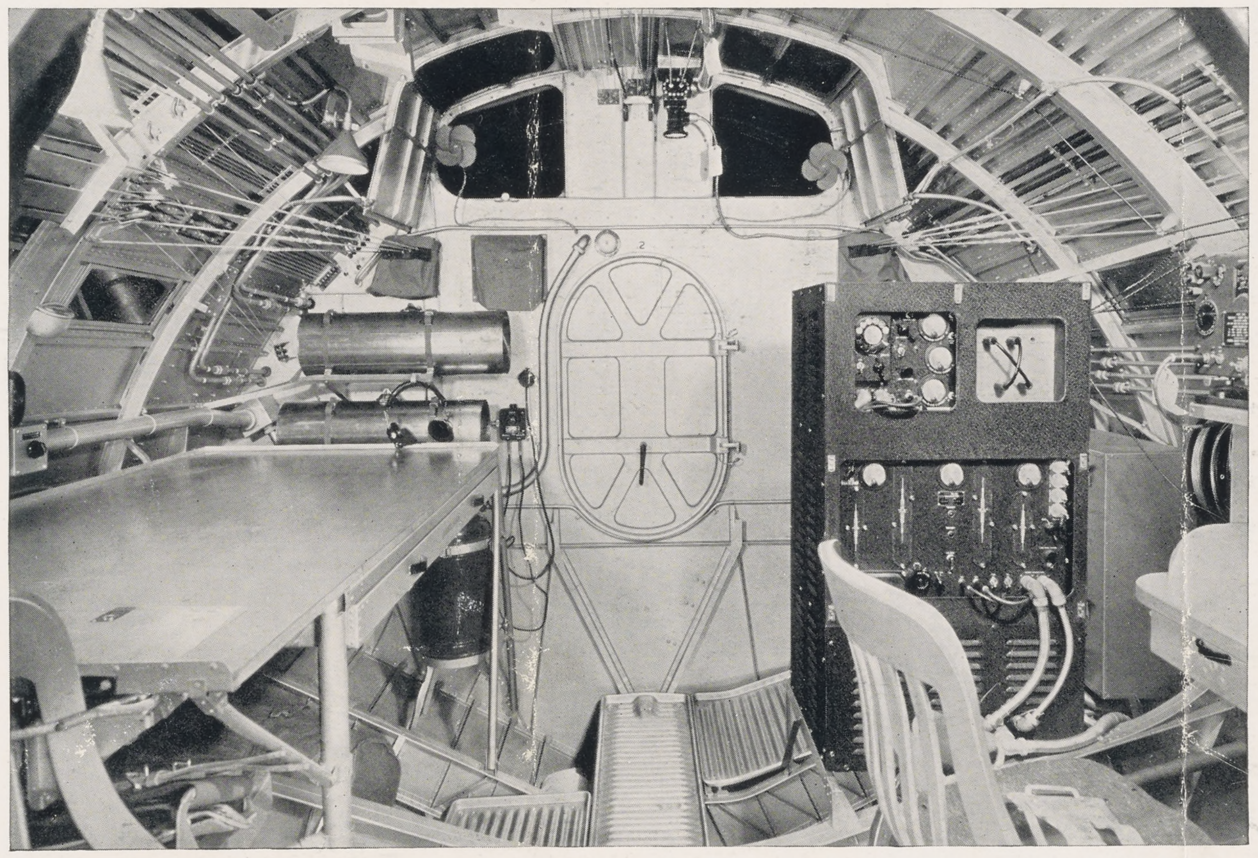
Glen L. Martin Co. of Baltimore won the twin-engine bomber competition, with the North American Aviation Corp., Inglewood, Calif.. second, and the Douglas Aircraft Corp., Santa Monica, third.

THE FIRST FLIGHT-DELIVERED WARPLANE

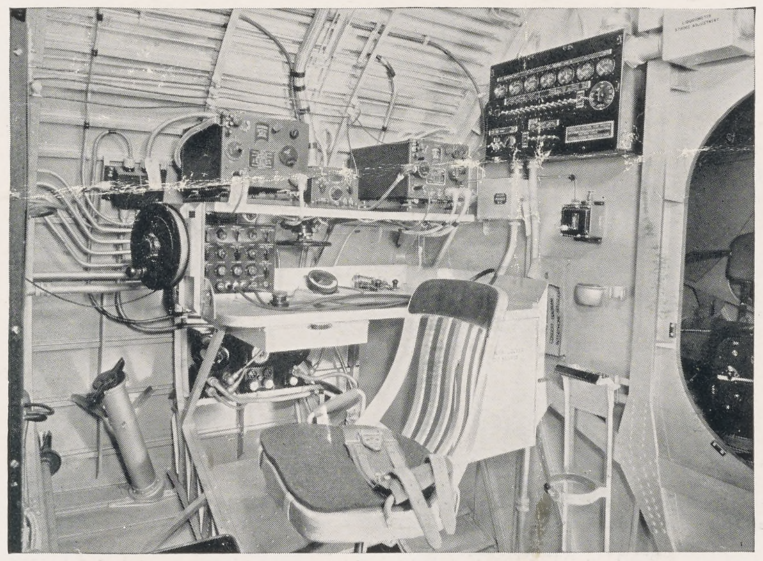
Which is to Fly 5,750 Statute Miles From San Diego to Felixstowe



READY TO MAKE FLYING HISTORY: The Consolidated Model 28-5 twin-engined flying-boat to be delivered to the Air Ministry on what will become the first military delivery flight across the Atlantic this month. The flight is from San Diego, California, to Felixstowe, Suffolk. The British designation numbers and Air Force colours have already been painted on the wings



FORWARD VIEW OF THE NAVIGATOR'S COMPARTMENT: On the left can be seen the chart table at which the navigator sits, while on the right is the radio operator's chair. In January last no less than forty-eight of these flying-boats flew in formation from San Diego Bay, California, to Coco Solo, Panama Canal zone, 3,087 miles non-stop, carrying 336 men



COMMUNICATION EQUIPMENT: A view of the radio installation aboard the Model 28 flying-boat. Strategically, the value of long-range flying-boats is more important to the British Empire than to any other group of countries in the world. One of these boats could easily be flown from England to the Persian Gulf and be in service the same day

THE COURSE OF THE FLIGHT

as officially arranged

Leave San Diego, California

Fly over Phoenix, Arizona; Albuquerque, New Mexico; Amarillo, Texas; Wichita, Kansas; Kansas City, Kansas.
Fly south of Chicago, Illinois.
Fly north of Detroit, Michigan.
Fly across Lake Saint Clare.
Fly over Toronto, Ontario; Ottawa, Ontario; Montreal, Quebec.
Fly south of Quebec, Quebec.
Land at Botwood, Bay of Exploits, Newfoundland.
Leave Botwood (55 deg. 21 mins. 27 secs. west) (49 deg. 08 mins. 30 secs. north).
Fly Great Circle course over north Atlantic.
Fly across centre of Ireland; Irish Channel.
Approach England at Cardigan Bay.
Fly across England.
Land at Felixstowe (Suffolk) England.

	Nautical Miles	Statute Miles
San Diego to Botwood	2,860	3,300
Botwood to Felixstowe	2,125	2,450
Total distance	4,985	5,750

At San Diego clear aeroplane and crew for Newfoundland and England.

At Botwood clear aeroplane and crew for England.

FLY WEST

YOU can now fly east; and you can now fly west. By air-liner you can fly east from London over Holland and Belgium into Germany, and on to Warsaw, Moscow, and beyond; or you can fly in a matter of hours right into the heart of the Balkans and on into Turkey; or you can fly as swift as an eagle over sea, mountain, and desert to India, Singapore, and Australia in time measured in days instead of the weeks of a decade ago; or, if you should so wish, you can branch off at Bangkok and fly across French Indo-China and up into Hong Kong, where, wonder of wonders, there may be a Clipper ready to fly you across the Pacific.

The air line companies who offer us these wonders can proudly proclaim achievement. We acknowledge their claim gladly. Especially do we honour those pioneer companies like Deutsche Lufthansa, Air France, K.L.M., and our own Imperial Airways who have opened up lines stretching thousands of miles away from their own national boundaries. And to Imperial Airways, who lead the way in carrying all first-class mail without surcharge as far south as Durban and as far east as Sydney (in conjunction with the Australian Qantas Company), we offer special congratulation.

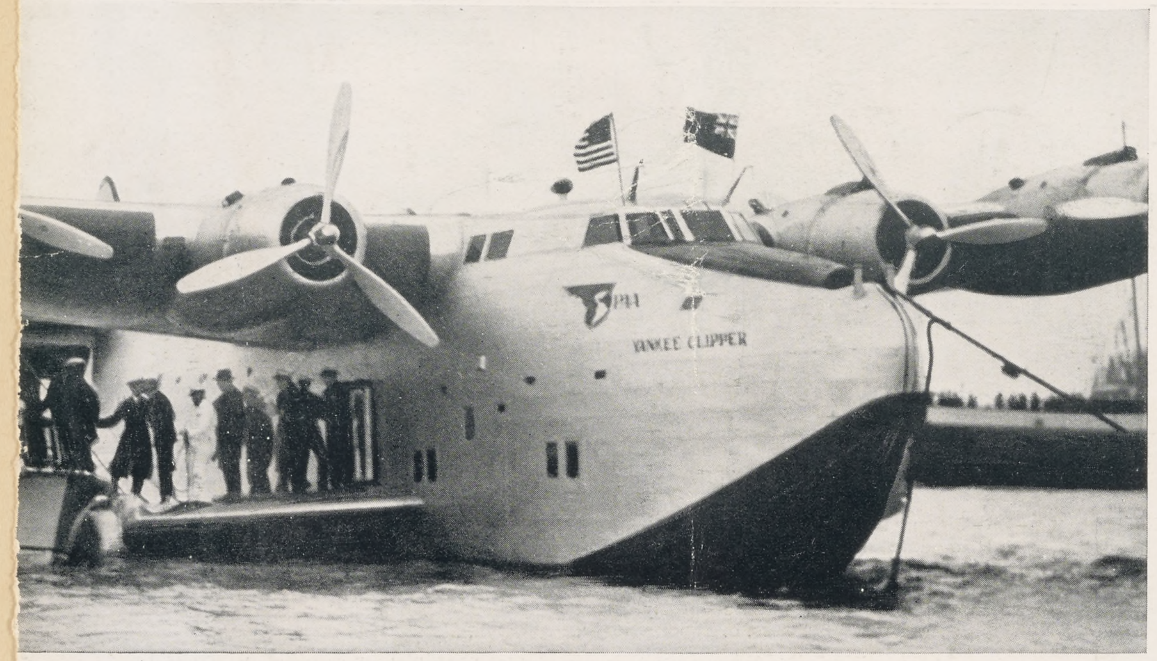
But in one important respect these air line developments have been, can one say, disappointing. From England they have stretched south and they have stretched east. We have therefore been geographically on the fringe of air transport development. Air traffic has only been able to emanate from us or to be absorbed by us. There has been no flow through us. For prosperity, just as a port at a river mouth depends on a flow of traffic for its existence, a flow of air traffic is desirable if not essential.

Now the forbidding Atlantic has been bridged by a regular air service, and the position of Great Britain in the realm of air transport is transformed. Instead of being on the outer fringe of an intensive network of international air lines, she finds herself in the position of a junction. Traffic from the United States flows into her from the west and on into Europe. And traffic from Europe flows into her from the east and on westward to the United States. At the moment, the traffic is obviously only a trickle; but can it be denied that it will be a fast-flowing stream within the next few years?

When you read of the carefree comfort that the first passengers experienced in the Clipper flying-boat the other day, of the nonchalance that came naturally to them as they flew across thousands of miles of ocean, you cannot help but wonder how the great Atlantic liners will fare in competition with the skyships in the years to come. Even to-day you can leave New York on Saturday and be in London on Monday and your ticket costs you less than cabin class on one of the big liners. Almost the worst that can be

"The Sphere"

—FLY EAST: Britain Becomes an Air Junction in Mid-1939



AN EPOCH-MAKING EVENT IN PASSENGER TRANSPORT RECORDED: July, 1939, is remarkable in the history of Anglo-American aviation, for during this month the first passenger services across the northern Atlantic were inaugurated by the American Clippers. The *Yankee Clipper* is here seen debarking her passengers on calm Southampton Water. This event transformed the air position of Great Britain

The New Geographical Situation

described by

NIGEL TANGYE

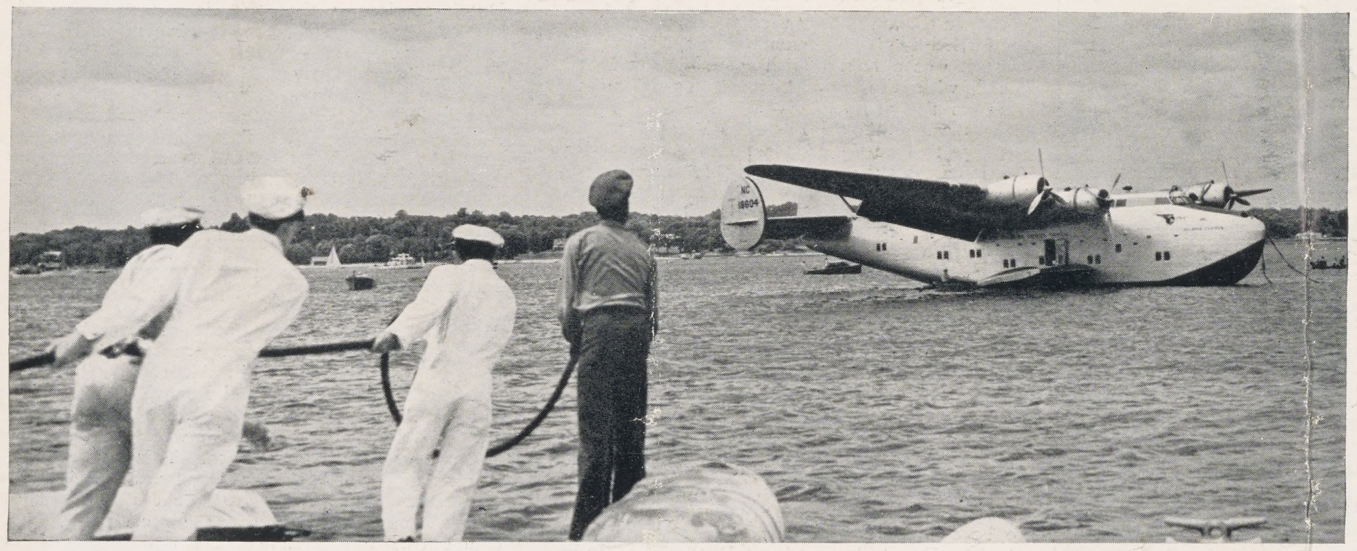
Here, unfortunately, she was held up for nearly three days, due to low cloud and fog. On such an important flight, the pilot was naturally going to take every precaution. But then she took off for Botwood and flew the 420 miles in under 3 hrs.

At Botwood she took on 3,485 gallons of petrol for the long ocean crossing of 1,920 miles. She arrived at Foynes 13 hrs. 38 mins. later and still with enough petrol in her tanks for a further flight of 1,700 miles. The average speed for the ocean flight was 144 m.p.h. If he had so desired, therefore, the pilot could have flown his heavy load of mail and passengers non-stop from Botwood to Constantinople. The flight from Foynes to Southampton was made in a little over 2 hrs.

The conquest of the Atlantic by air demonstrates, perhaps, more than any other branch of aviation activity, the tremendous pace of aeronautical science and development. It seems only yesterday when we welcomed Atlantic flyers as heroes. Indeed, it is only two or three years ago. Yet to-day we see the ocean crossed four times every week by flying-boats that carry nearly a ton of freight or mail and twenty passengers and flying to a schedule. It was twenty years ago that the Atlantic was first crossed non-stop, and the airmen were two Britishers, Alcock and Brown. So far ahead of their time were they that eight years were to pass before the feat was to be repeated. Then, in 1927, Lindbergh made his epic contribution to pioneer flight; but we are apt to forget that it was eight years after Alcock and Brown.

In retrospect eight years may not seem a very long time. But project your mind eight years ahead from to-day; do you dare to forecast where the giant strides of aviation will have led us?

> *On these pages, the success of the new* **Westward** *flying routes is emphasised. On the following double page the ease with which one can now fly* **Eastward** *is described by Michael Terry*



BACK FROM CROSSING THE NORTH ATLANTIC ON THE SOUTHERN ROUTE: While the *Yankee Clipper* was crossing the Atlantic to Foynes, Ireland, the *Atlantic Clipper* was flying from Port Washington to Marseilles via Horta and Lisbon and back to Long Island Sound, thus further connecting Europe with the United States by air

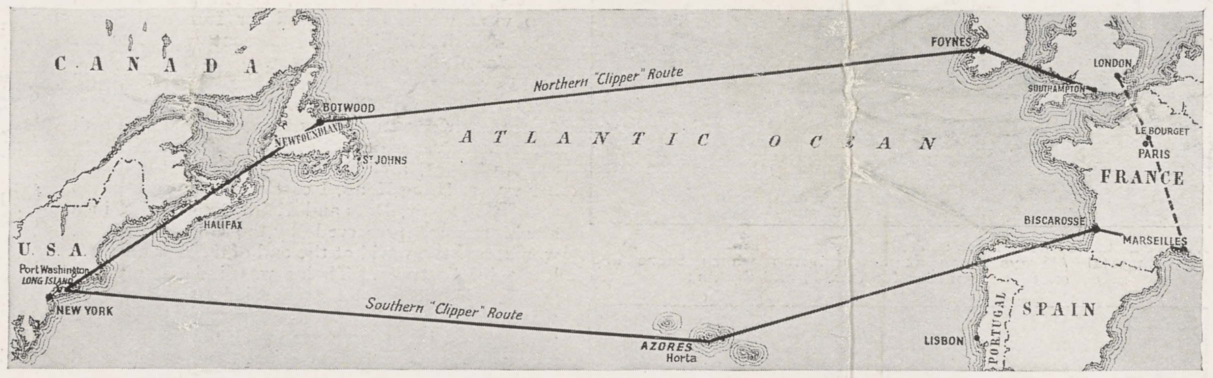
said of the Atlantic air service is that you must wait 25 mins. before your egg is boiled at the height at which you have to fly.

There are two routes that are being used by the Pan American Clipper flying-boats this summer. They are scheduled to fly a weekly return service on each, working up to two a week possibly by the end of the summer. These routes are termed the northern and southern routes. The southern route should have two services a week almost immediately.

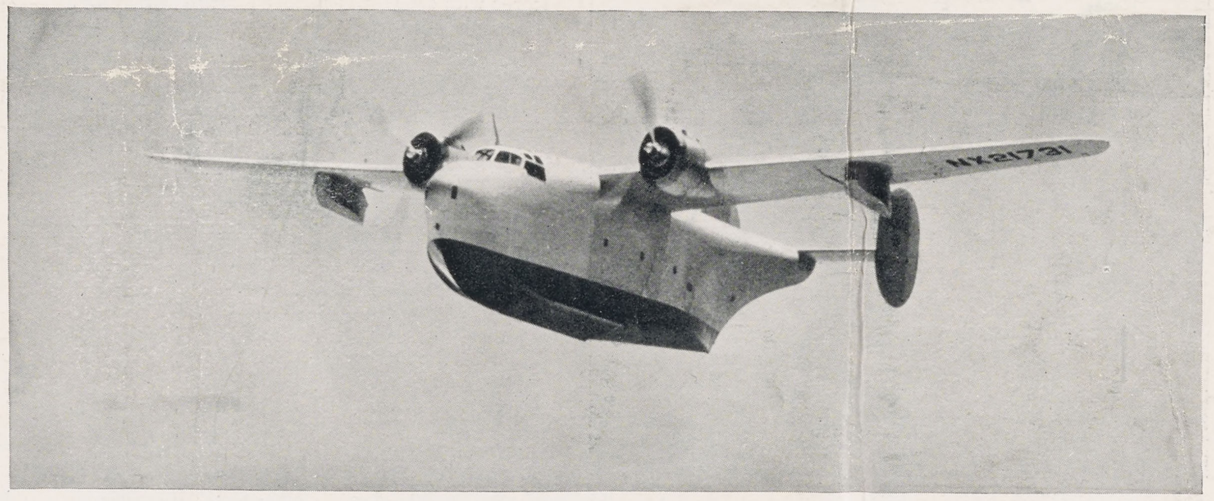
The southern route has its terminus at Port Washington, Long Island, New York. From there the Clipper flies direct to the Azores, a distance of some 2,400 miles. From there she hops the comparatively short distance to Lisbon where, after refuelling, she goes on to Marseilles which is the eastern terminus. On the first commercial flight she arrived at Lisbon 23 hrs. 15 mins. after leaving Port Washington.

The northern route is of more direct interest to us. This is the route to be flown by Imperial Airways. The Clipper flies from Port Washington to Shediac, New Brunswick, Canada. Thence she flies to Botwood, Newfoundland, and on across the ocean to Foynes where, after a short stop, she takes off for Southampton which is the eastern terminus.

For the flying time of this service, let us follow the flight of the first commercial service that reached Southampton on June 28. The *Yankee Clipper* loaded up at Port Washington with 1,734 lb. of mail, consisting of 60,000 letters, and took on board 19 passengers. Her crew numbered twelve. She flew the 620 miles to Shediac in a little under 6½ hrs.



THE TWO NEW PASSENGER AIR ROUTES ACROSS THE NORTH ATLANTIC: This is the first time that it has been possible to give such an air map of the north Atlantic. Hitherto the crossings have been sporadic, by individual effort. Now giant flying-boats, built by American skill and initiative, have inaugurated a regular passenger service across the wide and once-threatening Atlantic Ocean. The crossing of the ocean is now cut down to about a day and a half



A LONG-RANGE FLYER: A new 52-passenger long-distance flying-boat of the Consolidated Aircraft Corporation. All-metal construction coupled with high speed are the main characteristics of this craft. It is powered by two 18-cylinder, 2,000-h.p. Wright Duplex-Cyclone engines, said to be the largest and most powerful air-cooled aircraft engines in the world

ARMY ORDERS $100,000,000 WAR PLANES

WASH. D.C. TIMES HERALD

U. S. Throws Air Program Into High Gear by Biggest Award Of Peacetime Contracts

By ERIC FRIEDHEIM

In a spectacular preparedness move to keep the United States apace with the international armaments race, the War Department today awarded contracts for more than $100,000,000 worth of Army airplanes—the largest single aircraft purchase in peacetime history.

While dictator nations were placing emphasis on air might, this country, through the aircraft orders, served notice that its air expansion plan to bring this nation's first line of defense up to 5,500 fighting planes by July 1, 1941, was in high gear.

Number Not Given

The awards, made on a tentative basis, included $64,113,000 for various types of aircraft and $21,865,000 for aircraft engines. Other equipment for which separate contracts will be let will bring the orders well in excess of $100,000,000.

The War Department did not make public how many airplanes it was purchasing but the contracts awarded to various airplane companies included:

Four engined bombers: Consolidated Aircraft Corporation, San Diego, Calif., $8,485,000; Boeing Aircraft Company, Seattle, Wash., $8,090,000, and $5,400,000 additional to these two firms for planes to be ordered later.

$32,120,000 Warplanes Contracts Placed Here

L. A. Times 8-11-39

Southland Factories to Build 870 Ships in Race to Bring Air Force Up to 6000

Southern California aircraft factories yesterday took a large share of the War Department's contracts for $64,120,000 worth of military planes by booking exactly $21,120,000 of the total business—one-half of the latest awards in America's race to bring its air force to 6000 ships before 1942.

Engine orders placed with East Coast concerns bring the grand total of governmental defense expenditures yesterday to $85,978,000. Options for more near-future purchases adds another $7,400,000.

Most of the trade came to Los Angeles plants.

MORE THAN 850 SHIPS

Unofficial estimates of the total number of aircraft, ranging from mighty four-engined bombers to single-engined basic trainers, which the Southland will manufacture under this latest War Department award indicate that more than 850 ships are involved.

To North American Aviation, Inc., subsidiary of General Motors, at Inglewood, went $11,771,000 for fast-flying twin-engined bombers, $2,707,000 for basic trainers and $1,326,000 for advanced trainers.

Only the Glenn L. Martin Co., Baltimore, Md., topped this total with a single order for $15,815,000 worth of twin-engined bombardment machines.

Consolidated Aircraft Corp., San Diego, stepped squarely into the Army Air Corps picture—after years of building heavy-duty Navy patrol bombers—with a contract for $8,485,000 worth of four-engined "flying fortresses."

To Lockheed Aircraft Corp., Burbank, went a $4,845,000 order for what many experts class as the world's fastest twin-engined interceptor-type pursuit ship.

BASIC TRAINERS

For basic trainers, the Vultee division of the Aviation Manufacturing Corp., Downey, got $2,986,000.

By last night, as the War Department's allotments finished ticking over telegraph wires, Southern California's aircraft industry counted a total backlog of unfilled orders amounting to $123,500,000. Los Angeles County's four major plants alone represent $111,500,000 of this figure.

This means a 700 per cent increase over 1936's amount; 50 per cent over that of last February. More than 20,000 men now work in these factories. Hundreds more will be added to pay rolls.

Based on prices disclosed during the opening of bids recently, Los Angeles' latest contribution to the eventual 6000-plane air force will reach approximately 870 machines. This is the breakdown by companies:

North American: An estimated 100-150 Model NA-40 attack bombers powered with twin 1350-horsepower engines, tricycle landing-geared, highwinged, and capable of more than 300 m.p.h.; an estimated 300 basic trainers; an estimated 100 advanced trainers.

Consolidated: An estimated 40 four-engined Type 24 landplane bombers.

Lockheed: An estimated 30 twin-engined Model XP-38 interceptor pursuit ships capable of better than 400 m.p.h. This ship, virtually a "flying wing," boasts liquid-cooled engines and carries six heavy-caliber machine guns. Last February this single-seater streaked across America in 7h. 43m., once attaining 420 m.p.h.

Vultee: An estimated 300 basic trainers.

SCATTERED ORDERS

Other orders scattered by the War Department throughout the United States include Martin's $15,815,000 contract; an $8,090,000 order for four-engined "fortresses" from the Boeing Aircraft Corp., Seattle; a $688,000 order from that concern's Stearman division, Wichita, for primary trainers.

Engine orders totaling $21,865,000 were given to Pratt & Whitney, Hartford, Ct., ($12,320,000,) Wright Aeronautical Corp., Paterson, N.J. ($7,000,000,) Allison Engine Corp., Indianapolis, ($2,275,000,) and Lycoming division of the Aviation Manufacturing Corp., Williamsport, Pa. ($270,000.)

Some 1600 planes still remain to be purchased, it was disclosed.

LARGEST BACKLOG

Although unmentioned in yesterday's contract awards, the Douglas Aircraft Co., Inc., Santa Monica, still shows one of the nation's largest backlogs, $48,000,000, chiefly as a result of an order for approximately 150 attack-bombers totaling $15,000,000 filed last May.

Crew That Flew Ship to England Returns

NEW YORK, Aug. 3. (AP)—Capt. Lewis Yancey, American aviator, returned today aboard the liner Washington after making the first "flying delivery" of an American plane to England. He flew a Consolidated Aircraft Co. flying boat from California to the Royal Air Force base at Felixstowe, Eng. It was his fourth trans-Atlantic flight. He left San Diego July 12 and arrived in England July 15.

His crew, Russell Rogers, copilot; Gerald Brown, engineer, and Raymond Booth, radio operator, returned with him.

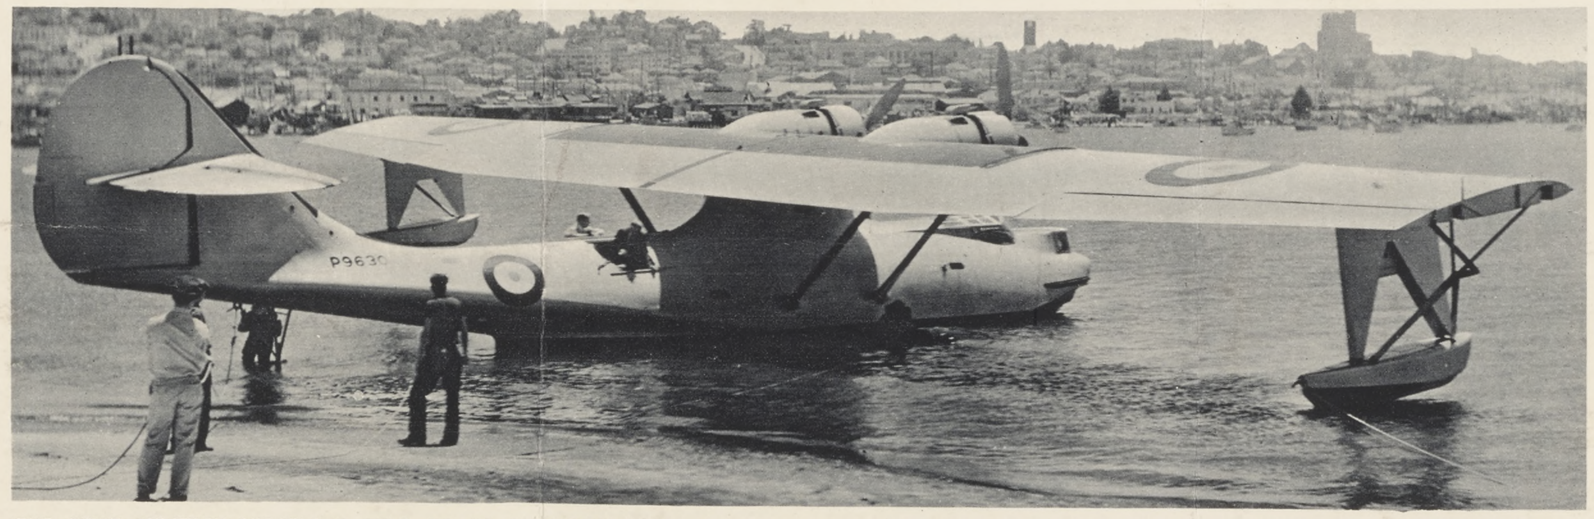
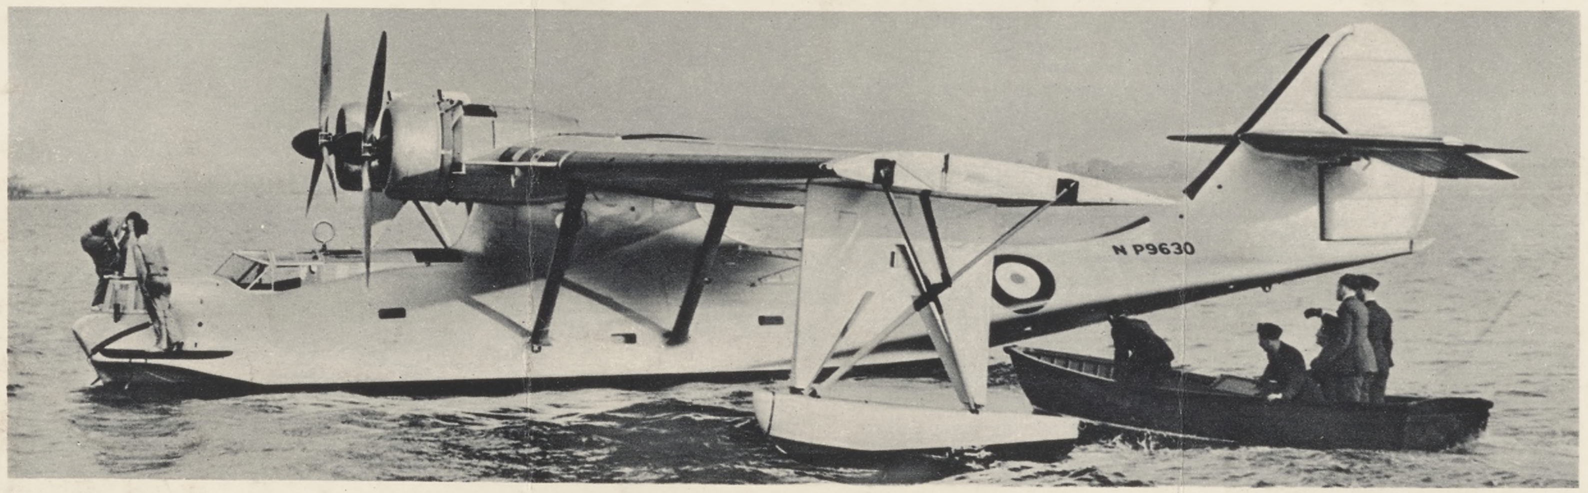
Consair Design Wins In Bomber Contest

Consolidated Aircraft Corp. has won a design contest for 4-engined bombers conducted at Wright field, The Associated Press reported. Purchase of 2500 planes are expected to be based on results of the various design contests. The Glen L. Martin Co., of Baltimore, won the twin-engined bomber competition, with the North American Aviation Corp., Inglewood, Calif., second, and the Douglas Aircraft Corp., Santa Monica, third.

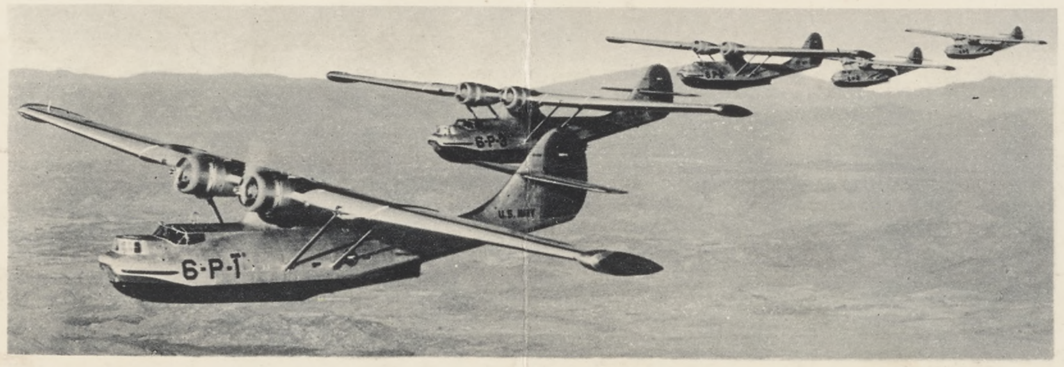
SAN DIEGO TO FELIXSTOWE: HESTON TO JERSEY



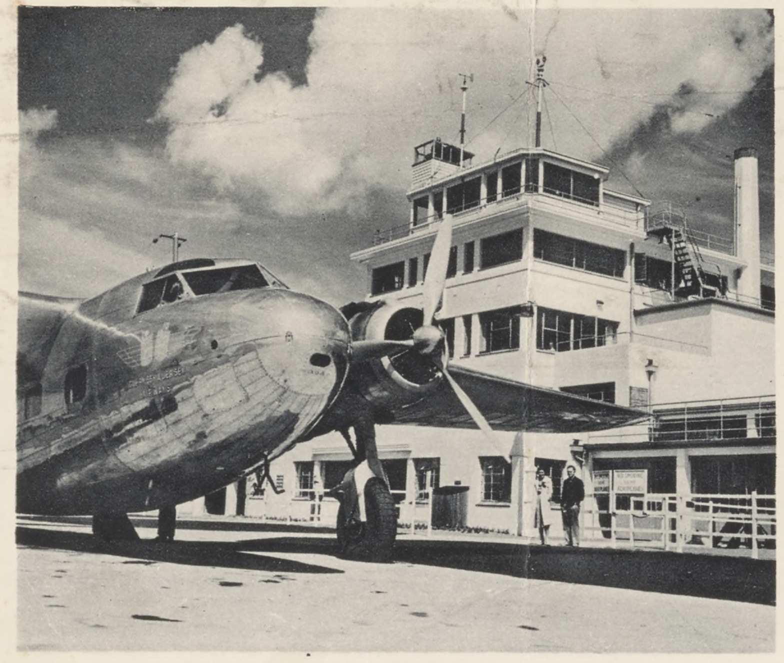
THE FIRST MILITARY AEROPLANE EVER TO BE FLIGHT-DELIVERED ACROSS THE ATLANTIC: The Consolidated flying boat Model 28-5 at rest in San Diego Harbour, California, before setting out for Felixstowe, England, via Botwood, Newfoundland. The Consolidated arrived safely at Felixstowe last week, making the long trip of 5,750 miles without mishap. She has been bought, just as other foreign aircraft have been bought by the Air Ministry, in order to be tested and examined in British conditions of service. She is largely constructed of aluminium alloy. The type has a range of 4,200 miles when carrying a fair military load

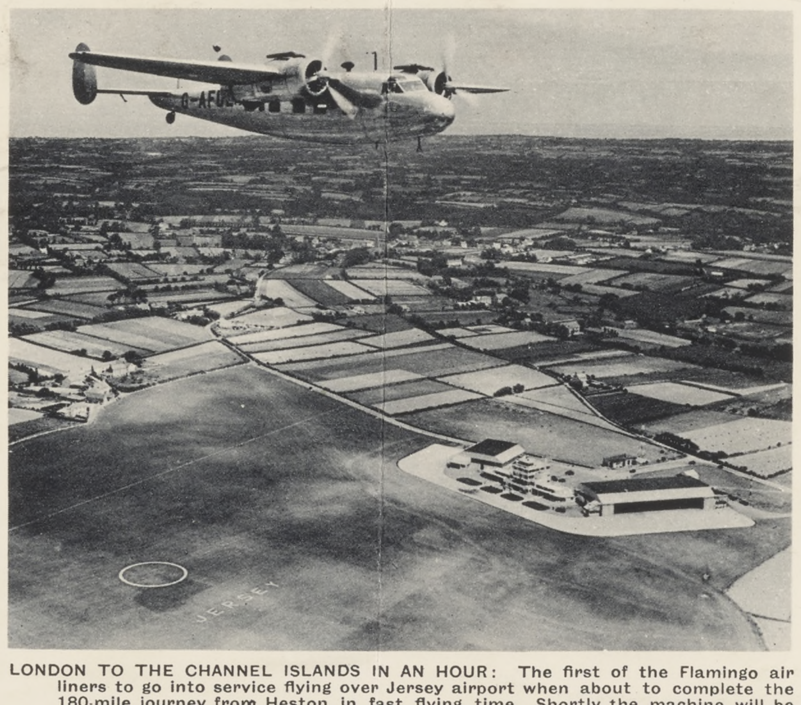


"LANDFALL" IN ENGLAND: The Consolidated flying boat at Felixstowe after completing her 5,750-mile flight from San Diego, the only halt on the way being at Botwood, Newfoundland. The Consolidated has many unusual features, including wing tips that can be retracted during flight in order to reduce wind resistance to a minimum. The U.S. Navy is now using long-range bombers of this type for patrol work and in certain respects they are supplanting destroyers. The carrying capacity is said to exceed that of any military plane manufactured in Europe, this being in part accounted for by the skilful positioning of the fuel tanks



CONSOLIDATEDS FLYING IN FORMATION: The long-range bombers seen as they set out on a delivery flight from the American mainland to Pearl Harbour, Honolulu. Many similar routine delivery flights between bases thousands of miles apart have been carried out by the makers with 100 per cent. success. *Above on right*—The crew of the Consolidated at Felixstowe





LONDON TO THE CHANNEL ISLANDS IN AN HOUR: The first of the Flamingo air liners to go into service flying over Jersey airport when about to complete the 180-mile journey from Heston in fast flying time. Shortly the machine will be making several trips every day. The saloon, fitted with twelve armchair seats, has ample headroom. *On left*—The Flamingo at rest on the concrete at Jersey airport

U. S. Arming Sped by Record Plane Contracts

WASH. D.C "STAR"
8-10-39

Over 1,000 Aircraft Ordered, Costing $100,000,000

By the Associated Press.

The War Department accelerated the expansion of Army air forces today with an award of contracts totaling $85,978,000 for aircraft and engines.

Acting Secretary of War Louis Johnson said they represented the largest peacetime arms orders.

Including equipment, which will be provided by the Government, for which separate contracts are to be let, more than $100,000,000 was represented, the War Department said.

The largest single contract went to the Glenn L. Martin Co. of Baltimore, for two-engine bombers, costing $15,815,000.

More Than 1,000 Ships.

For an undisclosed number of the same type plane, an $11,771,000 contract was awarded North American Aviation, Inc., Inglewood, Calif.

Altogether, the contracts represented purchases of more than 1,000 planes of all types, military circles understood, although numbers were not disclosed in conformity with the new policy of secrecy.

The War Department indicated that new four-motor bombers—$17,394,000 worth ordered in separate groups from Consolidated Aircraft Corp. at San Diego, Calif., and Boeing Aircarft Co. at Seattle—would be able at least to approach 300 miles an hour.

'Flying Fortresses' Improved.

The planes ordered from the Boeing company are an improved version of the "flying fortress" which averaged 263.8 miles an hour in a transcontinental flight last week.

Fastest of the new planes are $4,845,000 worth of new type interceptor pursuit craft ordered from Lockheed Aircraft Corp. at Burbank, Calif.

These twin-engine craft are designed to climb quickly to head off any wartime raids and are said to be similar to the experimental ships which last February attained a top speed of 420 miles an hour in a transcontinental flight which ended in a crackup at Mitchel Field, N.

OUTLAY OF ARMY FOR PLANES TO BE $100,000,000

CINCINNATI "TIMES" STAR

U. S. Awards Contracts for High-Speed Craft.

8-10-39

WASHINGTON, Aug. 10—(AP)—The War Department threw the expansion of Army air forces into high gear today with an award of contracts totaling $85,978,000 for aircraft and engines.

Louis Johnson, Acting Secretary of War, said they represented the largest peacetime arms orders.

Including equipment, which will be provided by the Government, for which separate contracts are to be let, more than $100,000,000 was represented, the War Department said.

The largest single contract went to the Glenn L. Martin Co., Baltimore, for two-engine bombers, costing $15,815,000.

For an undisclosed number of the same type plane, an $11,771,000 contract was awarded to North American Aviation, Inc., Inglewood, Calif.

Altogether, the contracts represented purchases of more than 1,000 planes of all types, military circles understood, although numbers were not disclosed in conformity with a new policy of secrecy.

The Department indicated that new four-motor bombers—$17,394,000 worth ordered in separate groups from Consolidated Aircraft Corp. at San Diego, Calif., and Boeing Aircraft Co. at Seattle—would be able at least to approach 300 miles an hour. The planes ordered from the Boeing company are an improved version of the "Flying Fortress" which averaged 263.8 miles an hour in a trans-continental flight last week.

Fastest of the new planes are $4,845,000 worth of new type interceptor pursuit craft ordered from Lockheed Aircraft Corp. at Burbank, Calif. These twin-engine craft, designed to climb quickly to head off raids, were said to be similar to the experimental planes which, last February, attained a speed of 420 miles an hour in a flight which ended in a crack-up at Mitchel Field, New York.

Non-Stop Hop To Seattle Planned For 'Flagship'

On its first assignment as "flying flagship" of Rear Adm. Arthur B. Cook, Aircraft Scouting Force commander, the Navy's four-motored patrol bomber piloted by Comdr. Andrew Crinkley will take off at dawn Sunday on a non-stop 1200-mile flight to Seattle.

The plane, operated by a nine-man crew, will join Rear Adm. Cook's "surface flagship," the USS Memphis, due in Seattle today for a week's visit before proceeding to the Alaska-Aleutian Islands area of Navy patrol plane operations. The four-motored bomber, biggest in the Navy, is expected to operate in the Gulf of Alaska and the Aleutian Islands, and is tentatively scheduled to return here about Sept. 5.

Just released from the Consolidated Aircraft Corp. plant, where it was refitted during the past seven months for its special use as an admiral's flagship, the plane made a round-trip test flight to San Francisco Tuesday.

Officers in addition to Comdr. Crinkley permanently assigned to the airboat are Lieut. Thomas E. Gillespie and Ensign John A. Ferguson. Remainder of the crew consists of six enlisted men.

Delivery of six sister ships of the bomber, now under construction at Consolidated in a $4,700,000 contract, probably will begin next spring, it was learned today, with the contract to be completed in the summer of 1940.

TRANS-PACIFIC MAIL

Aug. 18, from Los Angeles. Mail for Hawaii.

Aug. 18, from San Francisco. Mail for Hawaii, Japan and Hongkong.

Aug. 21, from San Francisco. Mail for Hawaii.

Aug. 21, from Los Angeles. Mail for Panama and Canal Zone.

Note: Time allowances in San Diego mailing must be made for connections with sailings at other ports listed.

Rare Birds, Beasts, and Orchids Found in New Guinea Search

Special to The Christian Science Monitor

SYDNEY, New South Wales—Discoveries claimed to equal those of Darwin and Wallace in importance have been reported by the Archbold expedition, which recently returned to New York after conducting an extensive survey of Netherlands New Guinea.

In an interview here before embarking for home on the expedition's flying boat Guba, Richard Archbold, leader of the expedition and an associate of the American Museum of Natural History, described some of the important "finds," including dancing birds that build hurdles to jump through, and tree rats four feet long. Animals, birds, insects, and plants—20 per cent of them new to researchers—were found in New Guinea by the expedition, he declared.

"The results of the expedition are the greatest in my experience in various parts of the world, and perhaps will never be equalled again," Mr. Archbold said. "The use of a modern flying boat, which made 168 flights from the coast to the interior and carried 568,000 pounds of food and equipment over jungle impassable on foot, helped us a great deal.

Radio Connection Invaluable

"The erection of radio stations at our three bases permitted the flying-boat crew to keep in communication and receive the latest weather reports, but great skill was required for the heavily-laden take-offs and landings in jungle rivers and on a lake 11,000 feet above sea level. We saw territory never before seen by a white man. In one large valley—we call it the Grand Valley—we estimated the native population to be from 70,000 to 80,000. One previously unknown river, the Baliem, was a large stream.

"Our expedition has made the most important and extensive discoveries since Darwin and Wallace. We have 20 new animal species, among which is a kind of giant arboreal rat. It is a thick, squat creature, four feet long from nose to end of tail, and a foot high. It has rows of long sharp teeth, and lives on green shoots. We also discovered a new bird which lives on flies in barren, rocky country 15,000 feet above sea level. It is blue-black, with a bright red spot on the breast and stands about nine inches high.

"We obtained many new plants and collected more than 40 rare varieties of orchids. The expedition made new geographical discoveries. It obtained movies of birds of paradise in action on their dance-grounds. The birds indulge in amazing dances on small velodromes or race-tracks, which they build out of moss. Sometimes they build hurdles and hoops, over and through which they jump."

Mr. Archbold has been flying since 1932, and the expedition now terminated was his third to New Guinea. He used a flying boat on his second expedition, but it was wrecked in a windstorm known by the natives as a "guba"; hence the name of his present craft.

Night Flight Over Equator

Capt. Lewis Yancey, navigator of the Guba, recalled one highlight of the expedition, a night flight over the equator. "We saw some pretty heavy stuff—clouds and rain—just ahead of us," he said. "So we went on up to climb over it. Pretty soon we ran right into it—sleet and rain and snow. Remember, we were 17,500 feet up. And was it cold! We wore fur-lined flying suits, and we were still frozen. It was snowing so hard that the windshield of the cockpit was coated thick. I had an after-hatch open, and I gathered up a snow ball, just to be able to say that I had handled snow over the equator."

Describing the hazards of establishing the initial inland base in New Guinea, after landing at Hollandia, on the north coast of Netherlands New Guinea, Captain Yancey said: "Our first trip revealed hundreds of native villages on the banks of a big river. There must have been 60,000 or 70,000 natives all told. They had never seen white people before. There was not one thing to show that they even knew of the existence of the outside world. We flew low over the river, and watched them run. They were scared by the Guba. Later we learned that every one of them was a head-hunter."

Mr. Archbold has spent almost all of the last year in hitherto unexplored territory in Netherlands New Guinea on this elaborate and intensive research expedition, with the co-operation of the Netherlands East Indies Government. The expedition cost £250,000, of which Mr. Archbold provided £100,000. He said that he had found the country so interesting that he proposed to make another visit next year, using another flying boat.

BIG S. D. BOMBER REACHES SEATTLE

The four-motored, 25-ton PB2Y—the Navy's biggest bomber and "flying flagship" of Rear Admiral Arthur B. Cook, Aircraft Scouting Force commander, was in Seattle today after a flight from San Diego, to join Admiral Cook's surface flagship, the U. S. S. Memphis.

The Cruiser and bomber will leave Thursday on a cruise into Alaska waters, stopping at Sitka, Kodiak and Dutch Harbor.

The ship will proceed from Dutch Harbor to Honolulu, while it was believed the plane was scheduled to return to San Diego about Sept. 5.

CONSOLIDATED PLANES BEST

Official Places In Contest Released

Sun 8-21-39

Aeronautics

Superiority of the Consolidated Aircraft Corp. four-motored Army bomber planes over those entered in the Army Air Corps competition was officially confirmed with the announcement by Brig.-Gen. George H. Brett, chief of the Air Corps material division, that the San Diego concern won first place in the design contest at Wright Field, Dayton, O.

Tangible result of this rating was the recent award to the local firm of a $8,485,000 contract for an un-named amount of four-engined craft, on which production will get under way in about four months.

It was learned that Consolidated might have received an order double this size had not the War Department wished to take advantage of the fact that the Boeing Aircraft Co. of Seattle, developers of the original four-motored "flying fortress" was fully equipped for immediate production of additional similar planes.

Boeing received an $8,090,000 contract. The War Department reserved options totalling $5,400,000 for purchase of more multi-motored bombers from these concerns.

Glenn L. Martin Co. of Baltimore submitted the best design in the twin-engine bomber competition, followed by North American Aviation Corp., Inglewood, and Douglas Aircraft Corp., Santa Monica, in second and third places, respectively.

Union 8-21-39

Big Navy Plane On 1200-mile Hop to Seattle

SEATTLE, Aug. 20 (A.P.)—The aerial flagship of Rear Adm. Arthur B. Cook arrived at the Sand Point naval air station here late today from San Diego.

Piloting the navy's newest and largest four-motored long-range patrol bomber, Comdr. Andrew Crinkley, pioneer naval aviator, took off from San Diego bay yesterday on a 1200-mile sustained flight to Seattle.

Assigned as aerial flagship of Rear Adm. Arthur B. Cook, commander scouting force aircraft, the plane is to carry the admiral on a series of inspection flights to new and projected naval air bases in the Alaska-Aleutian island sector. From Seattle the plane is to fly to Sitka, thence to Fairbanks, Nome, Dutch Harbor. From the latter port the aerial flagship will cruise through Unimak pass into the Bering sea.

Flying with Comdr. Crinkley are Lt. Thomas E. Gillespie, Ens. John A. Ferguson and a crew of six enlisted men.

The plane, built by Consolidated, has been undergoing tests a year but was accepted by the navy department only a fortnight ago.

Adm. Cook is aboard the cruiser Memphis at Seattle. He is due to return Sept. 15.

Tuesday, August 22, 1939

'GUBA' READIED FOR NEW TRIP

New Guinea Expedition Resumes In Spring

Sun 8-22-39

Aviation

The 15-ton, twin-engined Consolidated airboat "Guba"—world's largest and most widely-travelled private plane—soon will set out on new journeys.

Capt. Russell Rogers, chief pilot of the plane, which is owned by Richard Archbold, wealthy research associate of the American Museum of Natural History, revealed here today that according to tentative plans, the "Guba" will be flown from San Diego to the east coast about Sept. 15.

ARCHBOLD EXPECTED

Mr. Archbold is expected here from New York City in about 10 days or two weeks before the takeoff. He remained in the east when the Guba was taken across the continent to San Diego last month, ending a 25,000 mile trip around the world.

The plane, which flew more than 100,000 miles since leaving San Diego in June, 1938, has been receiving overhaul at the Consolidated factory. It blazed many new air trails in its work for the American Museum expedition in Netherlands' New Guinea, its spanning the Indian Ocean on a survey flight for the Australian government, its crossing of the continents of Africa and Australia, and its making the longest over-water non-stop flight, 3300 miles from Dakar, Africa to the Virgin Islands.

NAMES DESTINATION

Capt. Rogers said the eastern destination of next month's flight will be either New York or Miami, if the weather is too cold in the north. A stop probably will be made in San Antonio en route.

The New Guinea expedition will be resumed next spring, according to present plans, he declared.

Of the original Archbold crew, only Capt. Rogers and Stephen Barrinka, assistant flight engineer, remain. Capt. Lewis Yancey, navigator, Ray Booth, radioman, and Gerald Brown, engineer, who served with Capt. Rogers in the recent delivery of a Consolidated patrol bomber to the English Royal Air Force, have left for other jobs in the east.

U. S. TO GET NEW FLYING BOAT

Plane To Be Equipped With Four Motors

Sun 8-25-39

Aviation

NEW YORK.—America's growing family of trans-oceanic flying boats, some of which are already plying on regular schedule between the United States and Europe, will soon have a new member, capable of providing overnight nonstop service to London.

With four 1000-horsepower motors hauling its 32 tons of gross weight through the air faster than any flying-boat now in commercial service, it is patterned closely after a four-motored patrol bomber delivered recently to the U. S. Navy. Builder of both the naval and commercial ships is the Consolidated Aircraft Company of San Diego.

The flying-boat has a wing span of 115 feet, a length of 79 feet and a height of 23 feet in its naval version. The Navy boat's gross weight is 57,600 pounds, but it can be loaded more heavily—probably up to 64,000 pounds—in commercial service. American Export Airlines, now making transatlantic surveys, has ordered two or more of them.

Neither speed nor load figures are given in the trade journal advertisement which revealed the new airliner's existence, as these are still confidential Navy data. The plane will be equipped with the retractable wing-tip float that has become famous in the smaller twin-engined patrol bomber the same firm has supplied by the score to the Navy.

Sun 8-25-39

S. D. 'MYSTERY PLANE' DAMAGES WING

The 50-000-pound "mystery plane," X31, of the Consolidated Aircraft Corp., gave watchers a moment of anxiety today, as it made a rough landing in the San Diego harbor, damaging a wing float.

Coast Guard officials sent Patrol Boat 442 out to give aid, but the experimental two-motored ship taxied to the landing under its own power. Pilot W. B. Wheatley reported that either an "air-bump" or a submerged object was the probable cause of the accident.

Eventful Finish Planned for Navy Relief Carnival

"Never a dull moment."

Officials and entertainers of Navy Relief carnival, who so far have lived up to that slogan with rapid-fire programs, predicted that today's wind-up show would overshadow all former attractions.

The three-day carnival, being held at Naval Training station, will close at 12 tonight.

KIDDIE REVIEW TODAY

Today's program will open at 3:30 p.m. with a special "Kiddie Revue." Following in fast succession will be a military band concert and a series of 5-minute sketches by four local dancing academy groups, a skating act, acrobatics, a magician and songs.

A 8 p. m. a waltz group featuring the Navy Juniors will be presented. Following will be a vocal duet by Lorna and Rita, songs by Donna Lee, sketches from "The Drunkard" by the Community players and songs by Frances Maddux, famed night club entertainer.

MARINES PARADE

Two film players, Ellen Drew and William Frawley, will appear at 9 p. m. The entertainment program will conclude at 10 p. m. with a spectacular searchlight display.

Patrons will be entertained between programs by 36 concessions, eight thrill rides and 29 skill games.

More than 500 marching marines opened yesterday's show. The entertainment-packed program included military displays, songs, dances, two "air raids" and a personal appearance of Pat O'Brien, film star.

Imperial Airways Suspends Bookings for Long Trips

LONDON, Aug. 9 (AP)—Imperial Airways has suspended passenger reservations on Empire air routes to Africa and Australia after today, principally because of a shortage of planes caused by Britain's military program.

The company said British plane factories were unable to fill commercial orders in addition to requirements of the Army and Navy. Imperial Airways therefore is buying 48 Pratt & Whitney cyclone engines in the United States.

Reservations already made for passenger accommodations on the company's long routes will be filled, but no new reservations will be accepted at least until after the Christmas mail rush. About 1,100 passengers have been carried each month on these routes recently.

Curtailment will not affect Imperial Airways' many cross-channel services and continental schedules.

Other causes contributing to the decision were the shortage of trained personnel owing to Royal Air Force recruiting, larger amounts of mail carried, and desirability of carrying a greater fuel reserve in each plane.

Suspension is the first major pinch felt by the British public in transport facilities since rearmament reached its present huge proportions.

Army Demands Come First

Written for The Christian Science Monitor

Air armament demands in Great Britain, requiring not only equipment but personnel for the needs of the air force, have consistently hampered recent development of British commercial aviation.

British trans-Atlantic air mail service, for example, which originally had been scheduled for last summer, was inaugurated last week with the flight of the Caribou. The New York-Bermuda service of Imperial Airways, interrupted by the sinking of the flying boat Cavalier, has not been restored. The Tasman Sea link from Australia to New Zealand has been projected only recently owing to inability to get delivery of flying boats needed for the route.

Until last season British continental services were operated with 15-year-old equipment. It was not until public pressure was exerted at home and severe competition was offered by the French and Dutch lines, with their new fast equipment, that new fast planes were placed on British continental services. American planes were purchased to augment the slow delivery of the British factories.

Need for additional pilots for the British commercial services had become so acute, due to Royal Air Force demands, that a call had gone out to Canada offering inducements to Canadian flying clubs to enter commercial flying. But this apparently did not yield sufficient personnel, owing to Canada's pre-occupation with the needs of its own new transcontinental air service.

The British "all up" mail scheme, whereby first-class mail outbound to the Empire has been carried by planes, unquestionably has contributed greater mail loads sometimes even to the extent of cancelling passenger bookings to accommodate the extra weight of mail sacks.

Coupled with Britain's desire to carry a greater fuel reserve in commercial planes, the mail loads, plus extra fuel, contributed to cancellation of the only cargo that could be omitted—that is, passengers. These undoubtedly are the contributing factors to passenger cancellations in the British long-distance services.

8/20/39 LA Times

Four-Hundred-Mile-an-Hour Bomber Motor Put on Display

NEW YORK, Aug. 19. (AP)—An aeronautical engineer yanked a tarpaulin unceremoniously off an exhibit in the Aviation Building at the New York World's Fair today to uncover the most powerful high-altitude aircraft engine ever built.

Tested by both the Army and Navy, it will make possible speeds above 400 miles an hour for bombing planes for the first time since the feverish quest for higher speeds began incident to the world-wide rearmament.

HIGHLY SUPERCHARGED

The engine, with a rating of 1600 horsepower above altitudes of 20,000 feet, is highly supercharged. Streamlined in accordance with specifications of the National Advisory Committee for Aeronautics, it is bullet-like, compact and narrow of profile to reduce wind resistance. At the Fair it is mounted in a display wing.

Military men attach high tactical value to high-speed bombers. In wartime they could not only elude defending pursuit planes, but also would make difficult targets for anti-aircraft fire. Unofficially it was said that no world power has yet produced a bomber which would approach within 75 miles an hour the speed made possible by the new engine.

EIGHTEEN CYLINDERS

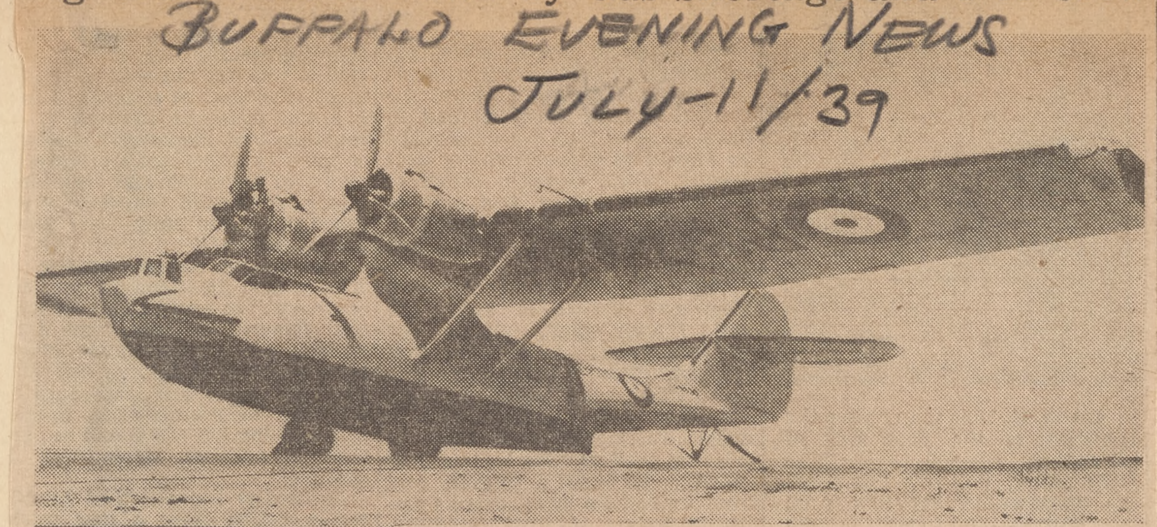
Produced by the Pratt & Whitney division of United Aircraft Corp. and supercharged with the aid of the Naval Bureau of Aeronautics, it contains 18 cylinders in two "banks" which are cooled both by a frontal blast of air and by wing ducts which deliver air to the rear cylinders.

To reduce "drag" or head resistance, the engine is smaller in diameter than any engine of similar horsepower ever built.

About a month ago, Louis A. Johnson, Assistant Secretary of War, described the engine, without supercharging, as the most powerful motor that had passed the rigorous 150-hour Army Air Corps test at Wright Field, Dayton, O.

Big Craft Forced Down by Gas Shortage and 2 of Crew

BUFFALO EVENING NEWS
JULY-11/39



These two members of the crew of the Consolidated Aircraft Corporation flying boat pictured above came ashore when the big ship, en route from San Diego to England, was forced to alight here for fuel. They are Lewis A. Yancey, left, navigator, and Pilot Russell R. Rogers.

England-Bound Flying Boat Lands at Buffalo to Refuel

Huge Military Craft Left San Diego Monday for First Scheduled Air Delivery Abroad.

Fearing a gasoline shortage before they could reach Botwood, Newfoundland, on the first scheduled air delivery of an American military plane to England, four fliers alighted at the Marine Airport here today in a Consolidated Aircraft Corporation flying boat after a 2500-mile flight from San Diego, Cal.

The airmen planned to take off for the remainder of their projected 5900-mile flight to Felixstowe, England, after taking aboard 400 or 500 gallons of gasoline. The fliers are Capt. Russell R. Rogers, pilot; Lewis A. Yancey, navigator; Raymond Booth, radioman, and Gerald Brown, engineer.

Capt. Rogers said he took off from San Diego at 8:30 o'clock Monday morning (12:30 P. M., Buffalo time), flew a direct route toward Botwood but bucked heavy headwinds virtually all the way.

Makes Smooth Landing.

"We flew over Chicago a little after 4 o'clock this morning, about two hours behind schedule," Capt. Rogers said. "We figured we had enough fuel to reach Botwood if conditions were favorable but we didn't want to take any chances on fog as we neared the coast. So we decided to come down at Buffalo and take on more gas."

Radioman Booth contacted the Consolidated plant at San Diego and asked to have arrangements made for gasoline to be ready at Buffalo.

The 15-ton ship was brought down just outside the Buffalo Harbor gap about 6:45 o'clock. It came down on the water smoothly and headed toward the Marine Airport at the foot of Georgia st. Capt. John J. Daly and a Coast Guard crew went out to meet the plane.

Capt. Rogers said arrangements had been made for gasoline, but Capt. Daly said none was waiting at the airport and Cept. Rogers then had to make his own arrangements. Capt. Daly furnished a pump so the fuel could be put aboard as speedily as possible. But four hours later they still were waiting for gasoline.

Fliers Recently Circled Globe.

Capt. Rogers had planned to be in England in time to keep a dinner engagement at Claridge's tomorrow evening. This is out of the question now. He said he would finish the trip to Botwood today, refuel and take off for Felixstowe, about 60 miles north of London, tomorrow morning.

The plane in which the men are flying is a new twin-motored flying boat, model PBY-4. It has been sold to the British Air Ministry and bears the insignia of the British Royal Air Force. It is an all-metal, high-wing monoplane.

The four fliers just got back to New York July 1 after a round-the-world flight for the American Museum of Natural History under the leadership of Richard Archibald of the museum staff. They left San Diego June 2, 1938, in a plane similar to the one they are taking to England.

Capt. Rogers and Mr. Yancey, an experienced trans-Atlantic flier, are on leave from museum posts to make the delivery of the Consolidated ship.

Largest Navy Bomber to Make Long Flight

SAN DIEGO, Aug. 19. (U.P.)—The Navy's largest bomber, the four-motored, 25-ton PB2Y, "flying flagship" of Rear Admiral Arthur B. Cook, Aircraft Scouting Force commander, will take off at dawn tomorrow on a 1200-mile, nonstop flight to Seattle.

On its first assignment since it was turned over to the Navy by Consolidated Aircraft Co. officials a week ago, the huge patrol bombing plane, piloted by Comdr. Andrew Crinkley and operated by a crew of eight.

Largest Navy Bomber Arrives at Seattle

SEATTLE, Aug. 20. (U.P.)—The four-motored, 25-ton PB2Y—the Navy's biggest bomber and flying flagship of Rear Admiral Arthur B. Cook, aircraft scouting force commander—arrived in Seattle today from San Diego, Cal., to join Admiral Cook's surface flagship, the U.S.S. Memphis.

AVIATION MAG. FEB. 39

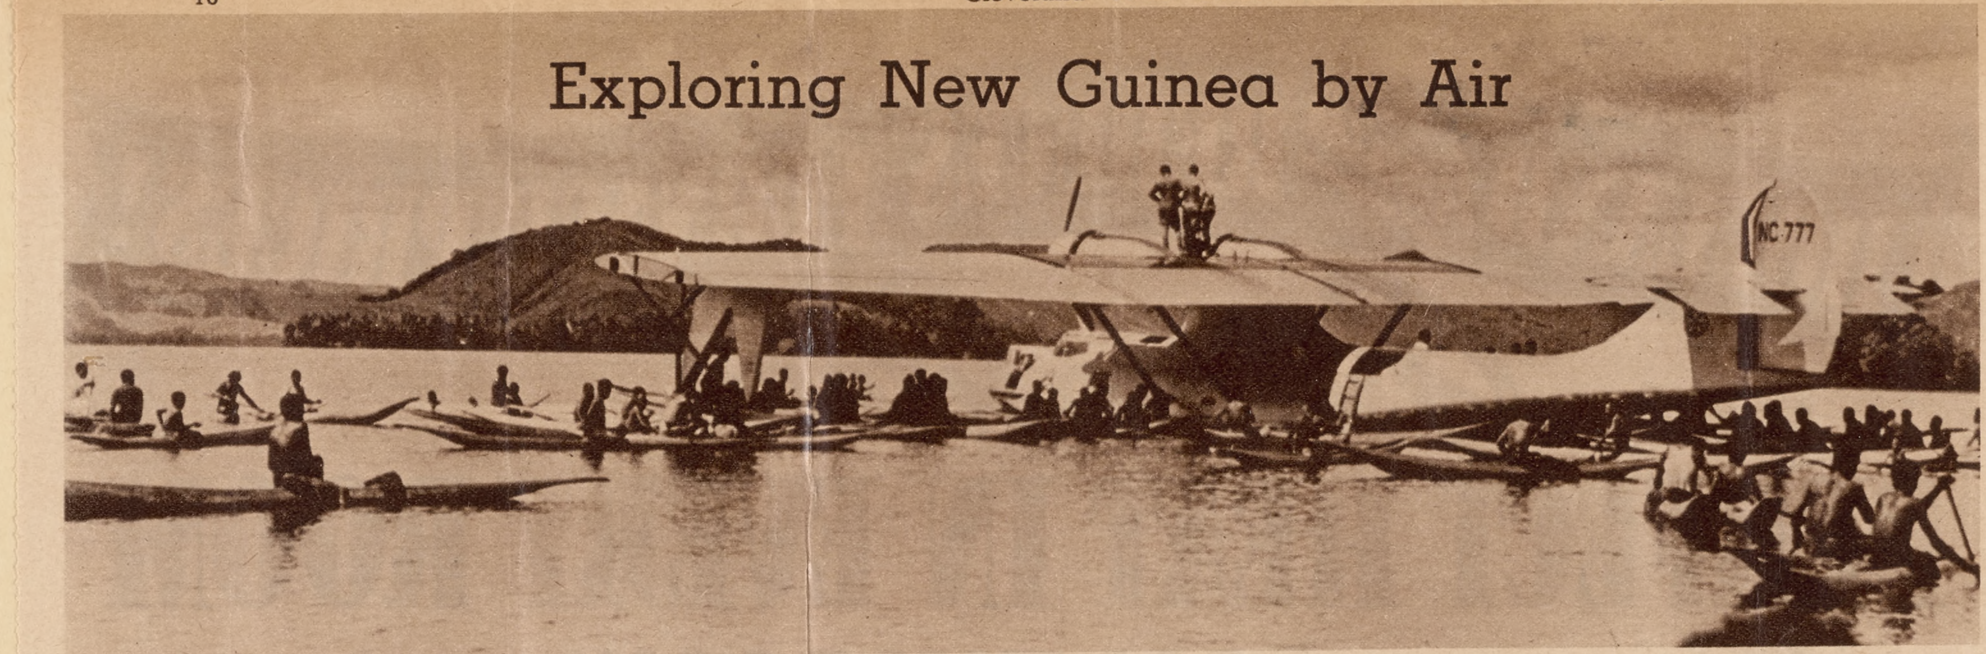
Consolidateds Do It Again

THE LONG, BRILLIANT SERVICE RECORD of the Navy's twin-engined Consolidated patrol-bombers grew brilliantly longer last month as 48 of these big boats made their way to the current "war zone" in the Caribbean.

Led by Capt. Marc A. Mitscher, the formidable four dozen, comprising PB Squadrons 7, 9, 11 and 12 from Fleet Patrol Wing No. 1 lifted off the bay at San Diego just before noon on January 10, then headed southward in what local reporters described as a 120 mile parade. Some twenty-five hours later 45 of the planes were riding quietly at Coco Solo, Canal Zone, 2,500 non-stop miles from their take-off. A few hours after that, three planes of Squadron 7 which had stopped at the Gulf of Fonseca, presumably for refueling, rejoined their fellows.

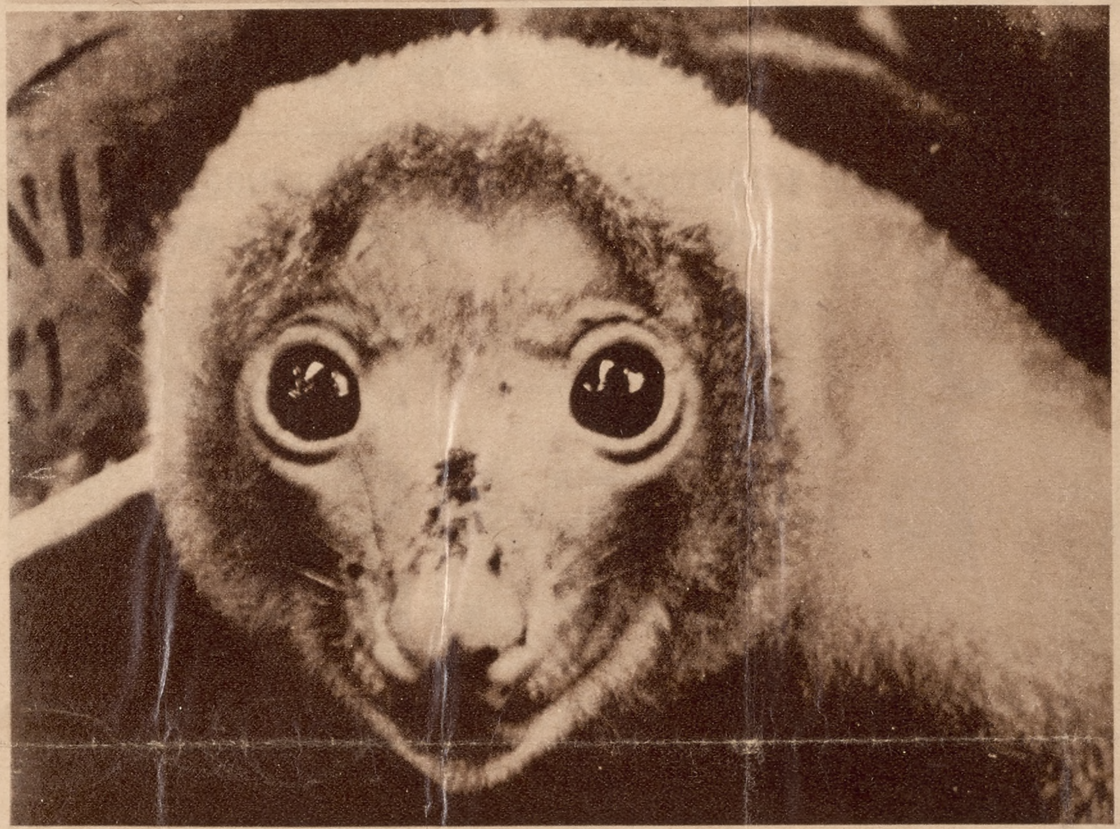
The same day the Consolidated's left San Diego for the Canal Zone, nine Sikorsky Amphibians and eight Grummans headed eastward across our southern border to join fleet forces at Guantanamo, Cuba. All in all, there seems little wrong with the mobility of our naval air arm.

Exploring New Guinea by Air

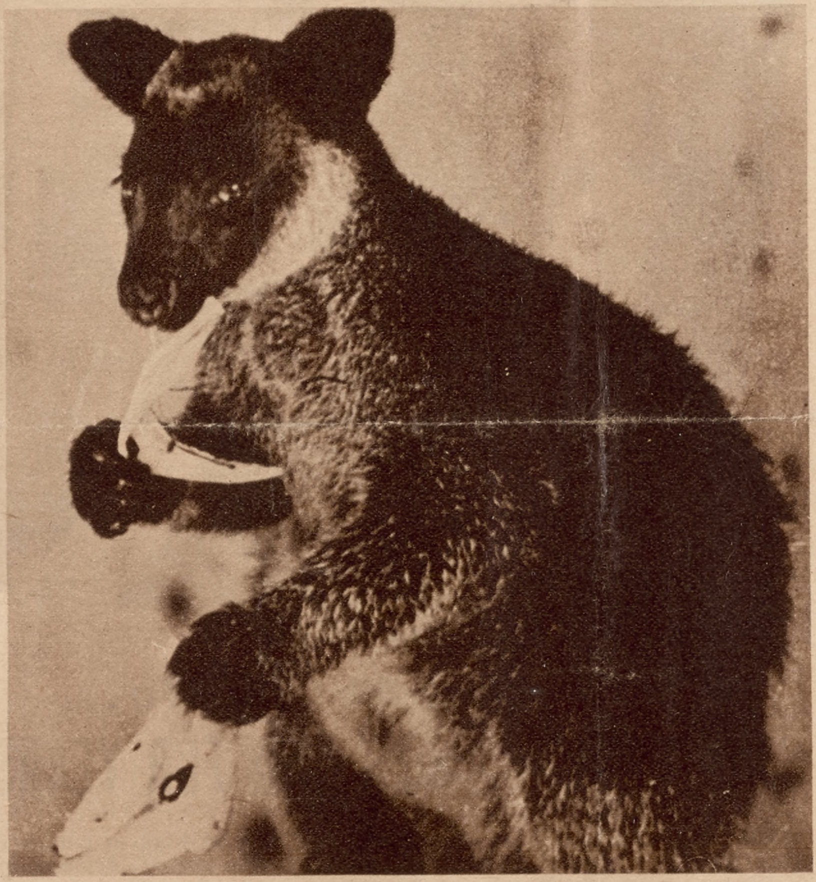


After eleven months of successful exploration for rare specimens of plant, animal and bird life on the island of New Guinea, the American Museum of Natural History Expedition, headed by Mammologist Richard Archbold, recently returned to New York. These pictures, brought back by the party, show some aspects of the work which was carried on from the expedition's fourteen-ton flying boat, the Guba. The plane is seen ABOVE on the waters of Lake Habbema, a two-mile-high body of water in the mountainous region of New Guinea, where the party established an advance camp.

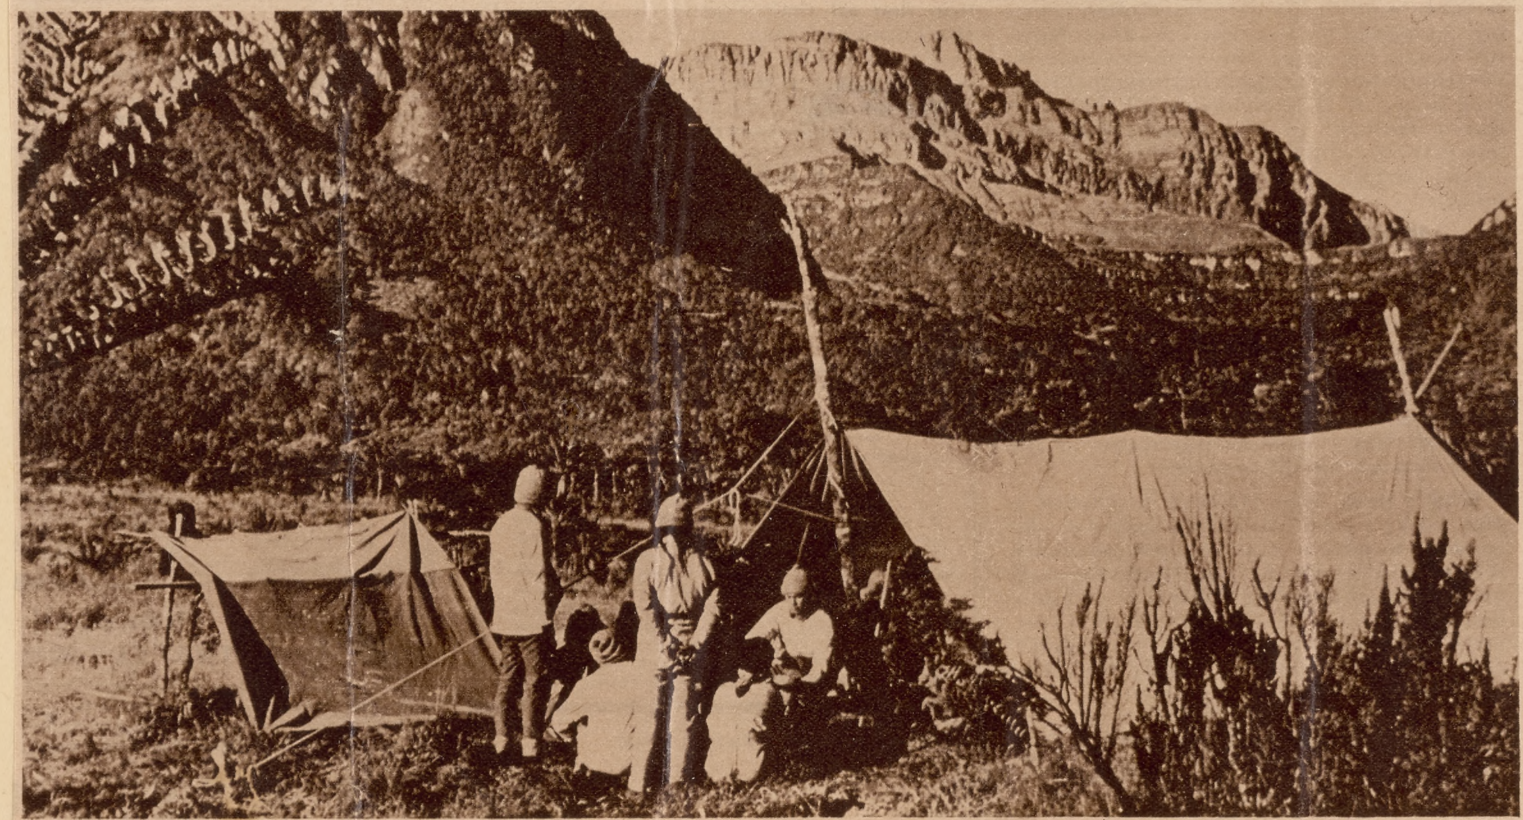
Biological Exploration Photos from Wide World



THIS WIDE-EYED FELLOW is the Cuscus, a night-prowling marsupial related to the opossum.—It was among the many unusual animal specimens obtained for the American Museum of Natural History in New York.



RIGHT: Another prized find of the New Guinea expedition was this tree-climbing kangaroo, shown here eating a banana. These animals, which are about six feet over-all in length, climb trees by pulling themselves up the trunk with their front paws.



MOUNTAIN CAMP of the expedition, where some bird specimens new to science were discovered.—In the background lies Mt. Wilhelmina, 15,560 feet, second loftiest peak on the island.

» **AFTER SITTING IN** at the midsummer Maintenance Meeting (6/12 to 6/14), we spent the rest of the wee going the rounds of plants in the Los Angeles and San Diego areas. We would like to take the opportunity here to thank all those at Douglas, Lockheed, North American, Consolidated, Ryan, and Solar for the courtesies extended to Charlie McReynolds and your editor during that time. We hope

to see you all in the east before too long. How about coming over to see our Fair?

Flyaway Factory

Consolidated makes first trans-Atlantic delivery

Twenty-two years ago, a lot of high-pitched crowing was going on in this country about (1) How many tens of thousands of combat planes the U. S. was about to build and deliver to Europe. (2) How the biggest of these were going to be delivered by flying them across the Atlantic. Cynics on the subject of war-time propaganda as dished out for home consumption may therefore relish the facts that (1) The U. S. has already this year delivered more combat planes to England and France than it did during the entire war period. (2) That just last month the first military aircraft ever to be delivered by air across the Atlantic arrived in England.

Not that the delivery on July 14, of the Royal Air Force's new fifteen-ton Consolidated patrol-bomber was not a brilliant enough feat of airmanship. The crew was no amateur one. Russel Rogers was pilot; Lewis A. Yancey, navigator and relief pilot; Raymond Booth, radio man; and Gerald Brown, engineer. All of them were just returned from the brilliant Archbold round-the-world flight described in another column. First plans were to make the first stop out of San Diego at Botwood, Newfoundland, but the first leg of the trip, which started July 10, was ended at Buffalo after the ship had run into severe headwind conditions while crossing the Middle West. The next day, the big ship pushed on toward Botwood. The day after that with no more fanfare than as if they were ferrying their big Consolidated across San Francisco Bay, Rogers and his crew crossed over to land at Felixstowe, England.

New Contract Won By Ryan Company

Receipt by the Ryan Aeronautical Co. of more than $70,000 in additional manufacturing contracts was announced today by T. Claude Ryan, president.

Among the latest contracts obtained by Ryan is one for approximately $30,000 from the Consolidated Aircraft Corp., builders of huge army and navy multi-motored bombers. This order calls for the production of several hundred exhaust collector rings, one of the specialty aircraft products which Ryan produces on contract for other plane manufacturers.

Other recent orders closed by Ryan for aircraft parts and equipment are with the Douglas Aircraft Co., Lockheed Aircraft Corp. and the United States army air corps. In addition to a recent $100,000 order from the army for primary training planes, Ryan now is working on manufacturing contracts for the air corps, which include exhaust collector rings and a drop-hammer.

Work in progress represents a value of nearly $300,000 and backlog of uncompleted contracts as of the first of the month equaled approximately $750,000, the highest in the company's history.

On the first of July the company moved into its modern new $150,000 factory, which more than doubled the manufacturing floor space. Production output, though temporarily hampered slightly during the period of moving, has now climbed to approximately twice the former production volume.

Aeronautics

Receipt of a contract for approximately $30,000 from their "next door neighbors," the Consolidated Aircraft Corp. was announced today by officials of the Ryan Aeronoutical Co.

The contract order calls for the production of several hundred exhaust collector rings, one of the specialty aircraft products which Ryan produces for other plane manufacturers, President T. Claude Ryan said.

Other recent orders closed by Ryan have been with the Douglas Aircraft Co., the Lockheed Aircraft Corp., and the U. S. Army Air Corps. Work now in progress represents a value of nearly $300,000, with approximately $750,000 of contracts yet to be completed, it was said.

Production output, slightly hampered during the company's moving into its new $150,000 factory in July, now has climbed to twice its former level, Mr. Ryan said.

CHEST TO SEEK AID IN COUNTY COMMUNITIES

New Division For Campaign Will Be Organized Tonight

Sun 8-29-30

Community Chest

A county communities division of the Community Chest campaign for funds will be organized at a meeting tonight at 6:30 in the U. S. Grant hotel, with Arthur M. Shoven, president, as chairman of this unit.

In the year's appeal for funds for support of 35 agencies serving in welfare, relief and character-building fields, a goal of $216,553 has been set. Campaign dates are from Sept. 28 to Oct. 14.

SYSTEM OUTLINED

The campaign organization committee, with a membership of upward of 40, met late yesterday when details of the "unit account" system, basic feature of the coming appeal, were outlined. Each member of this committee will form a sub-committee which will direct the solicitation of funds in business and industrial establishments.

Members of the main committee and the groups they are to form will hold a joint meeting a week from tomorrow in the board room of San Diego Trust & Savings Bank.

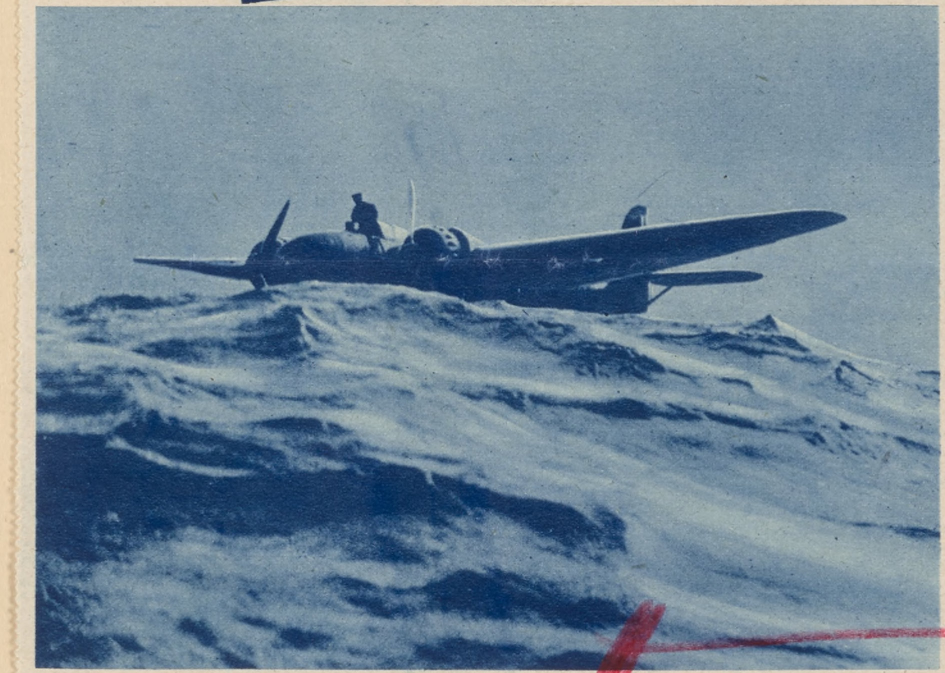
COMMITTEEMEN

Comprising the campaign organization committee, of which J. O. Miller is general chairman, were Thomas Hamilton, E. B. Gould Jr., Ewart W. Goodwin, Edgar N. Gott, S. M. Sullivan, Harry E. Callaway, David N. Millan, W. D. Rudd, Neil Nettleship, Alan Klauber, John L. Fox, Marston Burnham, Frank J. Guasti, George N. Lynch, Carleton Lichty, Verne Sutherland, Charles B. Wincote, Robert Frazee, Korley H. Golden, Emery D. Sherwin, Fred Annable, Douglas Young, Wilbur Thomas, Mrs. Frank E. Marcy, Mrs. E. T. Hale, Mifflin Ward, Dan S. Kuqkendall, E. Robert Anderson, Sam Claggett, J. B. McLees, D. M. Hammond and F. A. Rhodes.

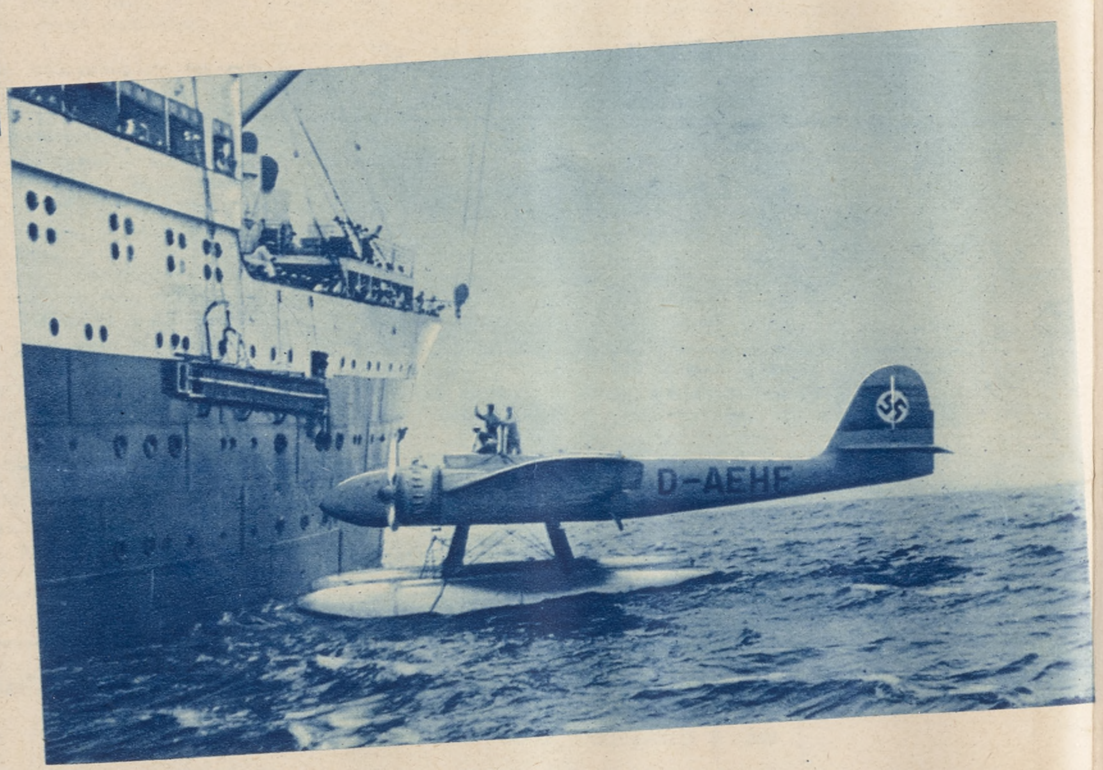
L'ACTU

A la date du 5 mai, l'ensemble des 3 hydravions quadrimoteurs Blohm & Voss Ha 139 et HA 139 B, de la Lufthansa a totalisé 50 traversées transatlantiques. On voit, ici, une photographie d'un des bateaux relais, l' « Oostmark », prise en vol d'un de ces hydravions.

Une grande curiosité a été éveillée, ces temps derniers, par une tentative de record de distance accomplie en direction de l'Amérique du Sud par un hydravion allemand. Nous avons la bonne fortune de pouvoir publier, à ce sujet, quelques photographies. La tentative a été faite par un ← hydravion Heinkel He 115 à deux moteurs BMW. Au départ l'appareil pesait 15 tonnes.



L'appareil, parti de la Baltique, en face de Rostock, a dû se poser en mer, après avoir survolé les îles du Cap Vert, par suite d'une avarie survenue à un des moteurs. On voit, ici, l'hydravion posé par grosse mer.



Peu avant de devoir interrompre son vol, l'équipage avait aperçu le vapeur « Monte Pascoal ». Celui-ci fut alerté au moment de l'amérissage et se porta aussitôt au secours de l'hydravion qu'il réussit à prendre à son bord.

F. R. WATCHES U. S. AIRCRAFT

Plane Production In America Speeded

Sun 8-31-39

Aviation

By United Press

WASHINGTON, Aug. 31.—High ranking officials have advised President Roosevelt, who is closely scrutinizing the status of the national defense program because of the European crisis, that present production of military aircraft can be accelerated two and one-half times if an emergency arises in the near future, it was disclosed today.

The report was given to the chief executive by Assistant Secretary of War Louis Johnson during a series of White House conferences in which Acting Secretary of the Navy Charles Edison, Admiral Harold R. Stark, chief of the naval operations, and other top defense officials participated.

PROCEED SMOOTHLY

The President was informed it was reported that both Army and Navy aviation programs, embracing the nation's greatest aircraft construction effort, are proceeding "smoothly." The Army has already let the bulk of its $170,000,000 worth of authorized contracts designed to raise its present strength of 2,000 planes to 5,500 by July 1, 1946. The Navy, with slightly fewer planes than the Army, is building more gradually to a goal of not less than 3,000 planes.

Mr. Johnson is understood to have based his report on a series of conferences with leading manufacturers, data available in the Army Air Corps, and on first hand information obtained during a recent inspection trip to the west coast, where most military aircraft factories are located.

NEED PLANES

Under the Air Corps expansion program, the Army will need 3,500 planes to reach its goal within the next 23 months or an average of slightly more than 150 monthly. In addition, it will nave to replace a considerable number, which become obsolete or damaged.

Officials refused, however, to give out definite production schedules on the grounds that it is "confidential" data.

Much of the new Army program is being constructed by the Glenn L. Martin Co., Baltimore, Md.; North American Aviation, Inc., Inglewood, Calif.; **Consolidated Aircraft Corp., San Diego, Calif.**; Boeing Aircraft Co., Seattle, Wash.; Boeing Airplane Co., Stearman division, Wichita, Kans.; Lockheed Aircraft Corp., Burbank, Calif., and Vultee Aircraft division, Aviation Manufacturing Corp., Downey, Calif., and several other concerns.

GIANT U.S. BOMBERS

Released For Britain

GIANT United States bombers, with a range of at least 3,000 miles when fully loaded, have been released to Britain, it was announced by General George C. Marshall, U.S. Chief of Staff, in Washington.

The machines are under construction at the works of the Consolidated Aircraft Corporation. Three are due to be delivered this month, three will be ready in December, while another 20 will be completed before March.

The Consolidated machines are similar to the "Flying Fortresses," are equipped with Pratt and Whitney engines, and were being built for the United States Air Force.

General Marshall said that the planes to be released were equipped with the Sperry bombsight, recently released to Britain.

ENGINES IN EXCHANGE

In exchange for getting priority for these Consolidated bombers, Britain had released to the United States sufficient engines to equip 41 "Flying Fortresses," of which delivery to the United States Army was due before the end of the year.

Meanwhile, the general added, negotiations are continuing for the release to Britain of 20 of the latest type of "Flying Fortresses," fully-equipped except for the secret bombsight. Any of these machines released to Britain would be equipped with the Sperry bombsight, the same as the Consolidated bombers.

General Marshall pointed out that no comparable plane had ever been used in active operations, therefore the United States was anxious to see the results.

United States air officers, acting as observers, actually fly in British machines during air battles over England, the general said.

BASES IN USE

While General Marshall was making this announcement, Colonel Frank Knox, Secretary for the U.S. Navy, stated that the United States Navy was already using some of the bases leased from Britain as stations for the Atlantic patrol.

Planes of United States Navy were using the bases, and were working from Bermuda, St. Lucia, and probably from Newfoundland, and warships were maintaining an active patrol at Martinique.

—British United Press.

SIX KILLED IN NAVY BOMBER CRASH

S. D. TO FILL PLANE ORDERS

Neutrality Not In Way Of $18,000,000 Back Log

Sun 9-7-39

Aviation

President Roosevelt's neutrality proclamation will not stand in the way of San Diego's aircraft industry fulfilling an $18,000,000 backlog of orders.

This was learned by Chamber of Commerce officials after a survey of this city's three major aircraft firms.

Consolidated Aircraft Corporation's $17,000,000 backlog of orders are all for United States Army and Navy and for American firms and individuals, chamber officials said. No portion of the orders are for belligerent nations named by the President in his neutrality measure.

Ryan Aircraft Corporation's $750,000 in orders and its recently acquired order of $200,000 from the Army likewise will not be affected by the legislation. Solar Aircraft Co., builders of airplane parts, has a backlog of more than $500,000, but none of the orders are from nations termed "belligerent" in President Roosevelt's proclamation.

The tense international situation is expected to speed up work in filling the huge orders for this government, aviation officials indicated.

WHERE SIX FELL TO THEIR DEATHS . . . Here is the twisted, smoking wreckage of a Consolidated seaplane which crashed last night at the Chollas Heights radio station. In the background fire still rages several hours after the plane exploded, cremating six Navy fliers. A naval board of inquiry blamed a low ceiling for the tragedy.

* * *

Radio Wires Believed Cause In San Diego Bomber Crash

Six Bodies Recovered From Wreck Of Consolidated Sea Plane

A Navy board of inquiry today learned that six fliers killed in the flaming crash of a giant patrol bomber near the Chollas Heights naval radio station probably fell to their doom when trapped over a layer of fog that blotted out vision of a radio tower and antenna rising 1100 feet above sea level.

The Consolidated seaplane, which smashed into the Chollas Heights radio antenna at 9:15 last night, fluttered a half mile farther, then plunged into the brush and exploded.

Flames leaped high into the air, brilliantly lighting the night sky, and attracting hundreds to the wreckage and blocked fire-fighting apparatus of the city and the Navy.

Killed were:

Lieut. A. H. Irons, 817 B-st, Coronado, survived by his widow and two children.

Ensign L. W. Latremore, 966 F-st, Coronado, survived by his widow.

Frank Vukovich, 31, chief aviation machinist's mate 3c, survived by his widow and three children.

V. E. Morris, 24, aviation ordinance man, 3970 Goldfinch-st, survived by his widow.

H. G. Berry, radioman 3c, 2044 Columbia-st, survived by his widow.

H. O. Wilson, aviation machinist's mate (3c), unmarried.

Death was belived to have been instantaneous. It was several

SIX KILLED IN PLANE CRASH

Airboat Strikes Wires Of Radio Towers

Sun 9-8-39

(Continued from Page 1)

hours before the pyre cooled sufficiently for salvage crews to remove the charred remains.

An official Navy announcement, as the board of inquiry convened, stated that the bomber, one of a group of six of Patrol Squadron 12 on a routine night training flight, was believed to have crashed while attempting to cut through the overcast. The ceiling over the bay last night was only 700 feet, while the Chollas Heights tower, situated at a 500-foot level rises another 600 feet.

The pilots, Lieut. Irons and Ensign Latremore, apparently anticipated landing in the harbor after descending through the fog, as the wing tip floats had been lowered. That they never saw the antenna which brought their doom was almost certain.

The other five planes of the group returned to their North Island base safely.

Funeral arrangements were being made at Bonham Bros. Mortuary today.

The accident brought the year's Navy aviation fatality list in the San Diego area to a total of 16 in seven crashes. It was the first fatal mishap in San Diego to a PBY bomber since Aug. 15, 1938, when two airboats made crash night landings near the Destroyer Base, resulting in six deaths.

S. D. Plane Hits Chollas Radio Antenna

Wreckage Burns 2 Hours; Thousands Rush to Scene

Six navy flyers were killed last night when their Consolidated patrol seaplane tore into the antenna at the Chollas Heights long-range navy radio station then crashed in the brush 3000 feet west of the radio towers and burst into flames.

Firemen and navy crews fought the fire more than two hours before it was controlled, the position of the plane making it difficult to bring fire-fighting equipment to the scene.

The dead are:

LT. A. H. IRONS, pilot, El Cordova hotel, Coronado.

ENS. L. W. LATREMORE, 966 F st., Coronado.

FRANK VUKOVICH, chief aviation machinist's mate, Coronado.

H. O. WILSON, aviation machinist's mate, third class, naval air station.

V. E. NORRIS, aviation ordnance man and naval air pilot, San Diego.

H. G. BERRY, radioman third class, San Diego.

AUTOS JAM ROADS

Thousands of San Diegans rushed to the scene as the pillar of flame lighted up the plateau where the plane crashed a mile east of Radio rd. and three-fourth of a mile south of University ave. They jammed roads with their automobiles and delayed attempts of the fire department and navy rescue crews to reach the blazing plane.

An eye witness account of the crash was given by Mr. and Mrs. Sidney Diday, 429 Sixteenth st., who were sitting in an automobile at the radio station at the time of the crash.

"As the plane flew over our heads we saw the pilot was in trouble and about to crash into the antenna," said Diday. "One of the motors was sputtering and then both engines became quiet and the plane tipped to the right to avoid the wires (of the radio station). The tip of the wing hit the wires, then the plane crashed with a roar and immediately exploded, sending clouds of smoke into the air. We could not see any landing lights on when the plane approached the wires."

A city fireman reported there was a cloud over the radio station when he arrived and thought it possible the pilot did not see the antenna.

EAST S. D. HEARS BLAST

The explosion was heard throughout East San Diego.

The plane was one of a flight of six planes engaged in regular night flying operations. The other five returned safely.

Three engine companies of the San Diego fire department responded to an alarm turned in at 9:24 p.m. They were hampered by a traffic jam on the road and were unable to approach nearer than several thousand feet.

Firemen made their way to the blazing plane with portable extin-

Consolidating a Reputation

CONSOLIDATED FLYING-BOATS, built by the Consolidated Aircraft Corp., Lindbergh Field, San Diego, California, U.S.A., have made two outstanding long-range flights recently. The first, by the *Guba*, was the survey crossing of the Indian Ocean, along the Imperial Reserve Route, from Australia to Africa, managed by Capt. Bill Taylor, and on across the Atlantic to California. The second was the delivery flight from San Diego to Felixstowe of the Consolidated 28-5 for the British Air Ministry. Both were reported in THE AEROPLANE at the time. The crew of the *Guba*, Russel Rogers, Lewis Yancey, Ray Booth, and Gerald Brown, also delivered the Model 28-5 flying-boat to the R.A.F. in England.

Recently we had an interesting lunch with Mr. Booth and Mr. Brown, who were brought along by Mr. John Millar, of Aviation Corporates Ltd., the British agents for Consolidated.

The Americans were loud in their praises of the great time they had had at Felixstowe where they have been turning the Service boat over to the Marine and Experimental Establishment. At the moment it has been stripped down for detailed examination by R.A.F. technical officers.—We shall be interested to learn how it flies afterwards.

Although the original intention on the British delivery flight was to fly from San Diego to Felixstowe with one stop at Botwood, Newfoundland, Messrs. Booth and Brown told us that, unfortunately, they encountered average head winds of between 30 and 40 m.p.h. on the first part of the trip. So, although they had enough fuel to take them to Botwood without any reserve, they decided to alight at Buffalo, because Botwood might be fogged in and they would have no extra fuel for cruising around.

The strong head winds brought down their average speed to Buffalo to only about 124 m.p.h. They followed the T.W.A. route across the American Continent to Chicago. On that day, July 10, the average time of the Eastbound commercial transports was 125 m.p.h. against the wind, and that of the Westbound transports somewhere about 222 m.p.h.—nothing to cause undue excitement.

For the flight from Botwood to Felixstowe the boat averaged 169 m.p.h. for the 2,460 statute miles. They arrived over Felixstowe in the dark, so they cruised around until daylight. For the whole flight the Pratt and Whitney Twin Wasps used only 995 gals. of fuel. Nearly 500 gals. were left when the boat alighted. In fact, this fuel was used for test flights by R.A.F. officers during the next two days. Only the plugs were changed before the boat was flown after its Atlantic crossing.

The clean appearance of the nacelles and wings after the crossing was particularly commented on at Felixstowe. One particularly inane Pressman suggested that the crew must have swabbed down the wings and nacelles before they alighted.

The Consolidated 28 supplied to the R.A.F. takes off and cruises on 100 octane fuel, which probably accounts for the very low consumptions. The *Guba* was operated on 87 octane fuel.

The Atlantic was crossed at about 13,500 ft. Mr. Booth was in constant radio-telephonic communication with stations on both sides of the Atlantic through the Bendix equipment.

Botwood seems to be getting quite an amount of traffic these days. At the same time as the Consolidated boat arrived from Buffalo a Boeing Clipper arrived from England. They alighted within a few minutes of each other. The remark in *Punch* that there is no danger in flying the Atlantic nowadays, except from collisions, is silly but quite funny.

Mr. Brown said that the retraction of the wing-tip floats increases the speed by about 18 or 20 m.p.h. and decreases the length of the take-off considerably. Also it improves the handleability of the boat slightly. Retraction is done electrically, and there is an emergency hand-operating gear.

Both Mr. Brown and Mr. Booth agreed with the statement which has been made in this paper any time in the past ten or twelve years namely that the wing-tip floats of big high speed flying-boats nowadays must be retractable. And both were convinced that after the Royal Air Force have done a bit of flying in the Model 28 they will be converted too.

They also told us something of the flight of the *Guba*. This boat was flown from San Diego to Netherlands New Guinea for archæological and survey work by the Archbold Expedition sponsored by the American Museum of Natural History. During its time in New Guinea the *Guba* carried a total of 450,000 lb. (about 200 tons) of freight from the coast up to Lake Habbema, 11,500 ft. above sea level.

This involved repeated alightings and take-offs from the lake at that height. We have never before heard of a flying-boat operated in such conditions. From New Guinea the *Guba* was flown to Australia and then was the first aeroplane to cross the Indian Ocean from Australia to Africa. It was also the first flying-boat to cross Africa,—which it did from Mombasa to Lagos, after which it went on to Dakar.

From Dakar the *Guba* was flown non-stop across the Atlantic to St. Thomas in the Virgin Islands, 3,300 statute miles in 19 hours 33 minutes. Actually the boat remained in the air for 22 hours because of darkness. When it alighted it still had fuel for another 10½ hours.

All across the South Atlantic there were very favourable trade winds. At times the motors were throttled to the minimum needed to keep in the air. From St. Thomas the boat was flown to Miami and on to San Diego.

Thus the *Guba* was the first aeroplane and the first flying-boat to be flown round the World near its greatest diameter. Also from Dakar to St. Thomas was the longest non-stop over-water flight by any flying-boat.

After being in the Tropics for about a year, and although there were only two mechanics with the Expedition and practically no arrangements for maintenance, the boat was in extraordinarily good condition. Hardly any repairs were necessary compared with what would be expected for an aeroplane which had flown for more than 1,000 hours, mostly in the Tropics.

The original coat of paint was still in good condition and the only refinishing done on the trip was one coat of black bituminous paint below the water line. There was practically no corrosion. During the year the boat has done 750 hours flying and has been out in the open all the time.

One lesson to be learned is that flying-boats can be stationed in out-of-the-way tropical places for long periods with only a small personnel for maintenance,—as the R.A.F. found years ago with their Short and Vickers boats.

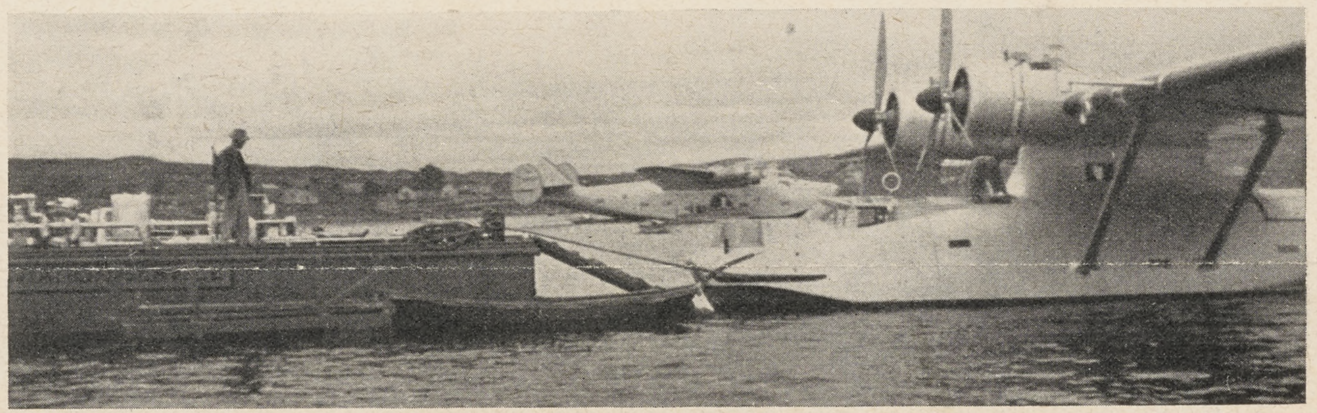
An interesting point is that complete overhauls on Consolidated boats are necessary only once every 44 months. Before these boats came into service the overhaul periods were 12 to 14 months. A strip-down of a Consolidated boat after 3½ years of service showed that complete overhaul was unnecessary, only minor repairs had to be made and there was very little corrosion.

The normal gross loaded weight of the type is 27,000 lb. Tests were made at a loaded weight of 30,500 lb. for the U.S. Department of Commerce for the licencing of the Commercial boat for American Export Airlines. The *Guba* was on occasion overloaded up to 35,000 lb., a 30% overload.

The makers do not advise open sea or rough water operation at a weight of more than 27,000 lb. Accelerometer readings in rough water tests have been as high as 8 or 10, which shows what a pounding a boat can get.

Both Mr. Booth and Mr. Brown had flown in the Consolidated Model 31 flying-boat (two 2,000 h.p. Wright Duplex Cyclones) and confirmed all the rumours of extraordinary performance which we have published about that boat.

Certainly the new Consolidated Model 31 is among the World's best aeroplanes. It contains the accumulated experience gained by the building of more than 200 PBYs for the U.S. Navy. The progress of the smaller Consolidated 28-5 in this country will be most interesting to watch.



TRANS-ATLANTIC TRAFFIC.—In the foreground the Consolidated model 28-5 flying-boat (two 1,200 h.p. Pratt and Whitney Twin Wasps) refuelling at Botwood, Newfoundland, before being flown across the Atlantic for delivery to the R.A.F.,—the first time a military aeroplane has been delivered by air from America. The Pan American Airways Boeing "Yankee Clipper," en route to New York from England, is in the background.

AIR FLAGSHIP BACK IN S. D.

Rear Admiral Ends Alaska Inspection

Aviation

The four-motored "flying flagship" of Rear Adm. Arthur B. Cook, Aircraft Scouting Force commander, today was back at its San Diego base after a tour of patrol plane facilities in the Alaska-Aleutian Islands area.

Piloted by Comdr. Andrew Crinkley, the 25-ton Consolidated bomber yesterday flew with a nine man crew from Sitka, Alaska, to San Francisco, then to San Diego on a spectacular 1900-mile flight.

Meanwhile, the surface flagship of Rear Adm. Cook, the light cruiser Memphis, was scheduled to leave Kodiak for Dutch Harbor today in a continuation of the officers' inspection of Navy air bases in the far north.

MEMPHIS GOING

The Memphis will depart Monday from Dutch Harbor for Hawaii, where the Navy's greatest concentration of long-range patrol bombers is based.

Due home this week from Mare Island Navy Yard after several weeks' overhaul are the destroyers Aylwin and Dale of Division Two, which has been reported slated for transfer, probably in October, to the Asiatic Fleet as replacements for older vessels. The two craft will anchor in San Diego Saturday. A third destroyer, the 1850-ton USS Phelps, will arrive from Mare Island Sept. 15.

OTHER ARRIVALS

Other arrivals from Mare Island this month will be the destroyers Henley, Helm, Craven and Fanning, on Sept. 20. Destroyer Division 28—the Southard, Chandler, Hovey and Long—will proceed to Mare Island for overhaul Sept. 18, and the aircraft carrier Yorktown will go to Puget Sound Navy Yard Sept. 20 for its first overhaul since coming to the west coast with the Fleet last May to begin permanent duty in San Diego.

Union 9-7-39

S. D. Aircraft Output Escapes Neutrality Ban

In sharp contrast to Los Angeles, where aircraft factories are affected deeply by the President's proclamation putting an embargo on delivery of planes and accessories to European belligerents, San Diego's aircraft industry is not affected by the neutrality measures.

Work is going on as usual here on the $18,000,000 backlog of orders for airplanes and accessories while in Los Angeles millions of dollars in orders from France and Great Britain cannot be filled under the neutrality proclamation.

Aviation leaders, speaking informally, indicated belief that instead of slowing down, aircraft work here would tend to speed up to fill U. S. government orders in view of the tense international situation.

Of the $17,000,000 backlog now awaiting fulfillment by Consolidated Aircraft Corp., no portion is for export to any of the belligerent nations named in the proclamation, chamber of commerce officials declared. They said all unfilled Consolidated orders are for the United States army and navy and for American firms and individuals.

Ryan Aircraft Corp., possessing a backlog of more than $750,000 and a new order of nearly $200,000 from the army, likewise is unaffected by the President's neutrality measure. Solar Aircraft Co., builders of airplane parts, has a backlog of more than $500,000 but none of the orders are from nations named in the proclamation.

---

6 S. D. Fliers Killed in Crash

Union 9-8-39

(Continued from Page 1)

guishers but were unable to cope with the flames.

Eddie McLarney, fire department battalion chief, fought his way with firemen close to the plane and said he saw five bodies jammed in the forward part of the still smoking ruins. He said it was possible the other was under wrecked parts of the craft. McLarney said the bodies were burned beyond recognition.

BODIES TAKEN OUT

The navy rushed special equipment to fight gasoline fires and late last night sought to cool the wreckage to permit removal of the bodies. On removal they were taken to Bonham's mortuary.

There was a report that the wing tip of the plane was torn off when it struck the radio station wires and was found several hundred feet from the foot of one of the great radio towers which project several hundred feet into the air.

The Chollas Heights radio station refused to answer questions about damage to the station, which transmits messages to navy outposts all over the world.

SIX KILLED IN NAVY BOMBER CRASH

S. D. TO FILL PLANE ORDERS

Neutrality Not In Way Of $18,000,000 Back Log

Sun 9-7-39

Aviation

President Roosevelt's neutrality proclamation will not stand in the way of San Diego's aircraft industry fulfilling an $18,000,000 backlog of orders.

This was learned by Chamber of Commerce officials after a survey of this city's three major aircraft firms.

Consolidated Aircraft Corporation's $17,000,000 backlog of orders are all for United States Army and Navy and for American firms and individuals, chamber officials said. No portion of the orders are for belligerent nations named by the President in his neutrality measure.

Ryan Aircraft Corporation's $750,000 in orders and its recently acquired order of $200,000 from the Army likewise will not be affected by the legislation. Solar Aircraft Co., builders of airplane parts, has a backlog of more than $500,000, but none of the orders are from nations termed "belligerent" in President Roosevelt's proclamation.

The tense international situation is expected to speed up work in filling the huge orders for this government, aviation officials indicated.

SIX KILLED IN PLANE CRASH

Airboat Strikes Wires Of Radio Towers

Sun 9-8-39

(Continued from Page 1)

hours before the pyre cooled sufficiently for salvage crews to remove the charred remains.

An official Navy announcement, as the board of inquiry convened, stated that the bomber, one of a group of six of Patrol Squadron 12 on a routine night training flight, was believed to have crashed while attempting to cut through the overcast. The ceiling over the bay last night was only 700 feet, while the Chollas Heights tower, situated at a 500-foot level rises another 600 feet.

The pilots, Lieut. Irons and Ensign Latremore, apparently anticipated landing in the harbor after descending through the fog, as the wing tip floats had been lowered. That they never saw the antenna which brought their doom was almost certain.

The other five planes of the group returned to their North Island base safely.

Funeral arrangements were being made at Bonham Bros. Mortuary today.

The accident brought the year's Navy aviation fatality list in the San Diego area to a total of 16 in seven crashes. It was the first fatal mishap in San Diego to a PBY bomber since Aug. 15, 1938, when two airboats made crash night landings near the Destroyer Base, resulting in six deaths.

S. D. Plane Hits Chollas Radio Antenna

Wreckage Burns 2 Hours; Thousands Rush to Scene

Six navy flyers were killed last night when their Consolidated patrol seaplane tore into the antenna at the Chollas Heights long-range navy radio station then crashed in the brush 3000 feet west of the radio towers and burst into flames.

Firemen and navy crews fought the fire more than two hours before it was controlled, the position of the plane making it difficult to bring fire-fighting equipment to the scene.

The dead are:

LT. A. H. IRONS, pilot, El Cordova hotel, Coronado.

ENS. L. W. LATREMORE, 966 F st., Coronado.

FRANK VUKOVICH, chief aviation machinist's mate, Coronado.

H. O. WILSON, aviation machinist's mate, third class, naval air station.

V. E. NORRIS, aviation ordnance man and naval air pilot, San Diego.

H. G. BERRY, radioman third class, San Diego.

AUTOS JAM ROADS

Thousands of San Diegans rushed to the scene as the pillar of flame lighted up the plateau where the plane crashed a mile east of Radio rd. and three-fourth of a mile south of University ave. They jammed roads with their automobiles and delayed attempts of the fire department and navy rescue crews to reach the blazing plane.

An eye witness account of the crash was given by Mr. and Mrs. Sidney Diday, 429 Sixteenth st., who were sitting in an automobile at the radio station at the time of the crash.

"As the plane flew over our heads we saw the pilot was in trouble and about to crash into the antenna," said Diday. "One of the motors was sputtering and then both engines became quiet and the plane tipped to the right to avoid the wires (of the radio station). The tip of the wing hit the wires, then the plane crashed with a roar and immediately exploded, sending clouds of smoke into the air. We could not see any landing lights on when the plane approached the wires."

A city fireman reported there was a cloud over the radio station when he arrived and thought it possible the pilot did not see the antenna.

EAST S. D. HEARS BLAST

The explosion was heard throughout East San Diego.

The plane was one of a flight of six planes engaged in regular night flying operations. The other five returned safely.

Three engine companies of the San Diego fire department responded to an alarm turned in at 9:24 p.m. They were hampered by a traffic jam on the road and were unable to approach nearer than several thousand feet.

Firemen made their way to the blazing plane with portable extin-

ON THE IMPERIAL RESERVE ROUTE.—The Cocos Island Reef and its lagoon, the main island is in the right-hand bottom corner. This is probably the first air picture to be published of Cocos Island,—and few photographs of any group of atolls have been seen.

Wings over the North Sea

CAPTAIN NORMAN MACMILLAN had a beautiful story in the *Daily Mail* on July 26 headed " Germans Fly Over the East Coast." He tells us that " a keen watch is being kept by the R.A.F. on the East Coast areas following the appearance of German military aircraft close to British shores on a number of occasions during the past few weeks. These machines have been engaged either on specific exercises or normal routine training flights."

That is all very probable. German machines from Jutland and the islands round about Sylt cruising over the North Sea are almost bound to get over the British or Scottish coast somewhere or another, just as our navigation pupils aiming, with the best of good will, from Manston to Edinburgh occasionally find themselves over Holland and Belgium.

Also there is the possibility that enthusiastic young air scouts in high-speed machines may have mistaken German Junkers or Condor air liners for German bombers. Certainly the Condor at high cruising speed would take some catching and seeing.

Capt. Macmillan very rightly says that there can be no connection between these German flights over British territory and the long-distance flights of the R.A.F. over France, because the German military machines were seen over British territory before the British training flights to France began.

Young navigators on training flights cannot well help trespassing over foreign territory at times. Look at the number of people from French training schools in foreign aeroplanes who landed in Red Spain and stayed there

The London Airports Committee

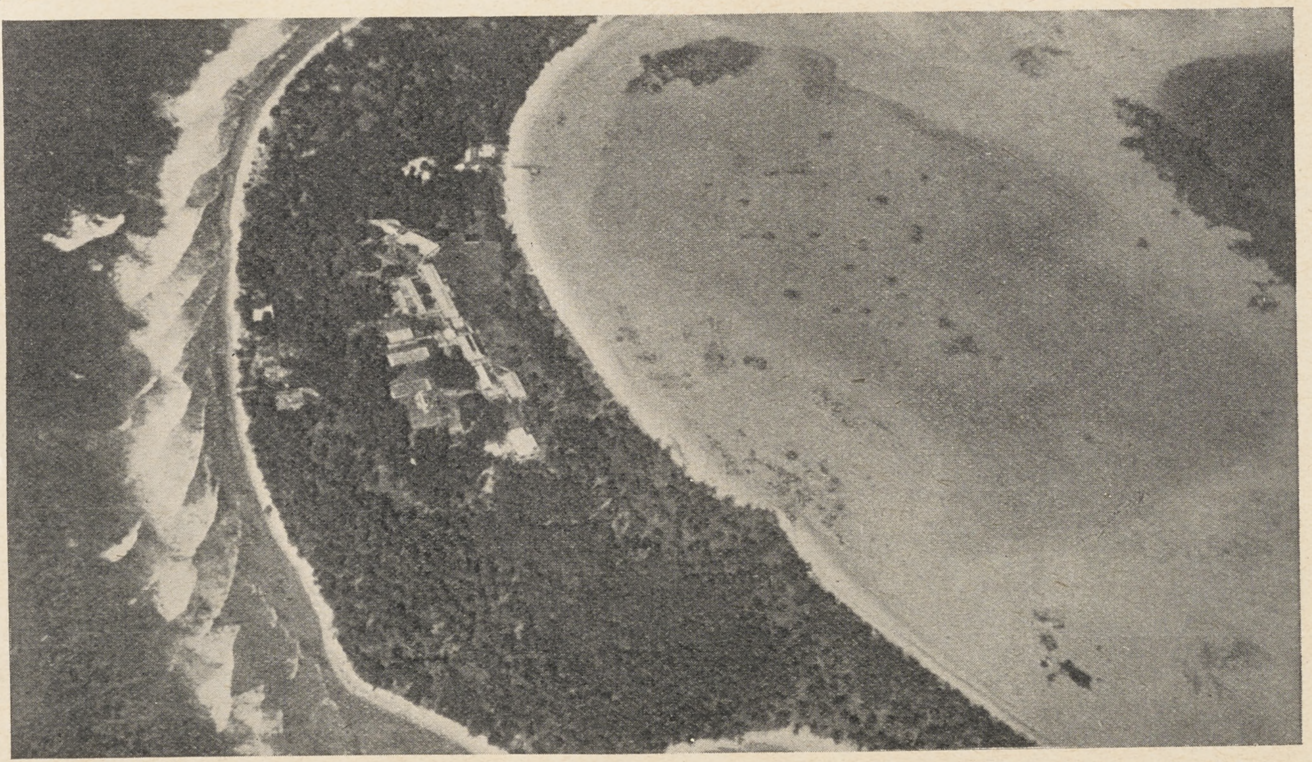
REAR ADMIRAL SIR MURRAY SUETER (Con. Hertford) asked the Secretary of State for Air in Parliament on July 25 whether he could make any statement about the proposed London Airport Committee.

SIR KINGSLEY WOOD, Secretary of State for Air, said that a London Civil Airports Joint Committee had been appointed representative of the Air Ministry and the Corporation of London, the two parties which own terminal airports in the London Area.

The Chairman will be the Parliamentary Under-Secretary of State for Air, and each of the parties will appoint three members.

The duties of the Committee are: 1. To make proposals to the Secretary for Air and the Corporation of London for the pooling of receipts from all the airports. 2. To consider plans for distributing traffic among them and advising the Secretary of State thereon. 3. To consider general matters of terminal airport organization in the London Area.

The Committee at present is constituted as follows: Captain Harold Balfour, Chairman; Lt.-Col. Sir Francis Shelmerdine, Director-General of Civil Aviation; Sir Harold Howitt and Mr. Whitney Straight representing the Secretary of State. Alderman F. Horner, Chairman of the Airport Committee of the Corporation of the City of London, Mr. Sheriff Rowland, and Alderman Colonel Whitaker will represent the Corporation. The Joint Secretaries are the Deputy-Director of Civil Aviation, Mr. Hildred, and the Town Clerk.



ON THE IMPERIAL RESERVE ROUTE:—The main Island, showing the Radio Station, photographed from above by a member of the crew of the flying-boat "Guba," in which Captain Bill Taylor made his survey of the route. The same member of the crew took the picture at the top of this page. The heavy surf from the open ocean on the left is an interesting contrast with the calm transparent water in the lagoon on the right.

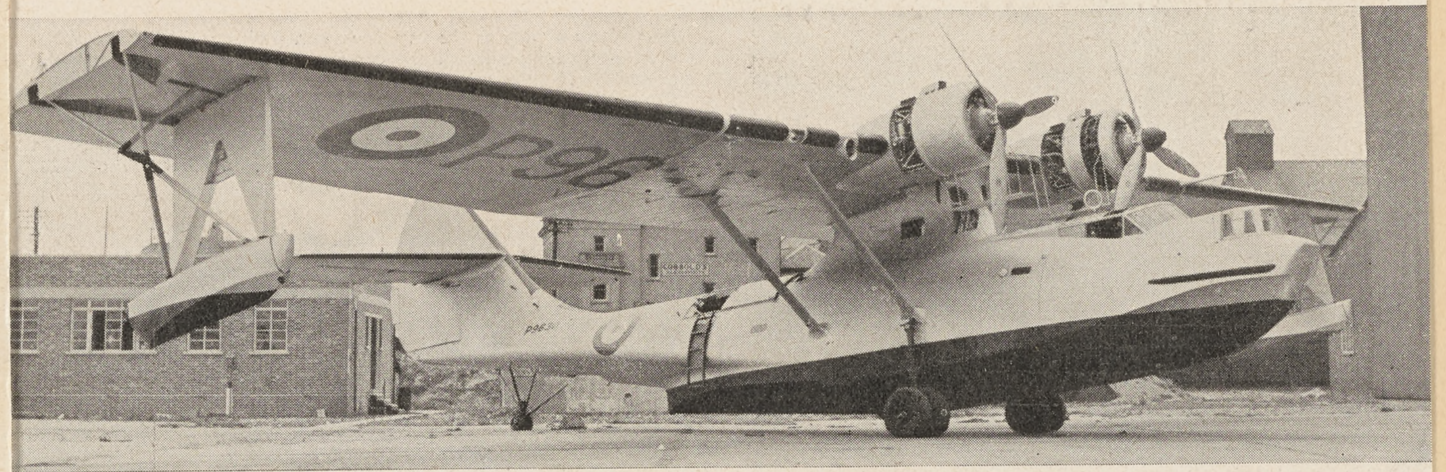
FLIGHT, August 10, 1939.



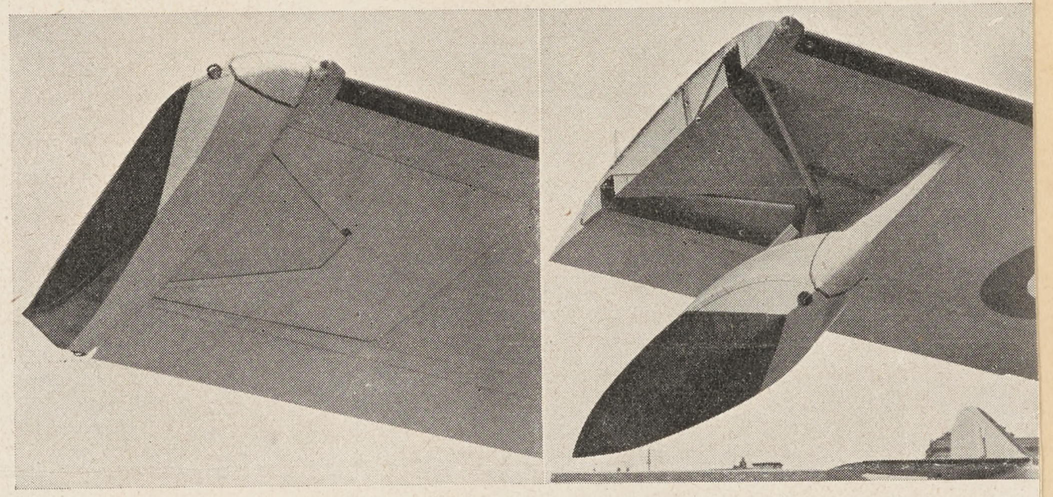
PICTORIAL SPECIFICATION

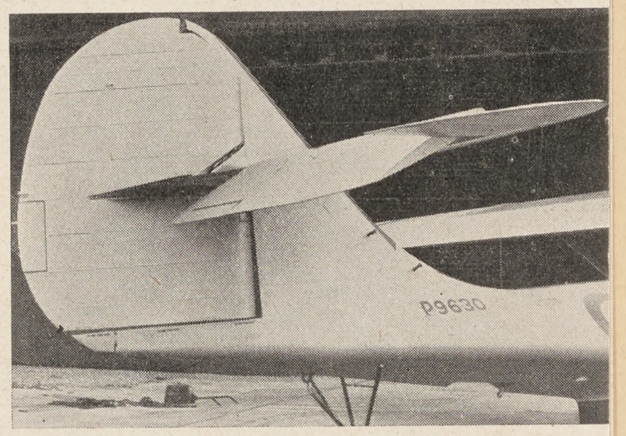
A Photographic Study of a Notable American Flying Boat

(Illustrated with "Flight" photographs)

THROUGH the courtesy of the Air Ministry, who have acquired the machine for experimental purposes, *Flight's* chief photographer was able at Felixstowe last week to "go to work" on the American Consolidated Model 28-5 twin-engined flying boat. This machine was lately flown across the Atlantic from Botwood, Newfoundland, to the Marine Aircraft Experimental Establishment at Felixstowe after having flown to Botwood from the Consolidated factory in San Diego.

In all essentials the machine resembles the PBY machines, more than 200 of which are being supplied to the U.S. Navy and which have replaced destroyers for scouting and reconnaissance duties. Despite its comparatively low wing loading, the 28-5 is claimed to have a maximum range of more than 4,200 miles. The engines are two Pratt and Whitney Twin Wasps and the top speed is claimed to be over 200 m.p.h.





The characteristic features of the Consolidated 28-5—large wing area, retractable wing-tip floats and peculiar hull formation—are apparent in the top view on this page. Below it are close-ups of the float retracted and partially extended while on the right is a study of the tail with its single fin and very large rudder, the former built integral with the hull. Below, on the left, is a view which shows more details of the tail, the broad hull and the termination of the step. Finally, there is a view of the bows showing the location of the bomb aimer's window and the gun turret.

AIR FLAGSHIP BACK IN S. D.

Rear Admiral Ends Alaska Inspection

Aviation

The four-motored "flying flagship" of Rear Adm. Arthur B. Cook, Aircraft Scouting Force commander, today was back at its San Diego base after a tour of patrol plane facilities in the Alaska-Aleutian Islands area.

Piloted by Comdr. Andrew Crinkley, the 25-ton Consolidated bomber yesterday flew with a nine man crew from Sitka, Alaska, to San Francisco, then to San Diego on a spectacular 1900-mile flight.

Meanwhile, the surface flagship of Rear Adm. Cook, the light cruiser Memphis, was scheduled to leave Kodiak for Dutch Harbor today in a continuation of the officers' inspection of Navy air bases in the far north.

MEMPHIS GOING

The Memphis will depart Monday from Dutch Harbor for Hawaii, where the Navy's greatest concentration of long-range patrol bombers is based.

Due home this week from Mare Island Navy Yard after several weeks' overhaul are the destroyers Aylwin and Dale of Division Two, which has been reported slated for transfer, probably in October, to the Asiatic Fleet as replacements for older vessels. The two craft will anchor in San Diego Saturday. A third destroyer, the 1850-ton USS Phelps, will arrive from Mare Island Sept. 15.

OTHER ARRIVALS

Other arrivals from Mare Island this month will be the destroyers Henley, Helm, Craven and Fanning, on Sept. 20. Destroyer Division 28—the Southard, Chandler, Hovey and Long—will proceed to Mare Island for overhaul Sept. 18, and the aircraft carrier Yorktown will go to Puget Sound Navy Yard Sept. 20 for its first overhaul since coming to the west coast with the Fleet last May to begin permanent duty in San Diego.

Union 9-7-39

S. D. Aircraft Output Escapes Neutrality Ban

In sharp contrast to Los Angeles, where aircraft factories are affected deeply by the President's proclamation putting an embargo on delivery of planes and accessories to European belligerents, San Diego's aircraft industry is not affected by the neutrality measures.

Work is going on as usual here on the $18,000,000 backlog of orders for airplanes and accessories while in Los Angeles millions of dollars in orders from France and Great Britain cannot be filled under the neutrality proclamation.

Aviation leaders, speaking informally, indicated belief that instead of slowing down, aircraft work here would tend to speed up to fill U. S. government orders in view of the tense international situation.

Of the $17,000,000 backlog now awaiting fulfillment by Consolidated Aircraft Corp., no portion is for export to any of the belligerent nations named in the proclamation, chamber of commerce officials declared. They said all unfilled Consolidated orders are for the United States army and navy and for American firms and individuals.

Ryan Aircraft Corp., possessing a backlog of more than $750,000 and a new order of nearly $200,000 from the army, likewise is unaffected by the President's neutrality measure. Solar Aircraft Co., builders of airplane parts, has a backlog of more than $500,000 but none of the orders are from nations named in the proclamation.

SIX KILLED IN NAVY BOMBER CRASH

S. D. TO FILL PLANE ORDERS

Neutrality Not In Way Of $18,000,000 Back Log

Sun 9-7-39

Aviation

President Roosevelt's neutrality proclamation will not stand in the way of San Diego's aircraft industry fulfilling an $18,000,000 backlog of orders.

This was learned by Chamber of Commerce officials after a survey of this city's three major aircraft firms.

Consolidated Aircraft Corporation's $17,000,000 backlog of orders are all for United States Army and Navy and for American firms and individuals, chamber officials said. No portion of the orders are for belligerent nations named by the President in his neutrality measure.

Ryan Aircraft Corporation's $750,000 in orders and its recently acquired order of $200,000 from the Army likewise will not be affected by the legislation. Solar Aircraft Co., builders of airplane parts, has a backlog of more than $500,000, but none of the orders are from nations termed "belligerent" in President Roosevelt's proclamation.

The tense international situation is expected to speed up work in filling the huge orders for this government, aviation officials indicated.

WHERE SIX FELL TO THEIR DEATHS . . . Here is the twisted, smoking wreckage of a Consolidated seaplane which crashed last night at the Chollas Heights radio station. In the background fire still rages several hours after the plane exploded, cremating six Navy fliers. A naval board of inquiry blamed a low ceiling for the tragedy.

* * *

Radio Wires Believed Cause In San Diego Bomber Crash

Six Bodies Recovered From Wreck Of Consolidated Sea Plane

A Navy board of inquiry today learned that six fliers killed in the flaming crash of a giant patrol bomber near the Chollas Heights naval radio station probably fell to their doom when trapped over a layer of fog that blotted out vision of a radio tower and antenna rising 1100 feet above sea level.

The Consolidated seaplane, which smashed into the Chollas Heights radio antenna at 9:15 last night, fluttered a half mile farther, then plunged into the brush and exploded.

Flames leaped high into the air, brilliantly lighting the night sky, and attracting hundreds to the wreckage and blocked fire-fighting apparatus of the city and the Navy.

Killed were:

Lieut. A. H. Irons, 817 B-st, Coronado, survived by his widow and two children.

Ensign L. W. Latremore, 966 F-st, Coronado, survived by his widow.

Frank Vukovich, 31, chief aviation machinist's mate 3c, survived by his widow and three children.

V. E. Morris, 24, aviation ordinance man, 3970 Goldfinch-st, survived by his widow.

H. G. Berry, radioman 3c, 2044 Columbia-st, survived by his widow.

H. O. Wilson, aviation machinist's mate (3c), unmarried.

Death was believed to have been instantaneous. It was several

SIX KILLED IN PLANE CRASH

Airboat Strikes Wires Of Radio Towers

Sun 9-8-39

(Continued from Page 1)

hours before the pyre cooled sufficiently for salvage crews to remove the charred remains.

An official Navy announcement, as the board of inquiry convened, stated that the bomber, one of a group of six of Patrol Squadron 12 on a routine night training flight, was believed to have crashed while attempting to cut through the overcast. The ceiling over the bay last night was only 700 feet, while the Chollas Heights tower, situated at a 500-foot level rises another 600 feet.

The pilots, Lieut. Irons and Ensign Latremore, apparently anticipated landing in the harbor after descending through the fog, as the wing tip floats had been lowered. That they never saw the antenna which brought their doom was almost certain.

The other five planes of the group returned to their North Island base safely.

Funeral arrangements were being made at Bonham Bros. Mortuary today.

The accident brought the year's Navy aviation fatality list in the San Diego area to a total of 16 in seven crashes. It was the first fatal mishap in San Diego to a PBY bomber since Aug. 15, 1938, when two airboats made crash night landings near the Destroyer Base, resulting in six deaths.

S. D. Plane Hits Chollas Radio Antenna

Wreckage Burns 2 Hours; Thousands Rush to Scene

Six navy flyers were killed last night when their Consolidated patrol seaplane tore into the antenna at the Chollas Heights long-range navy radio station then crashed in the brush 3000 feet west of the radio towers and burst into flames.

Firemen and navy crews fought the fire more than two hours before it was controlled, the position of the plane making it difficult to bring fire-fighting equipment to the scene.

The dead are:

LT. A. H. IRONS, pilot, El Cordova hotel, Coronado.

ENS. L. W. LATREMORE, 966 F st., Coronado.

FRANK VUKOVICH, chief aviation machinist's mate, Coronado.

H. O. WILSON, aviation machinist's mate, third class, naval air station.

V. E. NORRIS, aviation ordnance man and naval air pilot, San Diego.

H. G. BERRY, radioman third class, San Diego.

AUTOS JAM ROADS

Thousands of San Diegans rushed to the scene as the pillar of flame lighted up the plateau where the plane crashed a mile east of Radio rd. and three-fourth of a mile south of University ave. They jammed roads with their automobiles and delayed attempts of the fire department and navy rescue crews to reach the blazing plane.

An eye witness account of the crash was given by Mr. and Mrs. Sidney Diday, 429 Sixteenth st., who were sitting in an automobile at the radio station at the time of the crash.

"As the plane flew over our heads we saw the pilot was in trouble and about to crash into the antenna," said Diday. "One of the motors was sputtering and then both engines became quiet and the plane tipped to the right to avoid the wires (of the radio station). The tip of the wing hit the wires, then the plane crashed with a roar and immediately exploded, sending clouds of smoke into the air. We could not see any landing lights on when the plane approached the wires."

A city fireman reported there was a cloud over the radio station when he arrived and thought it possible the pilot did not see the antenna.

EAST S. D. HEARS BLAST

The explosion was heard throughout East San Diego.

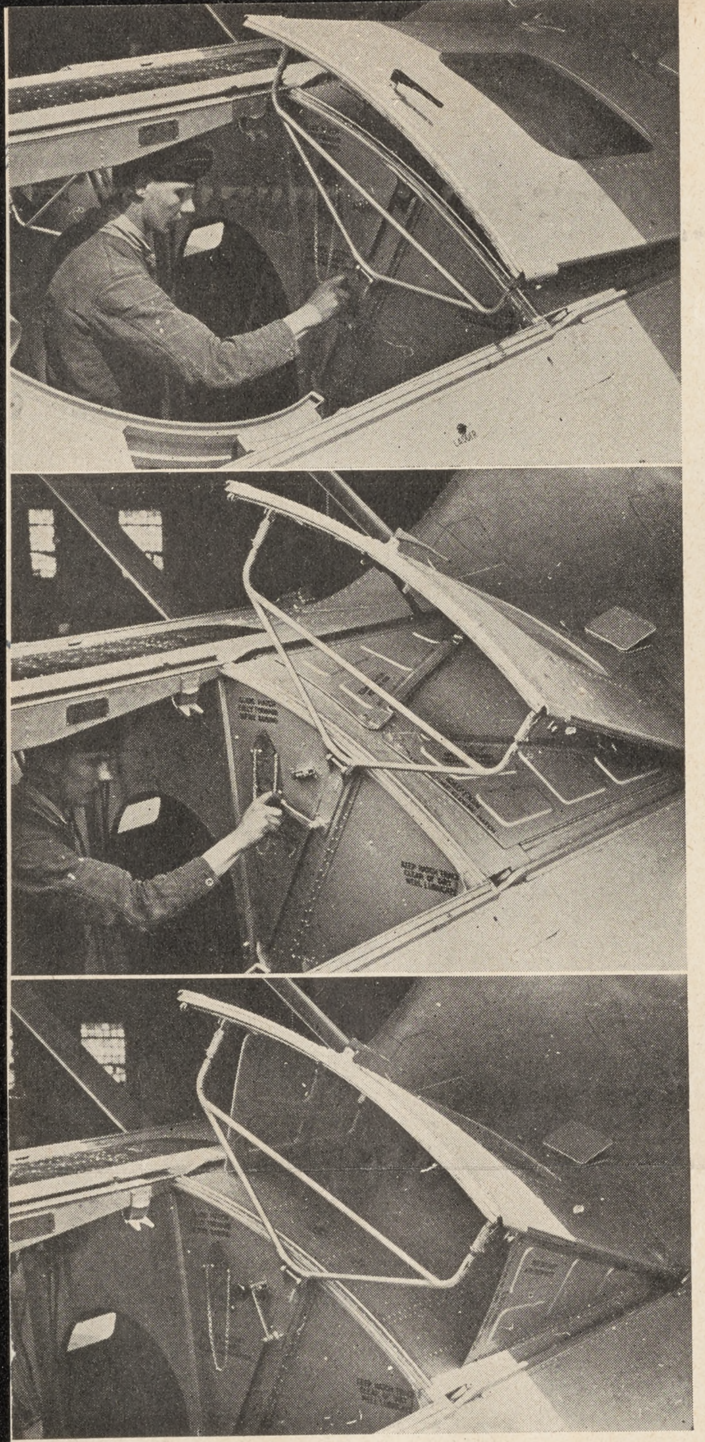
The plane was one of a flight of six planes engaged in regular night flying operations. The other five returned safely.

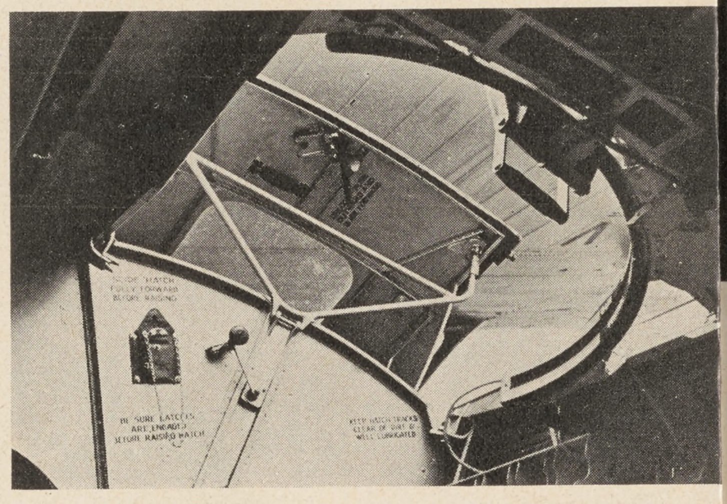
Three engine companies of the San Diego fire department responded to an alarm turned in at 9:24 p.m. They were hampered by a traffic jam on the road and were unable to approach nearer than several thousand feet.

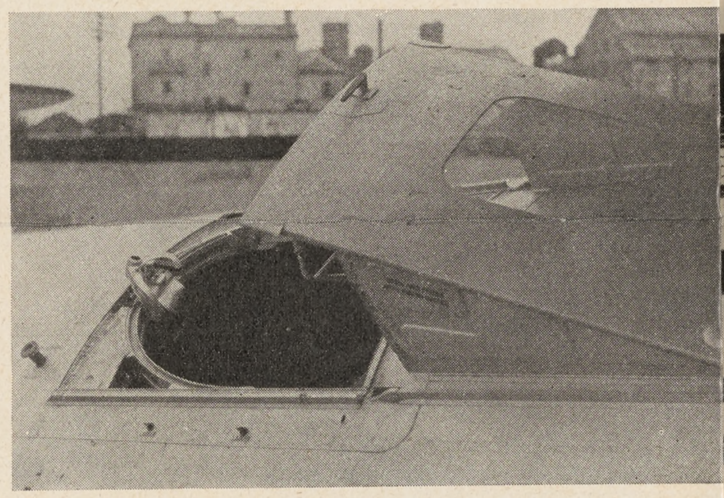
Firemen made their way to the blazing plane with portable extin-

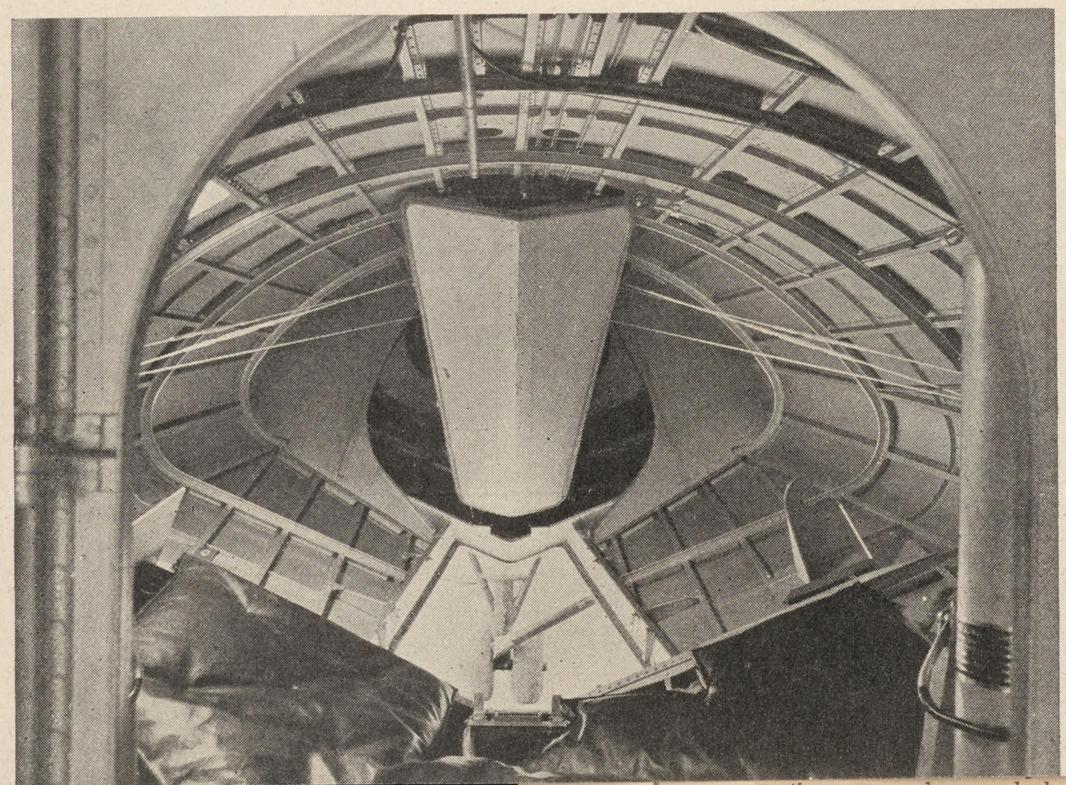
(Continued on Page 3, Col. 1)

Five views of one of the two deck gun positions. On the left the portion of decking which protects the gunner from the airstream is shown being raised after having been slid forward. The third view shows the side plates in position. Below is a "shot" of the gunner's position from inside the hull and below that is a view showing everything ready for action, except that the gun is not fitted to the track-type mounting which, incidentally, operates very smoothly.

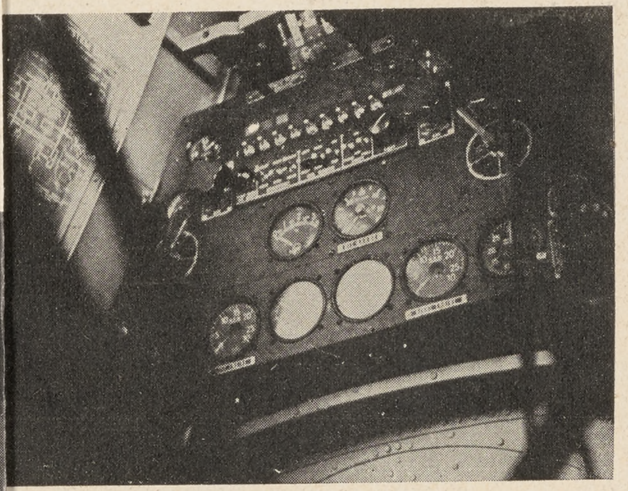




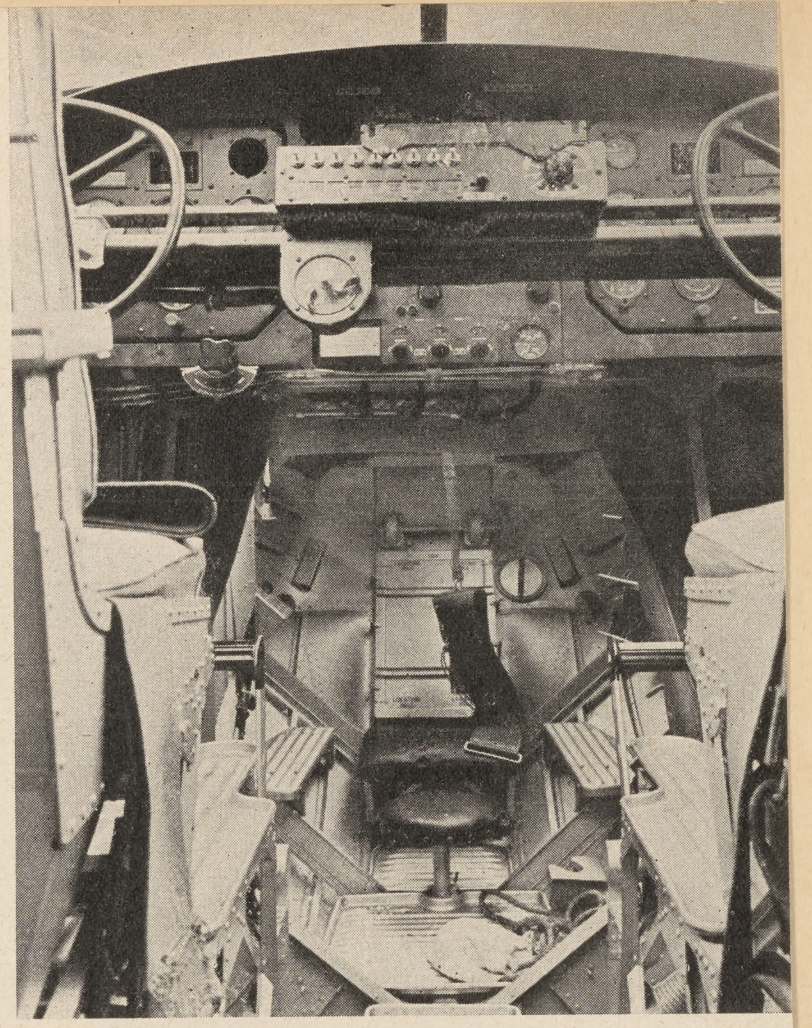


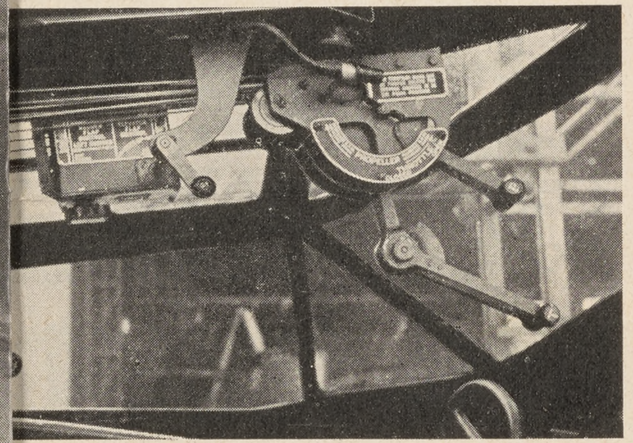


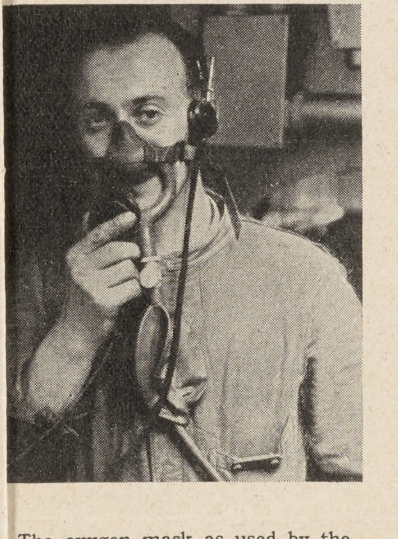
(Left) This is what the Americans call the tunnel gun position. Actually it is not so much a tunnel as an aperture in the floor which is normally filled by the folding section of hull seen above it. This view also shows the section and construction of the rear portion of the hull.



The majority of the engine instruments are grouped on the flight engineer's panel shown above and not in the pilot's cockpit which is seen on the right. The row of switches on the pilot's dashboard transmit orders to corresponding visual indicators on the engineer's panel. The flight engineer sits in the superstructure between the hull and the wing where he may observe the engines directly. He also operates the wing tip floats either manually or electrically. Below are the pilot's throttle and trim controls in the roof of the cockpit.

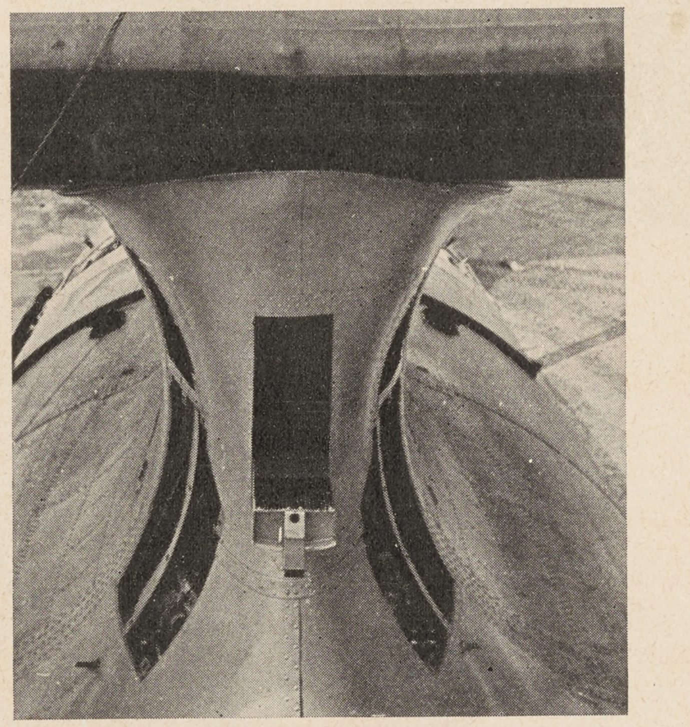


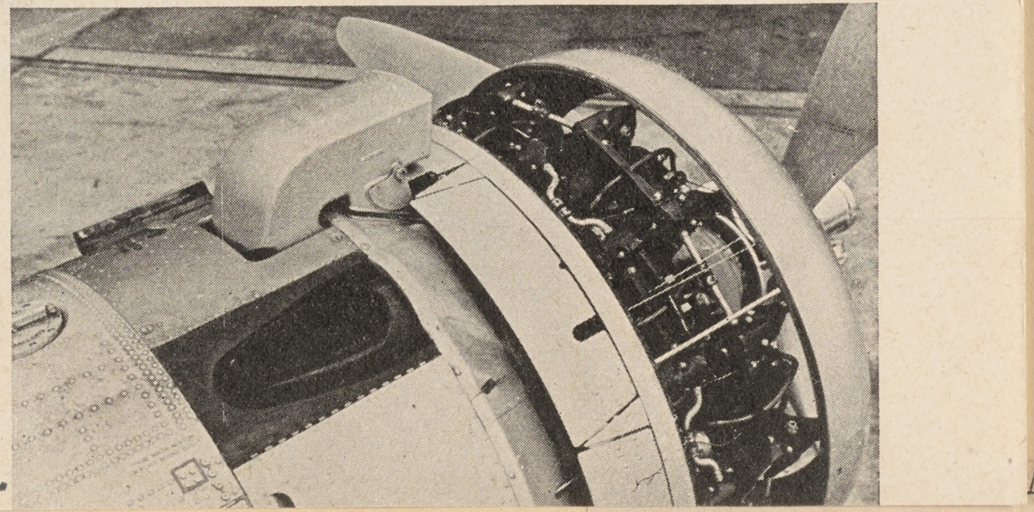




The oxygen mask as used by the crew of the Consolidated 28-5 leaves the mouth free to use the intercommunication system which extends throughout the boat.

On the right is a view looking aft showing the superstructure in which the flight engineer is housed. A section of the deicer is also visible. Below is a view of the installation of one of the Pratt and Whitney Twin Wasps with part of the cowling removed.





OVER.

---

other was under wrecked parts of the craft. McLarney said the bodies were burned beyond recognition.

BODIES TAKEN OUT

The navy rushed special equipment to fight gasoline fires and late last night sought to cool the wreckage to permit removal of the bodies. On removal they were taken to Bonham's mortuary.

There was a report that the wing tip of the plane was torn off when it struck the radio station wires and was found several hundred feet from the foot of one of the great radio towers which project several hundred feet into the air.

The Chollas Heights radio station refused to answer questions about damage to the station, which transmits messages to navy outposts all over the world.

AIR FLAGSHIP BACK IN S. D.

Rear Admiral Ends Alaska Inspection

Aviation

The four-motored "flying flagship" of Rear Adm. Arthur B. Cook, Aircraft Scouting Force commander, today was back at its San Diego base after a tour of patrol plane facilities in the Alaska-Aleutian Islands area.

Piloted by Comdr. Andrew Crinkley, the 25-ton Consolidated bomber yesterday flew with a nine man crew from Sitka, Alaska, to San Francisco, then to San Diego on a spectacular 1900-mile flight.

Meanwhile, the surface flagship of Rear Adm. Cook, the light cruiser Memphis, was scheduled to leave Kodiak for Dutch Harbor today in a continuation of the officers' inspection of Navy air bases in the far north.

MEMPHIS GOING

The Memphis will depart Monday from Dutch Harbor for Hawaii, where the Navy's greatest concentration of long-range patrol bombers is based.

Due home this week from Mare Island Navy Yard after several weeks' overhaul are the destroyers Aylwin and Dale of Division Two, which has been reported slated for transfer, probably in October, to the Asiatic Fleet as replacements for older vessels. The two craft will anchor in San Diego Saturday. A third destroyer, the 1850-ton USS Phelps, will arrive from Mare Island Sept. 15.

OTHER ARRIVALS

Other arrivals from Mare Island this month will be the destroyers Henley, Helm, Craven and Fanning, on Sept. 20. Destroyer Division 28—the Southard, Chandler, Hovey and Long—will proceed to Mare Island for overhaul Sept. 18, and the aircraft carrier Yorktown will go to Puget Sound Nav Yard Sept. 20 for its first over haul since coming to the wes coast with the Fleet last May to begin permanent duty in San Diego.

* * *

BOTH FROM SALEM, SOLONS' HOMES ARE MILES APART

There are two congressmen from Salem here today, although they live 3000 miles apart.

Rep. James W. Mott is a resident of Salem, Ore., and a graduate of Stanford university, as well as having attended the University of Oregon and Columbia; he received his LL.B. degree at Willamette university, Salem, in 1917, and began the practice of law, leaving it to enlist in the navy in the World war.

Rep. George J. Bates is a resident of Salem, Mass. Before his election to congress he was a member of the Massachusetts house of representatives and also was mayor of Salem.

Both are Republicans.

WHAT, NO BADGE? NO TICKET, EITHER

There is a little matter which Rep. Melvin J. Maas, ranking minority member of the house naval affairs committee, would like to take up with Police Chief J. T. Peterson.

"Here I am in San Diego, which I call my 'second home,'" he said last night, "and I'm not a member of the police department!"

Rep. Maas is the possessor of an imposing array of badges ranking from deputy sheriff to chief of detectives—and honorary chief of police—in many widely separated cities. One of them is from Miami, Fla.

"I got that when Pat Cannon was a motorcycle cop in Miami," he explained. He added that Rep. Cannon, who is here with the congressional party, studied law while on the Miami police force, attended law school and began the law practice before he was elected to congress last fall.

Sun 9-11-39

CONGRESSMEN VIEW S. D. BASE

Committee Impressed By Destroyer Job

Convinced that the United States' powerful Navy will enable this country to maintain its neutrality, 11 members of the House Naval Affairs committee today inspected San Diego shore establishments and were particularly impressed with the activity at the Destroyer Base, where recommissioning of destroyers for patrol duty was in full swing.

The solons arrived late yesterday from San Clemente island aboard the heavy cruiser Chester, and today toured the Destroyer Base after a drive from Coronado via Silver Strand, the 11th Naval District headquarters and supply depot, Naval Training Station, Naval Fuel Depot, Fort Rosecrans, Cabrillo National Monument, and Consolidated Aircraft Corp.

LEAVE TOMORROW

Tomorrow the group will inspect the Naval Air Station, the aircraft carrier Yorktown, the Marine Base, and Naval hospital, leaving for Los Angeles by train at 4:15 p. m.

Acting chairman of the committee in the absence of Rep. Carl Vinson was Rep. Leonard W. Schuetz (D., Ill.), who was born in Posen, on Polish territory recently occupied by the Nazis. Other congressmen were Reps. Melvin Maas (R., Minn.); James W. Mott (R., Ore.); William H. Sutphin (D., N. J.); W. Sterling Cole (R., N. Y.); George J. Bates (R., Mass.); William E. Hess (R., Ohio); William S. Jacobsen (D., Ia.); Arthur B. Jenks (R., N. H.); Michael J. Bradley (D., Pa.), and Pat Cannon (D., Fla.).

MAAS VISITS MESA

Rep. Maas, accompanied by San Diego's Rep. Ed V. Izac and Chamber of Commerce representatives, visited Camp Kearney Mesa yesterday to inspect the proposed site either for a Marine Corps combat range or a $10,000,000 aeronautical research laboratory.

Rep. Mass, ranking minority member of the committee, was certain Congress will repeal the present neutrality laws in the special session, and will replace it with "cash and carry" regulations benefiting American industry.

---

11 CONGRESSMEN ARRIVE TO INSPECT NAVY BASE; EMBARGO REPEAL SEEN

Union 9-11-39

"If we'd had a proper navy back in 1914 we wouldn't have landed in the World war. We've got a proper navy now—and we can see to it that so far as we are concerned, international law will be enforced."

Thus Rep. Melvin J. Maas (R-Minn) summed up the international situation here last night. Maas, ranking minority member of the house naval affairs committee, arrived last evening in company with other committeemen on a flying tour of inspection of the Pacific coast naval defenses. The party came into port from San Pedro via Santa Catalina and San Clemente in the U.S.S. Chester, heavy cruiser, and will be here today and tomorrow.

(Pictures on Page 1--B)

Acting chairman of the committee is Rep. Leonard W. Schuetz (D-Ill), who is head of the committee in the absence of its chairman, Rep. Carl W. Vinson (D-Ga). Born in what now is Poland in 1887, Rep. Schuetz was brought to this country when a year old, and now heads a large Chicago contracting firm. He offered no comment upon probable action of congress relative to neutrality legislation:

"That will have to be decided when congress convenes," he said. "They'll have to make up their minds about it then—and there are more than 400 congressmen."

In the Chester's boats the 11 congressmen, most of them accompanied by their wives, landed at the Naval Air station at North Island at 5:15 p.m., and with exception of Rep. Maas, immediately headed for Hotel del Coronado, where they are staying.

On hand to greet the visitors

Chest Leaders, Business Firms Parley Today

Union 9-11-39

Another important step in development and application of the "unit account" plan of self-solicitation of business and industrial establishments in the Community Chest campaign will be taken today at meetings scheduled for division chairmen and group leaders.

The meetings, to be held in the San Diego Trust & Savings bank board room, are for three groups—finance at 11 a.m., national firms, 1:35 p.m., and industry, at 4 p.m. Eight similar meetings for other groups are announced for the remainder of the week.

Each establishment in the several groups has been requested to send representatives to these meetings, at which details of the "unit account" plan will be outlined. This method is based upon solicitation of contributions at all places of employment, for which previously agreed upon quotas have been fixed. Adopted in this year's Chest campaign for the first time, the plan has been highly successful in fund-raising efforts in scores of cities.

Division leaders meeting today with company representatives are:

Industrial—Edgar N. Gott, chairman; S. M. Sullivan, Lionel Ridout, Claude Brakehill, J. E. Rockwell, Russell Bremer, Arthur Ponsford, Walter Kranes.

Finance—John L. Fox, chairman; Marston Burnham, Kenneth Jennings, Wilbur Martin, Sam Snyder, Beryl Blevins, Roy Hegg, Eugene Zeiss, George Stannard.

National firms—George N. Lynch, Frank J. Guasti, chairmen; E. K. Hurlburt, G. T. Gallagher, C. D. Doerr, A. A. Robinson, Frank Nolan, W. S. Bigelow, Milton Heller, E. K. Klenke, Charles W. Amos, John M. Jones.

---

11 Congressmen Here on Navy Inspection Tour

Union 9-11-39

(Continued from Page 1)

were Rear Adm. Joseph R. Defrees, commandant of the 11th Naval district, and his aid, Comdr. F. W. Benson; Capt. John S. McCain, commanding the Naval Air station; Rep. Ed V. Izac of San Diego; Howard Worth, chairman of the army and navy committee of the chamber of commerce; Maj. T. C. Macaulay, executive secretary, and D. W. Campbell and Tom Bomar, chamber department heads.

Reps. Maas and Izac, accompanied by Bomar, immediately left the air station, taking advantage of the remaining minutes of dusk for a hurried trip to Camp Kearney mesa, to look over one of the proposed sites for the marine corps combat range. Rep. Maas, a marine reserve officer, will accompany Rep. Izac back to Washington, D. C., by plane tomorrow, cutting short the trip to get back for the work which is piling up there ahead of the special session which President Roosevelt is expected momentarily to call.

HINTS EMBARGO REPEAL

Either outright repeal on the arms embargo, or enactment of "cash and carry" legislation governing the export of war materials, is predicted by Rep. Maas.

"They tried an embargo 100 years ago," he said, "and it gave them a depression that lasted 20 years."

Other members of the group arriving here were Rep. James W. Mott, (R-Ore) and Mrs. Mott; Rep. William H. Sutphin (D-NJ) and Mrs. Sutphin; Rep. W. Sterling Cole (R-NY) and Mrs. Cole; Rep. George J. Bates (R-Mass) and Mrs. Bates. Rep. William E. Hess (R-Ohio) and Mrs. Hess; Rep. William S. Jacobsen (D-Ia) and son; Rep. Arthur B. Jenks (R-NH) and Mrs. Jenks; Rep. Michael J. Bradley (D-Pa); Rep. Pat Cannon (D-Fla) and Mrs. Cannon; Comdr. I. C. Bogart U.S.N. ret., aid, and Mrs. Bogart, and Robert H. Harper, clerk.

The members of the party are the guests of the city and county of San Diego, and of the chamber of commerce, during their stay.

PLAN ACTIVE TOUR

There will be no idle moments for the visitors while they are here. The following is the program outlined for them:

TODAY—Drive to San Diego via the Silver strand; inspect destroyer repair base, naval headquarters and naval supply depot; luncheon at Naval Training station, followed by station inspection and review of the recruits; visit naval fuel depot, Ft. Rosecrans and Cabrillo national monument; visit Consolidated Aircraft plant; official dinner-dance at Hotel del Coronado.

TOMORROW—Inspect Naval Air station and U. S. S. Yorktown; luncheon at Marine Corps base, followed by review of troops and inspection of base; visit Naval hospital, Balboa park, and entrain for Los Angeles on the Santa Fe streamliner San Diegan at 4:15 p. m.

Wives of the congressmen will visit Pt. Loma, the beaches and La Jolla this morning, with luncheon at the Casa del Rey Moro, Balboa park, as guests of Mrs. Izac; this afternoon will be spent at the zoo, under the guidance of Mrs. Belle J. Benchley. Tomorrow morning they will visit Tijuana, followed by luncheon at the Coronado Beach and Tennis club.

S. D. NAVAL EXPANSION FORECAST AS CONGRESSIONAL VISIT RESULT

Union 9-12-39

"Expansion of the San Diego naval establishment, especially the supply facilities, is a virtual certainty because of the present international situation," Rep. Ed V. Izac said last night after a day spent here with 11 members of the house naval affairs committee.

"There doubtless will be another storage warehouse south of the one now building, with an overhead to the pier. The pier, no doubt, will be widened and extended to a length of 1000 feet," he said. "Additional supply facilities will be absolutely necessary, with half the fleet operating out of San Diego and having requirement for supplies all the time. It is ridiculous to think ships would be sent 100 miles or more north for supplies, under such conditions.

(Pictures on Page 8-A)

"We hope also for an administration building at the Naval Training station. This is badly needed now. I think the other congressmen also agree that there is need for crews for the 100 ships to be put into service."

With only two days in which to inspect naval activities here, committee members were kept busy all day, on a whirlwind tour of local stations. They will furnish their inspections today.

Added strengthening of the defenses of the Pacific, especially here, was hinted by several members of the party, who also voiced the opinion that, in all likelihood, President Roosevelt gain his objective in having the arms embargo

VOUGHT-SIKORSKY COMPLETES ADDITION

Construction work has just been completed on the new factory addition to United Aircraft's Vought-Sikorsky Aircraft Division plant at Stratford, Connecticut, and seventy-five per cent of the machinery has been installed in the new space, which adds 64,500 square feet to the manufacturing area already existing. The addition includes an employes' cafeteria 125 x 70 feet in size, a new boiler room, a first aid department, and employes' locker and wash rooms, as well as increased factory floor space.

R. A. F. "CONSOLIDATES"

A new "first" was chalked up recently, when this Consolidated flying boat, built for the Royal Air Force, arrived at Felixstowe, England. Equipped with Hamilton Standard propellers and Pratt & Whitney engines, the 14-ton patrol-bomber was the first military airplane to be delivered by air across the North Atlantic, and the 5,750 mile trip from factory to England marked the longest military delivery flight on record. The airplane is shown at Buffalo where its crew, formerly of the Guba, stopped en route to refuel. After one more stop, at Botwood, Newfoundland, the plane took off for its successful Atlantic crossing.

Official U. S. Navy photograph

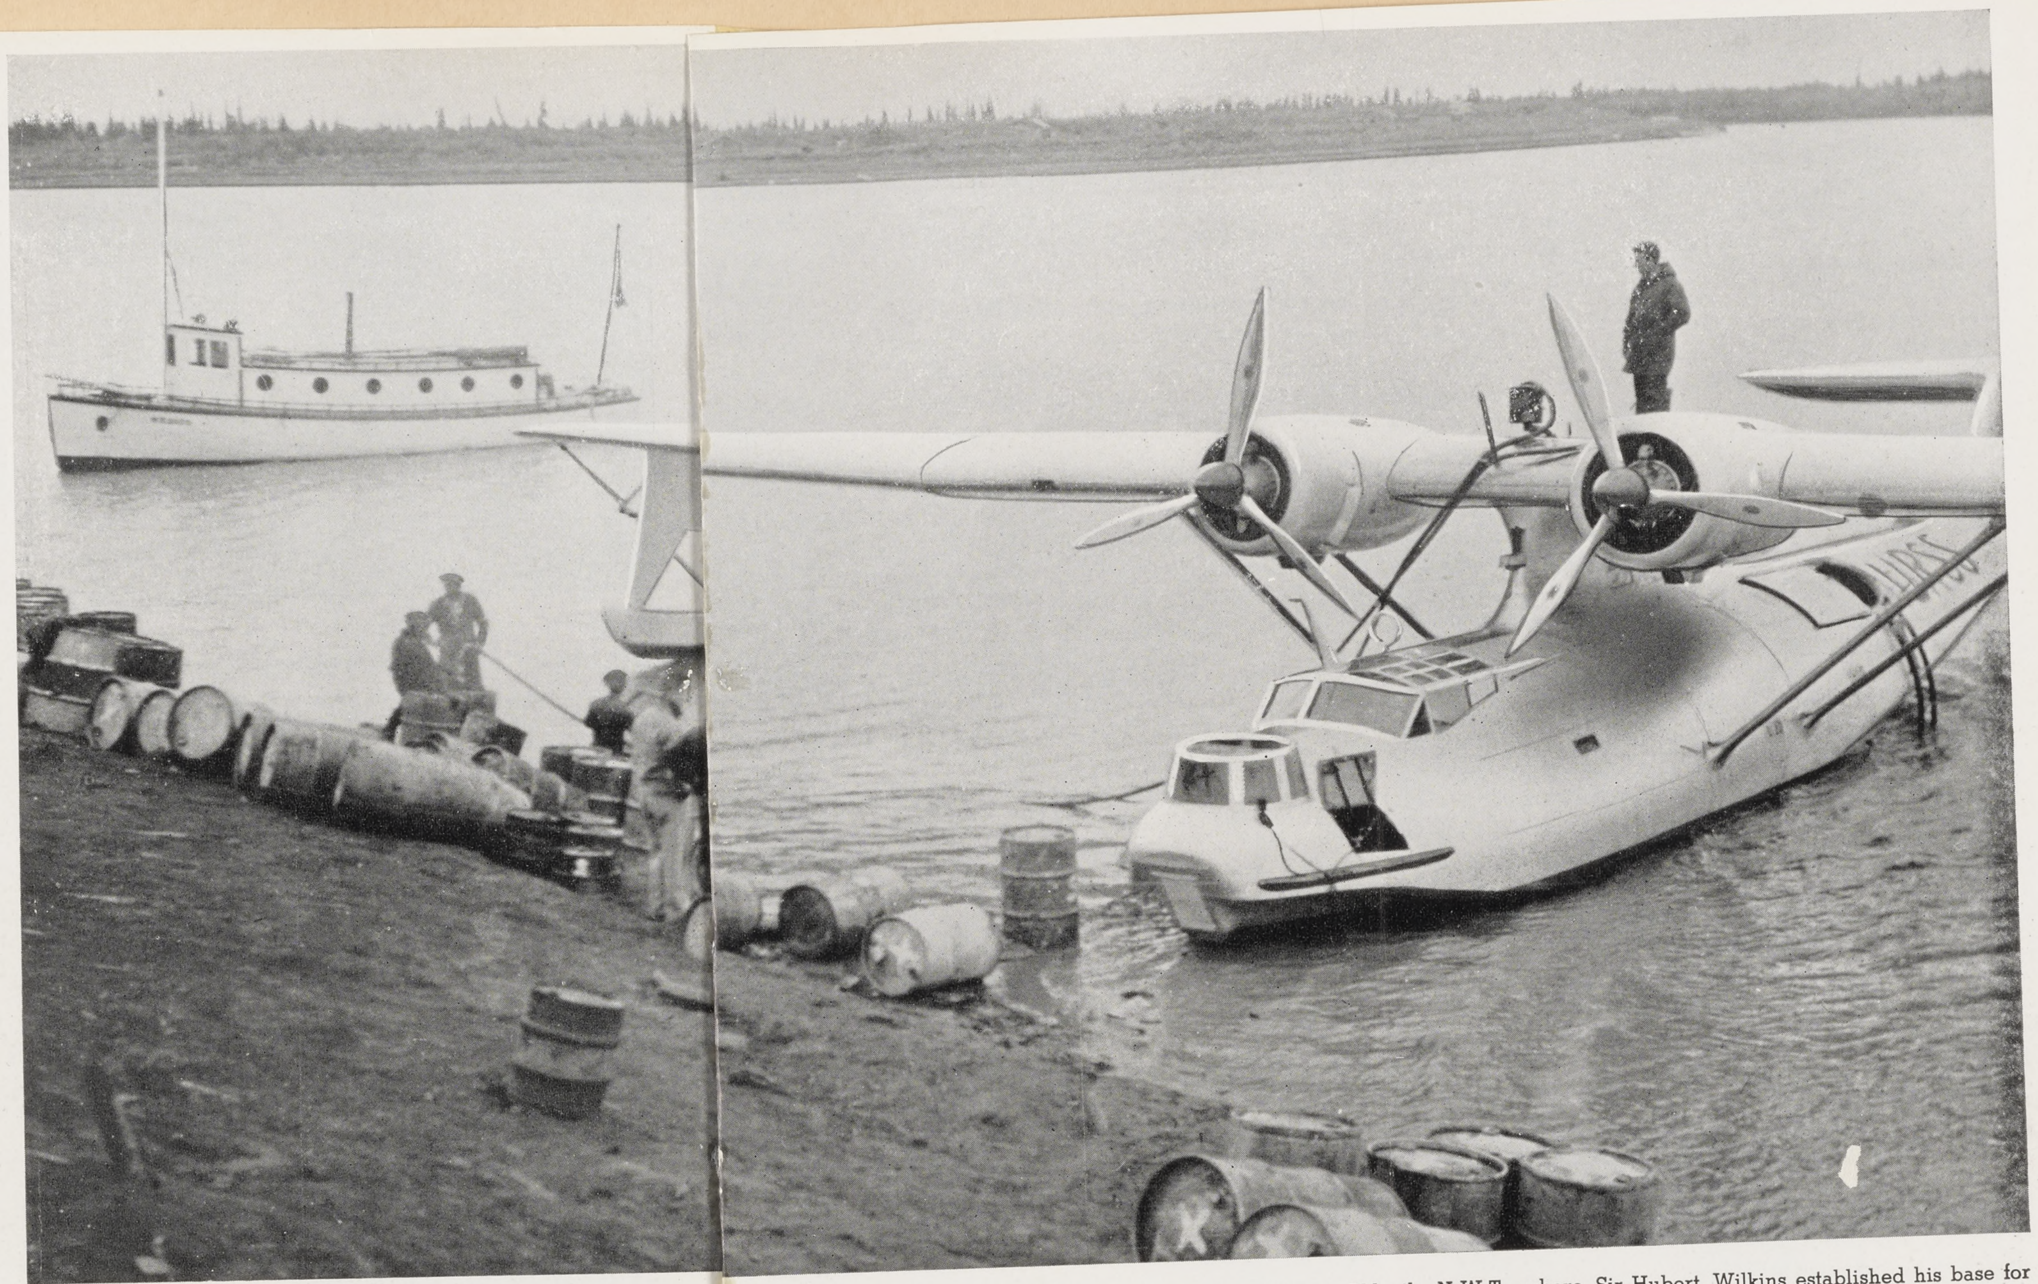
ATLANTIC ENTRANT

Shown here demonstrating ability to fly on one of its two Hydromatic propeller-equipped Twin Wasp engines, the American Export Line's "Trans-Atlantic" recently lived up to its name by completing the fifth of a series of trans-Atlantic survey flights for its parent company, which operates a fleet of 18 steamships. Planning to keep its planes in radio communication with its surface ships, which are equipped to make upper air weather observations, the company expects to inaugurate passenger service by air in the not distant future.

SIR HUBERT WILKINS' *Search* FOR THE LOST RUSSIAN FLIERS

● Fuel for a thirsty Arctic sky giant. Above—A gasoline engineer, at Aklavik, N.W.T., "doping" gasoline with tetraethyl lead. Note the gas mask. Below—Refueling from spare drums at Melville Island.

Photos by Sir Hubert Wilkins.



Photograph by Raymond E. Booth.

● Imperial fuel drums lie on the shore at Aklavik, N.W.T., where Sir Hubert Wilkins established his base for most of the autumn and winter flights. The powerful twin engines burned 75 gallons of gasoline an hour.

SOMEWHERE in the barren wastes of the Arctic Ocean the wreckage of an aeroplane lies buried, and with it the fate of six Russians led by Sigismund Levanevsky. A sequel to two successful flights from Moscow to the United States with single-engined planes, the experts believed Levanevsky's flight in a four-engined plane had an assured chance of success and would secure valuable data on flying conditions in the Arctic.

The expedition left Moscow on August 12th, 1937, to fly across the North Pole to Fairbanks, Alaska. The plane had made a successful passage over the Pole and was 300 miles beyond when a crackling code message suddenly told the listening radio stations on both sides of the Arctic Ocean that the plane was encountering trouble. It said quite briefly, that the plane was flying heavily against a 100-kilometer wind and was losing altitude. Then in a jumble of signals which followed, the last message said, "We are going to land. . ." No further message was ever received, and no conclusion could be reached as to where or under what conditions the big plane had alighted in the summer ice floes of the Arctic.

The story of the search for the Russian flyers has been graphically related by Sir Hubert Wilkins in "The National Geographic Magazine" by whose courtesy this material is reproduced here. As the world knows, the entire aviation and radio resources in the Yukon, Alaska, the North-West Territory, Greenland and the U.S.S.R. were made available in an effort to establish immediate contact with the flyers and to aid in their rescue. For the first time in aviation history, a rescue party was organized to conduct a search by air in the polar regions.

The failure of Levanevsky's tragic expedition to complete this important flight to Fairbanks ironically enough accomplished many of the things they had set out to do. Many important discoveries were made by those who went in search of the missing flyers—discoveries which years of spasmodic trans-Arctic test flights might never have revealed about the perils and problems to be encountered in the Arctic.

Sir Hubert Wilkins' search extended more than 44,000 miles, most of the flying being done over the Arctic Ocean. Using a flying boat at first and then a land plane equipped with skis, his series of flights in

AIRCRAFT FIRM ADDS TO LAND

L.A. Times

SAN DIEGO, Sept. 12.—The Consolidated Aircraft Corp., builder of fighting planes for both the Army and Navy, has been leased 17 acres of tidelands by the City Council to permit the firm virtually to double its present size.

The land adjoins the factory site and company officials told Councilmen that plans for factory expansion will be started immediately.

Anticipated orders for new planes from the United States government as well as foreign powers, when the neutrality law is revised, was given as the main reason for the expansion program.

GUBA'S PROGRESS

FINAL HOP TO-DAY.

Victoria, Australia

Colorful Scenes at Mahe

SEYCHELLES, Monday.
(From J. Percival, jnr., aboard the Guba)

The Guba will refuel to-morrow in preparation for its 940 miles flight to Mombassa—the last leg of the Indian Ocean flight survey. This flight is tentatively planned for Wednesday and is expected to take about eight hours.

There is a native population of about 24,000 on Mahe, and the Sunday church parade in rickshaws of snowy white linen and lace, with bright colored tunics and trousers, is not to be seen elsewhere. In the cool of the evening, princes exiled from the political tangles of the East sip cool drinks on the patio of a leading hotel, and then parade to the quay in rickshaws.

YANKEE CLIPPER

CARRIES 30 ACROSS ATLANTIC

LISBON, Sunday.

The giant Pan American flying-boat Yankee Clipper arrived here at 8.44 p.m. with 18 newspapermen and 12 members of the crew—the largest number ever to cross the Atlantic by plane.

AVIATOR'S DEATH

MAN CHARGED WITH MANSLAUGHTER

LONDON, Sunday.

The death is announced of the aviator Captain Nicholas Comper, who designed the Comper-Swift machine which held the England-Australian record in 1931.

Captain Comper was spending the week-end with a friend who is the proprietor of the Swan Hotel, at Hythe. He went for a walk alone and was found unconscious in High-street. He was taken to hospital where he died as a result of a fracture of the base of the skull.

The police state that a man has been charged with manslaughter.

SERIOUS DELAY

IN PRODUCTION OF PLANES

WAITING FOR MR. CLAPP

SYDNEY, Monday.

Air Force officials view with concern the delay in the scheme for mass production of British Beaufort aeroplanes in Australia. One senior officer said to-day that Australia had all the expert guidance she needed and it would appear that there had been a marked lack of initiative on the part of some responsible persons.

Australia's mass production of planes cannot become effective until Mr. W. H. Clapp, who is still Victorian Railway Commissioner, takes over the organising of the industry.

SDAY MORNING, SEPT. 12,

Union 9-12-39

Congressmen See S. D. Naval Expansion Need

(Continued from Page 1)

clause stricken from neutrality legislation at the forthcoming special session of congress.

Rep. Izac, San Diego, said that both congress and the public have turned decidedly toward approval of the President's views since war broke out. Either an outright repeal of the embargo on munitions shipments or a "cash and carry" plan is forecast.

VISIT AIRPLANE PLANT

Heading the party is Rep. L. W. Schuetz (D-Ill). Rep. Melvin J. Maas (R-Minn) is ranking minority member of the group. Others in the party are Reps. James W. Mott, William H. Sitphin, W. Sterling Cole, George J. Bates, William E. Hess, William S. Jacobsen, Arthur B. Jenks, Michael J. Bradley and Pat Cannon.

Yesterday was devoted to inspection of the Destroyer base, district headquarters, Naval Training station, fuel depot and the Consolidated Aircraft plant; in the evening the congressmen and their wives were guests of the city, county and chamber of commerce at a dinner dance at Hotel del Coronado.

This morning the party will inspect the Naval Air station and the U. S. S. Yorktown, aircraft carrier. They will have luncheon at the Marine base, after which they will inspect that base and Naval hospital. The party will entrain on the Santa Fe streamliner San Diegan at 4:15 p. m. for Los Angeles, on their way home.

SECRET BOMBER HOP TOMORROW

S. D. Navy Planes Due For Hawaii Flight

Sun 9-12-39

By HAROLD KEEN

Wartime secrecy today was clamped down on preparations of the Patrol Wing One command at North Island to dispatch a group of Navy patrol bombers on a nonstop flight from San Diego to Pearl Harbor, Hawaii, this week.

The tentative date for the takeoff from the harbor is tomorrow, weather permitting, it was learned.

Navy authorities refused to reveal the exact number of craft to participate in the mission. It was believed, however, that a minimum of 12 will make the 2500-mile trans-Pacific hop, and that Patrol Squadron 13, commanded by Lieut.-Comdr. Stuart H. Ingersoll, will be one of the units involved.

SECRECY ORDERED

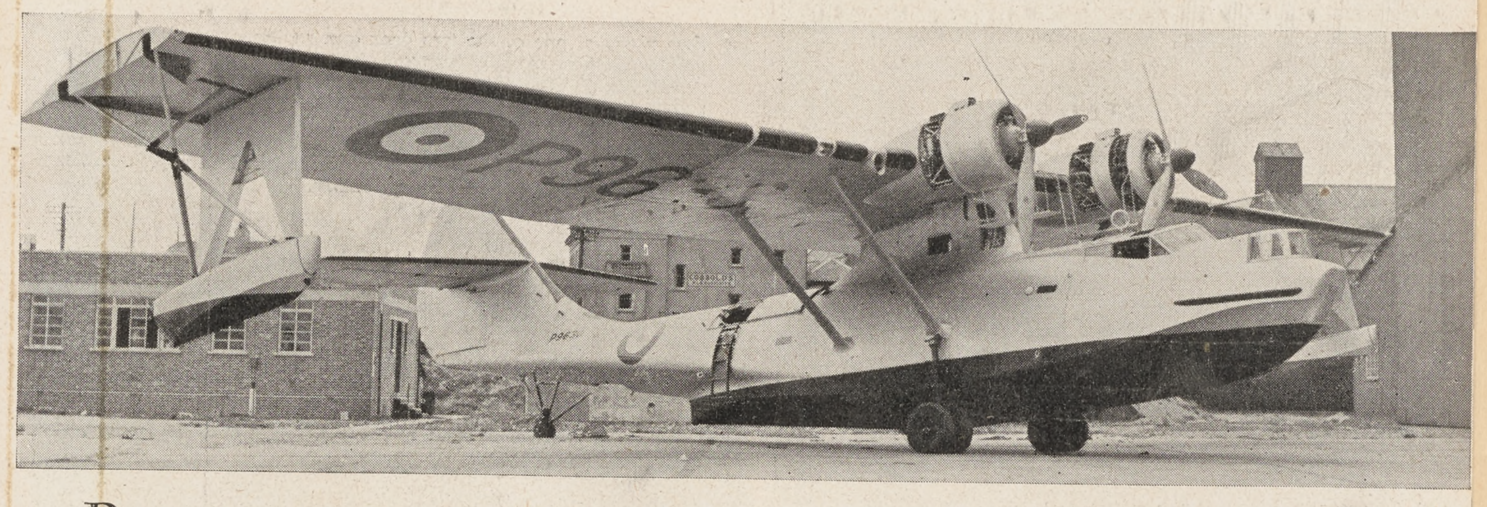
Capt. Charles P. Mason, commander of Patrol Squadron One, said that he has been given specific orders by the Navy Department to "avoid publicity" of the flight. In every long-distance mass hop from San Diego during the past two and one-half years, the Navy has taken pains to announce the venture, particularly to insure that the harbor channel will be clear of fishing boats and other small craft during the hazardous takeoffs with full gasoline loads.

The San Diego squadron will be sent to Hawaii to replace one just ordered to the Philippines in a move to strengthen defense forces required to enforce U. S. neutrality.

LANGLEY TO MANILA

The aircraft tender Langley, formerly based in San Diego and only recently sent to Pearl Harbor, has been ordered to Manila.

First indication of the contemplated Hawaii flight was the hurried departure Sunday of the aircraft tender Wright for Pearl Harbor. The vessel will act as guard hip for the planes en route and will be stationed in Hawaii as replacement of the Langley for an indefinite period.



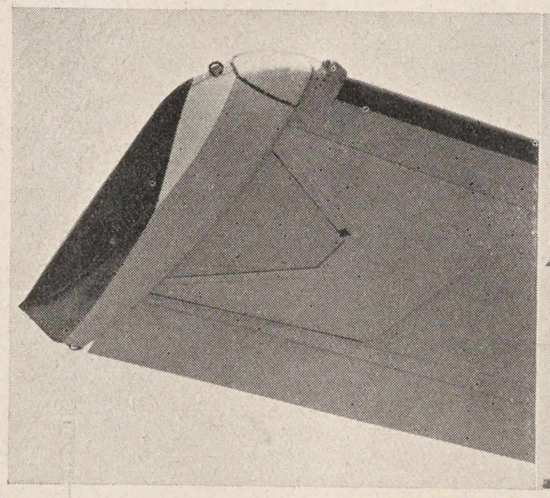
PICTORIAL SPECIFICATION

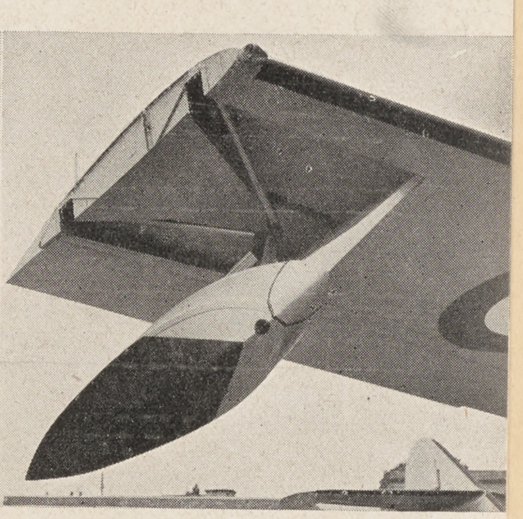
A Photographic Study of a Notable American Flying Boat

(Illustrated with "Flight" photographs)

THROUGH the courtesy of the Air Ministry, who have acquired the machine for experimental purposes, *Flight's* chief photographer was able at Felixstowe last week to "go to work" on the American Consolidated Model 28-5 twin-engined flying boat. This machine was lately flown across the Atlantic from Botwood, Newfoundland, to the Marine Aircraft Experimental Establishment at Felixstowe after having flown to Botwood from the Consolidated factory in San Diego.

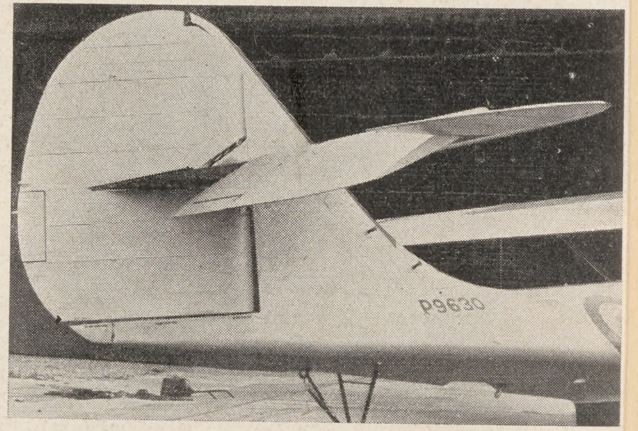
In all essentials the machine resembles the PBY machines, more than 200 of which are being supplied to the U.S. Navy and which have replaced destroyers for scouting and reconnaissance duties. Despite its comparatively low wing loading, the 28-5 is claimed to have a maximum range of more than 4,200 miles. The engines are two Pratt and Whitney Twin Wasps and the top speed is claimed to be over 200 m.p.h.

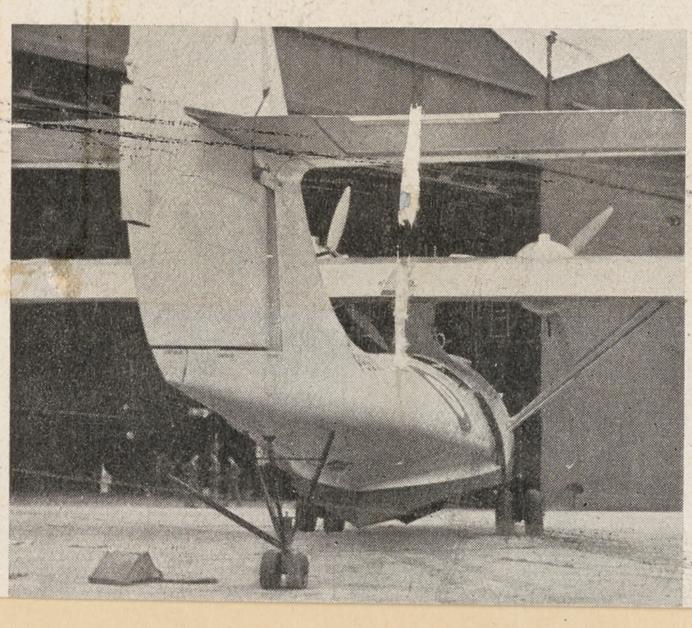


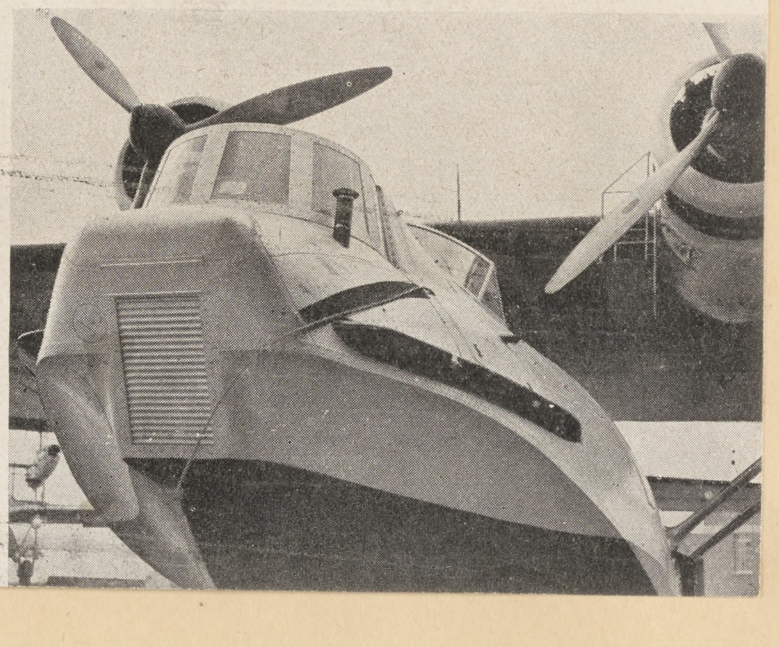


The characteristic features of the Consolidated 28-5—large wing area, retractable wing-tip floats and peculiar hull formation—are apparent in the top view on this page. Below it are close-ups of the float retracted and partially extended while on the right is a study of the tail with its single fin and very large rudder, the former built integral with the hull. Below, on the left, is a view which shows more details of the tail, the broad hull and the termination of the step. Finally, there is a view of the bows showing the location of the bomb aimer's window and the gun turret.

C







the Arctic proved beyond any doubt that standard aircraft is capable of undergoing the rigours of Arctic conditions. The performance of the radio equipment and the accuracy of the meteorological services also confirmed the belief that the conquest in the Arctic is many years nearer achievement than was anticipated before the Soviet flyers began their experiments in the summer of 1937.

WHEN the Russian flyers were first reported missing, the Mackenzie Air Service sent a plane along the Alaska Coast to check a story from Eskimos who told of having heard a plane on the day Levanevsky disappeared. On August 15th the Soviet Embassy at Washington asked Sir Hubert Wilkins, noted Arctic explorer, to head a search party. Convinced of the dangers of flying a land plane in the Arctic in mid-summer, due to the melted ice and treacherous landing conditions, he chose a long-range flying boat. He secured a twin-motor flying boat in New York which he felt was most suitable, and organized his crew. Within two days the party was en route to Edmonton and the North-West, leaving on the 17th. In the crew were Air Commodore Herbert Hollick-Kenyon of Toronto and S. A. Cheesman of Port Arthur, both of whom had accompanied Sir Hubert Wilkins as pilots on an Antarctic expedition. The other two members of the crew were Gerald D. Brown, Engineer, and Raymond E. Booth, Radio Operator. Sir Hubert Wilkins acted as navigator.

Four days after leaving New York the search party had established its first base at Coppermine, 90 miles north of the Arctic Circle and immediately began operations. The fuel tanks of the flying boat carried 1,760 gallons of gasoline which was sufficient for a flight of 3,000 miles. In addition to this supply ten extra drums of fuel were carried in the cabin of the plane to allow an additional flying range of 500 miles. As the plane was taxied out for the first search flight, a leaking oil line was discovered. The sudden change in temperature, which in August was a few degrees above freezing, had loosened some connections and a complete check-up was necessary before the flight could get underway.

On the first flight the flyers learned to their surprise that at high altitudes the temperature was warmer than nearer the ground. This was due to air currents, which are heated in the Tropics and blown toward the Poles. Falling towards the earth's surface in the Arctic, the air chills and drifts back towards the equator. This weather phenomenon made air travel in the Arctic considerably more comfortable than had been anticipated.

In the midst of one of the flights at an altitude of 10,000 feet, an overflow of gasoline from the drums flowed over the cabin floor. The Eskimo ground crew had filled the drums to capacity, and the reduced air pressure at this altitude caused the gasoline to expand and run over, covering the floor to a depth of about two inches. Locking himself in the cabin compartment, Sir Hubert Wilkins worked for two hours sopping up the fuel with old rags until it had been all evaporated. "It was really miraculous", says Sir Hubert Wilkins, "that it had not already caused an explosion". Three flights in all were made from the base, the total mileage being about 5,000 miles.

During their flights which were pointed directly into the region in which the flyers were lost, radio calls were sent out every thirty minutes in the hope of contacting Levanevsky. Although cloud and fog banks made it difficult to see whole areas of ice fields, the visibility, even at night during August and September in 1937, was generally good. Sir Hubert Wilkins spent most of his time in the air seated in the navigator's cockpit in the nose of the flying boat, wearing four-powered spectacle binoculars. When he spotted a dark object or anything even remotely suggestive of a plane or a tent on the ice below, he used high powered glasses for a closer inspection. With him the entire crew kept a lookout covering their vast network of flights.

On their return to Coppermine after the first series of flights, they decided to move their base to Aklavik, 600 miles West. This change was due in the first place to the fact that the Royal Canadian Air Forces' emergency supply of gasoline had been rapidly depleted by the plane which burned about 75 gallons per hour; and secondly because the new location was better suited for shorter approach flights into the area they wished to search. At Aklavik they also had the advantage of direct air communications with Edmonton.

When they reached Aklavik a representative of the Ethyl Corporation with an emergency supply of Ethyl fluid provided by Imperial Oil Limited was on hand to service the flying boat with the proper gasoline mixture and to formulate the necessary octane rating for the equipment in use. Rigged out in a gas mask, rubber clothes and gloves, his appearance was unusual even for the shores of the Arctic Ocean where styles seem strange to the visitor.

ON September 2nd the search party moved over into Alaska to visit Barter Island and re-check the rumours that Levanevsky's plane had been heard in that vicinity. After a short delay the weather report indicated good weather, and a new series of flights commenced. Zig-zagging back and forth between 82° and 85° north latitude and 135° to 150° west, they continued the search. A week or so later the ice began to encrust the surface of the flying boat and it was decided to discontinue the search with the flying boat. During the thirty-day search they flew 13,000 miles over the Arctic.

On his return to New York, the Soviet Government asked Sir Hubert Wilkins to continue his search in a plane equipped with skis. Dick Merrill's trans-Atlantic plane was purchased and flown to Edmonton where it was fitted out with skis. Although considerably smaller than the flying boat, since it only carried two men, this ship had a long cruising range. Sir Hubert Wilkins and Hollick-Kenyon returned to Aklavik on November 23rd, taking Allan Dyne, engineer from Canadian Airways and W. R. Wilson as radio operator in place of Booth and Brown. The twin-engined monoplane was equipped with de-icers on the propeller hubs and also had a radio direction-finder which was used extensively with two long-wave radio direction-finding sets which were put in operation at Aklavik and Point Barrow, Alaska.

The winter expedition did not have favorable flying conditions until well into the New Year. Grounded at Point Barrow, just prior to Christmas, they celebrated a real Arctic Christmas by visiting all the white families for Christmas dinners. On January 12th they were forced to return to Aklavik due to the heavy drifts at Port Barrow which would not allow a take-off with a full load. The plane had also begun to accumulate salty hoar frost which formed a solid coating of ice both on the inside and outside of the plane. This could be removed only by tapping the ice with hammers. To overcome this condition on the windows it was found necessary to fly with them open. Otherwise, the fliers could not see.

On January 16th Sir Hubert Wilkins and Hollick-Kenyon prepared for another cruise into the Arctic. They took off at night into the clear semi-gloom of the full moon in a temperature that registered 44° below and continued their search over another wide area. On their return, engine trouble developed from an accident to one of the propellers and another lay-off was necessary until a new motor could be flown up from Edmonton. It was about the first of March before the engine was installed and ready to fly. To test the new engine a complete inland search was made out across the Richardson and Brook Mountains in Alaska—an area into which the Russian plane might have flown if there was any accuracy in the stories told by the Eskimos of Barter Island. Bad weather delayed further flights until March 10th when an eleven-hour flight was made and this one was followed up by another flight on March 14th which proved to be the longest and most informative of the entire search. They were in the air for nineteen and a half hours and covered 2,300 miles in a search which carried them to within 200 miles of the North Pole. Two more flights were anticipated but before suitable flying weather was obtained the Soviet Government had decided to give up the search and asked them to return to New York.

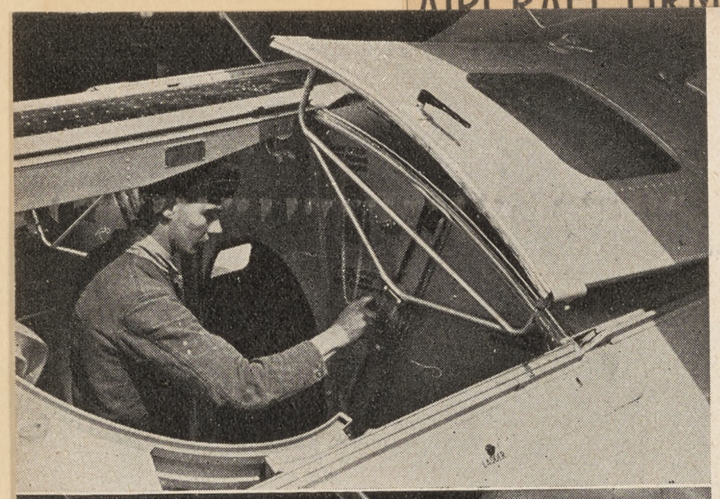
During the six months' search the Wilkins' flights covered 44,400 miles without any mishap or failure on the part of his equipment. In giving up the search Sir Hubert Wilkins stated that he and his companions "sincerely regretted" that the search did not succeed in locating Levanevsky and his companions. "Their efforts —perhaps more than those of any others," said Sir Hubert Wilkins, "will inspire the development which will eventually open the shortest routes for aerial transportation between the big cities of the Northern Hemisphere."

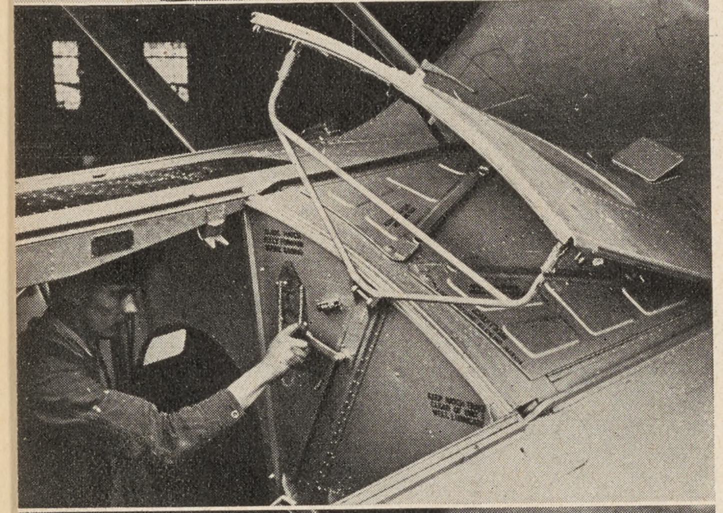
INTERNATIONAL DAY ON THE PRAIRIES

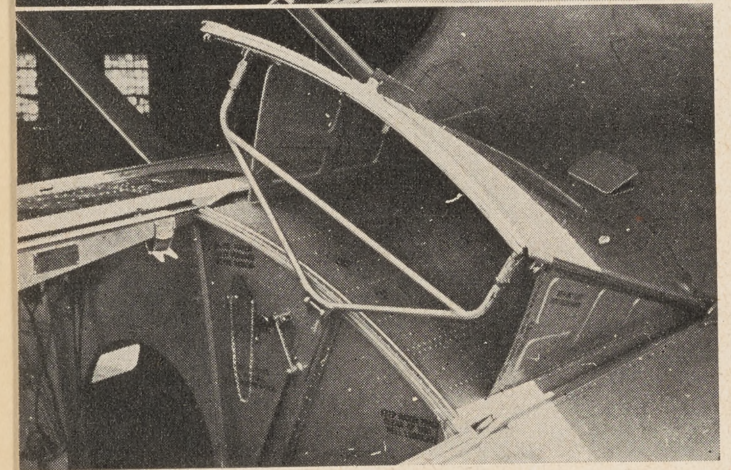
● International Day in Swift Current, Sask., sponsored by the Kinetic Club, is an event which crowds the prairie city with thousands of visitors. These photographs, supplied through the courtesy of the Swift Current "Sun", show (above) a part of the crowd watching the parade; an African kraal (left) which masked a merchant's store and (right) a desert scene masking a bank building.

AIRCRAFT FIRM

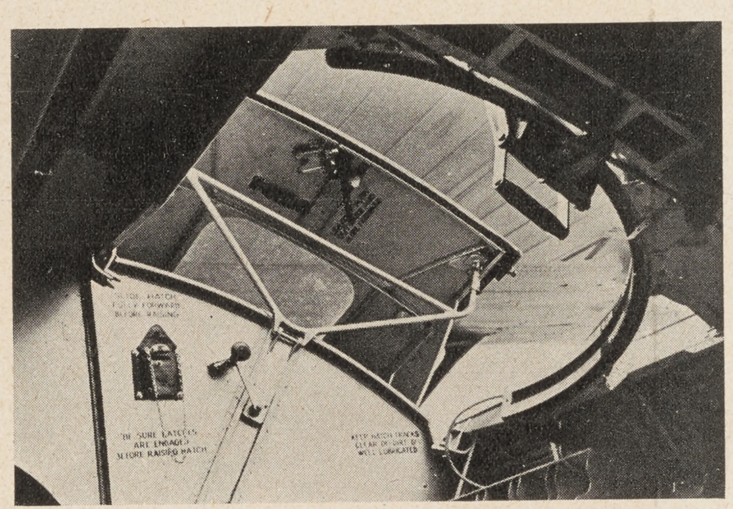
SDAY MORNING, SEPT. 12,

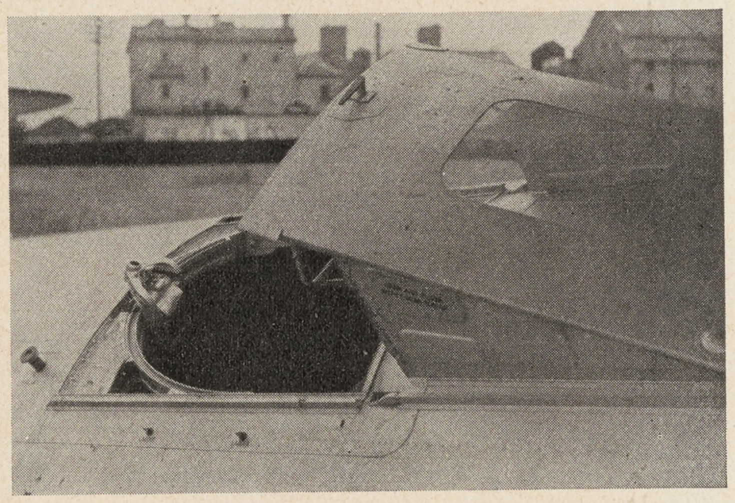


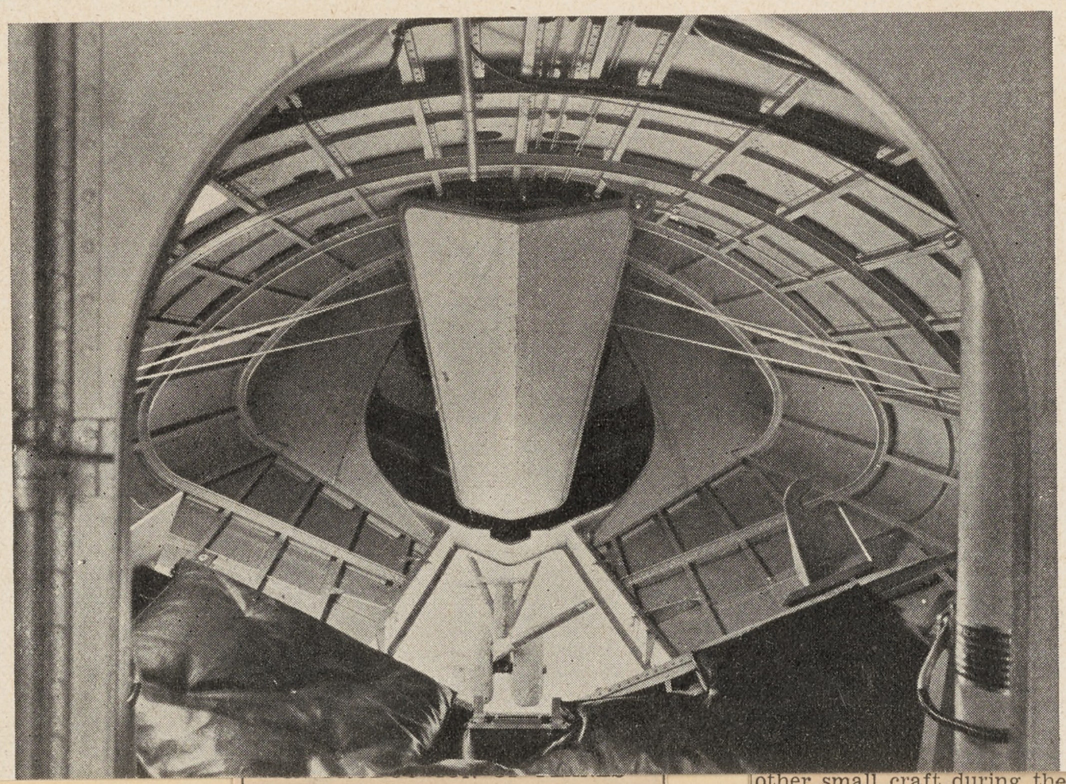




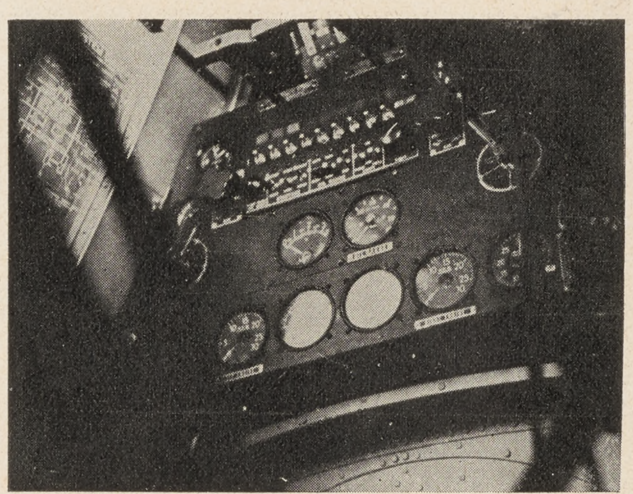
Five views of one of the two deck gun positions. On the left the portion of decking which protects the gunner from the airstream is shown being raised after having been slid forward. The third view shows the side plates in position. Below is a "shot" of the gunner's position from inside the hull and below that is a view showing everything ready for action, except that the gun is not fitted to the track-type mounting which, incidentally, operates very smoothly.



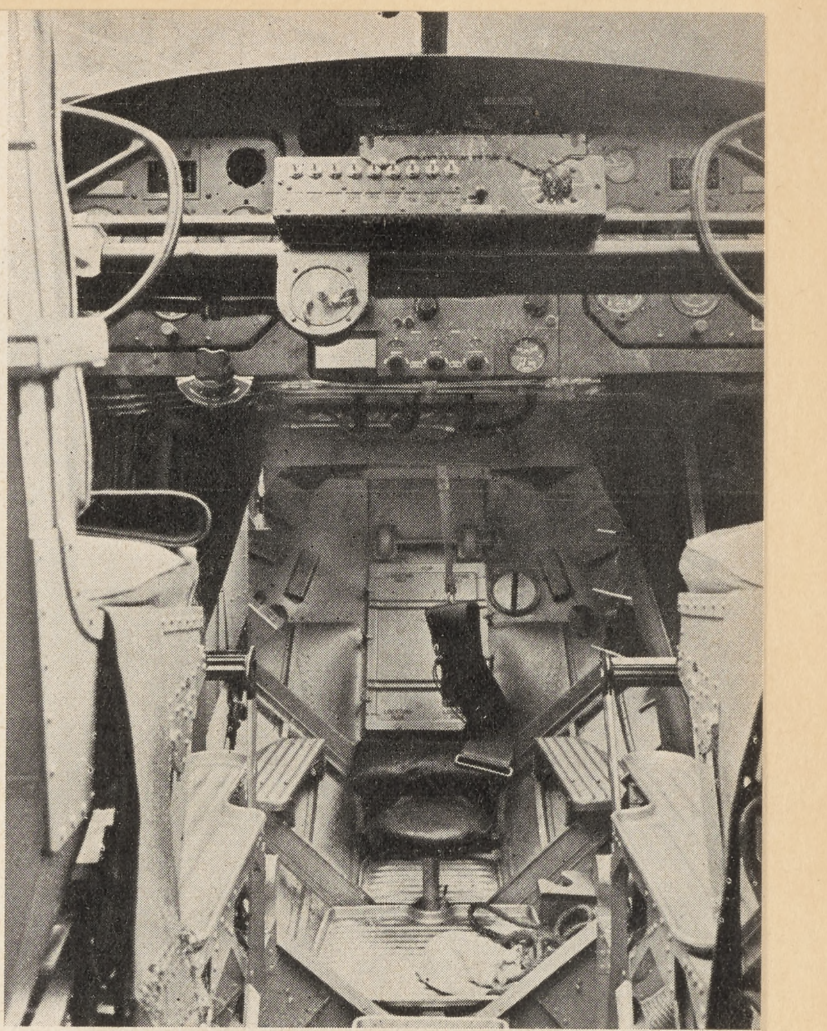


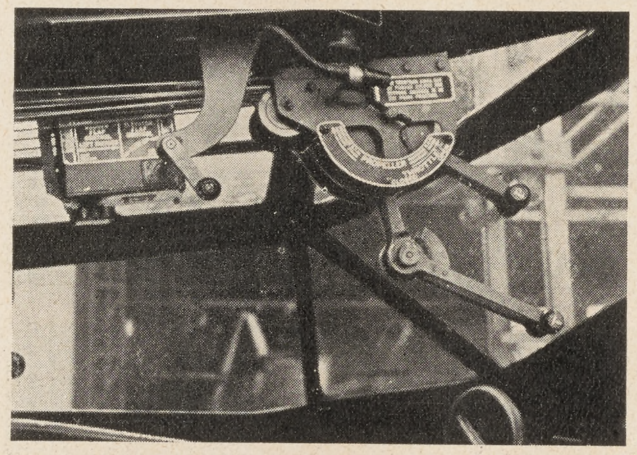


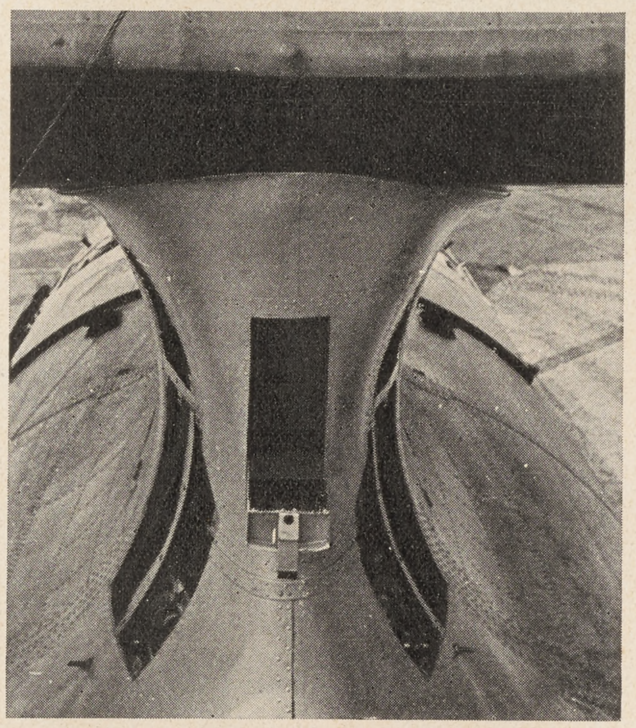
(Left) This is what the Americans call the tunnel gun position. Actually it is not so much a tunnel as an aperture in the floor which is normally filled by the folding section of hull seen above it. This view also shows the section and construction of the rear portion of the hull.



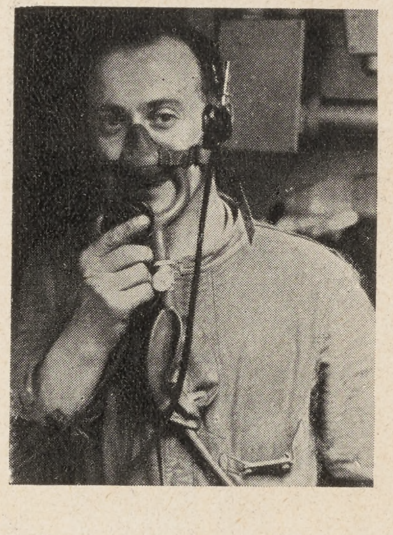
The majority of the engine instruments are grouped on the flight engineer's panel shown above and not in the pilot's cockpit which is seen on the right. The row of switches on the pilot's dashboard transmit orders to corresponding visual indicators on the engineer's panel. The flight engineer sits in the superstructure between the hull and the wing where he may observe the engines directly. He also operates the wing tip floats either manually or electrically. Below are the pilot's throttle and trim controls in the roof of the cockpit.



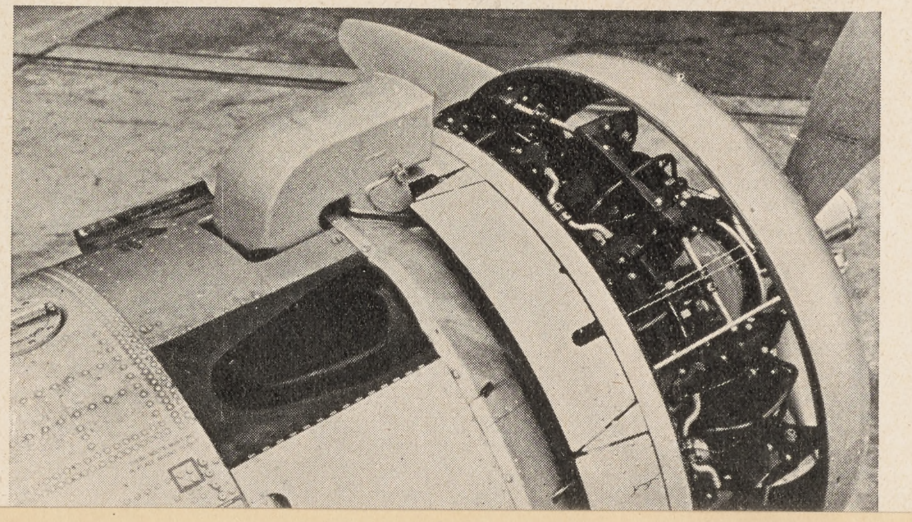




On the right is a view looking aft showing the superstructure in which the flight engineer is housed. A section of the de-icer is also visible. Below is a view of the installation of one of the Pratt and Whitney Twin Wasps with part of the cowling removed.



The oxygen mask as used by the crew of the Consolidated 28-5 leaves the mouth free to use the intercommunication system which extends throughout the boat.



WAITING FOR MR. CLAPP

SYDNEY, Monday.

Air Force officials view with concern the delay in the scheme for mass production of British Beaufort aeroplanes in Australia. One senior officer said to-day that Australia had all the expert guidance she needed and it would appear that there had been a marked lack of initiative on the part of some responsible persons.

Australia's mass production of planes cannot become effective until Mr. W. H. Clapp, who is still Victorian Railway Commissioner, takes over the organising of the industry.

Sir Hubert Wilkins spent most of his time in the air seated in the navigator's cockpit in the nose of the flying boat, wearing four-powered spectacle binoculars. When he spotted a dark object or anything even remotely suggestive of a plane or a tent on the ice below, he used high powered glasses for a closer inspection. With him the entire crew kept a lookout covering their vast network of flights.

On their return to Coppermine after the first series of flights, they decided to move their base to Aklavik, 600 miles West. This change was due in the first place to the fact that the Royal Canadian Air Forces' emergency supply of gasoline had been rapidly depleted by the plane which burned about 75 gallons per hour; and secondly because the new location was better suited for shorter approach flights into the area they wished to search. At Aklavik they also had the advantage of direct air communications with Edmonton.

When they reached Aklavik a representative of the Ethyl Corporation with an emergency supply of Ethyl fluid provided by Imperial Oil Limited was on hand to service the flying boat with the proper gasoline mixture and to formulate the necessary octane rating for the equipment in use. Rigged out in a gas mask, rubber clothes and gloves, his appearance was unusual even for the shores of the Arctic Ocean where styles seem strange to the visitor.

ON September 2nd the search party moved over into Alaska to visit Barter Island and re-check the rumours that Levanevsky's plane had been heard in that vicinity. After a short delay the weather report indicated good weather, and a new series of flights commenced. Zigzagging back and forth between 82° and 85° north latitude and 135° to 150° west, they continued the search. A week or so later the ice began to encrust the surface of the flying boat and it was decided to discontinue the search with the flying boat. During the thirty-day search they flew 13,000 miles over the Arctic.

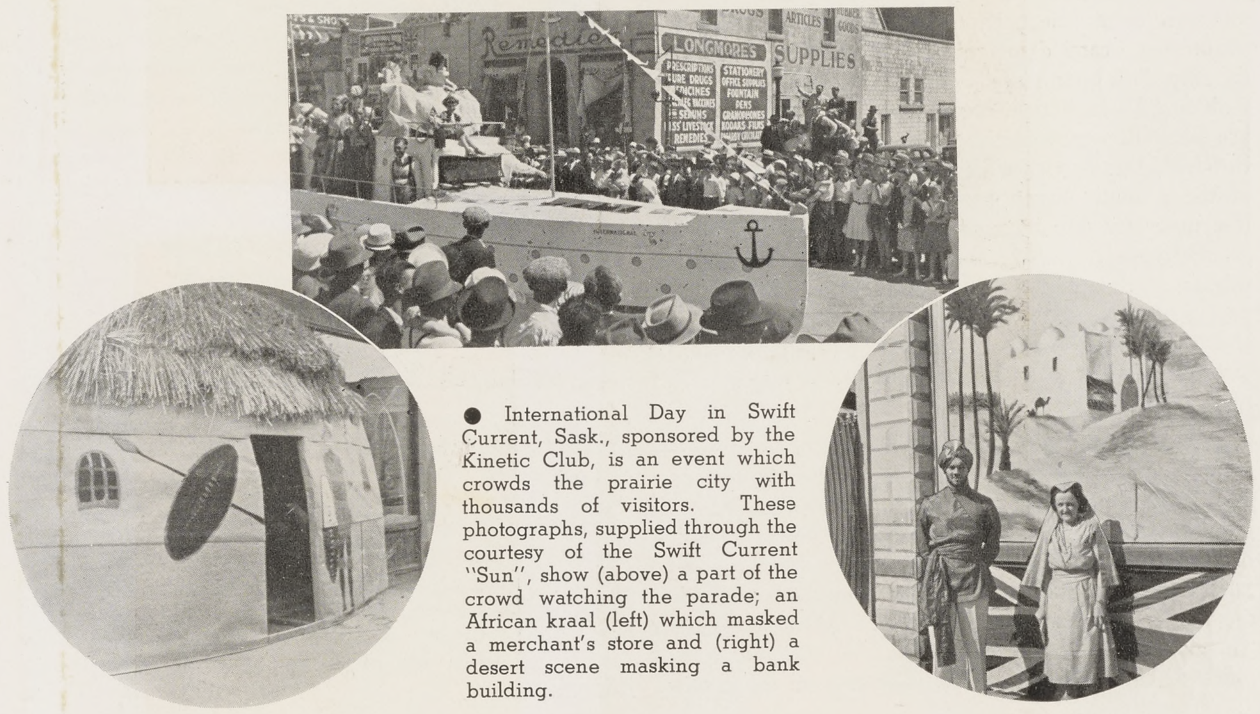
On his return to New York, the Soviet Government asked Sir Hubert Wilkins to continue his search in a plane equipped with skis. Dick Merrill's trans-Atlantic plane was purchased and flown to Edmonton where it was fitted out with skis. Although considerably smaller than the flying boat, since it only carried two men, this ship had a long cruising range. Sir Hubert Wilkins and Hollick-Kenyon returned to Aklavik on November 23rd, taking Allan Dyne, engineer from Canadian Airways and W. R. Wilson as radio operator in place of Booth and Brown. The twin-engined monoplane was equipped with de-icers on the propeller hubs and also had a radio direction-finder which was used extensively with two long-wave radio direction-finding sets which were put in operation at Aklavik and Point Barrow, Alaska.

The winter expedition did not have favorable flying conditions until well into the New Year. Grounded at Point Barrow, just prior to Christmas, they celebrated a real Arctic Christmas by visiting all the white families for Christmas dinners. On January 12th they were forced to return to Aklavik due to the heavy drifts at Port Barrow which would not allow a take-off with a full load. The plane had also begun to accumulate salty hoar frost which formed a solid coating of ice both on the inside and outside of the plane. This could be removed only by tapping the ice with hammers. To overcome this condition on the windows it was found necessary to fly with them open. Otherwise, the fliers could not see.

On January 16th Sir Hubert Wilkins and Hollick-Kenyon prepared for another cruise into the Arctic. They took off at night into the clear semi-gloom of the full moon in a temperature that registered 44° below and continued their search over another wide area. On their return, engine trouble developed from an accident to one of the propellers and another lay-off was necessary until a new motor could be flown up from Edmonton. It was about the first of March before the engine was installed and ready to fly. To test the new engine a complete inland search was made out across the Richardson and Brook Mountains in Alaska—an area into which the Russian plane might have flown if there was any accuracy in the stories told by the Eskimos of Barter Island. Bad weather delayed further flights until March 10th when an eleven-hour flight was made and this one was followed up by another flight on March 14th which proved to be the longest and most informative of the entire search. They were in the air for nineteen and a half hours and covered 2,300 miles in a search which carried them to within 200 miles of the North Pole. Two more flights were anticipated but before suitable flying weather was obtained the Soviet Government had decided to give up the search and asked them to return to New York.

During the six months' search the Wilkins' flights covered 44,400 miles without any mishap or failure on the part of his equipment. In giving up the search Sir Hubert Wilkins stated that he and his companions "sincerely regretted" that the search did not succeed in locating Levanevsky and his companions. "Their efforts—perhaps more than those of any others," said Sir Hubert Wilkins, "will inspire the development which will eventually open the shortest routes for aerial transportation between the big cities of the Northern Hemisphere."

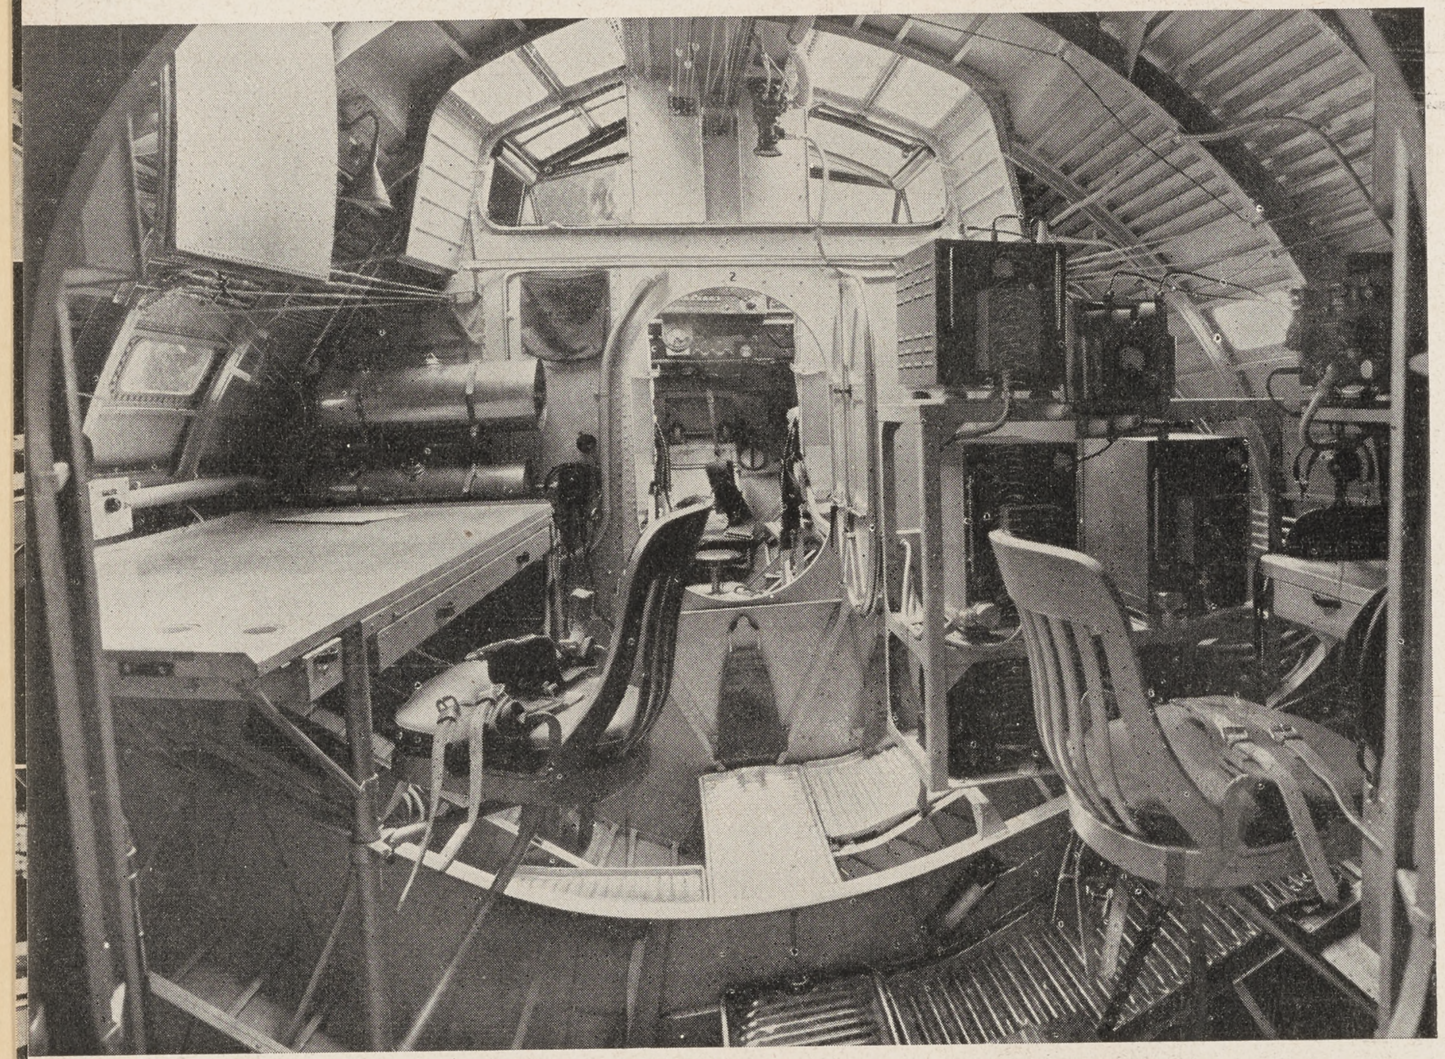
INTERNATIONAL DAY ON THE PRAIRIES



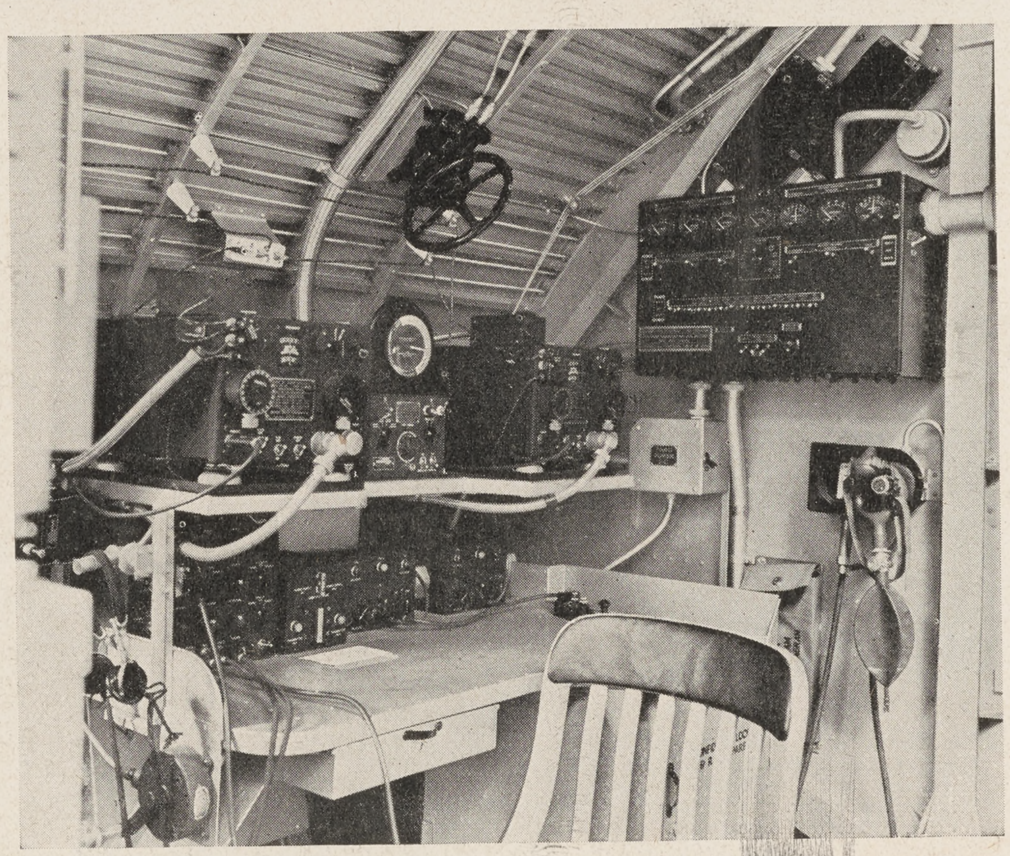
● International Day in Swift Current, Sask., sponsored by the Kinetic Club, is an event which crowds the prairie city with thousands of visitors. These photographs, supplied through the courtesy of the Swift Current "Sun", show (above) a part of the crowd watching the parade; an African kraal (left) which masked a merchant's store and (right) a desert scene masking a bank building.

AIRCRAFT FIRM

SDAY MORNING, SEPT. 12,



Above is a unique view showing the compartment occupied by the navigator and the wireless operator. The Bendix installation seen on the right and in the lower view comprises main and auxiliary transmitters, two complete receivers, a direction-finder and an inter-communication system which extends throughout the hull and permits both pilots to use the wireless directly when necessary. The loop aerial is extended through the roof and is remotely controlled from the wheel seen in the smaller view over the wireless operator's table. The cylinders by the navigator's table are drinking-water tanks.



WAITING FOR MR. CLAPP

SYDNEY, Monday.

Air Force officials view with concern the delay in the scheme for mass production of British Beaufort aeroplanes in Australia. One senior officer said to-day that Australia had all the expert guidance she needed and it would appear that there had been a marked lack of initiative on the part of some responsible persons.

Australia's mass production of planes cannot become effective until Mr. W. H. Clapp, who is still Victorian Railway Commissioner, takes over the organising of the industry.

---

other small craft during the hazardous takeoffs with full gasoline loads.

The San Diego squadron will be sent to Hawaii to replace one just ordered to the Philippines in a move to strengthen defense forces required to enforce U. S. neutrality.

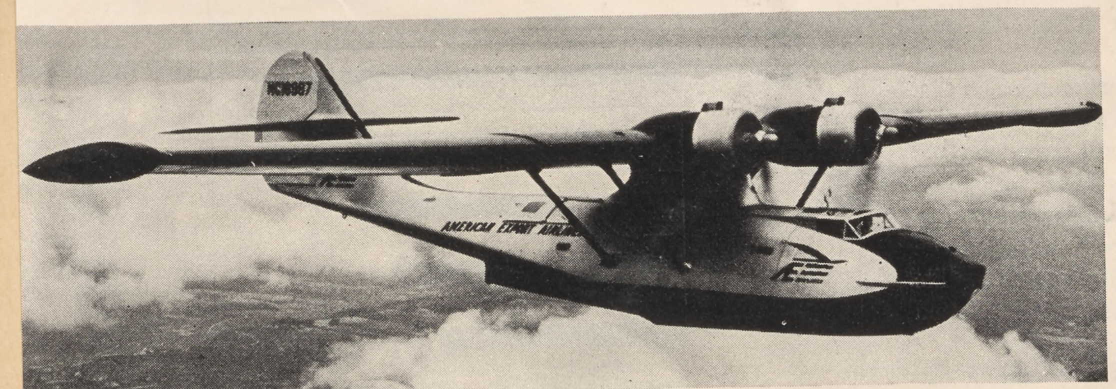
LANGLEY TO MANILA

The aircraft tender Langley, formerly based in San Diego and only recently sent to Pearl Harbor, has been ordered to Manila.

First indication of the contemplated Hawaii flight was the hurried departure Sunday of the aircraft tender Wright for Pearl Harbor. The vessel will act as guard hip for the planes en route and will be stationed in Hawaii as replacement of the Langley for an indefinite period.

HERE AND THERE IN BUSINESS

WHAT'S NEW AS OBSERVED BY THE AGENCY'S REPORTERS



Air Boat—*Trans-Atlantic surveys south of Pan-American's route are being conducted by American Export Air Lines. subsidiary of a shipping line, for Fall mail service.*

Caution—Rarely does a manufacturers' association say the trade's newest product is getting too much favorable publicity. In the end days of this June, the Board of Directors of the Radio Manufacturers' Association did this, going on record publicly as opposed to the creation of false hopes for television.

Scanning their new baby through the minimizing end of the spy glass, they saw television at present as limited within a 50-mile radius of the Empire State building, and to even smaller areas in a few other cities in the near future.

Television, they said, has suffered from over-statement, and its inauguration in New York may arouse false and ungrounded hopes in the minds of people throughout the country. Over 90 per cent of the geographical area of the United States will not be served for some time to come.

Television must be considered as a supplemental service to radio broadcasting. "It will not render the modern radio receiving set obsolete any more than the airplane renders the modern auto obsolete."

One reason for this caution is understandable. Folks who vainly await television sets, defer buying current radio equipment.

Selling—One of our reporters got a letter the other day from the Eberhard Faber Pencil Company, Brooklyn, N. Y. It answered a query about "Noblot," a mechanical pencil with lead which writes as permanently as ink. The letter was signed in pencil, but when the black tones were erased, a light blue ink effect remained—evidently "Noblot."

A former salesman, the reporter says this is one of the rare times he has encountered a manufacturer, publisher, or purchasing agent who demonstrated use of his company's product when either buying someone else's or answering an inquiry which was not a sales lead.

Electric bills—In Prosser, Wash., customers of the Benton Rural Electric Association read their own meters, figure their own bills, mail meter reading and payment together.

Before this an agent made the rounds, from two to 60 miles, read meters, and sent bills. The cost was about 30 cents each. Farmers paid when they got around to dropping into town.

Now monthly collections cost slightly over 10 cents per member. This includes money order fee, which is deducted from the bill, postage reply envelopes, and duplicated instructions. During its early operation, the plan has improved collections 50 per cent.

Monthly electric bills are filled out by the utility staff, except for current readings. Each bill form has four circles, numbered to correspond with electric meter clocks. On these the user draws arrows, showing where the pointers are on his meter.

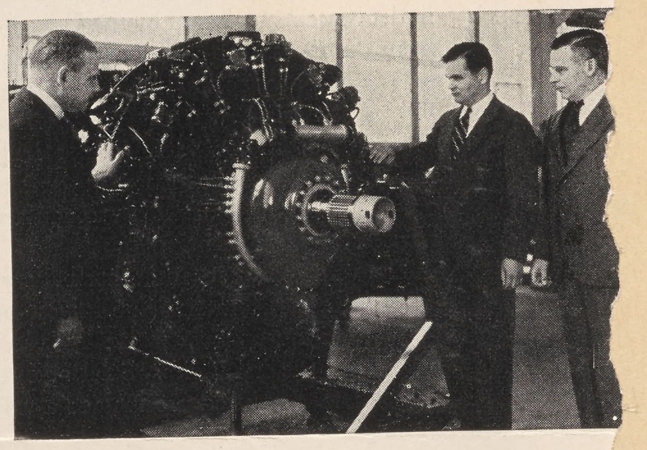
He enters his kilowatt-hour reading and subtracts last month's, already filled in. After a huddle with a table of charges, he knows what he owes. A money order from the rural postman finishes the matter quickly.

When all meter readings come in, Benton Rural Electric can check the total against its total output.

Shoes—Since the double header in World's Fairs opened, twin Meccas for what O. Henry fondly would have called "The American Rubberneck," it has become evident that the feet of today can't keep pace with the World of Tomorrow.

This problem was considered by the Florsheim Shoe Company, Chicago, Ill., and there is now available "The Shoe of Tomorrow." Cardinal virtue of this product is that every pair stretches, *i.e.*, swells luxuriously, to accommodate the prisoners within.

Tomorrow's shoe is cut from buckskin, which stretches. Backing up the buckskin is a woven Lastex lining. This pulls the leather back to its original shape while a wearer, presumably, is soaking his pedals in warm water.



Cloud thrasher—*World's largest, most powerful air-cooled airplane engine, this new 18-cylinder Wright Duplex-Cyclone motor powers a Consolidated Aircraft flying boat which holds 57 persons and can cruise 10,000 miles.*

Saw Scene—If you will visualize a one-room factory covering five acres, in which are four big drop hammers, a precision-testing engineering laboratory, an office force, and eight self-con-

CONSOLIDATED IN BUSINESS RUSH

3000 Employes Seen Before End Of '39

(Copyright, 1939, San Diego Sun Publishing Co., Ltd.)

By HAROLD KEEN
Aviation Editor

The feverish pace to prepare the United States for any eventuality is reflected in the intense activity at Consolidated Aircraft Corp., where important developments vital to national defense were made known today.

With a payroll of 1800 employes that is due to be swelled to 3000 before the end of the year, Consolidated is rushing to completion the first of 24 four-motored Army and Navy bombers in contracts totalling approximetely $16,000,000.

NAVY AIRBOATS

Six of these craft are Navy airboats, each costing about $800,000. They are similar to the bomber that has made non-stop round trip crossings of the continent and recently returned from Alaska, where it transported Rear Adm. A. B. Cook, Aircraft Scouting Force commander, on an inspectoin tour. Its 25 tons and armed potentialities make it the largest and most powerful plane in the U. S. Navy.

Little has been disclosed of the four-motored Army bomber. The Army, whose procurement system is different from that of the Navy, placed orders for 18 of these super winged fortresses merely on the basis of a wooden prototype, known as the mockup, and the design. Consolidated defeated the Boeing producers of the famous "flying fortresses" in the design competition, which was said to have brought out startling advances in performance possibilities of heavy bombers.

MYSTERY SHIP

The four 1000 h. p. Pratt & Whitney engines, which will be housed in a 110-foot wing similar to that on the Consolidated "mystery ship," the twin-engined, steep-hulled Model 31, will give the plane terrific speed possibilities. elocity in excess of 300 miles per hour will be achieved, the designers believe, and if this is true, it will not only provide America with a sensational improvement on its present flying fortresses but will furnish part of the answer to defense against speedy pursuit planes so essential in an air war.

Another almost characteristic will be the cruising range of the Army plane, which some reports set as high as 10,000 miles. Destruction over a wide area, hitherto unapproached, will be possible with such a non-stop ability.

MAJOR PRODUCTION

Careful to avoid placing all its contract hopes in one basket, as was done for a period of more than two years, when seaplanes comprised the major form of production and experimental activity, Consolidated has added an amphibian type, it was learned.

Adapted to the design of the twin-engined PBY airboat, of which more than 200 are in Navy service, a plane capable of both land and sea operation soon will be delivered to North Island.

The firm is advertising in trade magazines the practicality of converting its four-motored Navy bomber to a commercial transoceanic airliner. The copy, which undoubtedly was written before the European war, paints an attractive picture of overnight flights to London "in luxury non-stop in the ease of an exclusive club."

CONTRACTS EXPECTED

That Consolidated is expecting another large contract soon was revealed by Port Director Joe Brennan to the City Council yesterday, when he sought authority for the Harbor Commission to grant the firm a lease on 17 addi-

Navy Bomber Returns

Here to be fitted with special heating aparatus for flying at high altitudes, the navy's four-motored, long-range patrol bomber has returned to North Island from an Alaskan cruise. The bomber recently was assigned as aerial flagship to Rear Adm. Arthur B. Cook, commander scouting force aircraft, who is now on an inspection of Alaskan and Hawaiian naval air bases. The new flagship is commanded by Comdr. Andrew Crinkley.

POWERFUL NEW BOMBERS FROM AMERICA

Greatest U.S. Contribution To Victory

By THE "SUNDAY TIMES" AIR CORRESPONDE

News that America has released twenty-six Consolidated B-24 four-motor bombers for immediate delivery to the R.A.F. is most encouraging.

The Consolidated Model 32, designated the B-24 by the U.S. Army, is by far the best military aeroplane which the U.S.A. has yet produced and the first American aeroplane on which we can really unreserved enth

four motors, there is little
larity. Incidentally, the
Company has copyrighte
name "Flying Fortress"—
is misleading anyway.

The sending of these
dated bombers for the R
intensify the offensive is o
greatest contributions
can make towards the w
the war.

LAST STAGE OF GREAT GUBA FLIGHT

Victoria, Australia.

Safe Arrival At Mombasa

In this article, the last of a series of four on Captain P. G. Taylor's flight survey of the reserve Empire air mail route across the Indian Ocean, Mr J. Percival, Jun., official newspaper correspondent, describes the arrival of the Guba at Diego Garcia, in the Chagos Archipelago, and at Mahe, in the Seychelles.

THE Guba left Cocos Island late in the afternoon of June 13, and the 1470 miles flight through the night was uneventful in the smooth, cool air.

In the early hours of the morning, wireless communication with VIS, Sydney, and VIP, Perth, the Australian coastal stations, was lost for the first time.

It was estimated that the aircraft would arrive at Diego Garcia a few minutes before dawn. In the darkness of early morning the lights of H.M.S. Manchester, based there for the flight, were sighted.

The cruiser, anchored in the great pear-shaped lagoon, looked like an illuminated toy.

The aircraft made two wide circuits of the palm-covered coral, and as the first tinge of light appeared over the horizon she settled down beside H.M.S. Manchester. Soon a launch was beside her, and the crew was invited to board the cruiser for hot coffee, baths, shaves and breakfast. H.M.S Manchester left that afternoon.

LONELY FRENCHMAN

Diego Garcia was originally a French settlement, but is now British.

The cocoanut plantation is managed by a lonely Frenchman. In the space of a few days he saw the arrival of H.M.S. Manchester, the island steamer, Zambezi, which visits him once in every four months, and the Guba.

He dug deep into his cellar and his black servants fossicked the island to supply the best for our table. He made his first flight the day after our arrival.

The Guba made a smooth passage to Mahe, an island paradise in the Seychelles, on June 16. The mountains of Mahe rise sheer out of the surrounding ocean depths of 2000 fathoms to heights up to 3000 feet.

The sight of a mountainous island brought a strange feeling of security again. There is a feeling of insecurity about Cocos Island and Diego Garcia, where the highest coral outcrop from which the cocoanut palms sprout is only about 10 feet above sea level.

"GREAT VALUE"

The day after the Guba's arrival at the Seychelles, H.M.S. Liverpool, with which the Guba was in communication during the flight, entered Port Victoria.

The Governor of the Seychelles (Sir Walter Buchanan Smith) made his first air journey during a photographic flight.

After the survey work at Mahe, the Guba tooff-off for Africa in the morning on June 21, and alighted at Mombasa flying boat base the same day.

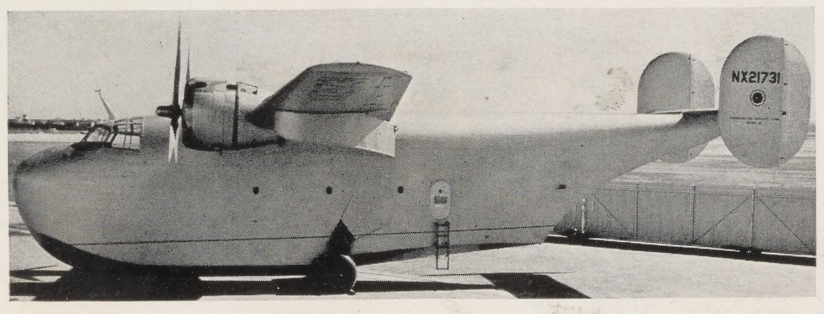
Arriving at Mombasa, Captain Taylor said that the flight had been fully justified, and that the route should be of great value to Imperial communications. Information obtained in the survey would enable the establishment of a regular service at short notice.

"The use of the Indian Ocean route will bring Australia and Africa within two days of each other," he said.

AERO EQUIPMENT REVIEW MAY-39

CONSOLIDATED MODEL 31 FLYING BOAT

POWERED WITH TWO WRIGHT 2,000 H.P. ENGINES TOPS 275 M.P.H.–CAPABLE OF 10,000 MILE RANGE



Consolidated Model 31 Flying Boat

Some ten months after its design and construction was initiated Consolidated Aircraft's new Model 31 twin-engine flying boat took to the air off San Diego Bay one day this month. The outstanding figures reported on completion of the first flight were that the 50,000-pound Model 31, powered with two 2,000 h.p. Wright Duplex-Cyclones, has a top speed of 275 m.p.h., is capable of a range of 10,000 miles, with a light passenger load.

Contrasted against a chunky hull, with a sharply upswept stern, is an extremely slim wing, reputedly the product of ten years' development work by engineer David R. Davis. The wing narrows to such a small tip that the outboard floats retract to the underside of the outer wing panel, rather than at the tip as they do on the PBY's. The wing, tail surfaces, and the planing surface of the hull are flush-riveted.

The Model 31 is built with two full decks, one above the other, providing a large flight control compartment and eight additional large compartments. It is designed to accommodate a crew of five in a completely sound-proofed flight compartment furnished with all the latest type instruments and equipment. As a commercial airliner, it has a maximum capacity for 52 passengers for daytime operations and 28 sleeper passengers for night operations. For trans-oceanic flights, it has accommodations for 28 passengers. As a military airplane its function would be similar to that of the well-known Consolidated twin-engine patrol bombers built for the U.S. Navy.

At this instance it seems probable that this last application will be the Model 31's first service assignment. Although this is entirely the Consolidated Corporation's private venture, the Navy has been cognizant of the construction, and the performance delivered by the 31 is reported to have excited much interest on the part of the Navy. The fact that this was a private venture, and was not government financed nor subjected to the ordinary procedure routine, is held to be a major factor in the swift production of the design. While the development of types of similar magnitude, under government contract, has heretofore occupied from two to three years' time, this project was completed in ten months.

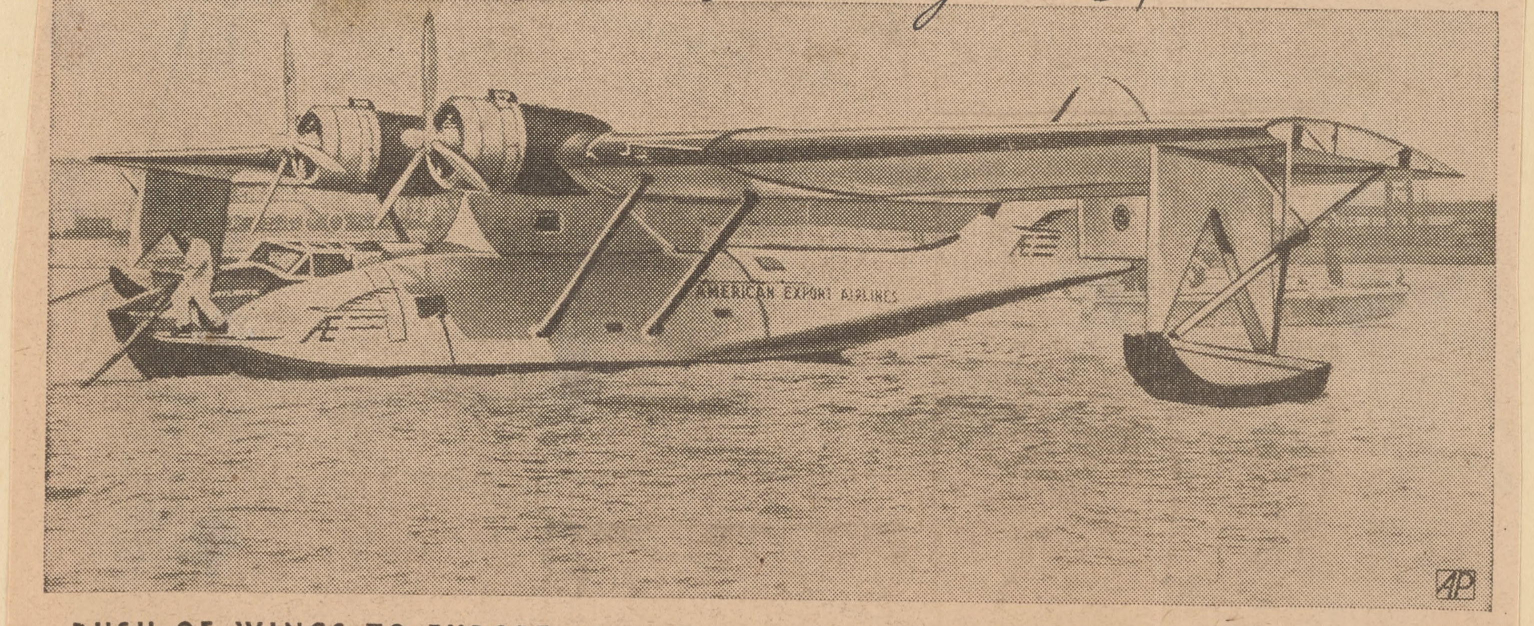
An aluminum coated aluminum alloy skin, internally reinforced with longitudinal stiffeners and transverse bulkheads and frames, is employed in the construction of the 31. Flush riveting is used on the wings, tail surfaces and the planing surface of the hull bottom. The full cantilever wing has integral fuel tanks in the center section. Hydraulically operated Fowler flaps extend from the inboard side of the ailerons to the hull. Ailerons and flaps are fabric covered. The full cantilever stabilizer has twin fins and rudders. Rudders and elevators are fabric covered.

The retractable tricycle beaching gear is hydraulically operated. The nose wheel is housed in a well in the bottom of the hull and the side wheels swing upward into wells in the side of the hull. All wheels are completely enclosed by doors for maximum efficiency in flight. The side wheels are removable in addition to being retractable. The two Wright Duplex-Cyclone 2,000 h.p. engines carry three-bladed, Hamilton Standard Hydromatic full-feathering propellers, with 16-foot diameters. Beyond the statement that the Model 31 exceeds the PBY in speed, range and load capacity, and those figures reported here, no performance figures have been released.

General specifications follow:

Wing span	approximately 110 feet
Length over-all	approximately 73 feet
Height	approximately 22 feet
Maximum wing chord	approximately 14 feet
Gross weight	approximately 50,000 lbs.

Santa Barbara News-Press aug 20-'39.



RUSH OF WINGS TO EUROPE—In the harbor at Saint Nazaire, France, rests "Transatlantic," the American Export Airlines' flying boat now engaged in making survey flights across the Atlantic, with a view to establishment of service from U. S. to 30 Mediterranean ports. The airline will possibly fly mail in the fall and passengers, in a year or two. Other airlines crossing the Atlantic are the Pan American Airways' Clipper ships, carrying passengers and mail, and Britain's Imperial Airways mail plane.

Sun 9-13-39

NAVY SQUADRON IN HAWAII HOP TODAY

Bound for Pearl Harbor to replace a squadron assigned to patrol Uncle Sam's westernmost defense line at the Philippines Patrol Squadron 13, commanded by Lieut.-Comdr. S. H. Ingersoll, was to take off at about 3 p. m. today, weather permitting, it was reported at North Island.

Ninety-eight officers and men will operate 14 twin-engined Consolidated bombers in the non-stop, 2500-mile jaunt to Hawaii.

The aircraft tender Wright, which left Sunday for an indefinite period of duty in Pearl Harbor, will be stationed along the line of flight to furnish weather reports and act as guard ship.

Extreme secrecy surrounded preparations for the hop during the past week, with Naval Air Station officials refusing to divulge details of the mission on direct orders from the Navy Department.

Today's flight will be the first to Hawaii by the Navy in more than a year. On Sept. 7, 1938, 17 bombers set a record of 17 hours, 17 minutes. To date, 59 Consolidated PBY's have been delivered by this method to Pearl Harbor, which has been developed into the Navy's strongest patrol plane base.

GUBA REACHES AFRICA

Victoria, Australia

Completes Aerial Survey Flight

(From J. Percival, jun., official correspondent aboard the flying boat Guba.)

MOMBASA (Kenya), Wednesday. — The Guba reached Mombasa at 9.45 a.m. Greenwich time (7.45 p.m. Melbourne time) today, completing her aerial survey of the trans-Indian Ocean flying boat bases.

The Guba took off from Mahe, Seychelles Islands, at 2 a.m. (12 noon, Melbourne time). The weather was fine with scattered cumulus cloud.

Flying at 8000ft. in a slight south-west wind, the Guba maintained a steady 128 knots.

Secret Fast Air Fighters For Australia

AUSTRALIA is to have a squadron of extremely powerful fighting planes — hush-hush machines which, when produced in England soon, will be the most modern in the Royal Air Force, the Minister for Defence (Brigadier Street) announced yesterday.

As the new planes are still on the secret list, details are not yet available, but it is understood that they will have a speed of 400 miles an hour, and will be armed with high-speed guns of a new type.

The squadron, probably consisting of 12 front-line planes, with six in reserve, will be stationed at Richmond (N.S.W.), and its function will be the protection of the industrial areas of the east coast.

Total cost to the Government will be about £400,000. It is hoped for delivery within a year.

POWERFUL NEW BOMBERS FROM AMERICA

Greatest U.S. Contribution To Victory

By THE "SUNDAY TIMES" AIR CORRESPONDENT

News that America has released twenty-six Consolidated B-24 four-motor bombers for immediate delivery to the R.A.F. is most encouraging.

The Consolidated Model 32, designated the B-24 by the U.S. Army, is by far the best military aeroplane which the U.S.A. has yet produced and the first American aeroplane on which we can really bestow unreserved enthusiasm.

It is fast, it is well defended (British gun turrets can be installed) it can carry a big load of bombs, and it has a long range. It is superior to any bomber at present in service, though not to some of our new machines now flying. It is vastly better than the old Boeing B-17 "flying fortresses"—as indeed it should be for it is five years later in design.

Before France fell the Armée de l'Air had ordered 120 of these Consolidated bombers, but orders previously placed by the U.S. Army had to take precedence. Great Britain took over all the French orders, but the gesture by America will mean that deliveries can begin immediately. The first production model flew three weeks ago.

3,000-MILE RANGE

The B-24 is claimed to have a top speed of round about 330 m.p.h., a bomb load of 4,000 lb., and a maximum range of more than 3,000 miles. So, in fact, it could fly from New York to England by way of Berlin.

The best feature of the machine aerodynamically, which accounts for its high speed, is its wing, designed on a new principle. This "Davies" wing, which in plan is very long and narrow, resembling a paper knife, presents about one-third less resistance to the air than a conventional type. The making of such a long thin wing, constructionally stiff, is a triumph of engineering.

There has been some confusion between the Consolidated bomber and the Boeing bomber. Apart from the fact that they both have four motors, there is little similarity. Incidentally, the Boeing Company has copyrighted the name "Flying Fortress"—which is misleading anyway.

The sending of these Consolidated bombers for the R.A.F. to intensify the offensive is one of the greatest contributions America can make towards the winning of the war.

THE R.A.F.'s NEW COMMAND

CO-OPERATION WITH THE ARMY

The new Army Co-Operation Command of the R.A.F. comes into being on December 1. The decision to form this new Command successfully avoids the drawbacks of handing over a separate Air Arm to the Army, yet presents to it a specialised body of Air Power under an officer—Air Marshal Sir Arthur Barratt—who came from the Army and thoroughly understands Army problems as no purely Army officer understands the air.

The step satisfies all the requirements outlined in these notes some weeks ago, yet has few disadvantages. Its great merit is its elasticity. So long as that is maintained the R.A.F. can fall into none of the troubles which the Luftwaffe dug for itself in its rigid training for and adherence to the dictates of the German Army.

Air strategy of necessity calls for an independent air force. There are times when the whole of the available fighter strength may be needed for defence of a single objective. There are times when the whole of the R.A.F. may have to be flung in to support of land forces.

The Army Co-operation Command forms thus a nucleus, which at times may serve as the hub of the operation of all the other Commands of the R.A.F., or it may form a small preserve from which the other Commands may draw machines for support in independent action as the situation needs.

As a strategic weapon the Army Co-Operation Command finds efficiency in its specialisation and strength in its elasticity.

LAST STAGE OF GREAT GUBA FLIGHT

Victoria, Australia.

Safe Arrival At Mombasa

In this article, the last of a series of four on Captain P. G. Taylor's flight survey of the reserve Empire air mail route across the Indian Ocean, Mr J. Percival, Jun., official newspaper correspondent, describes the arrival of the Guba at Diego Garcia, in the Chagos Archipelago, and at Mahe, in the Seychelles.

THE Guba left Cocos Island late in the afternoon of June 13, and the 1470 miles flight through the night was uneventful in the smooth, cool air.

In the early hours of the morning, wireless communication with VIS, Sydney, and VIP, Perth, the Australian coastal stations, was lost for the first time.

It was estimated that the aircraft would arrive at Diego Garcia a few minutes before dawn. In the darkness of early morning the lights of H.M.S. Manchester, based there for the flight, were sighted.

The cruiser, anchored in the great pear-shaped lagoon, looked like an illuminated toy.

The aircraft made two wide circuits of the palm-covered coral, and as the first tinge of light appeared over the horizon she settled down beside H.M.S. Manchester. Soon a launch was beside her, and the crew was invited to board the cruiser for hot coffee, baths, shaves and breakfast. H.M.S. Manchester left that afternoon.

LONELY FRENCHMAN

Diego Garcia was originally a French settlement, but is now British.

The cocoanut plantation is managed by a lonely Frenchman. In the space of a few days he saw the arrival of H.M.S. Manchester, the island steamer, Zambezi, which visits him once in every four months, and the Guba.

He dug deep into his cellar and his black servants fossicked the island to supply the best for our table. He made his first flight the day after our arrival.

The Guba made a smooth passage to Mahe, an island paradise in the Seychelles, on June 16. The mountains of Mahe rise sheer out of the surrounding ocean depths of 2000 fathoms to heights up to 3000 feet.

The sight of a mountainous island brought a strange feeling of security again. There is a feeling of insecurity about Cocos Island and Diego Garcia, where the highest coral outcrop from which the cocoanut palms sprout is only about 10 feet above sea level.

"GREAT VALUE"

The day after the Guba's arrival at the Seychelles, H.M.S. Liverpool, with which the Guba was in communication during the flight, entered Port Victoria.

The Governor of the Seychelles (Sir Walter Buchanan Smith) made his first air journey during a photographic flight.

After the survey work at Mahe, the Guba tooff-off for Africa in the morning on June 21, and alighted at Mombasa flying boat base the same day.

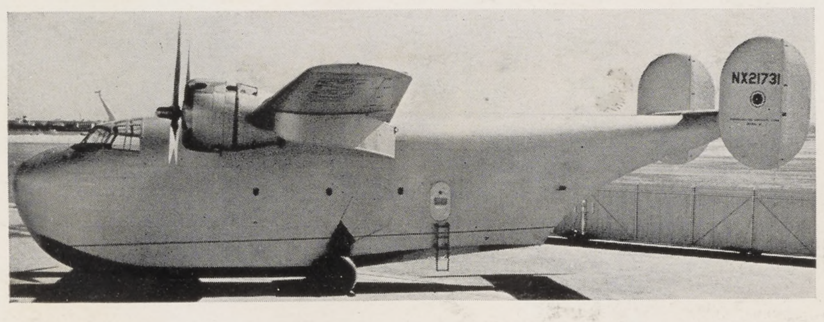
Arriving at Mombasa, Captain Taylor said that the flight had been fully justified, and that the route should be of great value to Imperial communications. Information obtained in the survey would enable the establishment of a regular service at short notice.

"The use of the Indian Ocean route will bring Australia and Africa within two days of each other," he said.

AERO EQUIPMENT REVIEW MAY-39

CONSOLIDATED MODEL 31 FLYING BOAT

POWERED WITH TWO WRIGHT 2,000 H.P. ENGINES
TOPS 275 M.P.H.–CAPABLE OF 10,000 MILE RANGE



Consolidated Model 31 Flying Boat

Some ten months after its design and construction was initiated Consolidated Aircraft's new Model 31 twin-engine flying boat took to the air off San Diego Bay one day this month. The outstanding figures reported on completion of the first flight were that the 50,000-pound Model 31, powered with two 2,000 h.p. Wright Duplex-Cyclones, has a top speed of 275 m.p.h., is capable of a range of 10,000 miles, with a light passenger load.

Contrasted against a chunky hull, with a sharply upswept stern, is an extremely slim wing, reputedly the product of ten years' development work by engineer David R. Davis. The wing narrows to such a small tip that the outboard floats retract to the underside of the outer wing panel, rather than at the tip as they do on the PBY's. The wing, tail surfaces, and the planing surface of the hull are flush-riveted.

The Model 31 is built with two full decks, one above the other, providing a large flight control compartment and eight additional large compartments. It is designed to accommodate a crew of five in a completely sound-proofed flight compartment furnished with all the latest type instruments and equipment. As a commercial airliner, it has a maximum capacity for 52 passengers for daytime operations and 28 sleeper passengers for night operations. For trans-oceanic flights, it has accommodations for 28 passengers. As a military airplane its function would be similar to that of the well-known Consolidated twin-engine patrol bombers built for the U.S. Navy.

At this instance it seems probable that this last application will be the Model 31's first service assignment. Although this is entirely the Consolidated Corporation's private venture, the Navy has been cognizant of the construction, and the performance delivered by the 31 is reported to have excited much interest on the part of the Navy. The fact that this was a private venture, and was not government financed nor subjected to the ordinary procedure routine, is held to be a major factor in the swift production of the design. While the development of types of similar magnitude, under government contract, has heretofore occupied from two to three years' time, this project was completed in ten months.

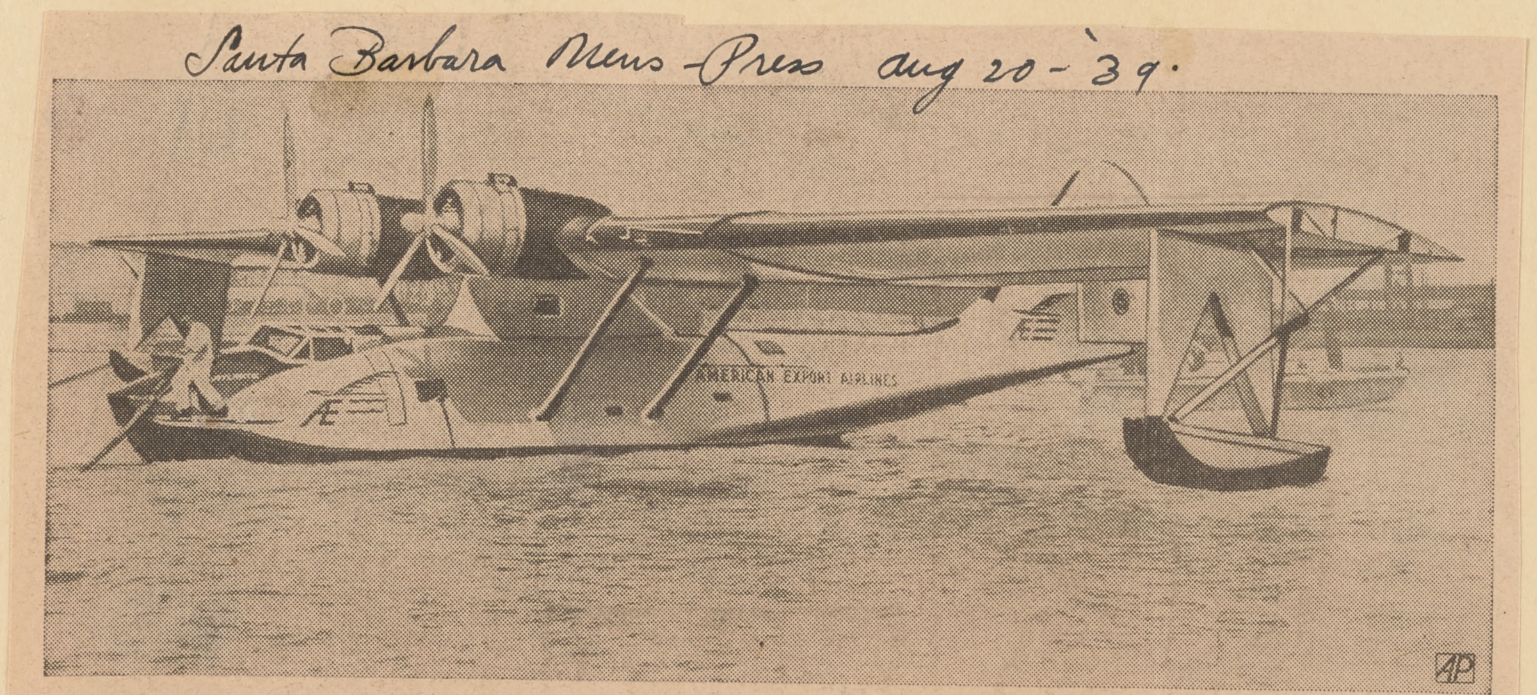
An aluminum coated aluminum alloy skin, internally reinforced with longitudinal stiffeners and transverse bulkheads and frames, is employed in the construction of the 31. Flush riveting is used on the wings, tail surfaces and the planing surface of the hull bottom. The full cantilever wing has integral fuel tanks in the center section. Hydraulically operated Fowler flaps extend from the inboard side of the ailerons to the hull. Ailerons and flaps are fabric covered. The full cantilever stabilizer has twin fins and rudders. Rudders and elevators are fabric covered.

The retractable tricycle beaching gear is hydraulically operated. The nose wheel is housed in a well in the bottom of the hull and the side wheels swing upward into wells in the side of the hull. All wheels are completely enclosed by doors for maximum efficiency in flight. The side wheels are removable in addition to being retractable. The two Wright Duplex-Cyclone 2,000 h.p. engines carry three-bladed, Hamilton Standard Hydromatic full-feathering propellers, with 16-foot diameters. Beyond the statement that the Model 31 exceeds the PBY in speed, range and load capacity, and those figures reported here, no performance figures have been released.

General specifications follow:

Wing span	approximately 110 feet
Length over-all	approximately 73 feet
Height	approximately 22 feet
Maximum wing chord	approximately 14 feet
Gross weight	approximately 50,000 lbs.

Santa Barbara News-Press Aug 20-'39.



RUSH OF WINGS TO EUROPE—In the harbor at Saint Nazaire, France, rests "Transatlantic," the American Export Airlines' flying boat now engaged in making survey flights across the Atlantic, with a view to establishment of service from U. S. to 30 Mediterranean ports. The airline will possibly fly mail in the fall and passengers, in a year or two. Other airlines crossing the Atlantic are the Pan American Airways' Clipper ships, carrying passengers and mail, and Britain's Imperial Airways mail plane.

Sun 9-13-39

NAVY SQUADRON IN HAWAII HOP TODAY

Bound for Pearl Harbor to replace a squadron assigned to patrol Uncle Sam's westernmost defense line at the Philippines Patrol Squadron 13, commanded by Lieut.-Comdr. S. H. Ingersoll, was to take off at about 3 p. m. today, weather permitting, it was reported at North Island.

Ninety-eight officers and men will operate 14 twin-engined Consolidated bombers in the non-stop, 2500-mile jaunt to Hawaii.

The aircraft tender Wright, which left Sunday for an indefinite period of duty in Pearl Harbor, will be stationed along the line of flight to furnish weather reports and act as guard ship.

Extreme secrecy surrounded preparations for the hop during the past week, with Naval Air Station officials refusing to divulge details of the mission on direct orders from the Navy Department.

Today's flight will be the first to Hawaii by the Navy in more than a year. On Sept. 7, 1938, 17 bombers set a record of 17 hours, 17 minutes. To date, 59 Consolidated PBY's have been delivered by this method to Pearl Harbor, which has been developed into the Navy's strongest patrol plane base.

GUBA REACHES AFRICA

Victoria, Australia

Completes Aerial Survey Flight

(From J. Percival, jun., official correspondent aboard the flying boat Guba.)

MOMBASA (Kenya), Wednesday. — The Guba reached Mombasa at 9.45 a.m. Greenwich time (7.45 p.m. Melbourne time) today, completing her aerial survey of the trans-Indian Ocean flying boat bases.

The Guba took off from Mahe, Seychelles Islands, at 2 a.m. (12 noon, Melbourne time). The weather was fine with scattered cumulus cloud.

Flying at 8000ft. in a slight south-west wind, the Guba maintained a steady 128 knots.

Secret Fast Air Fighters For Australia

AUSTRALIA is to have a squadron of extremely powerful fighting planes — hush-hush machines which, when produced in England soon, will be the most modern in the Royal Air Force, the Minister for Defence (Brigadier Street) announced yesterday.

As the new planes are still on the secret list, details are not yet available, but it is understood that they will have a speed of 400 miles an hour, and will be armed with high-speed guns of a new type.

The squadron, probably consisting of 12 front-line planes, with six in reserve, will be stationed at Richmond (N.S.W.), and its function will be the protection of the industrial areas of the east coast.

Total cost to the Government will be about £400,000. It is hoped for delivery within a year.

OCEAN SURVEY COMPLETED

Victoria, Australia

Guba For Africa Today

(From J. Percival, jun., official correspondent aboard the flying-boat Guba)

MAHE (Seychelles), Tuesday. — The survey of Seychelles Islands having been completed, the Guba will leave for Mombasa, Africa, at 2 a.m. Greenwich time (12 noon, Melbourne time) tomorrow.

The real purpose of the flight, to determine suitable bases for flying boats in the Indian Ocean, has been accomplished, since a base already exists at Mombasa.

As was anticipated, the surface winds over the entire route from Australia to Seychelles have been east to south-east. Note has been taken of the change of wind at levels at which the Guba has been flying.

It is understood that Captain Taylor will recommend the taking of regular upper wind observations at Cocos, Diego, Garcia and Seychelles.

This morning, at the invitation of the commanding officer of H.M.S. Liverpool, Captain Taylor made a flight in one of the vessel's Supermarine Walrus flying-boats.

This afternoon officers of the Liverpool inspected the Guba at her moorings in the inner harbor at Port Victoria.

NEW FLYING BOAT WITH RANGE OF 10,000 MILES

Successor to the Guba Tested In America

SAID to have a range of 10,000 miles and a top speed of 275 miles an hour, a new flying boat, successor to the Guba, has just completed its tests in America.

With this capacity it would be able to reach any point of the globe nonstop. A flight from America to Australia could be completed with hundreds of miles to spare.

The flying boat has been manufactured by the Consolidated Aircraft Corporation and, for a start, it will be used on transatlantic services. If its range is effective it could break the world's distance record by 2000 miles.

Slightly smaller than the standard Empire flying boat, its all-up weight of 50,000lb. is 9500lb. greater. Its eight compartments can be fitted to accommodate 52 passengers for day flights or 28 sleeper berths. With these its range would not be so extensive.

Union 9-14-39

Aircraft Employes All Sign for Votes

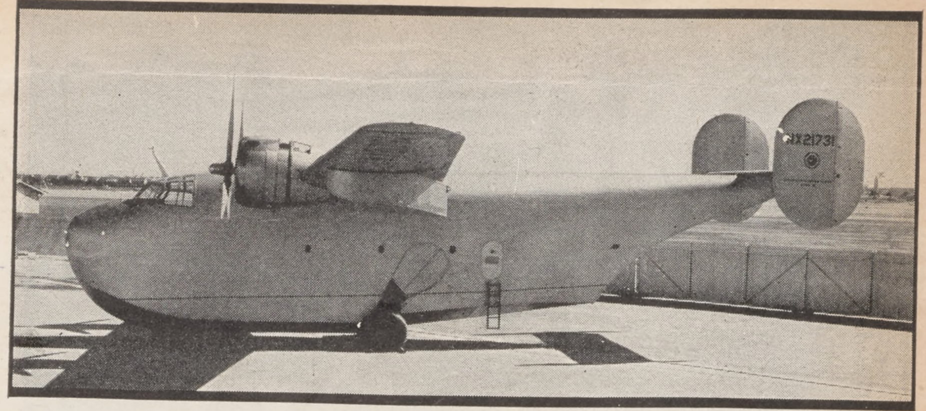
Employes at Consolidated Aircraft corp. yesterday learned that the firm they represent is the first in this county to report a "100 percent registration," thus qualifying all of their group, 21 years of age and over, to vote at the next election.

Rallying to the campaign to bolster the number of eligible voters in this county, Consolidated employes, registered, hurriedly summoned a deputy registrar to take their affidavits of registration.

The Consolidated employes, however, are not the only ones representing concerns in the "100 percent" bracket. Campbell Chevrolet Co., Frost Lumber Co., Standard Oil Co., Whitney & Co. and others now boast 100 percent registrations. These firms engage hundreds of employes.

Business Week May-13-39

Consolidated Aircraft's 25-Ton Flying Boat



In San Diego last week Consolidated Aircraft Corp.'s powerful new flying boat, Model 31, made its first test flight. Weighing 25 tons, Model 31 has a wing-span of 110 feet, is 73 feet long, 22 feet high. It has two—instead of the usual four—engines, 2,000-horsepower each, is capable of a speed exceeding 250 miles an hour. As a commercial air liner it can carry 52 passengers by day, 28 in berths at night. Consolidated's own private venture, Model 31 is nevertheless well adapted for use by the U.S. Navy, or for commercial transatlantic service.

11 Groups Ready To Begin Drive For Chest Funds

Union Sept 18-39

Organization of 11 sections in the industrial division of the Community Chest campaign is announced by J. O. Miller, general chairman, with the further information that city and county units of the public employes' group are ready to do their part in the annual fund-raising effort for support of 34 social service agencies.

Civic and business leaders who have assisted in organizing the division will meet at a "kick-off" breakfast tomorrow, 7:30, in the Italian room, U. S. Grant hotel. They will receive final instructions and supplies for the next step, which will be to contact company captains in 448 establishments participating in the campaign under the "unit account" system.

Each of these places of employment, said Miller, has accepted a goal toward which contributions of the firm, its executives and all employes will be credited. It is expected most of the establishments under the self-solicitation feature of the "unit account" plan, will complete their assignments when the general campaign begins a week from Thursday.

Directing the organization of the undustrial division units are:

Builders — Morley H. Golden, Robert Frazee.

Hotels - restaurants — Carleton Lichey, O. B. Wetzell.

National firms — George N. Lynch, F. J. Guasti.

Industrial—Edgar N. Gott, S. M. Sullivan.

Retail — W. D. Rudd, George Scott.

Wholesale—Allan S. Klauber.

Finance—John L. Fox, Marston Burnham.

Food—Wilbur Thomas, Douglas Young.

Public service — Fred L. Annable, Emery D. Sherwin.

Automotive — Chester Dorman, W. A. Morgan.

General—Charles B. Wincote.

Heading the city employes division are Fred A. Rhodes and D. M. Hammond, while the county unit has as leaders Sam A. Claggett and J. B. McLees.

AIR WAR AND SUPPLY

THE BATTLE OF RESOURCES

AID FROM U.S.A. AND EMPIRE

THE NIGHT BOMBING PROBLEM

BY OUR AIR CORRESPONDENT
(MAJOR OLIVER STEWART)

Germany is making an effort to check the growth of British air power. She believes that the numerical strength of the Royal Air Force now approaches that of the Luftwaffe and sees the danger to herself of a gigantic aerial offensive next year.

That is the reason for her concentrated night bombing especially of places in the midlands and in the west where aircraft factories are known to be.

Damage to an aircraft factory does not immediately affect air strength. There is a time lag. In order to ensure that our offensive shall have its full weight, production now, while the Germans are making their effort in large night attacks, is of supreme importance.

SAVING TIME AND SPACE

Evidence from the places that have received the severest attacks shows that the check to output, though appreciable, is less serious than was thought at first.

What deficiencies there have been must be made up and more than made up by the contributions from the Dominions and the United States of America. The appointment of Air Chief Marshal Sir Hugh Dowding, who handled the problems of fighter defence so brilliantly, to a post on the Ministry of Aircraft Production with special duties in the United States, should be of assistance in speeding up supplies.

If the American industry can but gear itself up quickly enough, nothing will be able to approach its output. And many of the aircraft made there for us can be flown across the Atlantic, so that the calls on time and shipping space are not heavy.

The Consolidated Aircraft Corporation, which makes the XB-24 four-engined bomber, mentioned in these notes last week, and the 31 flying boat, has a total floor space at its San Diego factory of about 2,000,000 square feet. The Lockheed factory now has a floor space exceeding 1,350,000 square feet, and it will eventually be larger than the Consolidated factory.

RESEARCH

Lockheed, who build the Hudson aircraft which have been in use with the Coastal Command since the beginning of the war, are also completing one of the largest privately owned wind tunnels in the world. The Northrop Aircraft Corporation is also completing a new wind tunnel. This company is making seaplane bombers which were originally ordered by Norway, but are now said to be coming here.

Meanwhile, research is being pressed forward in the United States as a sequel to the organisation of the National Defence Research Committee in June. The chairman is Dr. Vannevar Bush, who is also chairman of the National Advisory Committee for Aeronautics.

In Canada the rate of production of aircraft is rising. Initial training aeroplanes of the Fleet Finch and de Havilland Tiger Moth types have been coming through quickly during the past few months, and it is useful that United States engines, instead of the original British engines, are now being used for them. Harvard advanced trainers, Lysander Army Co-operation machines, Bolingbroke bombers (which are modifications of the Blenheim), and Hurricane fighters are among the other types being built in Canada.

Originally Britain was to have supplied Canada with Avro Anson twin-engined machines for intermediate

AIR WAR AND SUPPLY

(Continued from page 7, column 7)

training, and 1,600 were to have been delivered. After the fall of France, however, it was decided to have the Ansons built in Canada, and this is now being done.

FLEXIBILITY

If the best use is to be made of these and the other Dominion and United States resources, there will have to be a good deal of flexibility in our inspection and in the details of our Service requirements. In smoothing out this kind of thing, Sir Hugh Dowding should be particularly valuable.

In some instances there has been too great a tendency to insist on the British way of doing things and, consequently, too much unnecessary changing of compasses, radio equipment, and other accessories. The American machines must usually be re-armed. That is essential, for they do not carry anything like the gun power that the Royal Air Force has found to be necessary. But apart from such essentials it would be of assistance to the rate of supply if as few modifications and changes as possible were made.

Even the matter of gun turrets is open to argument. While the Germans have no reply to the night bomber, the additional apparatus and weight needed to furnish a night-bombing aeroplane with perhaps two power-operated turrets may seem unnecessary. For if the night-bomber is not called upon to fight—and certainly the German ones are not yet often called upon to do so—the full turret equipment might be temporarily dispensed with in aircraft being delivered from America.

That does not diminish the excellence of the turret as a piece of engineering nor does it make it less necessary when the big bomber must face fighter opposition. But to get a good flow of new aircraft to the operational units, the inclusion of some night bombers without turrets would seem to be justifiable.

IN GREECE

In Greece Royal Air Force operations in collaboration with the Greek Army have been mainly directed at checking the flow of supplies and reinforcements from Italy to Albania. Under Air Commodore J. H. D'Albiac, who is in command of the British Forces in Greece, this work is being done effectively. Moreover, a good deal of useful experience of Army co-operation duties is being accumulated.

At home the night bomber continues to be the chief trouble. The problem of finding it and shooting it down is complicated by the use by the Germans at night of great heights. They often come over very high and only descend when near their target.

The impression of so many people that the German machines fly on a "railway line" overhead, keeping to exactly the same course every time, is only partially correct. The enemy machines are plotted at a great many different heights and they converge on a great many different courses.

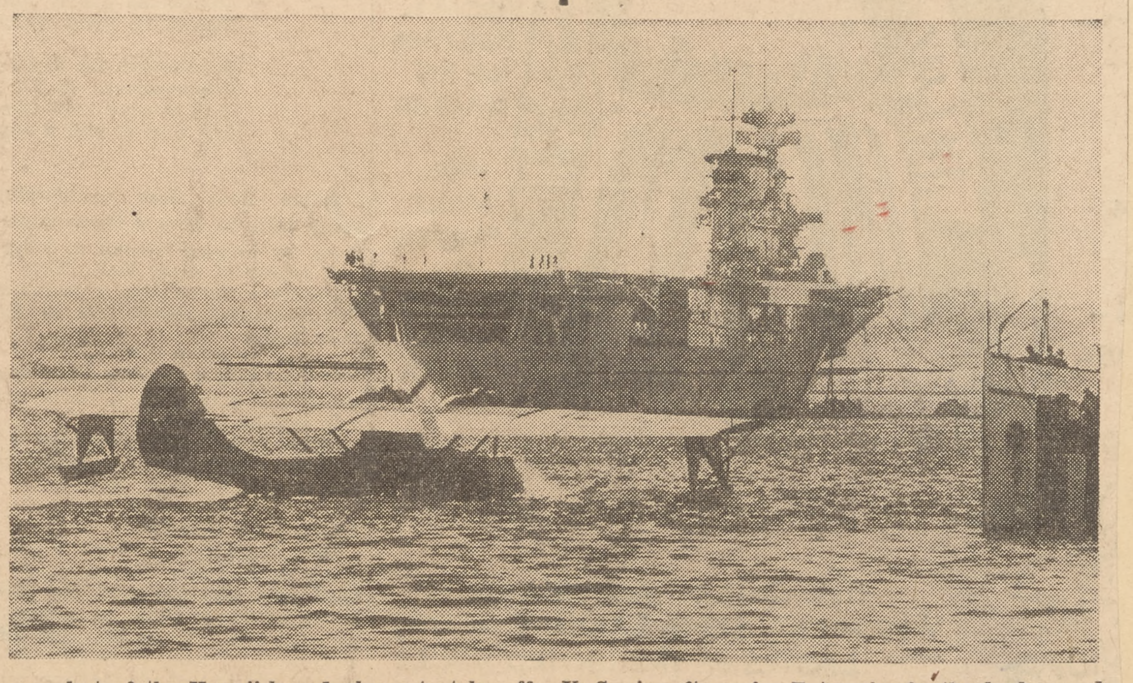
SAN DIEGO, CALIFORNIA, THURS

14 San Diego Bombers Hop for Hawaii Amid Wartime Censorship Conditions



. . . last of the Hawaii-bound planes to take off; U. S. aircraft carrier Enterprise in the background.

Patrol Wing Due At Pearl Harbor This Morning

Bound for Hawaii for duty with Patrol Wing 2, 14 patrol bombers of squadron 13 took off from the harbor starting at 3:15 p.m. yesterday. The last plane was aloft at 3:40, and 15 minutes later, after attaining a rendezvous 6000 feet above the Coronado islands, headed westward across the Pacific. The squadron is commanded by Lt. Comdr. S. H. Ingersoll.

Strung along the airway at 300-mile intervals between Pt. Loma and Diamond Head were the aircraft tenders Wright and Avocet, oiler Cimarron and destroyer Sicard. They will act as plane guards and will flash weather reports.

The grim shadow of war marked the departure of the squadron, in contrast to previous long-distance mass flight take-offs.

NEWSREELS BARRED

There were no newsreels, no news cameramen. The launching ramp was roped off and heavily guarded. Included among the 98 officers and men who manned the patrol bombers were the sons of a number of prominent San Diegans, including officials of Consolidated Aircraft Corp. who designed and built the planes in which their sons now are flying. The navy department ordered names of the crews not to be published, and hereafter all flights involving ships and planes engaged in neutrality enforcement will be censored.

No radio reports showing the progress of the planes on the 2500-mile flight to Pearl Harbor are to be made public. Because favorable weather conditions prevail, it is expected the squadron will land at Pearl Harbor between 9 and 10 a.m. today, Pacific coast time.

PROMPT IN TAKE-OFF

With characteristic celerity, the navy lost not time in getting under way when the zero hour for the take-off arrived. The flag plane went over the ramp at 3 p.m. The others followed in rapid succession.

Forming in two lines, the planes came barging down the take-off area, flanking both the starboard and port sides of the giant aircraft carrier Enterprise. Plane 7 was the only bomber that expreienced any trouble. Its motors sputtered at the beginning of the take-off but after wobbling for several hundred yards, the plane started picking up speed and finally left the water.

Plane No. 2 made the smartest take-off, getting aloft within 90 seconds after the pilot gave the engines full throttle.

SHIPS HEAVILY LOADED

All of the bombers were heavily loaded with gas and oil.

Early next week 12 bombers of Patrol wing 2, squadron 21, are to leave Pearl Harbor for Manila via Wake and Midway islands. With them will go the aircraft tender Langley. After that the movements of naval craft taking part in neutrality patrol in the Pacific, the canal zone, the West Indies and on the Atlantic no longer will be headlined in the nation's press.

Guba For Africa Today

(From J. Percival, jun., official correspondent aboard the flying-boat Guba)

MAHE (Seychelles), Tuesday. — The survey of Seychelles Islands having been completed, the Guba will leave for Mombasa, Africa, at 2 a.m. Greenwich time (12 noon, Melbourne time) tomorrow.

The real purpose of the flight, to determine suitable bases for flying boats in the Indian Ocean, has been accomplished, since a base already exists at Mombasa.

As was anticipated, the surface winds over the entire route from Australia to Seychelles have been east to south-east. Note has been taken of the change of wind at levels at which the Guba has been flying.

It is understood that Captain Taylor will recommend the taking of regular upper wind observations at Cocos, Diego, Garcia and Seychelles.

This morning, at the invitation of the commanding officer of H.M.S. Liverpool, Captain Taylor made a flight in one of the vessel's Supermarine Walrus flying-boats.

This afternoon officers of the Liverpool inspected the Guba at her moorings in the inner harbor at Port Victoria.

NEW FLYING BOAT WITH RANGE OF 10,000 MILES

Successor to the Guba Tested In America

SAID to have a range of 10,000 miles and a top speed of 275 miles an hour, a new flying boat, successor to the Guba, has just completed its tests in America.

With this capacity it would be able to reach any point of the globe non-stop. A flight from America to Australia could be completed with hundreds of miles to spare.

The flying boat has been manufactured by the Consolidated Aircraft Corporation and, for a start, it will be used on transatlantic services. If its range is effective it could break the world's distance record by 2000 miles.

Slightly smaller than the standard Empire flying boat, its all-up weight of 50,000lb. is 9500lb. greater. Its eight compartments can be fitted to accommodate 52 passengers for day flights or 28 sleeper berths. With these its range would not be so extensive.

Union 9-14-39

Aircraft Employes All Sign for Votes

Employes at Consolidated Aircraft corp. yesterday learned that the firm they represent is the first in this county to report a "100 percent registration," thus qualifying all of their group, 21 years of age and over, to vote at the next election.

Rallying to the campaign to bolster the number of eligible voters in this county, Consolidated employes, registered, hurriedly summoned a deputy registrar to take their affidavits of registration.

The Consolidated employes, however, are not the only ones representing concerns in the "100 percent" bracket. Campbell Chevrolet Co., Frost Lumber Co., Standard Oil Co., Whitney & Co. and others now boast 100 percent registrations. These firms engage hundreds of employes.

Union Sept 18-39

11 Groups Ready To Begin Drive For Chest Funds

Organization of 11 sections in the industrial division of the Community Chest campaign is announced by J. O. Miller, general chairman, with the further information that city and county units of the public employes' group are ready to do their part in the annual fund-raising effort for support of 34 social service agencies.

Civic and business leaders who have assisted in organizing the division will meet at a "kick-off" breakfast tomorrow, 7:30, in the Italian room, U. S. Grant hotel. They will receive final instructions and supplies for the next step, which will be to contact company captains in 448 establishments participating in the campaign under the "unit account" system.

Each of these places of employment, said Miller, has accepted a goal toward which contributions of the firm, its executives and all employes will be credited. It is expected most of the establishments. under the self-solicitation feature of the "unit account" plan, will complete their assignments when the general campaign begins a week from Thursday.

Directing the organization of the undustrial division units are:

Builders — Morley H. Golden, Robert Frazee.

Hotels - restaurants — Carleton Lichey, O. B. Wetzell.

National firms — George N. Lynch, F. J. Guasti.

Industrial—Edgar N. Gott, S. M. Sullivan.

Retail — W. D. Rudd, George Scott.

Wholesale—Allan S. Klauber.

Finance—John L. Fox, Marston Burnham.

Food—Wilbur Thomas, Douglas Young.

Public service — Fred L. Annable, Emery D. Sherwin.

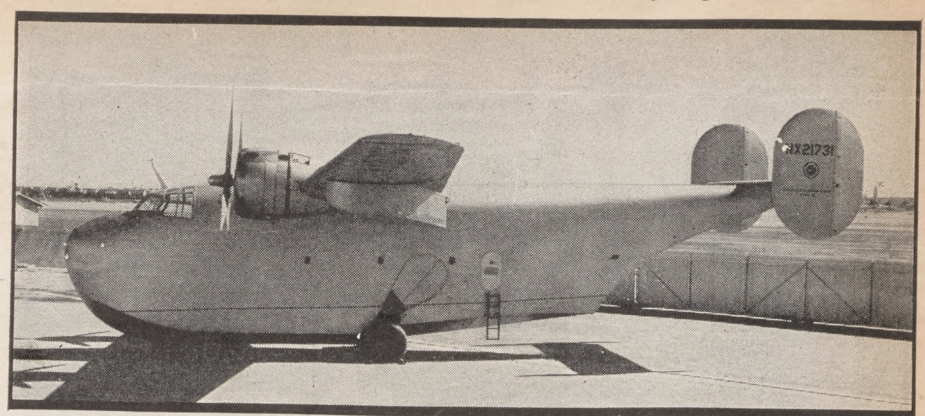
Automotive — Chester Dorman, W. A. Morgan.

General—Charles B. Wincote.

Heading the city employes division are Fred A. Rhodes and D. M. Hammond, while the county unit has as leaders Sam A. Claggett and J. B. McLees.

Business Week May 13-39

Consolidated Aircraft's 25-Ton Flying Boat



In San Diego last week Consolidated Aircraft Corp.'s powerful new flying boat, Model 31, made its first test flight. Weighing 25 tons, Model 31 has a wing-span of 110 feet, is 73 feet long, 22 feet high. It has two—instead of the usual four—engines, 2,000-horsepower each, is capable of a speed exceeding 250 miles an hour. As a commercial air liner it can carry 52 passengers by day, 28 in berths at night. Consolidated's own private venture, Model 31 is nevertheless well adapted for use by the U.S. Navy, or for commercial transatlantic service.

U. S. BOMBERS HOP FOR PHILIPPINES

HONOLULU, T. H., Sept. 19.—Navy headquarters announced a squadron of naval bombers took off from Pearl Harbor at 9 a. m. (PST) today on a mass flight to Manila—the first mass flight ever attempted from Hawaii to the Philippines.

Union Sept 20-39

Consair's Picture To Be Shown Club

Exchange club members and guests will see a showing of Consolidated Aircraft's picture, "Building the P. B. Y. Record Breakers," at tomorrow's noon meeting in Hotel San Diego, John Arthur Jenkins, entertainment chairman, announced.

Maj. Gott

The film will be presented by Maj. E. N. Gott, Consolidated. It pictures the progress of the giant air bombers from the laboratory to the record flights.

Union 9-14-39

Two San Diego Bombers Arrive at Pensacola

Two navy bombers which took off on a routine transfer flight from North Island at 5 a.m. yesterday, arrived at Pensacola, Fla., at 7 p.m. (P.S.T.) last night. The ships are scheduled to continue on to Norfolk, Va., today.

SAN DIEGO, CALIFORNIA, TUESDAY, SEPTEMBER 12, 1939 Tribune

CONSAIR SET TO DOUBLE PLANT

Given Space For Another Factory

By DON SHORT

A lease of tidelands to enable the Consolidated Aircraft Corp. to double the capacity of its airplane plant was authorized by the city council today.

Granted Option

The council was informed that officials of the company now in Washington were confident of federal government contracts that would demand doubling the size of the factory.

The tracts adjoin the present factory buildings and consist of 17 acres, or 722,832 square feet of space, on which another factory is to be constructed immediately.

In addition, the company was granted an option to lease after 10 years, of 22 additional acres, making 84 acres to be occupied by factory buildings. The present factory occupies 17 acres. The lease was recommended by the harbor board and was presented to the council by Joseph Brennan, port director, who said the terms of the proposed lease had been threshed out by the harbor commissioners. The additional acreage is to return $750 per year rental to the city.

Brennan told the council that under the new agreement the city would not be obligated to reimburse the company for taxes. When councilmen inquired as to how Lindbergh field would be affected, Brennan showed maps that indicated additions to Lindbergh field, proposed by the harbor commission, would increase the field to 450 acres.

When Councilman A. E. Housh inquired as to reason for the haste in presenting the new lease, Brennan explained that the company expects big contracts and it was imperative that the authorities in Washington be guaranteed that the company has ample room to expand its plant.

Adopted Unanimously

Brennan said every detail had been studied by the harbor commissioners and that they were satisfied with the terms. A resolution authorizing the lease was adopted unanimously. H. B. Daniel, assistant city attorney, said he would prepare the lease and that he would see that the rights of the city were amply protected.

Brennan informed the council that Consolidated's payrolls for the first year in San Diego amounted to $3,712,000; the second year, $5,193,000, and the third year, $3,198,000. He said the company brought 250 new families to San Diego, that at its lowest peak of operation employes numbered 1100, and that today 1800 are on the payrolls. He said the first year the company paid $23,973 in taxes and the third year, $45,425, the greater part of which was paid to the county.

---

14 S.D. BOMBERS REACH HAWAII

Sun 9-14-39

Mass Flight Ends Without Incident

Fourteen U. S. Navy bombing planes arrived at Honolulu today on a non-stop flight from San Diego to strengthen Hawaiian Island defenses.

The planes hopped across the Pacific in a routine overnight flight, completed successfully without incident.

The planes, which left San Diego at 3:30 p. m. yesterday, arrived at Honolulu at 9:50 a. m. PST. Clear weather prevailed on the 2000-mile flight.

The bombers, of Patrol Squadron 13, were commanded by Lieut.-Comdr. Stuart H. Ingersoll, and will replace a unit transferred from Hawaii to the Philippine Islands with the former San Diego-based aircraft tender Langley. Succeeding the latter will be the USS Wright, which sailed from here last Sunday and will become the flagship of Rear Adm. Arthur L. Bristol Jr., commander of Patrol Wing Two.

Sun 9-22-39

AIR SCOUT FORCE IN PEARL HARBOR

Rear Adm. Arthur B. Cook, Aircraft Scouting Force commander, and his staff have arrived in Pearl Harbor from Alaska aboard their flagship, the San Diego cruiser Memphis, to continue their inspection tour of patrol plane facilities. The officers recently completed visits to bases in Puget Sound, Sitka, Kodiak, and Dutch Harbor in the Alaska-Aleutian Islands sector.

Pearl Harbor has been the destination and starting point for two important Navy mass flights during the past 10 days. A squadron of 14 bombers flew from San Diego to Hawaii last week in approximately 18 hours to relieve a patrol plane unit which now is enroute to Manila from Pearl Harbar via Midway, Wake and Guam.

The Memphis is slated to return to San Diego October 8.

Sun 9-22-39

AIR CONTRACTS TO S. D. CONFIRMED

Confirmation of tentative contract awards for construction of Army planes by Consolidated Aircraft Corp., and Ryan Aeronautical Co., was made today by Assistant Secretary of War Louis Johnson in Washington, D. C., the United Press reported.

The contracts, which were given to winners of Air Corps design competitions, follow: Consolidated Aircraft Corp., for four-motored bombers, $8,613,674; Ryan Aeronautical Co., for observation planes, $132,020. The awards will not affect the previously announced backlogs of the two concerns, now aggregating about $16,000,000 for Consolidated and $1,000,000 for Ryan.

Sun 9-22-39

MANILA LOOKS FOR NAVAL SQUADRON

MANILA, Sept. 22.—A flight of Navy planes which departed from Honolulu last Tuesday, is expected to arrive at the Cavite Navy Yard Sunday afternoon, Navy authorities said tonight.

There has been no direct or official word of the planes since they departed from Honolulu, but it was generally believed that there were 15 in the squadron in charge of Lieut. Comdr. Sam Lahache, and that they had stopped at Wake Island, Midway Island and Guam, following the Pan-American Airways route. It was the first time any United States war plane flight had been made west of the international dateline.

Western Flying Aug 39

AMERICAN EXPORT LAUNCHES TESTS

AMERICAN Export Airlines began its long-deferred test flights across the Atlantic early in July, completing its first hop on July 9 from New York to Marseilles. **Capt. Patrick Byrne** commanded the big Consolidated flying boat with **T. S. Terrill, M. C. J. Doyle, W. W. Ehmer, R. B. Carlson** and **Charles F. McDonough** as the crew.

Plans for the season's tests have not been announced, but it is known that American Export, which is an affiliate of **American Export Lines,** proposes to tie in its flying boat operations closely with its steamer operations across the Atlantic. It is understood that the test flights of the **Transatlantic,** as the survey plane has been christened, will be timed to take advantage of the crossing of the steamers.

WANTED—INSPECTORS

Western Flying Sept 39(?)

THE engineering section of the Sixth Region of the C.A.A. has before it for testing and recommendation over 50 different aircraft and aircraft engine projects. Of these, seven are major projects, including the Douglas DC-5, Lockheed 16, Lockheed 27, Lockheed 44, the Consolidated 28, and others. There are, in addition, four engine projects, including the Menasco Vega-Unitwin, Seelig and Taylor's four-cylinder inverted gasoline engine, Seelig and Taylor's OX5 conversion, and L. M. Fisk's Diesel engine. There are two or three starter projects; one or two propeller projects.

The rest are all new airplanes of various types and importance, some large, some small.

To handle these projects, the engineering section of the Sixth Region has one senior engineering inspector, who has to assist him three engineering inspectors and six factory inspectors.

In addition to the static tests and flight tests of these new projects, this section is responsible for the routine factory inspection of all commercial aircraft in production in the factories of the Sixth Region, which includes California, Arizona, Nevada and Utah. Until recently, the Sixth Region engineering section also has been entrusted with the responsibility for the products of the Boeing Aircraft Company at Seattle and conducted all the early tests of the Boeing 314, prior to the time that special inspectors were sent from Washington to take charge of this work. Word has just been received that Inspector George Halderman has been assigned to duty at the Boeing plant, so that henceforth the Sixth Region officers will be relieved of this duty.

We cite the case of the engineering section of the Sixth Region, but the situation is the same in practically all divisions of the CAA. The inspector staffs invariably are too small, and have too much work to do, and this is responsible in large degree for many of the troubles between the CAA and the aviation industry. The CAA will never be able to do its work properly, and the industry will never be properly administered until the field force of the Authority is properly, and completely manned.

Consolidating a Reputation

CONSOLIDATED FLYING-BOATS, built by the Consolidated Aircraft Corp., Lindbergh Field, San Diego, California, U.S.A., have made two outstanding long-range flights recently. The first, by the *Guba*, was the survey crossing of the Indian Ocean, along the Imperial Reserve Route, from Australia to Africa, managed by Capt. Bill Taylor, and on across the Atlantic to California. The second was the delivery flight from San Diego to Felixstowe of the Consolidated 28-5 for the British Air Ministry. Both were reported in THE AEROPLANE at the time. The crew of the *Guba*, Russel Rogers, Lewis Yancey, Ray Booth, and Gerald Brown, also delivered the Model 28-5 flying-boat to the R.A.F. in England.

Recently we had an interesting lunch with Mr. Booth and Mr. Brown, who were brought along by Mr. John Millar, of Aviation Corporates Ltd., the British agents for Consolidated.

The Americans were loud in their praises of the great time they had had at Felixstowe where they have been turning the Service boat over to the Marine and Experimental Establishment. At the moment it has been stripped down for detailed examination by R.A.F. technical officers.—We shall be interested to learn how it flies afterwards.

Although the original intention on the British delivery flight was to fly from San Diego to Felixstowe with one stop at Botwood, Newfoundland, Messrs. Booth and Brown told us that, unfortunately, they encountered average head winds of between 30 and 40 m.p.h. on the first part of the trip. So, although they had enough fuel to take them to Botwood without any reserve, they decided to alight at Buffalo, because Botwood might be fogged in and they would have no extra fuel for cruising around.

The strong head winds brought down their average speed to Buffalo to only about 124 m.p.h. They followed the T.W.A. route across the American Continent to Chicago. On that day, July 10, the average time of the Eastbound commercial transports was 125 m.p.h. against the wind, and that of the Westbound transports somewhere about 222 m.p.h.—nothing to cause undue excitement.

For the flight from Botwood to Felixstowe the boat averaged 169 m.p.h. for the 2,460 statute miles. They arrived over Felixstowe in the dark, so they cruised around until daylight. For the whole flight the Pratt and Whitney Twin Wasps used only 995 gals. of fuel. Nearly 500 gals. were left when the boat alighted. In fact, this fuel was used for test flights by R.A.F. officers during the next two days. Only the plugs were changed before the boat was flown after its Atlantic crossing.

The clean appearance of the nacelles and wings after the crossing was particularly commented on at Felixstowe. One particularly inane Pressman suggested that the crew must have swabbed down the wings and nacelles before they alighted.

The Consolidated 28 supplied to the R.A.F. takes off and cruises on 100 octane fuel, which probably accounts for the very low consumptions. The *Guba* was operated on 87 octane fuel.

The Atlantic was crossed at about 13,500 ft. Mr. Booth was in constant radio-telephonic communication with stations on both sides of the Atlantic through the Bendix equipment.

Botwood seems to be getting quite an amount of traffic these days. At the same time as the Consolidated boat arrived from Buffalo a Boeing Clipper arrived from England. They alighted within a few minutes of each other. The remark in *Punch* that there is no danger in flying the Atlantic nowadays, except from collisions, is silly but quite funny.

Mr. Brown said that the retraction of the wing-tip floats increases the speed by about 18 or 20 m.p.h. and decreases the length of the take-off considerably. Also it improves the handleability of the boat slightly. Retraction is done electrically, and there is an emergency hand-operating gear.

Both Mr. Brown and Mr. Booth agreed with the statement which has been made in this paper any time in the past ten or twelve years namely that the wing-tip floats of big high speed flying-boats nowadays must be retractable. And both were convinced that after the Royal Air Force have done a bit of flying in the Model 28 they will be converted too.

They also told us something of the flight of the *Guba*. This boat was flown from San Diego to Netherlands New Guinea for archæological and survey work by the Archbold Expedition sponsored by the American Museum of Natural History. During its time in New Guinea the *Guba* carried a total of 450,000 lb. (about 200 tons) of freight from the coast up to Lake Habbema, 11,500 ft. above sea level.

This involved repeated alightings and take-offs from the lake at that height. We have never before heard of a flying-boat operated in such conditions. From New Guinea the *Guba* was flown to Australia and then was the first aeroplane to cross the Indian Ocean from Australia to Africa. It was also the first flying-boat to cross Africa,—which it did from Mombasa to Lagos, after which it went on to Dakar.

From Dakar the *Guba* was flown non-stop across the Atlantic to St. Thomas in the Virgin Islands, 3,300 statute miles in 19 hours 33 minutes. Actually the boat remained in the air for 22 hours because of darkness. When it alighted it still had fuel for another 10½ hours.

All across the South Atlantic there were very favourable trade winds. At times the motors were throttled to the minimum needed to keep in the air. From St. Thomas the boat was flown to Miami and on to San Diego.

Thus the *Guba* was the first aeroplane and the first flying-boat to be flown round the World near its greatest diameter. Also from Dakar to St. Thomas was the longest non-stop over-water flight by any flying-boat.

After being in the Tropics for about a year, and although there were only two mechanics with the Expedition and practically no arrangements for maintenance, the boat was in extraordinarily good condition. Hardly any repairs were necessary compared with what would be expected for an aeroplane which had flown for more than 1,000 hours, mostly in the Tropics.

The original coat of paint was still in good condition and the only refinishing done on the trip was one coat of black bituminous paint below the water line. There was practically no corrosion. During the year the boat has done 750 hours flying and has been out in the open all the time.

One lesson to be learned is that flying-boats can be stationed in out-of-the-way tropical places for long periods with only a small personnel for maintenance,—as the R.A.F. found years ago with their Short and Vickers boats.

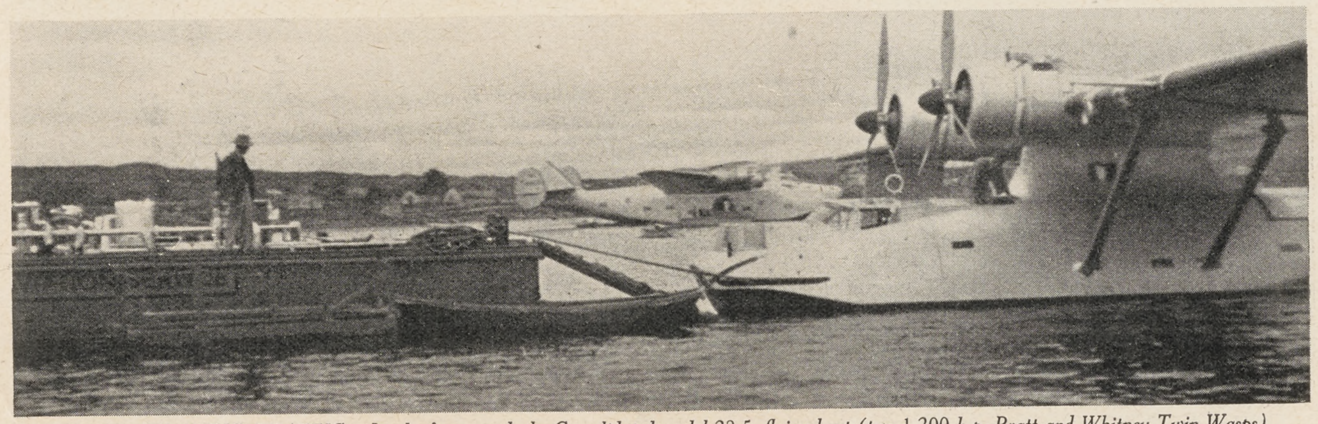
An interesting point is that complete overhauls on Consolidated boats are necessary only once every 44 months. Before these boats came into service the overhaul periods were 12 to 14 months. A strip-down of a Consolidated boat after 3½ years of service showed that complete overhaul was unnecessary, only minor repairs had to be made and there was very little corrosion.

The normal gross loaded weight of the type is 27,000 lb. Tests were made at a loaded weight of 30,500 lb. for the U.S. Department of Commerce for the licencing of the Commercial boat for American Export Airlines. The *Guba* was on occasion overloaded up to 35,000 lb., a 30% overload.

The makers do not advise open sea or rough water operation at a weight of more than 27,000 lb. Accelerometer readings in rough water tests have been as high as 8 or 10, which shows what a pounding a boat can get.

Both Mr. Booth and Mr. Brown had flown in the Consolidated Model 31 flying-boat (two 2,000 h.p. Wright Duplex Cyclones) and confirmed all the rumours of extraordinary performance which we have published about that boat.

Certainly the new Consolidated Model 31 is among the World's best aeroplanes. It contains the accumulated experience gained by the building of more than 200 PBYs for the U.S. Navy. The progress of the smaller Consolidated 28-5 in this country will be most interesting to watch.



TRANS-ATLANTIC TRAFFIC.—In the foreground the Consolidated model 28-5 flying-boat (two 1,200 h.p. Pratt and Whitney Twin Wasps) refuelling at Botwood, Newfoundland, before being flown across the Atlantic for delivery to the R.A.F.,—the first time a military aeroplane has been delivered by air from America. The Pan American Airways Boeing "Yankee Clipper," en route to New York from England, is in the background.

BREVES NOTICIAS DEL EXTERIOR

CHILE

• **Mejoras introducidas en el servicio aéreo.** — La empresa de transportes aéreos denominada Línea Aérea Nacional (L. A. N.), ha adquirido recientemente para los servicios internos y al exterior 2 nuevos aviones Junkers Ju 86. Se espera además en breve, la llegada de otros dos aparatos del mismo tipo. Con estos agregados se estará en condiciones de reiniciar el trayecto Santiago - Puerto Montt, que cesó a principios de 1938.

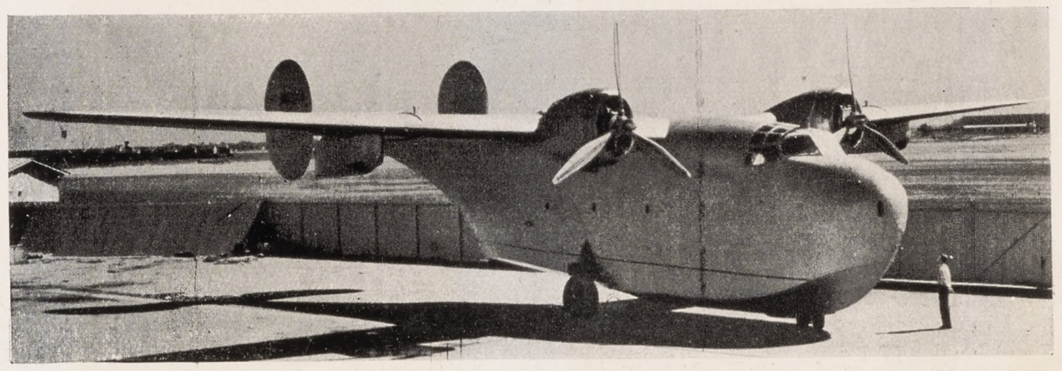
DINAMARCA

• **Nuevo tipo de avión deportivo.** — La empresa **Skandinavisk Aeroindustri,** de Copenhague, que está construyendo aviones livianos en base a los planos de dos ingenieros daneses, Kramme y Zeuthen, ha comenzado la producción de un nuevo modelo denominado K.Z. II Sport. La fábrica danesa construye únicamente los planeadores y no los motores. El nuevo avión será demostrado ante los oficiales de la Fuerza Aérea sueca, quienes, según noticias, se han interesado mucho por el modelo más pequeño, el K.Z. Sport. Sin embargo, estos oficiales advirtieron que no era recomendable que estos aviones se vendiesen a las organizaciones de aviación civil suecas, con las cuales parece ser que la Fuerza Aérea colabora, debido a que el aparato no poseía características que permitiesen efectuar aerobacia. Por ello, la empresa danesa ha construído este nuevo modelo, más poderoso, a fin de obtener su aprobación.

ESTADOS UNIDOS

• **Nueva fábrica Ryan en construcción.** — De acuerdo a informaciones, el 15 de junio debió darse fin a la construcción de las nuevas ampliaciones para la empresa Ryan. Estos trabajos costarán 150 mil dólares y la construcción abarcará una superficie de 60 × 84 m., siendo la estructura íntegramente de acero, con techo en forma de dientes de serrucho. Al lado de este edificio se erigirá una instalación para oficinas de dos pisos, que medirá 12,80 × 36,50 m. Además de estos dos grupos, habrá dos estructuras separadas para los talleres de pintura y dope. La empresa Ryan firmó un contrato de locación por el término de 50 años, por la superficie de terreno que ocupan actualmente sus instalaciones, además de otro tanto para futuras expansiones.

• **Pruebas de un tren de aterrizaje en un Ryan S-C.** — Durante la visita que efectuó a EE. UU. el conocido técnico británico Sr. George H. Dowty, constructor de los trenes de aterrizaje y elementos hidráulicos de su nombre, éste llevó a cabo interesantes pruebas con un nuevo tipo de tren de su concepción, el que fué instalado a dicho efecto en un avión Ryan S-C de cabina. El nuevo tren es fijo y está constituído por un nuevo tipo de montante amortiguador que hace uso de un movimiento telescópico horizontal, en lugar del tipo vertical actualmente conocido.



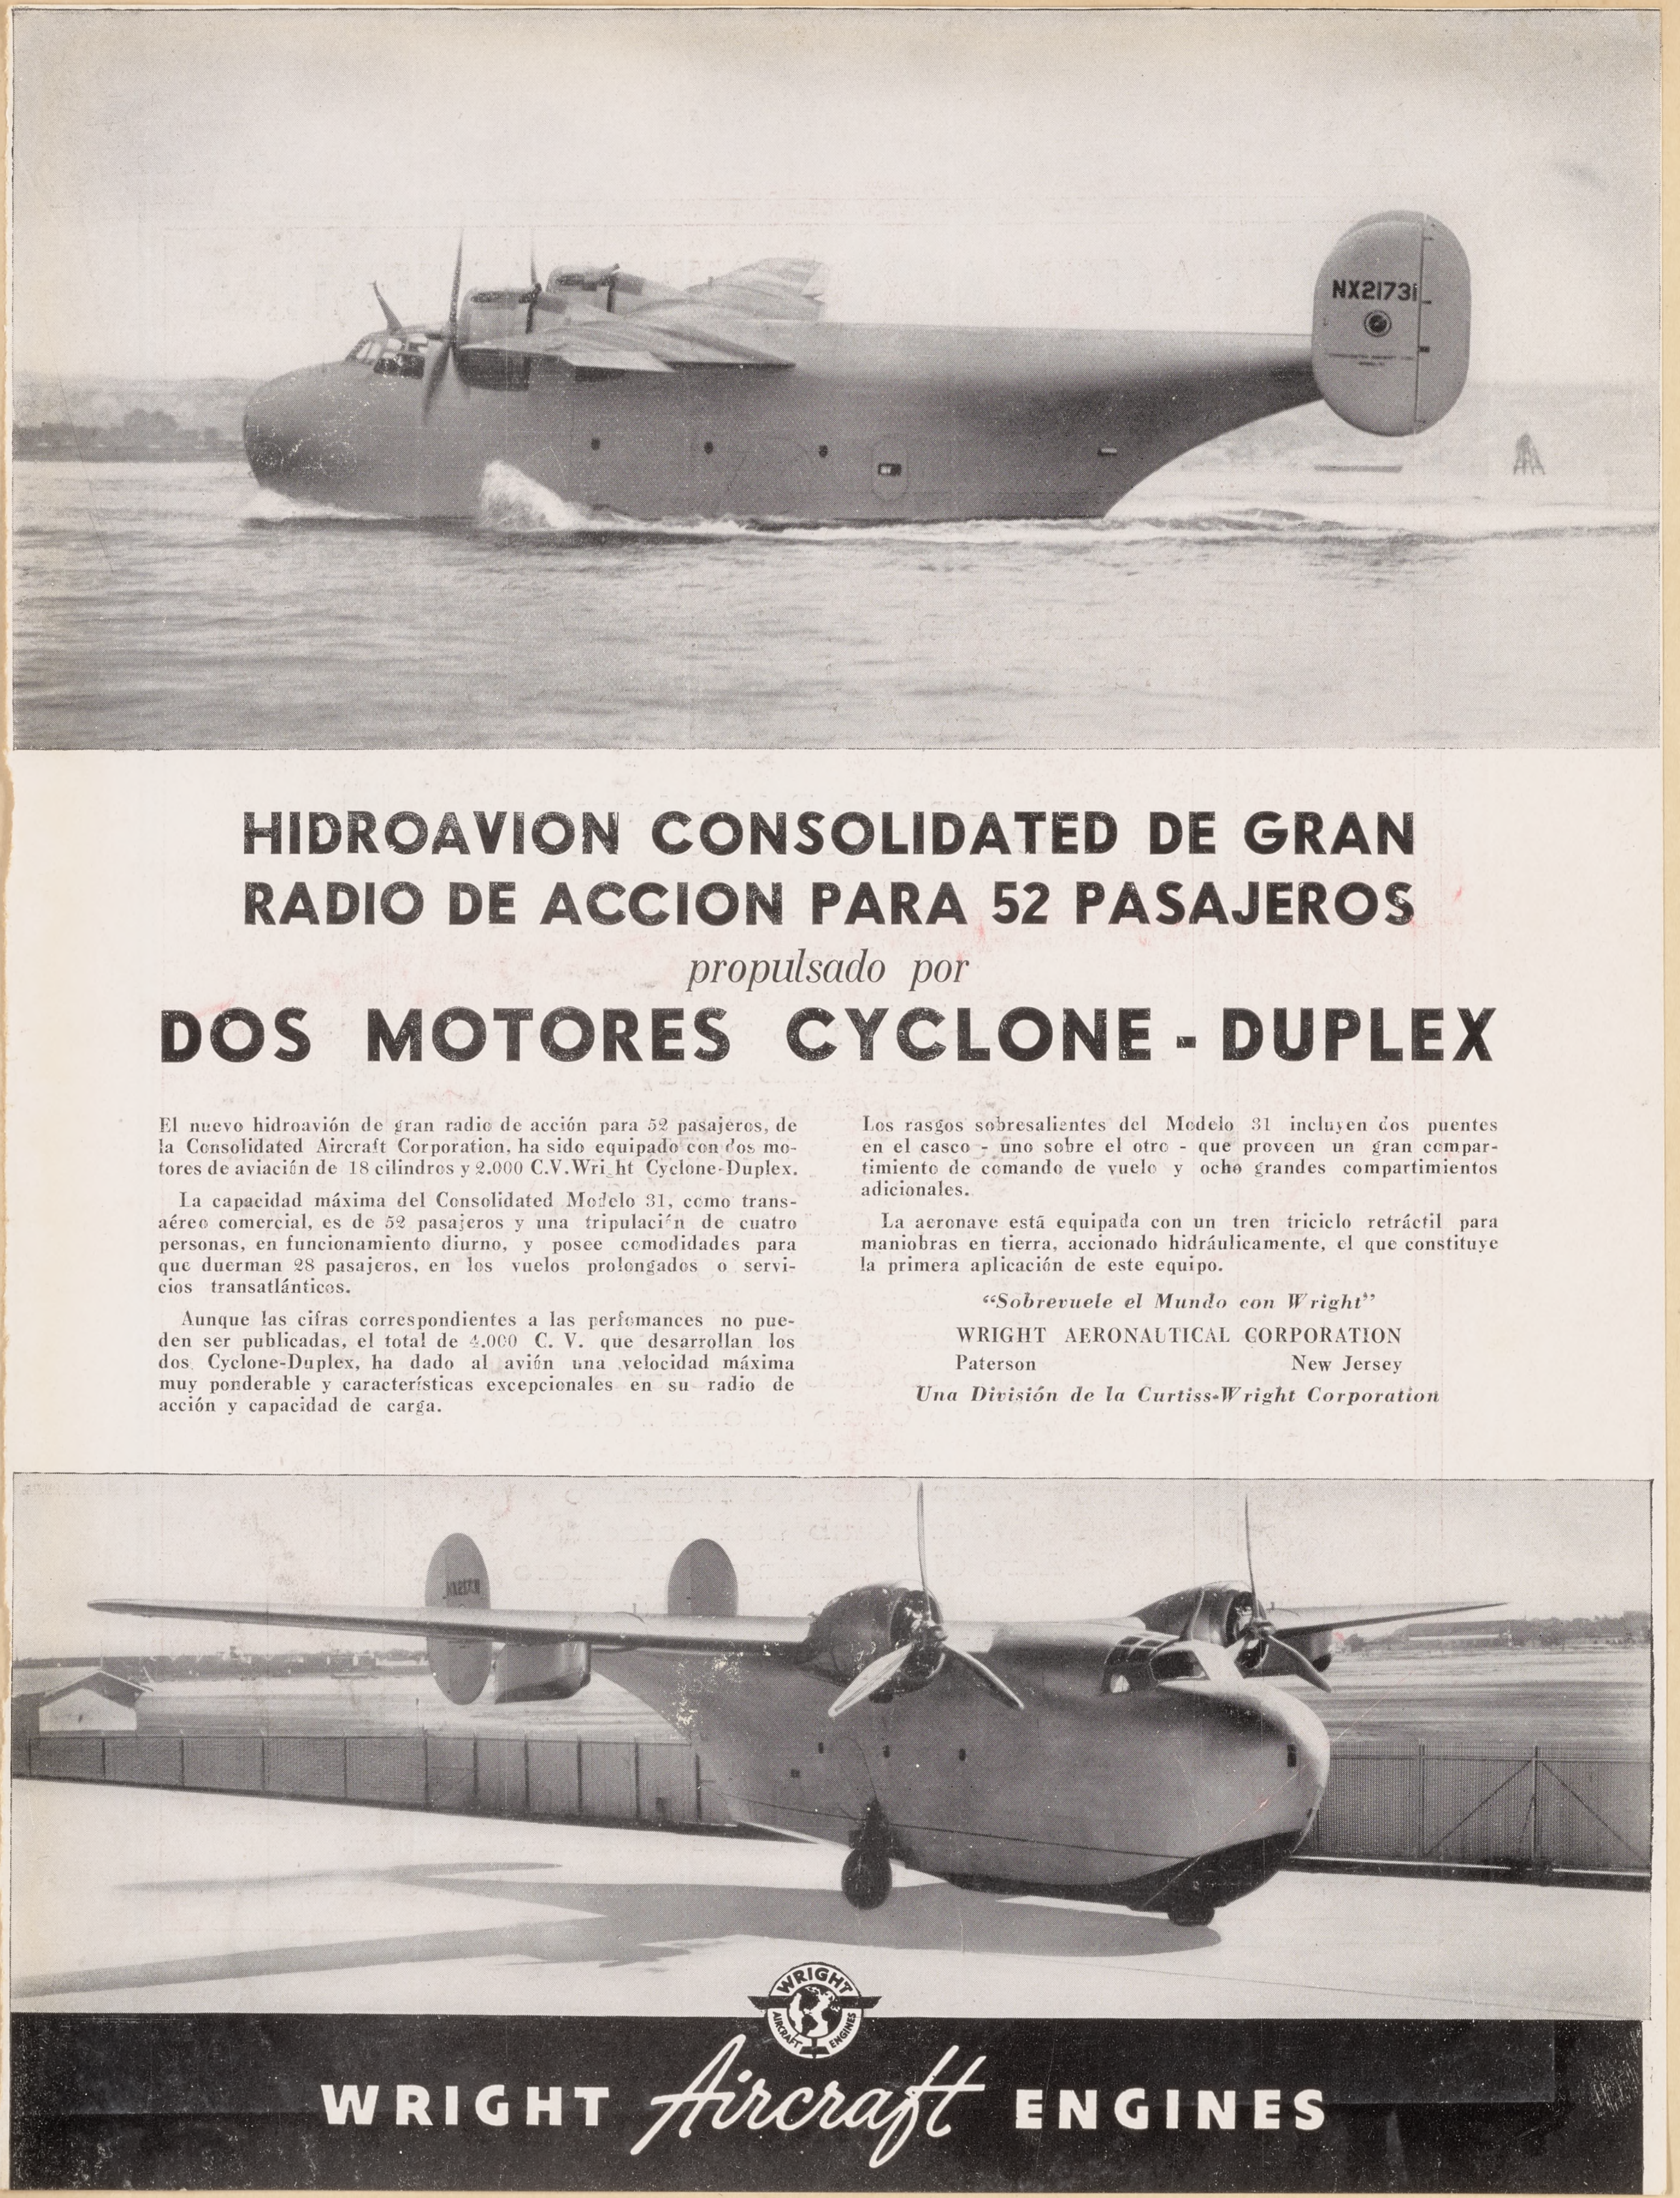
Vista de tres cuartos de frente del nuevo hidroavión Consolidated 31, propulsado por dos motores Wright Cyclone Duplex de 2000 C.V., que, según rumores, desarrolla una velocidad máxima del orden de 484 Km/h. y un radio de acción superior a 10.000 Km. Entre sus características de diseño figura la forma de su casco, dotado de un solo redán, sus flotadores retráctiles, su tren de maniobras en tierra, también retráctil y el diseño de su perfil alar, de extrema fineza, al que se debe gran parte de sus extraordinarias performances.

• **Nuevas construcciones de la Lockheed.** — Confirmando la noticia que diéramos en nuestro número anterior, damos a continuación las características resumidas de dos nuevos aviones Lockheed que se hallan en construcción. El primero es un monoplano bajo bimotor, denominado Lockheed Electra 16-E, destinado al transporte de 12 pasajeros, piloto y copiloto. Estará propulsado por dos motores Pratt & Whitney Wasp de 550 C.V. y hélices Hamilton Standard de velocidad constante. Su peso total será de 5200 Kg. con carga completa y sus dimensiones generales, las siguientes: envergadura, 18 m. y longitud, 13.50 m. Sus performances calculadas serán:

Velocidad máxima, a 2400 m, 368 Km/h.; de crucero a 3600 m., 350 Km/h.; carrera de decolaje, 265 m.; tiempo empleado, 15 segundos; velocidad de aterrizaje, 105 Km/h; velocidad ascensional, 460 m/min. a n. del m.; techo teórico, 7200 m.; techo práctico, 7000 m ; techo teórico con un motor, 3050 m.

El otro aparato será un monoplano bajo, cuatrimotor, para el transporte de 21 a 28 pasajeros y 3 tripulantes. Como novedad en los diseños Lockheed, poseerá un tren de aterrizaje triciclo retráctil. Los motores serán Pratt & Whitney Wasp S1H1-G de 600 C.V. cada uno para el decolaje. La envergadura será de 29 m. y la longitud, de 22,55 m. Según se anuncia, el nuevo aparato estará listo para nuestro otoño de 1940 y presentará notables perfeccionamientos en materia de hipersustentadores. La velocidad máxima será del orden de los 390 Km/h. y la de crucero llegará a 355. El radio de acción será de 3400 Km. normalmente, pero mediante depósitos auxiliares podría ser aumentado a cerca de 5000 Km. Las otras características del cuatrimotor proyectado, que se denominará «Excalibur», son: hélices Hamilton Standard «Hidromáticas»; peso total, cargado, con 21 pasajeros, 12.500 Kg.; carrera de decolaje a nivel del mar, 300 m.; velocidad ascensional máx. 365 m/min.; techo teórco, 7300 m.

• **Nuevo hidroavión construído por la Consolidated.** — La Consolidated Aircraft Corporation, de San Diego, California, acaba de dar fin a la construcción de un nuevo hidroavión bimotor, denominado modelo 31. Se trata de una iniciativa privada de la empresa, sin intervención del apoyo o las especificaciones de ninguna rama militar, salvo las referentes al empleo del motor, que figura en la lista secreta. Se trata de un monoplano de ala alta, sumamente fina y de planta y perfil decrecientes. Su construcción es íntegramente metálica con revestimiento de aleación de aluminio pintado con pintura del mismo color. Las alas son cantilever con los depósitos formando parte integral, en el plano central. Los «flaps» son del tipo Fowler de accionamiento hidráulico. Los flotadores laterales son retráctiles en el interior de los tramos exteriores del ala, pues, los extremos de la misma son demasiado reducidos para alojarlos según la práctica empleada en los hidros de las series PBY. Los aletones y los «flaps» son entelados. Los empenajes son del tipo cantilever, siendo los verticales dobles. Los timones van revestidos en tela. El casco posee dos puentes superpuestos, permitiendo un gran compartimiento central de comando y ocho grandes compartimientos adicionales. En el diseño se ha introducido un tren de maniobras en tierra, para el transporte hasta los hangares, de tipo permanente, retráctil, triciclo. La rueda anterior se retracta longitudinalmente hacia arriba, en el casco, mientras que las posteriores lo hacen lateralmente y también hacia arriba, alo-



HIDROAVION CONSOLIDATED DE GRAN RADIO DE ACCION PARA 52 PASAJEROS

propulsado por

DOS MOTORES CYCLONE - DUPLEX

El nuevo hidroavión de gran radio de acción para 52 pasajeros, de la Consolidated Aircraft Corporation, ha sido equipado con dos motores de aviación de 18 cilindros y 2.000 C.V. Wright Cyclone-Duplex.

La capacidad máxima del Consolidated Modelo 31, como transaéreo comercial, es de 52 pasajeros y una tripulación de cuatro personas, en funcionamiento diurno, y posee comodidades para que duerman 28 pasajeros, en los vuelos prolongados o servicios transatlánticos.

Aunque las cifras correspondientes a las perfomances no pueden ser publicadas, el total de 4.000 C. V. que desarrollan los dos Cyclone-Duplex, ha dado al avión una velocidad máxima muy ponderable y características excepcionales en su radio de acción y capacidad de carga.

Los rasgos sobresalientes del Modelo 31 incluyen dos puentes en el casco - uno sobre el otro - que proveen un gran compartimiento de comando de vuelo y ocho grandes compartimientos adicionales.

La aeronave está equipada con un tren triciclo retráctil para maniobras en tierra, accionado hidráulicamente, el que constituye la primera aplicación de este equipo.

DAY MORNING, SEPT. 25, 1

Aircraft Plants Guard Against Spies, Sabotage

Union 9-25-'39

Southern California aircraft manufacturers, acting under instructions from Washington to prevent sabotage and espionage, have imposed wartime restrictions.

Consolidated, Ryan and Solar aircraft plants have followed the lead of other plane factories throughout the nation in fingerprinting employes. These are checked with the federal bureau of investigation.

At the same time employes must produce evidence they are American citizens. Those who did not meet with these requirements have been discharged.

The Associated Press reported officials of the four major Los Angeles county plants—Douglas, Lockheed, Vultee and North American—say restrictions have been imposed in excess of those effective in peacetime. The plants manufacture military planes.

Consolidated has a backlog of $18,000,000 of orders for army and navy bombers, Ryan is building training planes for the army, and Solar is manufacturing accessories for military and naval planes being built by aircraft companies.

14 S.D. BOMBERS REACH CAVITE

Sun 9-25-39

One Of Squadron Returns To Midway

By United Press

MANILA, P. I., Sept. 25.—Fourteen Navy bombers, built by Consolidated Aircraft Corp., San Diego, landed at Cavite today after a leisurely mass flight from Honolulu, which marked one of the first passages of American military planes over the international date line.

The bombers arrived in formation and began landing shortly after 3:40 p. m. The planes were transferred here from the Pearl Harbor Base, along with the aircraft carrier langley.

The fifteenth plane of the squadron turned back to Midway Island after developing minor engine trouble and was to fly here later.

---

14 Patrol Bombers Reach Philippines

Union 9-26-39

MANILA, Sept. 25 (A.P.)—America's armed forces in the Far East today were increased by 14 big navy patrol bombers, which completed the first mass flight between Hawaii and the Philippines.

The planes left Pearl Harbor Tuesday and followed the 5586-mile route flown by Pan American airways, via the island stepping stones of Midway, Wake and Guam.

Wartime secrecy surrounded transfer of the squadron, which will be assigned to a "neutrality patrol" of Philippine waters, along with naval surface craft.

Lt. Comdr. Sam Lahache, who directed the flight, reported one accident en route, the loss of a thumb at Wake island by Ens. Willoughby Mercer, whose hand was struck by a whirling propeller.

Western Flying.

The awards announced by **Assistant Secretary of War Louis Johnson** on August 10, were as follows: Sept 39

1. **Bombardment, 4-engine Consolidated Aircraft Corporation,** San Diego, California, approximately $8,485,000.

Boeing Aircraft Company, Seattle, Washington, approximately $8,090,000.

With options to the firms of approximately $5,400,000.

The planes winning these awards are similar to the Consolidated type B-24, contract for which was announced on April 27, 1939, and the Boeing B-17B, contract for which was announced on October 8, 1937. No details or photographs have been published as to the Consolidated B-24. The bomber on which the award to the Boeing Airplane Company was made is similar to the B-17B, which established the Los Angeles-New York course record for plane with crew or passengers. This flight was made at an average speed of 263.8 miles per hour in an elapsed time of 9 hours 14 minutes, 30 seconds. This bomber incorporates various minor improvements found desirable as a result of more than a year's service test of this type at Langley Field, Virginia. The B-17B is powered with four Wright cyclone engines.

The Boeing B-17B Bomber, like the previous B-17 delivered in 1937 is a 22-ton all-metal, low-wing monoplane of some 105 feet wing span by 70 feet in length, and has an overall height of 15 feet. These bombers can fly at speeds greatly in excess of the 250 miles per hour of the earlier 4-engine bombers, carry 5 machine-guns and a crew of 7 to 9 men, including a comanding officer, pilot, co-pilot, navigator, engineer, bomber, radio operator, and gunners. All members of the crew can freely change stations, and for long flights sufficient additional personnel can be carried so that the operators of the airplane may be relieved from time to time and get the necessary rest.

CONSOLIDATED PATROL BOMBERS, DESIGNATED IN THE NAVY PBY'S, OF PATROL SQUADRON 8 ATTACHED TO PATROL WING 2, SCOUTING FORCE, AT PEARL HARBOR

Consolidated Aircraft Corporation is proceeding with its tests of its Model 31, in conjunction with the Navy. The CAA has not been requested to participate in the flight tests of the big ship, which has given rise to the unconfirmed report that the Navy will take it over. . . . A commercial version of the Navy PBY, with two twin-row Wasps, was ferried from San Diego to England for delivery to the British Air Ministry, during July.

NEW 'PLANES FROM U.S.

'Buffalo' May Be In News Soon

'BOSTON' BOMBER FOR R.A.F.

Hudsons Have A Fine Record

By J. M. Spaight, C.B., C.B.E.,
Principal Assistant Secretary of the British Air Ministry (1934-1937).

IT is welcome news for the British public that two further types of American aircraft, both excellent of their kind, are now being delivered in quantity to the Royal Air Force.

One is the Brewster fleet fighter, a single-seater machine of the dumpy appearance, which was developed in the United States for naval service. It is a small machine with a Wright Cyclone engine, and resembles in some respects the Spitfire, but whether it will have a performance equal to the latter's amazing one remains to be seen. It has been renamed the "Buffalo," a title with which the world will become familiar, no doubt, before long.

The other aircraft is the Douglas D.B. 7, a medium bomber with two Pratt and Whitney engines. Contracts for large quantities of this Douglas machine had been placed by the French Government before June, and have now been transferred to the British authorities. This machine, too, has been renamed; in the Royal Air Force it will be known as the Douglas "Boston."

STURDY CONSTRUCTION

Hudson With Nose Shot Off Flew Home

Large numbers of other types of aircraft are under order for Great Britain and Canada in the United States. They include a new type of fighter—the Curtiss P.40 (a successor to the Curtiss Hawk, which did fine service in the French Armée de l'Air). It is a single-engined aircraft. The bombers under construction in the United States on British account include some very heavy models, such as the Consolidated B.24 and the Boeing B.17D, both of which have four engines. Consolidated flying boats are also on order. Lockheed Hudsons and Harvard Trainers are still being delivered in big consignments to Britain and Canada

The two last-named types have already rendered invaluable service to the Royal Air Force. The stout, dependable Harvard has been one of the most useful trainers used for the instruction of both Britain's and Canada's great armies of the air. The Lockheed-Hudson has a wonderful record of service since it became one of the standard machines of the Coastal Command. Intended for reconnaissance work, it has had to turn its hand also to fighting and to bombing, and it has acquitted itself valiantly in each role.

FASTER VEGA COMING.

On June 1, 1940, three Hudsons engaged and shot down five German dive-bombers—two Junkers 87's and three Junkers 88's—near Dunkirk. Hudsons have also carried out many bombing attacks against objectives on the coast of German-occupied territories. Their sturdy construction can be judged from the experience of one of them: it had its nose completely shot off by a shell from a German destroyer and all the windows in the pilot's cockpit blown out, yet it succeeded in flying back to its base, two hours' journey away, through rain and wind that rose at time to the intensity of a typhoon. The pilot's verdict was: "Aircraft that can take punishment like that, and still fly, are pretty good, believe me."

The Hudson will yield its place before long to the "Vega," a larger and faster edition of the same machine, now being built for Great Britain by a subsidiary company of the Lockheed Aircraft Corporation. The Vega, one can safely predict, will maintain the high record of its predecessor. It should be one of the finest reconnaissance-bombers in the air. The other American types will also be first-class machines: of that there is evidence in abundance. There will be plenty of them, too.

AMERICA'S CAUSE, TOO.

The aircraft industry is in process of expansion. The largest of the aircraft firms—the Douglas, Martin, Lockheed, Boeing, North American, and Curtiss companies—have almost doubled their staffs in the last year. Another great increase is now taking place. It is safe to say that America's aircraft industry is on the eve of a period of activity which will rival that of her motor-car industry in its most hectic days.

All that America can send to Britain will be welcome, and it will be used for no selfish purpose. Britain's cause in this war is America's cause, too. That truth is being increasingly recognized in the United States. The Battle of Britain and of London is the battle, too, of America and New York. Democracy is on trial, and any help which Lincoln's country can afford to those who are fighting for democracy will be help for America's own defence.

EMPIRE WILL WIN.

If "government of the people, by the people, for the people" is not to perish, Britain must prevail in this titanic struggle. She will prevail the more surely and speedily if the great Republic of the Western Hemisphere lends her the fullest possible assistance, short of warlike intervention, in her conflict with the forces of evil

There is no shadow of doubt that in the end the British Empire will emerge victorious from the present ordeal. The struggle will be a long and bitter one, for aggression holds necessarily many advantages, and a country which has not made a cult and fetish of war needs time to gird on its armour against a country which has. How long the agony is to endure depends on how soon the huge potential forces of the British Commonwealth of Nations can be marshalled in their full array.

The time will be shorter in proportion as those who see that Britain and the Dominions are upholding the cause of every free nation, the world over, translate that recognition into the kind of action which is in such a crisis not unfairly to be expected by a nation which is fighting alone—to save all.

Local Aircraft Factory Makes Aviation History In Four Years of Operation on Waterfront

By N. V. DAVIDSON

Just four years ago this month, San Diego's largest single family of workers, the employes of Consolidated Aircraft Corp., began to "turn to" on what was destined to become, through subsequent contracts, the largest order for twin-engined flying boats ever placed by the U. S. government. During this time, virtually as fast as the plant and personnel could turn out these cruisers of the air, navy pilots and crews, manning them proceeded to build up a remarkable series of massed flight records which have received acclaim throughout the world as an outstanding achievement.

Some 209 of these twin-engined Consolidated Model 28s (designated by the navy as PBYs), have poured forth from the productive efforts of the artisans and engineers working together under the roof of San Diego's largest manufacturing plant. In addition, during the four short years, the remainder of the army contract for 50 "two-seater" pursuit airplanes, the PB2As, was completed and delivered.

Others built included a group of twin-engined P2Y-3As for the Argentine government; a model 82-5 for the British air manistry, which became the first military airplane ever to be flight-delivered across the Atlantic; another model 28, which was purchased by the Russian government and flown over 19,000 miles of Arctic wastes in search of the lost transpolar fliers; Mr. Archbold's famous Guba, and a special survey plane for transatlantic work for the American Export Airlines.

EXPERIMENTAL SHIPS BUILT

As though this were not enough, from behind the carefully guarded doors of the experimental building emerged two large experimental projects. These were the huge four-engined "flying battleship," the XPB2Y-1, upon which was expended in engineering, building and testing nearly $1,000,000, and the recent highly advanced twin-engined flying boat, the Model 31. This latest creation of the local plant set a precedent in large aircraft work in that it was designed, engineered, built, tested and flown in just under 10 months, exemplifying a remarkable coordination of skill and talent.

This program of aircraft building during the past four years at the local plant has given Consolidated a unique distinction among large aircraft builders. Taking as an arbitrary measure of "bigness" any airplane of a wing span of 100 feet or more, and including the airplane equivalent of spread furnished, Consolidated has constructed more than three times as many such airplanes as all other manufacturers combined. This includes those built during the World war period.

Consolidated came into existence after the war, in 1923, and figuring from that time, has constructed approximately four times as many as all other U. S. manufacturers combined. Since a good share of these have been the navy's PBYs, much of the credit is due the plant's force within the four years since Consolidated started here.

EMPLOYMENT INCREASED

Because the greater portion of this production of aircraft has been of a military nature, it has been accomplished behind closed doors, and the company's continual activity has not been realized by those outside. At no time in the four years has the personnel dropped below 1120 persons. Last March this figure was reached when it was difficult to obtain materials because of huge quantities being ordered by the whole industry. During the intervening months a steady increase has swelled the figure to about 1900. Former employes, of course, are given the first opportunity of employment as the total is increased. Based upon the present backlog of work, which is well over $17,000,000, the personnel will probably level off at around 2000 persons.

Taking advantage of a brief breathing spell just prior to the receipt of the latest contracts, a considerable program of rearrangement and placing of new equipment

(Continued on Page 2, Col. 1)

Local Aircraft Plant Makes Aviation History

(Continued From Page 1)

for even more efficient production was undertaken with an expenditure of approximately half a million dollars.

One new and spectacular piece of production equipment is the huge new hydraulic press capable of exerting a pressure of 9,000,000 pounds upon its platens, or the equivalent weight of three U. S. navy destroyers placed one on top of another. Full [illegible] equipped with the latest in cont[illegible], the powerful press employs a [illegible] slab of specially compoun[illegible] ubber in its upper platen. [illegible] ber is 10¼ inches thick, a[illegible] inates the necessity for emp[illegible] ing female dies.

HUGE MACHINES INSTALLED

Such large machinery requires considerable planning in advance of its installation. The hydraulic press was shipped disassembled from its eastern factory. To assemble it necessitated removing a large section of the plant roof and rebuilding a higher portion above it. Special steel re-enforced concrete sub-foundations were required.

Foundation work for the battery of new pneumatically operated drop hammers required a neat bit of engineering. The tremendous impact caused by the dropping of the bulky lead dies, thousands of pounds in weight, ordinarily would create local earthquakes of no mean proportions. The hammers, however, are cleverly mounted on massive inertia blocks resting on coil springs, supported by steel piles driven 60 feet into the ground. The inertia blocks, springs and pile supports, completely absorb the impact forces of the falling dies, so that none are transmitted to precision machinery operating in the vicinity of the hammers. Such an arrangement is literally confining an earthquake in a teacup, and is the exact reverse of the problem encountered in the building of the mounting for the Palomar observatory. The astronomers were concerned with keeping vibrations outside the Consolidated engineers, with keeping the vibrations inside.

Until the facts are brought to light, the amount of experience being brought to bear upon the fabrication of these airplanes is difficult to visualize. In those men who have been with Consolidated for five years or longer, a total of 2500 years of aircraft experience is represented.

TESTS ARE SPECTACULAR

The building of such a huge project as the four engined XPB2Y-1 is an excellent example of how this tremendous amount of experience is called into play to produce the remarkable results. A full sized mock-up first was built of wood and substitute materials to enable the engineers to work out difficult problems of arrangements, controls, etc., and to enable certain specifications to be met. Paralleling this, the test engineers carried out what amounted to the actual building and testing of each part designed before it was incorporated in the design.

Behind the carefully guarded doors of the experimental building the actual plane was built by hundreds of skilled workmen recruited from all over the plant, lending their efforts in one way or another. This was followed by a spectacular test in proofloading the huge wing. Ordinarily a semi-span, or half wing is tested, but due to the size of the structure that would have been necessary to erect, in order to keep the half wing from tipping over under its load, the whole wing was tested by supporting it in the middle. Because of the tremendous test weight which would bear upon the floor, it was necessary to determine how much load the concrete floor could stand. The load, it was found, had to be distributed over an area of 140 square feet of floor area through 1½-inch thick boiler plate. This was done to keep the supporting structure from sinking into the concrete floor.

SANDBAGS COST $5000

The actual loading was accomplished with 5, 10, and 20-pound sandbags specially made. Thousands of these were necessary, and their cost alone amounted to $5000. They were made locally under contract. The sand to fill these bags came from Oceanside. It had first to be carefully washed and dried to remove the salt. Had it not been washed, the salt would have absorbed moisture on a damp day, the sand would have gained weight, and the accuracy of the tests would have been destroyed.

For loading and unloading the sandbags for the various tests, timber platforms were erected alongside the huge wing. Enough lumber was used in these to build four medium-sized houses. The ¾-inch planking used over the wing to protect it during the loading and unloading would have built a two-car garage for each of the four houses!

There seems to be little limit to the tasks undertaken by the skilled artisans employed in the building of these airplanes, and the most difficult problem generally finds one or more persons fully qualified to lend expert knowledge or aid in its solution. Should you require an old-time blacksmith who knows the art of welding by hand forging, you'll find one in the welding department, assisting in the most modern methods of welding. If it's a deep sea diver you want, one qualified for 300-foot depths is to be found in the final assemply beaching gear crew, or if it's a cable or wire maker you can soon locate one at Consolidated with 30 years of background in this line!

Attesting to the skill of these men engaged in producing some of the world's finest aircraft, is the performance of the craft themselves. The first airplane built for Richard Archbold and fitted especially for tropical work, was on short notice purchased by the Russian government and flown for 19,000 miles in polar regions, under adverse Arctic weather conditions, without difficulty.

Mr. Archbold's second airplane was flown in three hops from San Diego to Dutch New Guinea, spent a year operating under severe tropical conditions and then completed the circumnavigatioin of the globe, establishing several records as it did so, and arrived once more in San Diego in excellent condition. Only minor overhaul and checkup was necessary, though the plane had covered approximately 25,000 miles on its return trip from New Guinea alone.

A third plane of this type was flown from San Diego to Felixstowe, England. This was the first flight delivery of a military airplane across the Atlantic. Because the airplane arrived in such a clean and tidy condition after its long flight, one British correspondent remarked that perhaps the clever crew wiped the spots off before the photographers arrived!

9/6/39

OFF FOR FAR NORTH—Rear Admiral A. B. Cook (left) looking out of the door of his flying flagship before leaving for Seattle. With him is Commander Andrew Crinkley, "skipper" of the huge flying boat, which is navy's biggest.

Flying Flagship Hops to Alaska

Flying the two-starred flag of Rear Admiral Arthur B. Cook, commander of the aircraft scouting force, the world's greatest naval airplane took off from San Point yesterday for an extended inspection trip in Alaska.

Admiral Cook is taking Congressman James Schrugham, chairman of the naval subcommittee of the house committee on appropriations, to Alaska to visit the naval air bases under construction in the Northern territory.

The party, numbering sixteen in all, will go direct to Sitka, and thence to various Alaska and Bering Sea points. Admiral Cook's floating flagship, the cruiser Memphis, will meet him somewhere in Alaskan waters and take him on to Honolulu next month, while the plane will proceed back to San Diego without stopping in Seattle.

The flying flagship, the first the navy ever owned, is an experimental plane developed last year by the Consolidated Aircraft Corporation. Weighing 55,000 pounds when fully loaded, she has a wing span of 115 feet and a fuselage 77 feet in length. She carries 3,500 gallons of gasoline, which gives her a cruising radius of 4,000 miles.

Powered with four 1,050 horsepower Pratt and Whitney engines, the huge plane is capable of a speed in excess of 200 miles per hour.

She is smaller than the Boeing Clippers but larger than the flying boats built in Great Britain for trans-Atlantic service.

In addition to Admiral Cook and Congressman Schrugham, the passengers aboard included Commander Ralph Davison, chief of staff; Commander Seth Warner, Lieut. Commander H. H. Goodwin, Lieut. R. S. Purvis, flag lieutenant, and Ensign T. M. Wohl of Issaquah, a reserve pilot who is being taken along because of his knowledge of Alaska flying conditions.

Commander Andrew Crinkley is in command of the plane. His crew comprises Lieut. (junior grade) T. E. Gillespie, Ensign J. A. Ferguson, C. K. Herman, chief radio man; L. A. Flynn and J. A. Peters, aviation chief machinist's mates; R. L. Caron, radio man first class; C. R. Roof, aviation machinist's mate first class, and A. H. Geck, aviation machinist's mate second class.

NO DECLINE IN PLANE OUTTURN

High-Speed Operations Bring Forth Plant Expansion Plans at L. A.

LOS ANGELES—Survey of the activities of airplane manufacturing companies shows a continuance of operations with plants working on commercial and military jobs. Several plants are planning expansion of existing manufacturing facilities. Most important of the plans for expansion is that of North American Aviation, Inc., which has already made provision for a 50% increase of facilities. Plans were confirmed here officially today.

It is learned that North American Aviation will start immediately to build the plant facilities. An increase in capacity of 50% should bring its usable floor space at the Inglewood plant to around 700,000 square feet.

It is estimated that the contemplated expansion of the plant will entail an outlay of upwards of $500,000 and may reach close to $1,000,000. In addition to a large unit for production and assembling of planes, North American will build two smaller buildings to house a die foundry and drop hammer shop. The expansion, it is explained by North American officials, is necessitated by the recent orders from the United States Army Air Corps and is in line with War Department plans for general expansion of United States facilities for plane production.

The Vultee division of Aviation Manufacturing Corp. confirms reports that a major plant expansion is planned and already authorized. According to company officials the expansion is being made to enable handling of existing contracts and to conform with the national policy of increasing plant facilities of the country.

Consolidated Aircraft Corp. officials at San Diego will make no comment on present expansion plans other than to admit extension of facilities is being seriously considered and may take shape shortly.

The newly organized Northrop Aircraft, Inc., yesterday through its president, John K. Northrop, announced that the contract for the construction of its $500,000 plant at Hawthorne, a suburb of Los Angeles, was awarded to E. S. McKittrick Co., Inc.

Construction of the plant will be started immediately and orders are to be placed shortly for machinery and equipment. According to company officials, the plant should get into plane production some time near mid-December.

The new plant will contain 115,550 square feet of floor space, and initial plans call for capacity for production of one plane daily. Arrangements have been made in the design of the plant whereby output can be expanded to meet production schedule of four planes daily.

Navy Plane Orders

NEW YORK—Completion of awards for purchase of Army aircraft under the current expansion program has now focused attention on possibility for additional Navy contracts being announced within the near future.

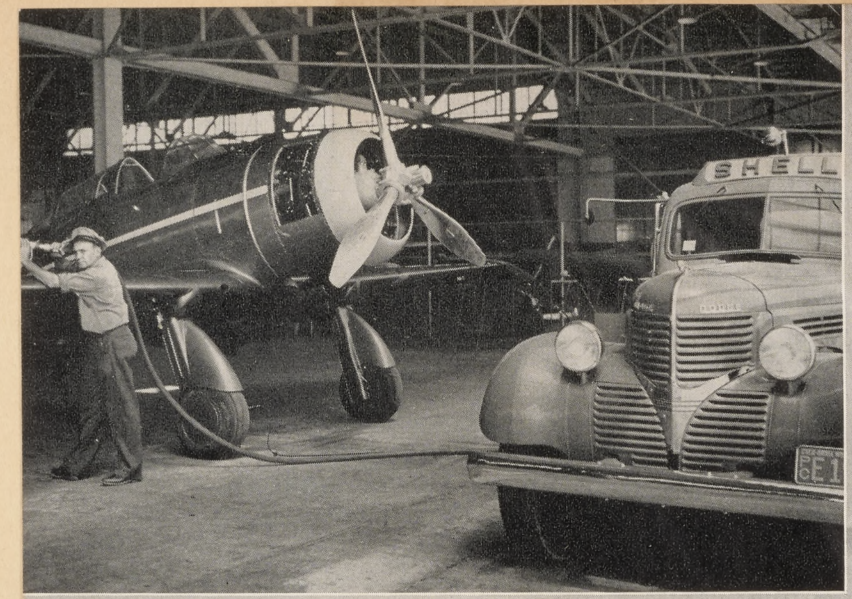
The Naval Bureau of Aeronautics has approximately $37,500,000 of unexpended funds remaining out of the 1940 appropriation for the purchase of aircraft. It is believed likely that a substantial portion of this amount may be used to obtain additional long-range bombers.

Most of the Navy's patrol bombers now in service were made by Consolidated Aircraft Corp., that company having earlier this year completed the last of more than 200 such planes. Glenn L. Martin Co. is now in production on a Navy order for a new type of patrol bomber. Boeing Airplane Co. and the Vought-Sikorsky division of United Aircraft Corp. are equipped for building large flying boats, but heretofore have not been major factors in supplying the Navy with patrol bombers.

As between the two primary sources, it appears that Consolidated is the more likely to obtain important new business at this time, particularly from the standpoint of unused capacity. The company's current backlog in the neighborhood of $17,000,000 is considerably less than its potential annual productive capacity. At the same time, the Martin company has unfilled orders in excess of $50,000,000.

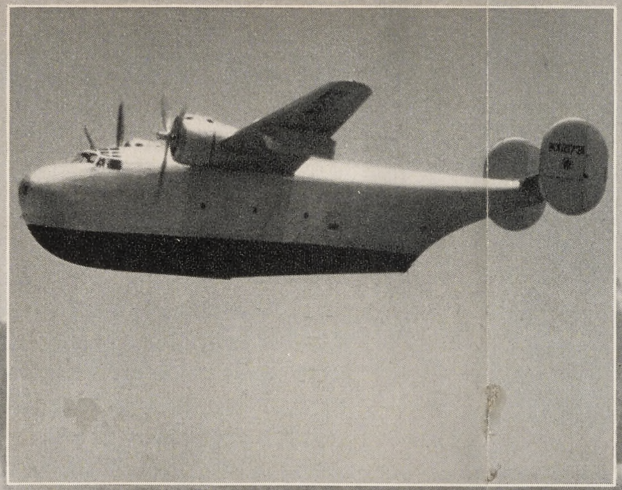
Another source of demand for aircraft is the domestic airlines, which are now shaping their plans for equipment to handle an expected increase in traffic during 1940.

WASHINGTON—(UP)—The Navy Monday awarded a $676,400 contract for airplanes and spare parts to North American Aviation, Inc. It awarded a $558,000 contract to the Standard Oil Co. of New Jersey, for oil and fuel.



(Left) Frank Fuller's fast Seversky job takes on Shell 100 Octane for the Bendix Trophy cross country event. Fuller won with an average speed of 288 m.p.h.

(Right) Consolidated Aircraft Corporation's latest creation — it can carry 52 passengers, has a wing spread of 110 feet; could cross the Atlantic with 28 passengers



Howard Hughes' big Boeing Stratoliner, which the noted flyer recently purchased in Seattle

Camera Eye-fulls of Shell Fueled Planes

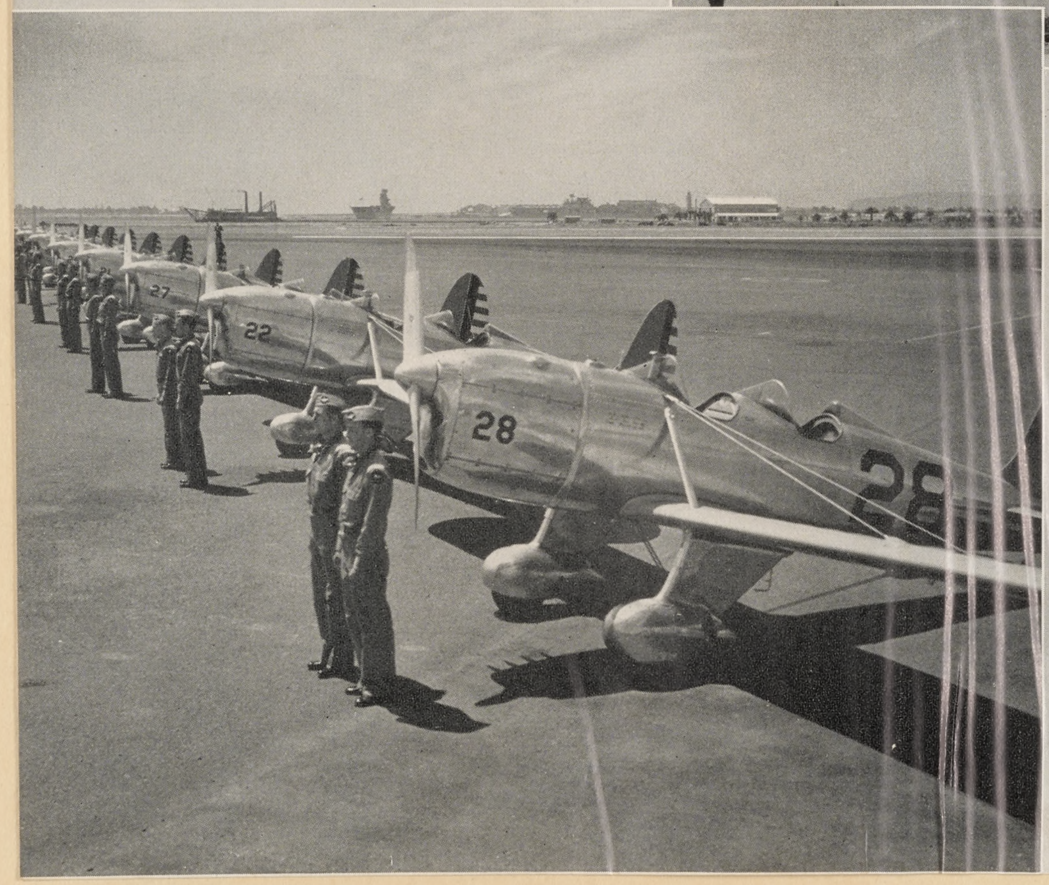
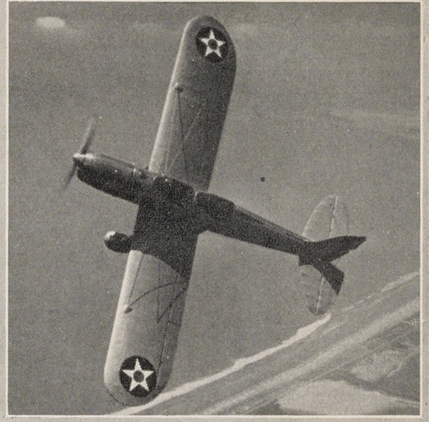
(Below) Low wing monoplanes of the Ryan School of Aeronautics line up for inspection. These ships and cadets are part of the Army's Air Corps Training Detachment. This is said to be the first time this low wing type of monoplane has been used in primary flight training

AMERICAN AIRLINES
FLAGSHIP NEWARK



(Below) A Ryan training plane cuts a few aerial didos. These ships are noted for stability and ease of handling



ON THESE PAGES you see a group of planes which are making, or have made news. Or to go one step farther, will very likely make news.

Take the pictures of the planes being fueled in the lower left hand portion of this spread. One of them is Frank Fuller's speedy Seversky, 1937 Bendix Air Race winner and a repeater again this year. San Francisco's favorite sky-pilot shot his blunt nosed modified pursuit plane across the sky at an average pace of 282 m.p.h. His fuel? Shell 100 Octane — the same as used by all starting planes in the Bendix Trophy; the nation's blue-ribbon cross country air event. Art Bussy and Paul Mantz placed second and third.

But Bendix winners aren't the only winged newsmakers. Down in San Diego, Shell fueled planes of the Ryan School of Aeronautics are being used to teach the Army's fledgling fliers their aerial A.B.Cs. Also using Shell to train Army war birds are Allan Hancock's College of Aeronautics, Santa Maria, California and Major C. C. Mosely's Grand Central Flying School, Glendale, California. It's all part of the United States' great air training program.

Howard Hughes, a headline name known around the world, is again active in his never-ending activity to push back the frontiers of scientific aviation knowledge by actual performance. His new Boeing Stratoliner tuned up its four motors on Shell 100 Octane recently in Portland.

Pictured on these pages you glimpse a soaring plane, graceful as a gull, which may well be a newsmaker of the air in the near future. It's Consolidated Aircraft Corporation's new twin engined flying boat — a big craft that can carry 52 people. As are all Consolidated's planes, it was test flown on Shell Aviation Gasoline.

(Above) Hughes supervises the fueling of the Stratoliner with Shell Aviation Gasoline

"Guba" Records

AVIATION OCT '39

A recapitulation of the around-the-world flight of the Consolidated "Guba" flown by Richard Archbold, shows that the following records were established:

1. The first airplane to fly around the world at its greatest diameter.
2. The longest over-ocean non-stop flight by a flying boat, Dakar to St. Thomas, Virgin Islands, 3300 miles.
3. The first flying boat to fly around the world.
4. The first airplane to cross the Indian Ocean from Australia to Africa.
5. The first flying boat to fly across Africa.
6. The first flying boat to fly across Australia.

During the time Archbold operated the Guba in New Guinea, more than 500 hours were flown under extremely primitive operating and service conditions, transporting hundreds of thousands of pounds of supplies and hundreds of people to various points in the interior.

U. S. EXPANDS DEFENSE PLANS AT S. D. BASES

Sun 10-3-39

Construction And Training Programs Provide Activities

Willis Werner's new series, "San Diego Key To Pacific Defense," starts tomorrow in The Sun.

By HAROLD KEEN
Navy Editor

San Diego business today took an optimistic view of the future standing of this community as a base for Naval and Military operations, despite the impending transfer of some 25 warships, with their crews o approximately 6000 officer and enlisted men to Hawaii.

The following development tended to dispel any gloom tha might have threatened to settl locally:

1. Consolidated Aircraft Corp backlog of more than $16,000,0 in contracts for U. S. Army ar Navy planes, on which productic will not reach a peak for sever months. Being added to the pa roll are as many as 100 me weekly, with about 2000 employe at present.

2. Increase in the enliste strength of the Navy from 110,0 to 145,000 has been reflected i sharply raised quotas of recrui at the Naval Training Statio where, for the month of Octob 810 young men will be in trair ing, as compared with 516 for th same period last year.

3. Accelerated activity at th Destroyer Base, where 22 Wor War-built destroyers, recommi sioned last week, are being ou

Turn to Page 2, Col. 1.

U. S. EXPANDS S. D. DEFENSE PLANS

Sun 10-3-39

(Continued from Page 1)

fitted and readied for security patrol.

4. Ryan Aeronautical Co.'s $1,000,000 list of unfilled orders, and Solar Aircraft Co.'s $500,000 backlog, largest in the history of these concerns, which are being fulfilled with unprecedented numbers of employes.

5. Acquisition by Consolidated from the city of 17 acres of tidelands, in anticipation of possible future expansion, and portending receipt of a large contract for construction of military planes.

NEW TRAINING SCHOOL

6. A new $174,000 annual payroll brought to San Diego by the Army Air Corps primary training program inaugurated July 1 at the Ryan School of Aeronautics.

7. Large subsidies by the Civil Aeronautics Authority for ground school training of college students at San Diego State College and flight instruction at Speer Flying Service.

8. Definitely scheduled continuation of the harbor dredging program, the first phase of which, under a $420,000 contract, will be completed about the end of this year. Congress has authorized a $500,000 appropriation for further deepening of warship anchorage areas as part of the $4,184,000 program conceived by the War Department to improve the bay as a naval base.

CARRIER EXPECTED

9. Expected basing in San Diego of the new aircraft carrier Wasp, nearing completion on the east coast. This vessel and its squadrons of combat planes would replace the Enterprise, should the latter, assigned to security patrol in the vicinity of the Hawaiian Islands, remain at the mid-Pacific base indefinitely.

10. Projected expansion of Supply Depot facilities here, including enlargement of the Navy Pier and construction of a six-story warehouse, as urgently requested of Washingtoh officials by 11th Naval District authorities.

AIRCRAFT MEN MEET IN L. A.

Los Angeles Herald and Express

10-5-39

Latest Designs Shown at Session Of Engineers

Delegates representing firms with unfilled orders for more than 275 million dollars worth of aircraft, participated today in the opening of the fourth annual national aircraft production meeting of the Society of Automotive Engineers at the Biltmore Hotel.

The convention is being held by the society in co-operation of its four Pacific Coast sections, namely Southern California, Northern California, Oregon and Northwest, and also the Aeronautical Chamber of Commerce of America and the Air Transport Association of America.

With Mac Short, president of the Vega Airplane Co., as general chairman, sessions will be held tomorrow and Saturday, with time out that afternoon to enable the delegates to see the University of Southern California-Washington State football game at the Los Angeles Memorial Coliseum. The convention will close Saturday night with a banquet at which E. W. Templin will preside and W. J. Davidson, president of the society, will speak.

Highlight of the convention will be an address Louis Johnson, assistant secretary of war, will deliver at the Friday night session when Robert E. Gross will be chairman.

The convention attracted a large gathering of airplane enthusiasts who viewed the extensive exhibits of the most modern designs, models, motors and aircraft materials that are on display. Officers said the exhibit is the most comprehensive and largest ever presented in the west and shows the remarkable strides made in the industry.

Three sessions are scheduled for today. The first was opened this morning with A. L. Klein as chairman. First speaker was Arvid Nelson of Hamilton Standard Propellors, who spoke on "Propellor Production." His talk was accompanied by motion pictures.

Henry H. Kerr and F. C. Frank of the Bendix Products Division, Bendix Aviation Corp., spoke on phases of airplane brake installation and control considerations. Harold W. Adams, Douglas Aircraft Co., discussed design and shop problems in high pressure hydraulic systems.

Another session will be held this afternoon with Courtney Hertel, Douglas Aircraft Co.; H. F. Schwedes, North American Aviation, and P. N. Jansen, Curtiss Aeroplane Division, Curtiss-Wright Corp., as speakers.

At tonight's session W. A. Hite, Vultee Aircraft Division, Aviation Manufacturing Co., and B. W. Sheahan, Consolidated Aircraft Corp., will be the speaker.

AVIATION, OCT. '39

West Coast Business

Completion of negotiations for erection of the new $325,000 Northrop Aircraft Co. plant on a 150-acre site at Hawthorne, Calif., have been announced by John K. Northrop, president. Terms of the contract provide for the outright purchase of 72½ acres of land by Northrop Aircraft from the city of Hawthorne for a consideration of $45,000, with the city to provide the remainder of the 150 acres to be established as a landing field. Construction of the 110,000 square foot factory was to start immediately, with completion scheduled within 90 days. Temporary offices have been opened in Hawthorne and a staff of engineers is already at work on preliminary design layouts. Hawthorne, site of the new factory and flying field, is about three miles east of the Los Angeles airport at Inglewood.

Rushing production plans in connection with contracts for the manufacture of four-engine bombers for the U. S. Army Air Corps, Consolidated Aircraft Corp., San Diego, has installed a huge Birsdboro hydraulic press, capable of exerting a force of 9,000,000 pounds.

Activities of Ryan Aeronautical Company, San Diego, have reached new all-time highs with receipt of additional U. S. Army Air Corps awards, and initiating of production in the new Ryan factory. Air Corps orders so far this year have topped $470,000, representing purchases of Ryan low wing monoplane type primary training planes, of which more than $100,000 worth have already been delivered to the Army. Additional parts orders awarded Ryan by Consolidated, Douglas, Lockheed, and other aircraft firms, have brought total business on hand to approximately $750,000.

American Aircraft Co., Long Beach, Calif., has announced completion of its financing program and early production of the 125 h.p. Security sport training plane which was acquired, with all design and manufacturing rights, through purchase of the Security Aircraft Corp. Factory space is being enlarged to provide for orders of $45,000 now on hand.

Aircraft Accessories Corp. has filed a registration statement with the Securities and Exchange Commission covering 100,000 shares of capital stock under option to underwriters at $1.50 per share. Proceeds from the sale of stock will be used to complete manufacturing facilities at the new Glendale plant and to expand the facilities of the Siebenthaler division in Kansas City. Substantial new orders have recently been received from various manufacturers for the hydraulic actuating devices developed by Aircraft Accessories Corp., and for the various specialties developed by the Siebenthaler division. Sale of the additional stock will bring outstanding shares of the company to 200,000 out of an authorized capital of 500,000 shares.

A special meeting of stockholders has been called by Don P. Smith, president of Interstate Aircraft & Engineering Corp., to act on a proposal to change the capital structure of the company from 500,000 shares of $1 par value to 200,000 shares of $5 par value, and reduce the stated capital from $500,000 to $250,000 through an exchange of one new share for ten shares of outstanding stock. The proposed change would clarify many problems of the company, it was said, and would facilitate plans for an expansion program.

Airplanes And War

MAJOR FLEET presented a thought for consideration when he suggested that the mere possession of a great fleet of military planes might become the best guarantor of peace any nation and the nations in general could have.

Airplanes can not win a war in the sense that they can occupy a territory. Russia has tried to develop a program of landing troops from airplanes by means of parachutes to hold and occupy a country, but the program is doubtful. Airplanes have become the scouting forces of the army and the navy, and are superb for that purpose.

But the main consideration that might deter nations from war is the destructiveness of the airplanes in raids on cities and on the civilian populations behind the front lines. The destructiveness has been attested in Spain and China.

The airplanes did not win the war in Spain and have not won the war in China. Their raids have aroused hatred, and instead of destroying morale have heightened it. But neither of these conflicts have provided such a test as would be provided in war between Britain and Germany, for example.

Whether London or Berlin and other cities would be wiped out by airplane bombs is still to be demonstrated, but, as Major Fleet put it, "possession without employment" of airplane fleets could be a deterrent factor. It has been in fact. There need be little doubt that Hitler would have invaded Danzig and the Polish corridor, probably Poland itself, before this, if in the interval since Munich, Britain had not brought its airplane strength up to a comparable standard with that of Germany. If that is the case, the British planes already have served to keep the peace.

Of course, peace in Europe is now an armed truce, and that is not a solid or permanent foundation for peace, but continued construction of great plane fleets might finally bring the nations to the conclusion that no side could win a war in the final analysis, and that peace should be adopted as a matter of necessity. It is true that the possession of a sharp weapon has not stopped war, and sometimes has encouraged it, but the case might be different if all the great powers possessed the same sharp weapon in equal proportions. In any event, in a world armed with air bombers, this nation can not afford to be without them.

Sun 10-10-39

ARCHBOLD RELATES STORY OF CRUISE

Strange animals he captured in Netherlands New Quinea as leader of an exhibition serviced by the San Diego-built flying boat "Cuba," were described in New York today by Richard Archbold, wealthy research associate of the American Museum of Natural History.

He exhibited a three-foot rat, four-foot fruit bats, a marsupial whose fur has three colors blending into each other, and a foot-long animal called the dactylonax, which plucked bugs and insects from under logs and rocks with a daintly poised forefinger.

Mr. Archbold described an initiation into one of the native tribes in a curious ceremony marked by the slaughtering of a pig, the toasting of its liver and its presentation to the expedition members to eat.

The Archbold plane is in the Consolidated Aircraft Corp. plant here.

Union 10-10-39

Venezuela Plane Mission Due Here

A Venezuelan military mission is expected to visit San Diego plane factories within a few days to inspect local products with a view to purchase of planes for strengthening Venezuela's air defense, it was reported yesterday.

Members of the commission are Lt. Col. Francisco Leonardl and Capt. Jorge Marcano, The Associated Press reported. They arrived in Los Angeles yesterday to make a tour of southern California factories.

T. Claude Ryan, president of the Ryan Aeronautical Co., which has made some sales of private planes in Venezuela, said he had heard the air mission would be in southern California for two weeks. While no definite time has been set for arrival of the officers in San Diego, they are expected to make a visit to check over aircraft available at the Ryan and Consolidated plants.

CONSOLIDATED DOUBLING SIZE OF FACTORY

Expects Emergency Orders From U. S. For Warplanes

[illegible]

To enable immediate expansion of the Consolidated Aircraft Corp. plant in view of the existing national emergnecy, the City Council today authorized the Harbor Commission to lease 17 acres to the concern at a yearly rental of $750.

Port Director Joe Brennan revealed that company officials now in Washington, D. C., must give the Federal government assurance that land will be available for enlarging the factory before large orders now pending may be granted Consolidated.

The lease, which is for land adjacent to the 27 acres now occupied by the company, carries the option of leasing 22 more acres within 10 years. It will run concurrent with the original 50-year lease the firm received on moving here from Buffalo in 1935.

LEASE URGENT

"The large contracts expected by Consolidated will require almost immediate doubling of the plant's size," Mr. Brennan said, "and for that reason it is urgent that the lease be granted without delay."

Councilman Addison Housh objected to the "rush act" on such an important deal, but voted with the rest of the Council to approve the lease because of the emergency. "If it were not for present war conditions, I'd never approve of doing it this way," he commented.

1800 ON PAYROLL

As support of his contention that the city will benefit greatly by the lease, Mr. Brennan pointed out that Consolidated has paid more than $111,000 in taxes during the past three years, has employed 3800 men at the peak, and today has 1800 on its payroll.

Fly Engines Here For Army Plane

10-14-39

A big army transport plane dropped down on Lindbergh field yesterday afternoon to discharge two 1600-pound airplane engines for installation in a 4-motored army bomber under construction at the Consolidated Aircraft Corp. plant The engines were rushed here from Hartford, Conn., to speed operations in the construction of the plane. Two more engines will arrive by air within a few days.

The transport, piloted by Lt. Thomas J. Schofield, with Lt. Glenn Holland as co-pilot, is specially designed as an air freighter and has made many flights around the country, although this is the first time engines for a new bomber have been flown here. Schofield and Holland are attached to the 10th transport group, Middletown, Pa.

Secrecy surrounds specifications of the engines, although they are said to develop in the neighborhood of 2000 horsepower each. The engines were inspected by Maj. E. R. McReynolds, army air corps inspector in this area; Edgar Gott, solidated executive, and W. G. Chamberlain, factory representative of the engine company.

~~(FOR WALL ST. JOURNAL [N.Y.] of above - See APRIL 13th)~~

CONSOLIDATED READY TO BUILD

Sun Oct 13 - 39

Permit For Addition To Factory Requested

Extension of Consolidated Aircraft Corp.'s production facilities by 75 per cent is contemplated in plans being prepared by the concern's officers, Plant Engineer William A. Maloney disclosed today in applying to the city for permission to construct a three-story steel building as part of this program.

The structure, he stated, would be 60 by 180 feet large, and would be used temporarily for offices, later to be converted to light manufacturing. It would be situated on part of the 17 acres of land adjacent to the 27 acres now occupied by the company and leased by the Harbor Commission for $750 a year.

PREPAREDNESS AID

The enlargement plans, according to Mr. Maloney, are in anticipation of a national emergency and with the desire to aid in the forthcoming preparedness campaign. Consolidated is known to be negotiating for large Army and Navy plane contracts in Washington,, D. C.

"It is our present desire to ultimately erect an administrative building of suitable size and area on property we now lease on the east side of Pacific Highway across the street from the present factory site," wrote Mr. Maloney.

HALF MILE FRONT

These additions will give the factory buildings a street frontage of 2521 feet, almost one-half mile, he pointed out.

The Board of Examiners and Appeals today recommended that an ordinance be adopted amending the city building code to allow construction of three-story all-steel buildings, providing they are protected by metal laths and plaster. The present regulations permit only frame buildings higher than two stories.

AVIATIONS LEAD STOCKS' RALLY

Sun 10-19-39

New High Recorded By Consolidated

By United Press

NEW YORK, Oct. 19.—Stocks made a feeble rally today under the leadership of the aviation issues which made new highs for the year.

The rails ignored favorable news and turned irregular. Utilities firmed slightly. Farm shares, oils, building issues, mercantile issues and coppers were mixed in a narrow area.

There were a few wide swings succh as American Metal preferred which lost 6½ points to a new low; Norfolk & Western, up 6½ points; Franklin Simon preferred, up 5½; Kinney 5 per cent preferred, up 5½, and William Filene's Sons, up 3.

In the aviations, new highs were made by Douglas. Consolidated, Curtiss Wright, North American Aviation, Glenn Martin, United Aircraft and Wright. These had gains ranging to more than 2 points in Douglas and Wright.

Anticipation of early repeal of he arms embargo helped the aviations. Other favorable market news included the Turkish pact with Great Britain and France, and decision of the Scandinavian countries not to attempt mediation o fthe war at this time.

Consair Officials Will Be Feted

Union 10-19-39

San Diego civic leaders will join with Hi Hatters in a birthday salute to Consolidated Aircraft Corp. tomorrow noon, fourth anniversary of the dedication of the huge local aircraft plant. The luncheon will be held in the San Diego club.

Emil Klicka, harbor board commissioner who is credited with doing much to "sell" Consolidated on moving from Buffalo, N. Y., to San Diego; President Don Hanson of the chamber of commerce; Rear Adm. A. B. Cook, commander of the scouting force; Leroy Richards, chairman of supervisors; City Councilman Fred Simpson, representing the city; T. Claude Ryan, president of Ryan Aeronautical Co., and Edmund Price, president of Solar Aircraft, will speak.

Maj. Reuben H. Fleet, president of Consolidated, and a prominent Hi Hatter, and these officials of the company have been invited as guests of honor: C. A. Van Dusen, C. T. Leigh, I. M. Laddon, William Shanahan and R. A. Stanberry. Specially honored guests will be Rear Adm. Joseph R. Defrees, commandant, 11th Navay district, and his aid, Capt. E. S. Root. Horace E. Rhoads will preside, and Edgar Gott will be chairman.

NEW CONSOLIDATED ENGINES ARRIVE

Sun 10-14-39

The first two giant engines, each weighing 1600 pounds, to be installed in Consolidated Aircraft Corp's. rapidly shaping four-motor Army bomber B-24, have arrived in San Diego by Army "air express" from the Pratt and Whitney plant in Hartford, Conn.

The other pair of power plants, each of which are reported to generate 1000 to 1250 h.p., are due here in the near future.

The San Diego plant may be ready to unveil its latest creation in about a month, the bomber is believed to represent a marked advancement in performance over the Boeing "flying fortress," with a 300-mile per hour capacity and a cruising range of as great as 10,000 miles.

SEE INSIDE PAGES

Der deutſche und der polniſche Soldat in polniſcher Beleuchtung

Am polniſchen Propagandahimmel iſt in letzter Zeit ein neuer Stern aufgegangen. Es iſt der Dipl.-Fliegerhauptmann Poleſiński, der neben ſeinem militäriſchen Rang auch den wiſſenſchaftlichen Magiſtertitel, in Polen die Vorſtufe zum Doktortitel, beſitzt. Hauptmann Poleſiński, der zweifellos ein gewandter Volksredner iſt, wird in erſter Linie vom Polniſchen Verband der Vaterlandsverteidiger, dem Hauptträger der Propagandaaktion zur Hebung und Befeſtigung der Stimmung unter der polniſchen Bevölkerung für den Fall eines Krieges, immer wieder eingeſetzt, um ſeinen Vortrag über das Thema „Der polniſche Soldat und der deutſche Soldat — Analyſe der kriegeriſchen Werte" zu halten. Hauptmann Poleſiński iſt bereits in allen größeren Zentren Polens, angefangen in Warſchau, über Lemberg, Krakau, Wilna, Kattowitz, Gdingen — um nur die wichtigſten Etappen zu nennen — und endigend beim Polniſchen Rundfunk zu Worte gekommen. Er hat, wenn wir den Berichten der polniſchen Preſſe Glauben ſchenken wollen, die bei den Kundgebungen anweſende Bevölkerung zu wahren Beifalls- und Begeiſterungsſtürmen emporgeriſſen, die letzten Endes ihren Abſchluß fanden in ſcharfen Entſchließungen gegen das Deutſche Reich und mit den bereits ſattſam bekannten uferloſen polniſchen Forderungen hinſichtlich der Verlegung der polniſchen Weſtgrenze mindeſtens bis zur Oder nach der Vernichtung der deutſchen Armee vor den Toren Berlins.

Der Inhalt des vielgehaltenen Vortrages des Hauptmanns Poleſiński wird auch in einer kleinen 48 Seiten ſtarken Broſchüre verbreitet, deren 2. Auflage ich vor mir habe, nachdem die erſte, wie auf der Umſchlagſeite des Titelblattes ſteht, ſchon eine Woche nach Erſcheinen vergriffen war.

Da ich die Vortragstätigkeit Poleſińskis auf Grund der mehr oder weniger eingehenden Berichte der „Polſka Zbrojna", des Organs des polniſchen Kriegsminiſteriums, genau verfolgt habe, bin ich mit großem Intereſſe und einer gewiſſen Neugier an die Lektüre und Durcharbeitung der Broſchüre herangegangen, da die polniſche Preſſe nur kurze Auszüge gebracht hatte, die ein allzu ſchwaches Bild des Ganzen vermitteln.

Ich möchte an dieſer Stelle auf Grund meines Studiums der Broſchüre zu einigen wenigen, beſonders kraß aufgeworfenen Fragen kritiſch Stellung nehmen und Hauptmann Poleſiński antworten, wobei ich vorwegnehmen will, daß ich der augenblicklichen politiſchen Lage entſprechend von einem Polen kein allzu günſtiges Urteil über die deutſche Wehrmacht erwartet habe, daß ich aber durch die Unwahrhaftigkeit des angeführten Materials und durch die zahlloſen Geſchichtsfälſchungen, durch die der Verfaſſer ſeine Behauptungen zu beweiſen und zu erhärten verſucht, einfach erſchüttert bin. Man ſollte es nicht für möglich halten, daß ein polniſcher Generalſtabsoffizier den Mut hat, ſoviel baren Unſinn zuſammenzuſchreiben.

Wenn Hauptmann Poleſiński einleitend bemerkt, daß im nächſten Kriege derjenige gewinnen werde, welcher den ſtärkeren Willen habe und 15 Minuten länger durchzuhalten vermöge, daß das beſte Flugzeug oder der beſte Kampfwagen zu einer wertloſen „Kiſte" wird, wenn der dies Gerät bedienende Menſch moraliſch ſchwach iſt, wenn er als Beweis dafür die tſchecho-ſlowakiſche Armee anführt, wenn er weiter ſagt, daß auf der Wacht der Kultur und Größe eines Volkes die Armee ſteht und daß die Grundlage der Armee der Menſch als das Rohmaterial iſt, aus dem das Hauptwerkzeug des modernen Kampfes — der Soldat — geſchaffen wird, daß der moderne Krieg ein Krieg der Schnelligkeit, ein Krieg von Präziſionsmaſchinen und von Millionen von Geſchoſſen ſein wird, daß ſtarke Nerven, die Beherrſchung der Gedanken und der eiſerne Wille die Hauptbedingungen für den Sieg ſind, daß auf dem modernen Schlachtfelde der moraliſch ſtarke Menſch ſiegt, ſo kann man das alles mit gutem Gewiſſen unterſchreiben. Das ſind Wahrheiten, die nicht nur jedem deutſchen Soldaten, ſondern auch jedem deutſchen Nichtſoldaten in Fleiſch und Blut übergegangen ſind.

Auch wenn der Verfaſſer bei der Überleitung zu dem Kapitel der Analyſe der kriegeriſchen Werte ſagt, daß heute die Möglichkeit eines bewaffneten Konflikts zwiſchen Deutſchland und Polen beſteht und daß es deshalb wichtig iſt, objektiv die Merkmale des deutſchen und polniſchen Soldaten zu vergleichen, ſo iſt das völlig natürlich und zu billigen. Wenn er weiter ſagt, daß die Unterſchätzung des Gegners ein Leichtſinn, ſeine Überſchätzung aber ein Verbrechen ſei, ſo bin ich mit dem erſten Teil des Satzes gern einverſtanden, mache aber hinſichtlich des zweiten gewiſſe Vorbehalte. Ich habe ſtets auf dem Standpunkt geſtanden, und tue es auch heute noch, daß es beſſer iſt, den Gegner etwas zu überſchätzen, als ihn zu unterſchätzen, daß dies aber kein Verbrechen iſt, wie Hauptmann Poleſiński meint, ſondern ein Akt der Klugheit. Von dieſem Geſichtspunkte aus habe ich in meinen zahlreichen Veröffentlichungen, vor allem auch in dieſer militäriſchen Fachzeitſchrift, die polniſche Armee betrachtet, deren Vorzüge ich ſehr wohl kenne und vor deren Aufbau und Entwicklung als das Werk des Marſchalls Piłſudſki ich auch heute noch eine große Hochachtung habe. Aber das hindert nicht, daß auch die teilweiſe nicht geringen Mängel und Unzulänglichkeiten dieſer Armee bekannt ſind, über die Poleſiński gefliſſentlich hinwegſieht. Denn das, was wir in dem kläglichen Machwerk finden, iſt die Verleugnung des mit dem Bruſtton der Überzeugung verkündeten Grundſatzes der Objektivität. Hauptmann Poleſiński ſtellt in der Art von Karlchen Mieſnik in einem bekannten Witzblatt die deutſche und die polniſche Armee einander gegenüber und weiſt mit einer Naivität ſondergleichen nach, daß an der polniſchen Armee alles gut, an der deutſchen Armee alles ſchlecht, daß der polniſche Soldat der Ausbund eines Helden, der deutſche ein Trottel iſt, daß die polniſche Kriegsgeſchichte voll von herrlichen Siegen iſt, die deutſche dagegen nichts als fürchterliche Niederlagen aufweiſt. Alles das wird in einer ſo einfältigen Weiſe dargeſtellt, daß es wirklich nicht lohnt, auch nur flüchtig auf alle dieſe teilweiſe nicht nur dummen, ſondern auch direkt albernen Vergleiche einzugehen.

Wenn der Verfaſſer zum Beweiſe für die hohen kriegeriſchen Werte der polniſchen Armee den polniſch-bolſchewiſtiſchen Krieg 1919/20 heran-

Aus dem Inhalt: Der deutſche und der polniſche Soldat in polniſcher Beleuchtung. — Das Luftverteidigungsproblem der USA., I. Teil. — England gewährt Rüſtungskredite. — Die polniſchen Kriegsleiſtungsgeſetze. — Vor 25 Jahren: Die deutſche Heereskavallerie am Entſcheidungsflügel. — Führergeſtalten aus Öſterreichs Heeren, XII. BRENNAN OFF FOR CAPITAL

To Seek Approval Of Harbor Projects

With the Board of Supervisors hesitant to go into partnership with the city in sponsoring a $150,000 WPA project for construction of a 2000-foot fishing pier at Ocean Beach, Port Director Joe Brennan was scheduled to leave for Washington, D. C., today in an attempt to speed up approval of Federal appropriations for this and other harbor department improvements.

Mr. Brennan was to be accompanied by Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp., who will seek information on the possibility of his concern obtaining further Army and Navy airplane orders. They were to leave by plane at 2 today.

$10,000 ASKED

A delegation of city officials yesterday asked the Board of Supervisors to contibute $10,000 toward the sum needed as the sponsor's contribution to meet material costs. The pleas of Councilman Fred Simpson, representing the beach districts; Mayor Benbough, City Manager Rhodes, and Carl Schroder, Ocean Beach civic leader, had effect only on Supervisor Walter Bellon, whose motion to appropriate the $10,000 failed to get a second.

The Supervisors asked for more time to consider the proposition.

SUBMIT REQUESTS

Mr. Brennan will submit to Washington authorities fund requests for harbor projects totaling more than $1,300,000, with the city as sponsor, due to contribute approximately $1,700,000. Chief among these will be the Ocean Beach pier, Federal $225,168, city $206,792; 10th-st pier, Federal about $800,000, city about $1,200,000; Municipal yacht harbor, Federal $122,282, city $149,128; and Lindbergh Field continuation, Federal $122,296, and city $104,803.

In addition he will give WPA officials plans of the city engineer for a $2,000,000 project to construct a trunk sewer from the Marine Base to the Destroyer Base and a sewage disposal plant. Minor requests will include funds for continuation of improvement, to the 28th-st tidelands, which has sufficient money to continue for some time. Mre. Brennan said he expected to be in the nation's capital for two weeks.

SAN DIEGO, CALIFORNIA, TUESDAY, SEPTEMBER 12, 1939

CONSOLIDATED DOUBLING SIZE OF FACTORY

Expects Emergency Orders From U. S. For Warplanes

To enable immediate expansion of the Consolidated Aircraft Corp. plant in view of the existing national emergnecy, the City Council today authorized the Harbor Commission to lease 17 acres to the concern at a yearly rental of $750.

Port Director Joe Brennan revealed that company officials now in Washington, D. C., must give the Federal government assurance that land will be available for enlarging the factory before large orders now pending may be granted Consolidated.

The lease, which is for land adjacent to the 27 acres now occupied by the company, carries the option of leasing 22 more acres within 10 years. It will run concurrent with the original 50-year lease the firm received on moving here from Buffalo in 1935.

LEASE URGENT

"The large contracts expected by Consolidated will require almost immediate doubling of the plant's size," Mr. Brennan said, "and for that reason it is urgent that the lease be granted without delay."

Councilman Addison Housh objected to the "rush act" on such an important deal, but voted with the rest of the Council to approve the lease because of the emergency. "If it were not for present war conditions, I'd never approve of doing it this way," he commented.

1800 ON PAYROLL

As support of his contention that the city will benefit greatly by the lease, Mr. Brennan pointed out that Consolidated has paid more than $111,000 in taxes during the past three years, has employed 3800 men at the peak, and today has 1800 on its payroll.

Fly Engines Here For Army Plane

10-14-39

A big army transport plane dropped down on Lindbergh field yesterday afternoon to discharge two 1600-pound airplane engines for installation in a 4-motored army bomber under construction at the Consolidated Aircraft Corp. plant The engines were rushed here from Hartford, Conn., to speed operations in the construction of the plane. Two more engines will arrive by air within a few days.

The transport, piloted by Lt. Thomas J. Schofield, with Lt. Glenn Holland as co-pilot, is specially designed as an air freighter and has made many flights around the country, although this is the first time engines for a new bomber have been flown here. Schofield and Holland are attached to the 10th transport group, Middletown, Pa.

Secrecy surrounds specifications of the engines, although they are said to develop in the neighborhood of 2000 horsepower each. The engines were inspected by Maj. E. R. McReynolds, army air corps inspector in this area; Edgar Gott, solidated executive, and W. G. Chamberlain, factory representative of the engine company.

CONSOLIDATED READY TO BUILD

Sun Oct 13-39

Permit For Addition To Factory Requested

Extension of Consolidated Aircraft Corp.'s production facilities by 75 per cent is contemplated in plans being prepared by the concern's officers, Plant Engineer William A. Maloney disclosed today in applying to the city for permission to construct a three-story steel building as part of this program.

The structure, he stated, would be 60 by 180 feet large, and would be used temporarily for offices, later to be converted to light manufacturing. It would be situated on part of the 17 acres of land adjacent to the 27 acres now occupied by the company and leased by the Harbor Commission for $750 a year.

PREPAREDNESS AID

The enlargement plans, according to Mr. Maloney, are in anticipation of a national emergency and with the desire to aid in the forthcoming preparedness campaign. Consolidated is known to be negotiating for large Army and Navy plane contracts in Washington,, D. C.

"It is our present desire to ultimately erect an administrative building of suitable size and area on property we now lease on the east side of Pacific Highway across the street from the present factory site," wrote Mr. Maloney.

HALF MILE FRONT

These additions will give the factory buildings a street frontage of 2521 feet, almost one-half mile, he pointed out.

The Board of Examiners and Appeals today recommended that an ordinance be adopted amending the city building code to allow construction of three-story all-steel buildings, providing they are protected by metal laths and plaster. The present regulations permit only frame buildings higher than two stories.

AVIATIONS LEAD STOCKS' RALLY

Sun 10-19-39

New High Recorded By Consolidated

By United Press

NEW YORK, Oct. 19.—Stocks made a feeble rally today under the leadership of the aviation issues which made new highs for the year.

The rails ignored favorable news and turned irregular. Utilities firmed slightly. Farm shares, oils, building issues, mercantile issues and coppers were mixed in a narrow area.

There were a few wide swings succh as American Metal preferred which lost 6½ points to a new low; Norfolk & Western, up 6½ points; Franklin Simon preferred, up 5½; Kinney 5 per cent preferred, up 5½, and William Filene's Sons, up 3.

In the aviations, new highs were made by Douglas. Consolidated, Curtiss Wright, North American Aviation, Glenn Martin, United Aircraft and Wright. These had gains ranging to more than 2 points in Douglas and Wright.

Anticipation of early repeal of he arms embargo helped the aviations. Other favorable market news included the Turkish pact with Great Britain and France, and decision of the Scandinavian countries not to attempt mediation o fthe war at this time.

Consair Officials Will Be Feted

Union 10-19-39

San Diego civic leaders will join with Hi Hatters in a birthday salute to Consolidated Aircraft Corp. tomorrow noon, fourth anniversary of the dedication of the huge local aircraft plant. The luncheon will be held in the San Diego club.

NEW CONSOLIDATED ENGINES ARRIVE

Sun 10-14-39

The first two giant engines, each weighing 1600 pounds, to be installed in Consolidated Aircraft Corp's. rapidly shaping four-motor Army bomber B-24, have arrived in San Diego by Army "air express" from the Pratt and Whitney plant in Hartford, Conn.

The other pair of power plants, each of which are reported to generate 1000 to 1250 h.p., are due here in the near future.

The San Diego plant may be ready to unveil its latest creation in about a month, the bomber is believed to represent a marked advancement in performance over the Boeing "flying fortress," with a 300-mile per hour capacity and a cruising range of as great as 10,000 miles.

(~~FOR WALL ST. JOURNAL [N.Y.] of above - See~~ APRIL 13th)

zieht, der nach ungeheuren Rückſchlägen und Rückzügen letzten Endes mit dem „Wunder an der Weichſel" endete, ſo vergißt er, daß dieſer glückliche Ausgang einer ganzen Reihe von „Imponderabilien", beſonders dem völligen Verſagen der bolſchewiſtiſchen Führung zu verdanken iſt, daß dieſer Krieg mit einem modernen nicht verglichen werden kann. Das hat kein Geringerer als der polniſche Oberkommandierende in dieſem Feldzuge, Marſchall Pilſudſki, erkannt und umumwunden zugegeben, der ihn eine „Schlägerei" nennt, die ohne alle überkommenen Kriegsregeln und Grundſätze der Strategie und Taktik, ja in zahlreichen Fällen gegen dieſelben durchgekämpft wurde. Das Studium der Werke des Marſchalls Pilſudſki würde ſich überhaupt empfehlen, da ſich in ihnen Urteile finden, die dem Ohr des polniſchen Soldaten nicht beſonders angenehm klingen, die aber den ſoldatiſchen Eigenſchaften des deutſchen volle Gerechtigkeit widerfahren laſſen und zu den Ausführungen Poleſińſkis in einem unüberbrückbaren Gegenſatz ſtehen.

In ähnlicher Weiſe werden die ſoldatiſchen Tugenden der Widerſtandsfähigkeit, des Mutes, der Opferfreudigkeit mit dem Verhältnis zum Leben und zur Ertragung von Wunden, Krankheit und Tod und den Beziehungen zu Gott, der militäriſchen Selbſtändigkeit geſchildert. Der in der harten Schule des Lebens groß gewordene Pole iſt dem „dickbäuchigen", bequemen Deutſchen in allem weit überlegen, was durch zahlreiche Beiſpiele belegt wird. Wie das gemacht wird, dafür nur ein Beiſpiel: daß der deutſche Soldat auch im Kriege nicht auf die Bequemlichkeiten des Lebens verzichten wollte, dafür wird der Ausbau der Weſtbefeſtigungen angeführt, bei deren ausgiebigen Beſchreibungen durch die deutſche Preſſe immer wieder die Bequemlichkeit und Sicherheit hervorgehoben würden, ſo von keinem Geringeren als dem Reichspreſſechef Dr. Dietrich, der mit Stolz hervorhebe, daß das meterdicke Betondach den Soldaten geſtatte, ſelbſt bei den ſchwerſten Kämpfen ruhig im Bett zu ſchlafen, daß durch die ordentliche Beheizung und Lüftung der Räume für die Geſundheit des Soldaten geſorgt werde, daß jeder Soldat ſeine Waſchgelegenheit beſitze, daß ihn nach dem Aufſtehen der Kaffee und am Tage warmes Eſſen erwarte und dergl. mehr.

Ganz anders ſtehe es mit dem polniſchen Bauern, für den die Frage, was er eſſen und wie er leben werde, nicht ſo wichtig ſei.

Das polniſche Offizierkorps ſei im Laufe einer 18jährigen Ausbildung und Erziehung und einer vernünftigen Beförderungspolitik organiſch und ſyſtematiſch gewachſen, die älteren Offiziere ſeien ſämtlich Männer, welche in ihren jungen Jahren die polniſche Armee aus dem Nichts hätten ſchaffen helfen, Männer, welche die Stärke des Geiſtes und die hohen moraliſchen Werte, aber keine Parteizugehörigkeit und Protektion auf ihre jetzigen Poſten gebracht hätte. Ganz anders ſtehe es dagegen mit dem deutſchen Offizierkorps. Der gewaltige Ausbau der deutſchen Wehrmacht im Laufe der letzten Jahre habe einen großen Bedarf an Offizieren zur Folge gehabt. Da die frühere Heranbildung von Offizieren in einem viel engeren Rahmen ſtattgefunden habe, ſo habe man die ſtark vermehrten Offizierſtellen nur mit Mühe und Not beſetzen können, wodurch naturgemäß die an die Offiziersausbildung zu ſtellenden Anforderungen hätten herabgeſetzt werden müſſen. Außerdem ſei der Wert des Offizierkorps durch die Einführung politiſcher Tendenzen in der Armee ſtark herabgemindert worden. Eine größere Verſtändnisloſigkeit gegenüber dem Werden des Offizierkorps der Wehrmacht des Dritten Reichs und der Struktur dieſes Reiches ſelber iſt kaum denkbar. Man darf im Intereſſe Polens nur ſehr beſorgt dieſe Frage ſtellen: denkt man ſo im polniſchen Generalſtab oder iſt dieſer Generalſtabsoffizier nur ein wider beſſeres Wiſſen redender Propagandiſt?

Hinſichtlich des Kriegszieles handle es ſich bei den Polen um einen Krieg um die Exiſtenz, um den Zugang Polens zum Meere, um Sein oder Nichtſein, bei den Deutſchen dagegen werde es ein Kampf um irgendeine Provinzſtadt ſein, die man nach der Beſetzung ſogar noch unterhalten müſſe, um eine Wojewodſchaft, deren Bevölkerung deutſchfeindlich ſei. Ein Krieg mit ſo verſchwindend kleinen Kriegszielen könne nach den bisherigen großen unblutigen Erfolgen im deutſchen Volke nicht populär ſein.

Die Broſchüre ſchließt mit den bezeichnenden Worten: „Heute geſtattet ſchon kein Land mehr, daß ſeine Grenzen ſtraflos verletzt werden." „Polen hat die Pſychoſe Europas gebrochen — Polen hat den Frieden gerettet" rufen alle Zeitungen der Welt. Die Augen der ganzen Welt ſind heute auf uns gerichtet — es iſt eine Ehre, ein Pole zu ſein. Weshalb iſt das geſchehen? Weil wir uns ſchlagen wollten, weil wir bereit waren, uns zu ſchlagen bis zum Umfallen um jede Hütte, um jeden Streifen Landes, weil unſere Hände das Gewehr feſt umſpannten und weil wir ungeduldig auf den Befehl warten: „Marſch! Wir wollen uns ſchlagen." Der Verfaſſer läßt ſeine Ausführungen ausklingen in die erſte Strophe des bekannten deutſchfeindlichen Hetzliedes, der ſogenannten „Rota".

Es müßte ein ganzes Buch geſchrieben werden, um all den Unſinn zu widerlegen, den Hauptmann Poleſińſki hier verzapft. Ich beſchränke mich darauf, dem Verfaſſer zu empfehlen, doch einmal die völkiſche Zuſammenſetzung der polniſchen Armee einer Prüfung zu unterziehen, da er ganz und gar vergeſſen zu haben ſcheint, daß Polen — im Gegenſatz zu Deutſchland — kein Nationalſtaat, ſondern ein Nationalitätenſtaat ſchlimmſter Sorte iſt, in welchem die polniſche Mehrheit im günſtigſten Falle 60% der Bevölkerung beträgt. Ich habe bisher nicht feſtſtellen können, daß Hauptmann Poleſińſki ſeinen Vortrag auch in den polniſchen öſtlichen Grenzgebieten gehalten hat, die in erſter Linie von Ukrainern und Weißruſſen bewohnt werden, wohl in der Befürchtung, daß die dortigen Kundgebungen einen anderen Charakter haben würden als die in Warſchau, Krakau oder Gdingen.

Der Vortrag bzw. die Broſchüre des Hauptmanns Poleſińſki iſt ein weiterer Beweis für die ſchon früher an dieſer Stelle vertretene Anſicht, daß das polniſche Offizierkorps bis zu einem erheblichen Teile jedes Gefühl für die Wirklichkeit der augenblicklichen politiſchen Lage verloren hat und ſich und dem polniſchen Teile der Bevölkerung mit leeren und eitlen Phraſen Mut einzureden verſucht unter völlig falſcher Einſchätzung der kriegeriſchen Werte der polniſchen Armee und unter ganz bewußter Herabſetzung — von einer Verkennung der Lage kann hier keine Rede ſein — der Eigenſchaften der vom Führer geſchaffenen und von ſeinem Geiſte beſeelten deutſchen Wehrmacht. Dies polniſche Maulheldentum wird ſich einmal, das iſt meine feſte Überzeugung, fürchterlich rächen. Die von Schwätzern im polniſchen Offiziersrock geſchmähte deutſche Wehrmacht muß es unter ihrer Würde erachten, auf dem Papier mit den Mitteln dieſes Generalſtabshauptmanns zu kämpfen. Sollte es aber einmal hart auf hart gehen, wird ſie eine beweiskräftige Antwort zu geben wiſſen.

Dr. A. Loeßner.

Das Luftverteidigungsproblem der USA.

I. Teil.

Der Militärſchriftleiter der „New York Times" bringt in der Monatsſchrift „Aviation" einen aufſchlußreichen Aufſatz über das Luftverteidigungsproblem der USA.

„Seit die Luftwaffe ſich zu einem ſo mächtigen Kampffaktor des modernen Krieges entwickelt hat, muß ſie bei faſt jeder größeren Situation, welche den Einſatz militäriſcher Streitkräfte irgendwelcher Art erfordert, eingeſetzt werden oder wenigſtens einſatzbereit ſein. So teilt Amerikas Luftwaffe mit die Verantwortung für

1. Verteidigung der kontinentalen Küſte der USA. im beſonderen und des ganzen Landes im allgeminen. Dies ſchließt ein Verteidigung der Städte gegen Luftangriffe, Verteidigung der ſtrategiſchen Zentren, Schutz der Docks, Brückenköpfe, Kraftwerke, Fabriken uſw.;
2. Verteidigung des Panama-Kanals;
3. Verteidigung Alaskas und der Aleuten;
4. Verteidigung der Hawaii-Inſeln;
5. Verteidigung der amerikaniſchen Inſelbeſitzungen im Karibiſchen Meer und Pazifiſchen Ozean;
6. Schutz des Küſten- und Überſeehandels;
7. Stützung der amerikaniſchen Außenpolitik und (möglicherweiſe) Schutz unſerer Staatsangehörigen und unſerer Intereſſen in Überſee.

Noch, ſo meint Hanſon W. Baldwin weiter, ſei bei dem derzeitigen Wirkungsbereich der Bombenflugzeuge ein ernſthaftes Maſſenbombardement nicht zu befürchten; man müſſe ſich aber heute ſchon für das Morgen ſichern. „Und wenn dieſer Tag kommt, werden alle vorgeſchobenen oder weit draußen liegenden Stützpunkte, wenn ſie den Feind ſchon nicht verhindern können, Amerika zu bombardieren, uns wenigſtens erlauben, mit größerer Ausſichtsmöglichkeit den Feind zu bombardieren.

1. Die Verteidigung der USA.

Das kontinentale USA. iſt wegen ſeiner günſtigen ſtrategiſchen Lage hinter den Baſtionen des Ozeans eigentümlicherweiſe gegen alle Arten militäriſcher Angriffe unverletzlich. Es hat keine ſog. Achillesferſe; keine kleine oder beſchränkte Zone iſt abſolut wichtig für die übrige Nation. Das Land könnte eine beträchtliche Abſchneidung ſeiner verſchiedenen Teile vertragen, ohne deshalb zur Übergabe gezwungen zu ſein. Jedoch gibt es auch ſehr wichtige ſtrategiſche Gegenden. Dieſe ſind, annähernd in der Reihenfolge ihrer Bedeutung:

a) Dreieck, Pittsburgh—Chikago—Detroit.

b) Induſtrie-, Schiffahrt-, Warenhaus-, Dock- und Finanzzentren New York—Philadelphia—Delaware Capes.

c) Ölfelder, Öllager, Docks, Flugzeugfabriken und Schiffahrt in der Zone San Pedro—San Diego (Kalifornien).

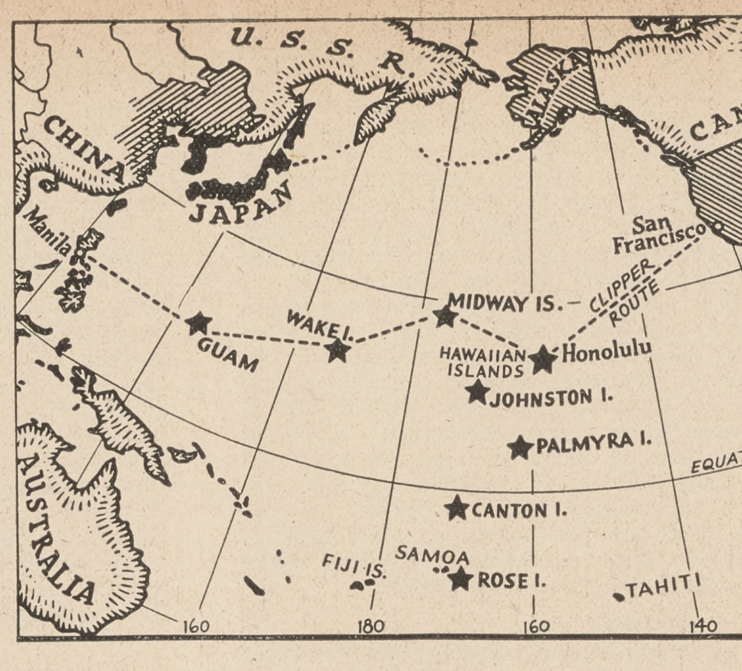
d) Flugzeug- und Munitionsfabriken und dicht konzentrierte Induſtrie des Gebietes von Neu-England, Schiffahrt und Werftanlagen in Boſton, Kraftwerke und Induſtrieanlagen des nördlichen Staates New York.

e) Cheſapeake-Bucht als Tiefſee-Waſſerweg zu Armee- und Marineſtützpunkten und Docks, den Flughäfen des Gebietes von Norfolk, der Induſtrie von Baltimore und der politiſchen Hauptſtadt Waſhington.

f) New-Orleans, Golfküſte und Miſſiſſippi als Einfallstor zu den Reichtümern des Südens und Südweſtens.

Die übrigen Gebiete müßten, wenn nicht vor allem ihrer ſtrategiſchen Bedeutung wegen, ſo doch geſchützt werden, um nicht von einem Angreifer als Operationsbaſis benützt zu werden. Der Verfaſſer ſchlägt ſodann die Errichtung von Hauptſtützpunkten vor, die nach europäiſchem Muſter aus einer Anzahl verſtreuter kleiner Flughäfen beſtünden, um einerſeits einem Bomber kein konzentriertes Ziel zu bieten, andererſeits aber ſchnell genug alle Kräfte dieſes Raumes zuſammenlegen zu können.

„Die Hauptſtützpunkte ſollen ſo angelegt werden, daß ſie dieſe wichtigen Zonen möglichſt gut ſchützen können. Unſere Tendenz iſt heute vielleicht, an einem einzigen Stützpunkt zu viele Flugzeuge zuſammenzufaſſen. Ein großer Hauptſtützpunkt iſt nötig, aber wir ſollten die europäiſche Methode ſtudieren und lieber die Flugzeuge auf zahlreiche kleine Flugplätze verteilen, als ſie auf einem großen Stützpunkt zuſammenlegen. Dieſe ganze Abhandlung hindurch, wenn das Wort Stützpunkt gebraucht wird, iſt es im europäiſchen Sinn zu verſtehen als Stützpunktfläche, mit einer Anzahl kleinerer Stützpunkte, welche zu verſtreut liegen, um ein konzentriertes Ziel für Bomber zu bieten, aber dicht genug, um ſchnelle Zuſammenfaſſung der Kräfte in dieſem Raum zu geſtatten. Wo das Wort „Hilfsſtützpunkt" gebraucht wird, iſt ein einzelner kleiner Flugplatz oder eine Seeflugzeug-Anlegeſtelle zu verſtehen mit Einrichtung, um höchſtens eine Staffel von Flugzeugen aufzunehmen."



Sehen wir uns mit Überlegung die Karte an und ſchauen wir, wie das Netz der angezeichneten Stützpunkte verwendet werden kann,

a) um es heute dem Feind unmöglich zu machen, ernſthafte beſtändige Maſſenluftangriffe gegen das kontinentale USA. zu unternehmen;

b) um in Zukunft als vorgerückte Stützpunkte zu dienen, von denen aus Operationen gegen den Feind beſſer durchgeführt werden können.

Der **Stützpunkt Weſtindien**, vorzugsweiſe in Puerto Rico gelegen (eine große Inſel mit gutem Hafen und Ankermöglichkeit, leicht zu verſorgen und im Rücken gedeckt durch die USA.), mit Hilfsſtützpunkten auf den Jungfrau-Inſeln und dem Marineſtützpunkt Guantánamo auf der Inſel Cuba, kann die Südatlantikküſte (vielleicht am wenigſten von allen Küſten verletzbar durch Luftangriffe wegen der landwirtſchaftlichen Natur des Landes und der Zentraliſation der wichtigeren Induſtrie in Inlandszentren wie Atlanta und Birmingham) ſchützen und 3 Zwecken dienen: Deckung der Anfahrt zum Panamakanal (Verteidigungsproblem Nr. 2), Hilfe bei Verteidigung der amerikaniſchen Inſelbeſitzungen im Karibiſchen Meer (Verteidigungsproblem Nr. 5) und Hilfe bei Durchführung der Monroe-Doktrin (Problem Nr. 7). In Flugweite von Südflorida könnte es unterſtützt durch Marine- und Landſtreitkräfte und die Hilfsſtützpunkte in Cuba und Florida im Rücken jedem Feind den Gebrauch irgendeiner der weſtindiſchen Inſeln oder der nördlichen Küſte Südamerikas als Luftſtützpunkt wirkſam abſchlagen.

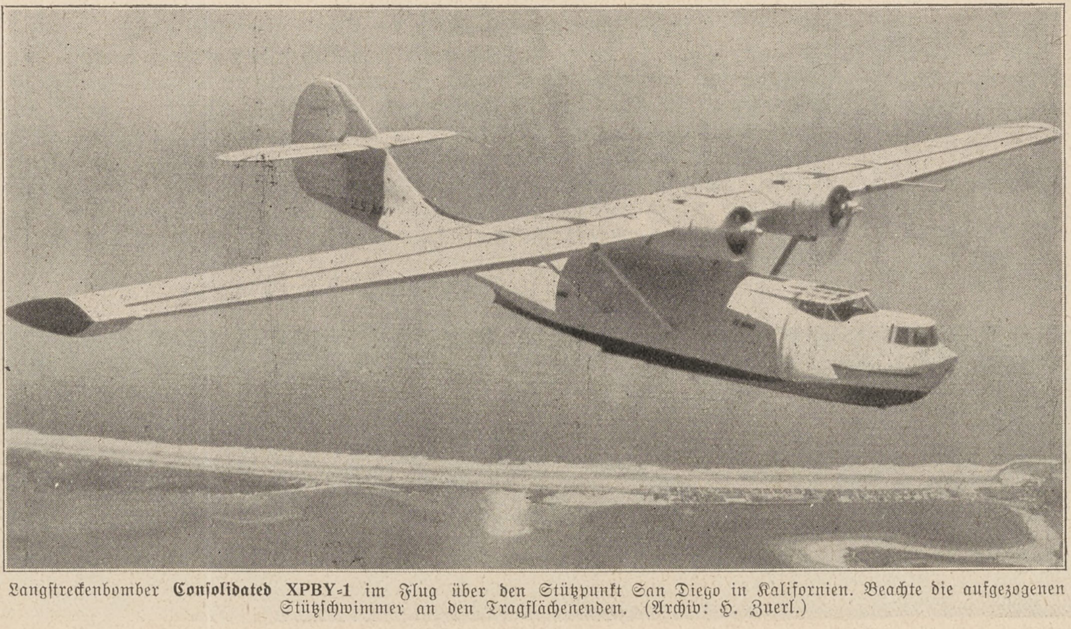
Der **Stützpunkt bei Norfolk** würde die Cheſapeake-Bucht-Zone wirkſam ſchützen und könnte mitwirken zum Schutz der Zone New York—Philadelphia—Delaware Capes ſowie Südatlantik- und Neu-England-Zone. Dieſer Stützpunkt könnte Bermuda beherrſchen und ſeinen Gebrauch jedem Feind verwehren.

In ähnlicher Weiſe würde ein **Stützpunkt in der Gegend von Neufundland**, vorzugsweiſe in Maine, dieſes Induſtriegebiet und das nördliche Gebiet des Staates New York ſchützen und könnte ebenfalls mithelfen bei Verteidigung der New York—Philadelphia—Delaware Capes-Zone. Neufundland und St. Lorenz-Golf (mit ihren zahlreichen Häfen für Seeflugzeuge) wären in ihrem mächtigen Bombenbereich. Selbſt Battle Harbor und die Sandwich-Bucht in Labrador (letzteres bietet im Sommer einen der beſten Häfen des Nordatlantik für Seeflugzeuge oder Flugboote) könnten gegen jeden Feind geſchützt werden. James-Bucht und der ſüdliche Teil der Hudſon-Bucht ſowie ein weiter Teil Kanadas wären ebenfalls im Bombenbereich und ſo der Anflug von Europa her über den Nordatlantik entſprechend geſchützt.

Die ſtrategiſchen Gebiete der Weſtküſte und die ganze Küſte ſelbſt können geeignet geſchützt werden durch zwei oder drei Hauptſtützpunkte: einen im Bereich San Diego—Los Angeles, einen in der Gegend von San Franzisko und ſchließlich einen dritten in der Nähe des Puget-Sunds. Flugzeuge können von dieſen Punkten aus die ganze Weſtküſte von ſüdlich des Kap Falo in Südkalifornien bis hinauf nach Alaska beherrſchen und wären ſo nicht nur in der Lage, die ſtrategiſchen Zonen an der Weſtküſte zu verteidigen, ſondern könnten darüber hinaus noch mitwirken bei Löſung der Probleme Nr. 4 (Hawaii) und Nr. 3 (Alaska). Ferner könnten ſie die Marine unterſtützen bei Überwachung der weiten Seezone, die kürzlich allgemein bekannt wurde unter dem Namen ſtrategiſches Dreieck Aleuten—Hawaii—Weſtküſte.

Stützpunkte bei New-Orleans oder etwas weiter öſtlich **und bei San Antonio in Texas** wären imſtande, in Zuſammenarbeit mit dem Stützpunkt im ſüdlichen Kalifornien den Golf von Mexiko und die Land- und Seezonen Mittelamerikas ſüdlich bis zum Golf von Teguantepec zu beherrſchen, welcher in Reichweite der Stützpunkte in Panama liegt. Die mexikaniſche Grenze iſt durch ſolche Stützpunkte weitgehend verteidigt.

Das wichtige Induſtriedreieck im Norden Pittsburgh—Chikago—Detroit könnte gegen direkte Überſeeangriffe durch unſere Küſtenſtützpunkte, beſonders von dem in Neu-England und im Puget-Sund geſchützt werden. Aber es bleibt die ſchwache und unwahrſcheinliche, ja geradezu phantaſtiſche Möglichkeit von Luftangriffen, die ausgehen von einem durch den Feind in Nord- oder Mittelkanada errichteten Stützpunkt oder gar von einem Waſſer- oder Landſtützpunkt, der am Rand der Arktis in der Hudſon-Bucht errichtet wird. Wie der Gegner ſeine Stützpunkte aufrichten, unterhalten und beliefern könnte, liegt außer der Betrachtung dieſes Artikels. Es genügt zu ſagen, daß wenig wirkliche Gefahr zu beſtehen ſcheint vor Luftangriffen, die von Stützpunkten in dieſen ſtrengen nördlichen Breiten ausgehen. Jedoch nicht nur eine weitere Schierung für unſer wichtiges Induſtriegebiet gilt es zu ſchaffen, ſondern ganz beſonders einen zentralen Stützpunkt inmitten des Kontinents, von dem aus jeder der übrigen Stützpunkte an der Küſte leicht verſtärkt werden könnte. Ein oder mehrere Stützpunkte in der Nähe von Chikago, Minneapolis und St. Louis ſind angezeigt. Soweit das Problem ernſtlicher, kontinuierlicher Fliegerangriffe gegen unſere Grenzen und ſtrategiſche Gebiete, ein



Langſtreckenbomber **Conſolidated XPBY-1** im Flug über den Stützpunkt San Diego in Kalifornien. Beachte die aufgezogenen Stützſchwimmer an den Tragflächenenden. (Archiv: H. Zuerl.)

ICTION

BRENNAN OFF FOR CAPITAL

To Seek Approval Of Harbor Projects

With the Board of Supervisors hesitant to go into partnership with the city in sponsoring a $150,000 WPA project for construction of a 2000-foot fishing pier at Ocean Beach, Port Director Joe Brennan was scheduled to leave for Washington, D. C., today in an attempt to speed up approval of Federal appropriations for this and other harbor department improvements.

Mr. Brennan was to be accompanied by Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp., who will seek information on the possibility of his concern obtaining further Army and Navy airplane orders. They were to leave by plane at 2 today.

$10,000 ASKED

A delegation of city officials yesterday asked the Board of Supervisors to contibute $10,000 toward the sum needed as the sponsor's contribution to meet material costs. The pleas of Councilman Fred Simpson, representing the beach districts; Mayor Benbough, City Manager Rhodes, and Carl Schroder, Ocean Beach civic leader, had effect only on Supervisor Walter Bellon, whose motion to appropriate the $10,000 failed to get a second.

The Supervisors asked for more time to consider the proposition.

SUBMIT REQUESTS

Mr. Brennan will submit to Washington authorities fund requests for harbor projects totaling more than $1,300,000, with the city as sponsor, due to contribute approximately $1,700,000. Chief among these will be the Ocean Beach pier, Federal $225,168, city $206,792; 10th-st pier, Federal about $800,000, city about $1,200,000; Municipal yacht harbor, Federal $122,282, city $149,128; and Lindbergh Field continuation, Federal $122,296, and city $104,803.

In addition he will give WPA officials plans of the city engineer for a $2,000,000 project to construct a trunk sewer from the Marine Base to the Destroyer Base and a sewage disposal plant. Minor requests will include funds for continuation of improvement, to the 28th-st tidelands, which has sufficient money to continue for some time. Mre. Brennan said he expected to be in the nation's capital for two weeks.

SAN DIEGO, CALIFORNIA, TUESDAY, SEPTEMBER 12, 1939

CONSOLIDATED DOUBLING SIZE OF FACTORY

Expects Emergency Orders From U. S. For Warplanes

To enable immediate expansion of the Consolidated Aircraft Corp. plant in view of the existing national emergnecy, the City Council today authorized the Harbor Commission to lease 17 acres to the concern at a yearly rental of $750.

Port Director Joe Brennan revealed that company officials now in Washington, D. C., must give the Federal government assurance that land will be available for enlarging the factory before large orders now pending may be granted Consolidated.

The lease, which is for land adjacent to the 27 acres now occupied by the company, carries the option of leasing 22 more acres within 10 years. It will run concurrent with the original 50-year lease the firm received on moving here from Buffalo in 1935.

LEASE URGENT

"The large contracts expected by Consolidated will require almost immediate doubling of the plant's size," Mr. Brennan said, "and for that reason it is urgent that the lease be granted without delay."

Councilman Addison Housh objected to the "rush act" on such an important deal, but voted with the rest of the Council to approve the lease because of the emergency. "If it were not for present war conditions, I'd never approve of doing it this way," he commented.

1800 ON PAYROLL

As support of his contention that the city will benefit greatly by the lease, Mr. Brennan pointed out that Consolidated has paid more than $111,000 in taxes during the past three years, has employed 3800 men at the peak, and today has 1800 on its payroll.

Fly Engines Here For Army Plane

10-14-39

A big army transport plane dropped down on Lindbergh field yesterday afternoon to discharge two 1600-pound airplane engines for installation in a 4-motored army bomber under construction at the Consolidated Aircraft Corp. plant The engines were rushed here from Hartford, Conn., to speed operations in the construction of the plane. Two more engines will arrive by air within a few days.

The transport, piloted by Lt. Thomas J. Schofield, with Lt. Glenn Holland as co-pilot, is specially designed as an air freighter and has made many flights around the country, although this is the first time engines for a new bomber have been flown here. Schofield and Holland are attached to the 10th transport group, Middletown, Pa.

Secrecy surrounds specifications of the engines, although they are said to develop in the neighborhood of 2000 horsepower each. The engines were inspected by Maj. E. R. McReynolds, army air corps inspector in this area; Edgar Gott, solidated executive, and W. G. Chamberlain, factory representative of the engine company.

(~~FOR WALL ST. JOURNAL [N.Y.] of above - See APRIL 13th~~)

CONSOLIDATED READY TO BUILD

Sun Oct 13 - 39

Permit For Addition To Factory Requested

Extension of Consolidated Aircraft Corp.'s production facilities by 75 per cent is contemplated in plans being prepared by the concern's officers, Plant Engineer William A. Maloney disclosed today in applying to the city for permission to construct a three-story steel building as part of this program.

The structure, he stated, would be 60 by 180 feet large, and would be used temporarily for offices, later to be converted to light manufacturing. It would be situated on part of the 17 acres of land adjacent to the 27 acres now occupied by the company and leased by the Harbor Commission for $750 a year.

PREPAREDNESS AID

The enlargement plans, according to Mr. Maloney, are in anticipation of a national emergency and with the desire to aid in the forthcoming preparedness campaign. Consolidated is known to be negotiating for large Army and Navy plane contracts in Washington,, D. C.

"It is our present desire to ultimately erect an administrative building of suitable size and area on property we now lease on the east side of Pacific Highway across the street from the present factory site," wrote Mr. Maloney.

HALF MILE FRONT

These additions will give the factory buildings a street frontage of 2521 feet, almost one-half mile, he pointed out.

The Board of Examiners and Appeals today recommended that an ordinance be adopted amending the city building code to allow construction of three-story all-steel buildings, providing they are protected by metal laths and plaster. The present regulations permit only frame buildings higher than two stories.

AVIATIONS LEAD STOCKS' RALLY

Sun 10-19-39

New High Recorded By Consolidated

By United Press

NEW YORK, Oct. 19.—Stocks made a feeble rally today under the leadership of the aviation issues which made new highs for the year.

The rails ignored favorable news and turned irregular. Utilities firmed slightly. Farm shares, oils, building issues, mercantile issues and coppers were mixed in a narrow area.

There were a few wide swings succh as American Metal preferred which lost 6½ points to a new low; Norfolk & Western, up 6½ points; Franklin Simon preferred, up 5½; Kinney 5 per cent preferred, up 5½, and William Filene's Sons, up 3.

In the aviations, new highs were made by Douglas. Consolidated, Curtiss Wright, North American Aviation, Glenn Martin, United Aircraft and Wright. These had gains ranging to more than 2 points in Douglas and Wright.

Anticipation of early repeal of he arms embargo helped the aviations. Other favorable market news included the Turkish pact with Great Britain and France, and decision of the Scandinavian countries not to attempt mediation o fthe war at this time.

Consair Officials Will Be Feted

Union 10-19-39

San Diego civic leaders will join with Hi Hatters in a birthday salute to Consolidated Aircraft Corp. tomorrow noon, fourth anniversary of the dedication of the huge local aircraft plant. The luncheon will be held in the San Diego club.

Emil Klicka, harbor board commissioner who is credited with doing much to "sell" Consolidated on moving from Buffalo, N. Y., to San Diego; President Don Hanson of the chamber of commerce; Rear Adm. A. B. Cook, commander of the scouting force; Leroy Richards, chairman of supervisors; City Councilman Fred Simpson, representing the city; T. Claude Ryan, president of Ryan Aeronautical Co., and Edmund Price, president of Solar Aircraft, will speak.

Maj. Reuben H. Fleet, president of Consolidated, and a prominent Hi Hatter, and these officials of the company have been invited as guests of honor: C. A. Van Dusen, C. T. Leigh, I. M. Laddon, William Shanahan and R. A. Stanberry. Specially honored guests will be Rear Adm. Joseph R. Defrees, commandant, 11th Navay district, and his aid, Capt. E. S. Root. Horace E. Rhoads will preside, and Edgar Gott will be chairman.

NEW CONSOLIDATED ENGINES ARRIVE

Sun 10-14-39

The first two giant engines, each weighing 1600 pounds, to be installed in Consolidated Aircraft Corp's. rapidly shaping four-motor Army bomber B-24, have arrived in San Diego by Army "air express" from the Pratt and Whitney plant in Hartford, Conn.

The other pair of power plants, each of which are reported to generate 1000 to 1250 h.p., are due here in the near future.

The San Diego plant may be ready to unveil its latest creation in about a month, the bomber is believed to represent a marked advancement in performance over the Boeing "flying fortress," with a 300-mile per hour capacity and a cruising range of as great as 10,000 miles.

Problem, das erſt akut werden kann für unſer Land, wenn die Luftraumgrenzen ſich vorſchieben und Flugzeuge mühelos die ſieben Weltmeere überfliegen können!

Die geſchilderten Stützpunkte zuſammen mit Hilfsſtützpunkten zum Schutz von Schiffanlegeplätzen, Küſtenbefeſtigungen uſw. würden auch gute Dienſte leiſten bei Verteidigung des Landes gegen See- oder Landangriffe. Hier gibt es kein großes Problem; ein ernſtlicher Angriff von Land oder See aus gegen das kontinentale USA. iſt nicht zu erwarten. Angriffe gegen unſere Küſte jedoch, geführt entweder durch ſchnelle Überwaſſerſchiffe, U-Boote oder durch von Flugzeugträgern aus geſtartete Flugzeuge, alſo Angriffe, welche in der Hauptſache gedacht ſind als Waffen gegen die Moral der Zivilbevölkerung oder um die Zerſtreuung und damit Schwächung unſerer Verteidigungskraft zu erreichen, müſſen jedoch ins Auge gefaßt werden. Man könnte hier einwenden, es ſei nicht möglich, mit völliger Beſtimmtheit ſich vor ſolchen Angriffen zu ſchützen, ebenſo wie es heute nicht einmal möglich iſt, ein einzelnes von Stützpunkten in Überſee angreifendes Flugzeug am Bombardieren unſerer Küſtenſtriche zu hindern. Die Frage iſt nicht: wie ſolche Angriffe aufhalten?, denn es gibt keine abſolute Sicherung dagegen, ſondern ſie lautet vielmehr: wie kann man ihren Schaden beſchränken und vermindern? Unſere Großſtädte und Induſtriebezirke werden wahrſcheinlich das Ziel ſolcher einzelner Angriffe ſein. Hilfsſtützpunkte in Nähe von Häfen und Küſtenbefeſtigungen wären alſo bei Verteidigung gegen ſolche Feinde beſonders nützlich.

2. Kanalzone.

Ein ſehr wichtiges Glied im ſtrategiſchen und handelspolitiſchen Leben der Nation und dabei ein konzentriertes Ziel für feindliche Angriffe bietet die Verteidigung des Kanals. Probleme, wie man ihnen nirgends ſonſt begegnet. Nicht, daß ein paar gut gezielte Bomben den Kanal endgültig vernichten könnten! Die Anlagen des Kanals, beſonders ſeine maſſiven Schleuſen, ſind nirgends auch nur annähernd ſo gerwundbar durch Sprengbomben als man bei Lektüre der Sonntagsblätter glauben möchte. Die Schleuſentreppe von Gatun, die berühmten Erdufer im Culebraeinſchnitt, die Kraftwerke, welche die Schleuſenpumpen und -tore betätigen, ſind lohnendere Ziele als die Schleuſen ſelbſt. Bomben, die ſorgfältig auf eines dieſer Ziele gelegt werden, könnten bei genügender Menge einen Schaden anrichten, daß der Kanal für einige Tage oder gar Wochen blockiert wäre. Demzufolge muß die Luftverteidigung des Kanals nicht ſo ſehr vor konzentrierten Angriffen als vielmehr einzeln angreifenden Flugzeugen mit weit größerer Sorgfalt auf der Hut ſein als nötig iſt im Fall der Luftverteidigung der USA., denn die Folge eines ſo ſorgloſen Wagniſſes iſt in Panama weit größer.

Flugſtützpunkte zu beiden Seiten der Kanalzone ſind natürlich weſentlich, aber vorgelagerte Hilfsſtützpunkte, welche ſo liegen, daß verteidigende Flugzeuge angreifende Flugzeuge oder Schiffe abfangen können, ſind faſt ebenſo wichtig. Die Galápagos- und Cocos-Inſeln im Pazifik ſind möglicherweiſe Hilfsſtützpunkte für Seeflugzeuge und würden wahrſcheinlich im Kriegsfall benutzt werden, ſelbſt wenn ſie nicht zu USA. gehören. Auf der Atlantikſeite des Kanals wäre der weſtindiſche Stützpunkt Porto Rico wirkſam imſtande, die Anfahrt in der weſtlichen See zu bewachen. Um jedoch noch größere Sicherheit zu gewährleiſten gegen ſchnelle Überraſchungsangriffe eines feindlichen Flugzeugs, das vielleicht von einem verſteckten Flugplatz in Mittel- oder Südamerika oder einem weit draußen auf See liegenden Flugzeugträger kommt, ſollten Nachforſchungen angeſtellt werden zur Errichtung von defenſiven Hilfsſtützpunkten im Kriegsfall bei Cape Mala (Panama), das die Bucht von Panama beherrſcht, in der Magdalenenbucht (Südamerika), in der Bucht von Fonſeca (Nikaragua) und der Bucht von San Blas bei Bocas del Toro (Panama). Solche Stützpunkte könnten ſehr wohl als Kriegsmaßnahmen nach Konſultierung der freundlichen mittelamerikaniſchen Länder errichtet werden.

3. Alaska.

Alaska und ſein Anhängſel, die Aleuten, ſind wichtig wegen ihrer Bedeutung bei der Verteidigung der USA. Ein Blick auf die Karte des Pazifik zeigt klar, daß die Aleuten und Hawaii den nordöſtlichen Pazifik überwachen. Daher ſind geeignete Flugſtützpunkte in unſerem großen Nordweſten Alaska nötig. Hauptſtützpunkte in Kodiak Island und vielleicht bei Juneau, Fairbanks oder Guſtaſſons Point mit Hilfsſtützpunkten für Patrouillenflugzeuge in Adak oder anderen Häfen der Aleuten würden Alaska hinreichend ſchützen und auch zur Verteidigung Hawaiis beitragen.

(Schluß folgt.) Hanſon W. Baldwin.

England gewährt Rüſtungskredite

Grenzen der engliſchen Finanzkraft.

Englands Reichtum iſt Englands ſchärfſte Waffe! Das iſt die herkömmliche Meinung, und gerade in der letzten Zeit iſt viel von Rüſtungskrediten berichtet worden, die England zur Durchführung ſeiner Einkreiſungspolitik ausgiebig austeile. Nicht ſelten begegnet einem dazu die naive Auffaſſung, daß Englands Wohlſtand groß genug ſei, um ungezählte Hunderte von Millionen Pfund ausleihen zu können. Von dieſem Wahn waren auch die Polen erfaßt, deren urſprüngliche Kreditwünſche wohl 50 Mill. Pfund betragen haben mögen. Selbſt nach dem Abſchluß der ſo viel beſcheidener endenden Kreditverhandlungen ſind polniſche Äußerungen laut geworden, daß man wenigſtens 20 Mill. Pfund erwartet hätte. Statt deſſen bekommt Polen einen Rüſtungskredit in Höhe von 8 Mill. Pfund eingeräumt, der in Waren abzunehmen iſt, und zu dem vielleicht noch ein Barkredit in Höhe von 5 Mill. Pfund hinzukommt, über deſſen Verwendung ſich aber England offenbar die Kontrolle vorbehalten hat. 13 Mill. Pfund ſind es alſo höchſtens, die Polen vom reichen England erhält. Das iſt kein überwältigender Betrag, wenn man die Umſtände der engliſch-polniſchen Annäherung, ihre Motive und ihre offenſichtlichen Zwecke bedenkt. An die geringe Höhe des Kredits ſind mancherlei Vermutungen geknüpft worden, doch ſcheint ein triftiger Grund zu ſein, daß England nicht mehr geben kann. England iſt reich, aber ſein Einkommen reicht nicht aus, allen Anforderungen gerecht zu werden, daher muß es ſeit geraumer Zeit ſeine Subſtanz angreifen.

Englands Kreditfähigkeit hätte demnach Grenzen?

Einer ſolchen Behauptung wird auch heute noch nicht ohne weiteres Glauben geſchenkt, ſo tief verwurzelt iſt die allgemeine Weltmeinung über Größe und Kraft des Pfundes als beſter engliſcher Waffe. Allerdings iſt eine derartige Behauptung auch ungewöhnlich, und ſie wäre geeignet, wenn ſie zutrifft, die Meinung über Englands Schlagkraft zu beeinfluſſen.

England fällt es aber offenſichtlich nicht leicht, den finanziellen Anforderungen ſeiner Freunde voll zu entſprechen. Zunächſt muß man bedenken, daß England 1937 und 1938 eine paſſive Zahlungsbilanz von je etwa 50 Mill. Pfund aufwies. Das heißt, daß nach Verrechnung aller Einnahmen, auch der gewaltigen Zinsbeträge aus ſeinen ſchier endloſen Auslandsguthaben, und nach Abzug aller Ausgaben, insbeſondere für die Wareneinfuhr ein Defizit blieb, deſſen Deckung vermutlich nur durch Auflöſung dieſer oder jener Auslandsguthaben, durch Rückzahlung alter, früher gewährter Kredite erfolgen konnte. Jedes andere Land wäre bei einem ſo hohen Defizit ſeines Zahlungsverkehrs mit dem Ausland finanziell längſt in die ärgſten Schwierigkeiten geraten. England nicht. Das iſt der Beweis für den auch heute noch vorhandenen außerordentlichen Reichtum, aber dieſer Reichtum wächſt nicht mehr. Die ſeit Jahren immer wiederkehrende Schwäche des engliſchen Pfundes und der weitgehende Verzicht Englands auf die Gewährung neuer Auslandsanleihen zeigen ſchon, daß England nicht aus dem Vollen ſchöpfen kann.

Weder die engliſche Regierung noch die engliſchen Banken ſcheinen ſich hier irgendwelchen Täuſchungen hinzugeben. Bereits zu Beginn der polniſchen Kreditverhandlungen war in der Londoner City erklärt worden, England könne ſo hohe Kredite nicht bewilligen, das verbiete ſchon die Rückſicht auf das engliſche Pfund. Zu der ſeit Jahren vom Schatzamt geübten Kontrolle über neu zu gewährende Auslandsanleihen — es iſt eine Kontrolle, die ſich lange Zeit wie eine Sperre ausgewirkt hat! — iſt in jüngſter Zeit mit dem Hinweis auf die hohen Anforderungen, die man zu erfüllen habe, vom Schatzamt wiederholt erklärt worden, das engliſche Publikum möge auf den Erwerb ausländiſcher Wertpapiere verzichten, wobei beſonders an die im engliſchen Effektenpublikum begehrten amerikaniſchen Wertpapiere zu denken iſt.

Die britiſchen Dominien leiden ſchon lange unter der Schwäche des

ICTION

BRENNAN OFF FOR CAPITAL

To Seek Approval Of Harbor Projects

With the Board of Supervisors hesitant to go into partnership with the city in sponsoring a $150,000 WPA project for construction of a 2000-foot fishing pier at Ocean Beach, Port Director Joe Brennan was scheduled to leave for Washington, D. C., today in an attempt to speed up approval of Federal appropriations for this and other harbor department improvements.

Mr. Brennan was to be accompanied by Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp., who will seek information on the possibility of his concern obtaining further Army and Navy airplane orders. They were to leave by plane at 2 today.

$10,000 ASKED

A delegation of city officials yesterday asked the Board of Supervisors to contibute $10,000 toward the sum needed as the sponsor's contribution to meet material costs. The pleas of Councilman Fred Simpson, representing the beach districts; Mayor Benbough, City Manager Rhodes, and Carl Schroder, Ocean Beach civic leader, had effect only on Supervisor Walter Bellon, whose motion to appropriate the $10,000 failed to get a second.

The Supervisors asked for more time to consider the proposition.

SUBMIT REQUESTS

Mr. Brennan will submit to Washington authorities fund requests for harbor projects totaling more than $1,300,000, with the city as sponsor, due to contribute approximately $1,700,000. Chief among these will be the Ocean Beach pier, Federal $225,168, city $206,792; 10th-st pier, Federal about $800,000, city about $1,200,000; Municipal yacht harbor, Federal $122,282, city $149,128; and Lindbergh Field continuation, Federal $122,296, and city $104,803.

In addition he will give WPA officials plans of the city engineer for a $2,000,000 project to construct a trunk sewer from the Marine Base to the Destroyer Base and a sewage disposal plant. Minor requests will include funds for continuation of improvement, to the 28th-st tidelands, which has sufficient money to continue for some time. Mre. Brennan said he expected to be in the nation's capital for two weeks.

Union 10-10-39

3-FOOT RATS, HUGE BATS FOUND BY ARCHBOLD

★ ★ ★ ★ ★ ★ ★ ★ ★

Aerial Explorer Brings Back Many Specimens, Plans Next Trip

S. D. Flying Boat Boasts Many Flight Records

A native tribe that had never before seen a white man . . . a tree-climbing alligator . . . a white-ring rat three feet long . . . four-foot bats.

These were a few of the things that Richard Archbold, flying explorer of the American Museum of Natural History, who makes headquarters in San Diego and New York, described and exhibited in New York yesterday as the rare items he collected in a New Guinea exploration trip arrived at the museum.

STARTED FROM HERE

Archbold figured prominently in the news last year when he started his New Guinea flight from here in a San Diego-built flying boat. He stroked the back of the huge rat as he described his amazing experiences in New York to a reporter for The Associated Press. The rat—it was dead and in life had been a vegetarian, anyway—was only one of hundreds of rare specimens Archbold obtained in his expedition to the South Pacific islands—an expedition replete with "firsts."

Here are some of the firsts he and his fellow scientists marked down as they traveled 18,000 miles in the $250,000 flying boat Guba:

First to fly around the world at its widest diameter.

First white men to discover an hitherto unknown tribal "nation" of natives in the interior of Dutch New Guinea.

First to fly a flying boat over the Indian ocean.

First to survey and demonstrate the feasibility of a new air route from England via Africa to Australia, thus providing an important link in time of war.

Archbold has been back only since July 1, when the Guba sat down on Jamaica bay. But already, he's planning his next expedition—for "probably November, 1940."

NATIVES EAT BATS

It may take him that time to classify the species of flora and fauna which are arriving now, by the crateful, at the American Museum of Natural History, of which Archbold is a research associate.

He put the rat—it's called a mallornys—back in a huge drawer with a dozen other similar rats, and opened up another drawer.

It was filled with bats — huge, four-foot fruit bats.

"The natives eat 'em," Archbold explained. "I tried that once, too. They're considered quite a delicacy, but my boy didn't think much of it when I told him to cook one."

A musty odor, like old fruit, exuded from the bat.

"The natives cut out a gland, and that's supposed to make it more palatable. But I didn't care much for mine."

SHOWED FURRED ANIMAL

One of the prizes of all the specimens was an animal which would delight—and despair—furriers and women alike.

It's called a phalanger. The female's hide was covered with soft fur of three merging colors, ending in a tail tipped with a tuft of white. The male's coat looks like that of a leopard, with irregular spots.

Their beauty is probably safe from trappers, though, for Archbold explained they are rarely found, and then only at a height of 14,000 feet, after an arduous, dangerous trip through unexplored country. The animals are marsupials, nurturing their young in pouches.

Another curious animal discovered was the foot-long dactylonax, which scoops his food of bugs and insects from beneath logs and rocks with a long, extended forefinger.

"We tried to find a climbing dog the natives told us about," Archbold related. "We never did find it, but one of the natives gave us two teeth which he insisted had come from such an animal. We found out they were tusks from a pig. So another myth was exploded.

"In a previous trip, though, we found a tree-climbing alligator."

FIND NEW TRIBE

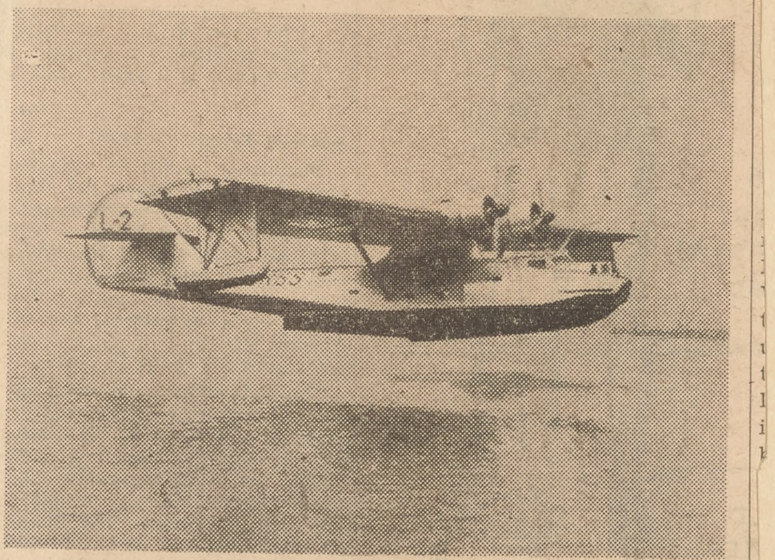
Deep in the interior, the exploring party discovered the new tribe of natives, living in a pleateau country 11,000 feet above sea level.

"They had never seen a white man before," Archbold said. "They called themselves the Witti-Paw and the Assilitti-Paw. They showed a high degree of agricultural development, growing beans, sweet potatoes and taro, principally.

"They had constructed a system of ditches and fences, and an adroit system of rocked-in lanes, down which they could drive their pigs without danger of their getting into the crop-land."

The party was accompanied by detachments of Dutch soldiers but they encountered no hostile inhabitants, he said. Instead, the natives they discovered "adopted" Archbold and other members of the group.

"They slaughtered a pig, toasted the liver and gave it to us to eat. Then they cooked the pig, with elaborate ceremony. Afterward, each of us received a small pig. Then it was set free, and the headman told us that when they had grown up, we would return to the tribe."



Glistening silver wings of his San Diego-built flying boat carried Richard Archbold (lower), flying explorer, into a strange land where a white man had never been seen before.

S. D.-Built Bombers Return to Manila

Union 10-11-39

Fourteen S. D.-built patrol bombers, comprising Squadron 21, that flew from Manila Saturday to Mindanano to escape a typhoon, returned yesterday to the Cavite naval station, The Associated Press reported.

Also arriving at Cavite from duty along the China coast were the destroyer Perry and the cruiser Marblehead.

Squadron 21, commanded by Comdr. Sam La Hache, flew from San Diego to Honolulu last month and after a brief stay at Pearl Harbor, proceeded to the Philippines for neutrality patrol.

VENEZUELAN HEADS TO VISIT AIR PLANTS

A Venezuelan military mission which has just arrived in Los Angeles is due to visit the Consolidated and Ryan aircraft plants here, it was learned today.

The officers, Lieut.-Col. Francisco Leonardi and Capt. Jorge Marcano, were reported in the market for planes for the Venezuela air force, and will remain in Southern California for two weeks while touring aviation factories.

HI HATTERS ON OCT. 20 TO HONOR CONSAIR FOURTH ANNIVERSARY OF COMING TO S. D.

High officials of city, county, Army, Navy and government will join in a fourth birthday salute to the Consolidated Aircraft Corp. at a gala program at Hi Hatters luncheon in The San Diego Club on Friday, Oct. 20. That date is the fourth anniversary of the dedication of the big plant in San Diego.

For the first time in Hi Hatters' history, the entire program will be broadcast over KGB of the Don Lee-Mutual Network.

Besides Maj. R. H. Fleet, president of Consair, honored guests will be Vice Pres. C. A. Van Dusen and other high ranking officers of the company. Maj. Edgar Gott, executive vice president, will be chairman of the day.

Emil Klicka, harbor commissioner who was largely instrumental in "selling" Consolidated on moving from Buffalo, N. Y., to San Diego as a permanent home, will speak briefly, as will city and county officials; T. Claude Ryan, president of Ryan Aeronautical Co.; Edmund Price, president of Solar Aircraft Co.; and Don Hanson, president of Chamber of Commerce.

Consair is one of the most important factors in San Diego's civic and business life. Not only is it the biggest industry here, it is one of the largest aircraft plants in the world.

Its PBY planes have set record after record for distance in mass flights, and more Consolidated patrol-bombers have been bought by the Navy than any other manufacturer's planes.

Consair's latest model, produced as a non-military commercial ship, is the "Model 31," a sleek-winged boat with a stubby two-deck hull which can haul a bigger load than has ever been done before on two motors. Her wing is reported to be at least 15 percent more efficient than any other wing yet developed.

The huge four-motored patrol plane built by Consolidated is now the flagship of the admiral commanding the scouting force, marking the first time a heavier-than-air craft has flown the flag of an admiral as a permanent flagship.

Conklin To Speak At Hi Hatter Meet This Friday Noon

Harold R. Conklin, chief counsel for the Union Title Insurance & Trust Co., will be speaker on the special program to be put on by that company at Hi Hatters luncheon in The San Diego Club this Friday noon.

A native San Diegan, member of both the state and local bar associations, Mr. Conklin is recognized as an authority on real estate law. His subject will be "Peculiarities of the Community Property Law."

Guests of honor will be James D. Forward, president of the company, and George W. Marston, pioneer citizen.

Special guests will include: Vice Presidents Maj. A. W. Neely, H. D. Barnes, John Gordon McGregor, Rufus Choate and Charles H. Forward, and Joseph C. Forward, James D. Forward, Jr., and J. D. Thompson, assistant secretaries; and the company's board of directors: Mat Heller, Rear Adm. T. J. Senn, USN (ret), George Sawday and B. C. Wohlford.

S. D. Club Barber Shop Offers Best Service

The best of service and individual attention is provided in The San Diego Club's Barber Shop, First Floor, through the expert attention of Barber Harry Fox. He has been with The Club for eight years, and his clientele includes many members who have insisted on having him exclusively for their tonsorial needs during that time.

COMING EVENTS in The SAN DIEGO CLUB

WEDNESDAY, Oct. 11—

Opti-Mrs. (Optimists Auxiliary) luncheon.

THURSDAY, Oct. 12—

Executives Association, breakfast meeting.

Lions Club luncheon, 12 noon. Imperial Lounge.

Twelve-Ten luncheon, Main Banquet Hall. Ritza Freeman Reardon to review "escape" books of lighter vein.

S. D. Druggists, luncheon meeting.

Duplicate Contract Tournament, 8 p. m. Lounge.

FRIDAY, Oct. 13—

Hi Hatters luncheon, 12:10 p. m. Main Banquet Hall. Special program by Union Title Insurance Co. Frank Forward as chairman.

Monte Carlo Nite, 8 p. m. Lounge.

"C & D" Bridge Club, dinner.

SATURDAY, Oct. 14—

Saturday Nite Club dance, 9:30 p. m. to 2 a. m. Sans Souci Grill. J. Warde Hutton and his music. For members and accompanying guests. No cover, no admission charge.

Mermaids Swim period, 11 a. m. Plunge.

MONDAY, Oct. 16—

Duplicate Contract Tournament, 1:30 p. m. Lounge.

TUESDAY, Oct. 17—

Kiwanis Club luncheon, 12 noon. Main Banquet Hall.

Jay Gees gym and volleyball, 3:45 p. m.

WEDNESDAY, Oct. 18—

Twelve-Ten annual Fall-Winter Style Show and Fashion Parade, 12:10 p. m. Main Banquet Hall. Reservations must be made in advance. Price $1 per person. Supervised bridge follows program.

THURSDAY, Oct. 19—

Executives Association, breakfast meeting.

Lions Club, luncheon, 12 noon. Main Banquet Hall.

Junior Chamber of Commerce, dinner meeting.

Duplicate Contract Tournament, 8 p. m. Lounge.

FRIDAY, Oct. 20—

Hi Hatters luncheon, 12:10 p. m. Main Banquet Hall. Gala Fourth Birthday program honoring officials of Consolidated Aircraft Corp.

Monte Carlo Nite, 8 p. m. Lounge.

Naval Air Station Is Hotel For War Birds Of U. S. Fleet

Hundreds Of Planes Soar From Field, But They Belong To Two Other Branches Of Service

Constantly expanding military bases have made San Diego the key to defense of the Pacific Coast—the Navy with 120 ships and 40,000 men, hundreds of planes, the Marine Base, Fort Rosecrans, the Naval Training Station and Coast Guard. The history and present status of the various branches of the service in the community, are being given in 12 articles.—The Editor.

By WILLIS WERNER

Month in, month out, day and night, hundreds of planes soar into the air from North Island. Some of them maneuver over San Diego and some of them don't stop until they reach Coco Solo or Honolulu. But despite all this activity, our Naval Air Station can claim less than a dozen planes of its own!

SIXTH OF A SERIES

Most of the war birds belong to "airbatfor" — aircraft battle force—and are attached to aircraft carriers. They come under authority of admirals afloat. Others are attached to the Scouting Force or the Fleet Marine Force.

Which means that the NAS with its 60 officers, 1250 men, and 2000 civilian employes is actually a hotel for airplanes. The station's job is to provide supplies and maintenance.

A part of the 11th Naval District under Rear Adm. J. R. Defrees, North Island customarily is commanded by a senior captain. In the normal course of events, this means an officer who is likely to become a rear admiral in a couple of years, as was the case with San Diego's popular Capt. John H. Towers, now an admiral stationed in Washington as head of the Bureau of Aeronautics.

At present in command is smiling, quick-spoken Capt. John McCain, a real Southern gentleman from Mississippi, whose record reads like a condensed summary of the Navy's activities.

During the war he spent most of his time on the Atlantic in escort service with the convoys. He was, in fact, aboard the old USS San Diego in June of 1918. That month, however, he was transferred to a post in Washington—and, just a couple of weeks later, the San Diego was sunk by a mine!

Captain McCain has commanded the ammunition ship Nitro, has been with the Bureau of Navigation and three years ago was in command of the fleet air base at Coco Solo. In June, 1937, he took over the ship which was then the smartest in the Navy—the huge, new aircraft carrier Ranger, which sent hundreds of San Diegans to the waterfront for a look when she first arrived here.

It was from the Ranger that Captain McCain came to North Island this June.

With an uncle in the army and a brother at West Point, Captain McCain originally planned to go into the Army himself but there wasn't an appointment available so he gladly accepted an appointment to the Naval Academy in 1902.

Through the years that have

Turn to Page 3, Col. 1.

S. D. Sun

NORTH ISLAND IS HOTEL FOR U. S. WAR BIRDS

Station Planes Are Owned By Other Branches

(Continued from Page 1)

followed, the two brothers have kept pace with each other, one in the Army and the other in the Navy. Capt. McCain's brother is Col. W. A. McCain, at present in command of the Quartermaster Depot in Philadelphia.

SAME DUTY TWICE

Only twice have they found themselves on duty together in the same city—both times Washington. The last time was in 1933-34, when Captain McCain was in the "BuNav" (Bureau of Navigation). Brother W. A. was then president of the Army Industrial College which gave them opportunity for reunion.

Captain McCain, who of course is an aviator or he wouldn't be commanding an air station, did not enter the air service until 1935. Relatively few officials who have been in the Navy for more than 30 years can pass the rigid tests required to get into this branch.

Aviation service is voluntary. Once accepted by the Bureau of Navigation, after meeting a stiff physical examination, an officer goes to Pensacola for flight training. If he is successful he can become a qualified observer in five or six months, while the full course takes six months to a year, producing a Naval aviator. Every Naval aviator commissioned since the war has gone through Pensacola. The men who wear the wings are a class apart.

Enlisted men can become fliers, too, but only officers are called aviators; enlisted men are designated as pilots when they take to the sky.

USUAL ROUTE

Usually an enlisted man gets into the air branch via an aircraft carrier or ship attached to aircraft although for the first time this year a limited number of picked recruits have been given opportunity to qualify as aviation mechanics at the Naval Training Station, going direct from the station into the air service.

An enlisted man who makes the grade and wins special training as a pilot gets a chance at 50 per cent more pay but doesn't necessarily advance his rating. He may be, for example, a first class machinist's mate — and even though he qualifies as a pilot he still must earn his promotion to Chief in the usual way.

Men attached to the air station get the same pay as men in the fleet unless their duties take them into the air for four hours or more per month. If a radioman, for instance, is attached to a plane and finds himself aloft more than four hours during the month, his pay automatically jumps 50 per cent. Less than 10 per cent of the men on North Island draw this extra money.

Some of the men also draw an allowance of 50 cents a day for living "ashore." The Island has 14 houses for officers, and barracks not only for the men stationed on the island but for the personnel of squadrons aboard the carriers when they're in port. The elaborate massing arrangements permit feeding as many as 4000 men per day.

MANY AT HOME

But many of the enlisted men have wives and families and prefer to live in their own homes. Under certain conditions, the commanding officer can allow them 50 cents a day for the food and bunk they don't use.

Otherwise they do as they do in the fleet and make their regular pay cover the extra expense of a home ashore. It's "ashore" even when they're on North Island. Navy men speak of going "aboard" when they go to the air station just as though it were a ship.

Practically everything is double at the air station, however, as fleet aircraft has its own offices, giving the island two officers of the day, etc.—one for Naval Air, the other for Fleet Air.

Unlike aboard ship, Naval Air has a permanent daytime "O.D." because there is so much to keep track of. He's the man to see first if you want anything on the island. He's the man that stores phone to when they want to make deliveries but have a new man on the truck. Everyone must have a pass to enter the air station now and regular delivery men have them. If a different man is going to be at the wheel, his name is phoned in advance of arrival. For a year now, Lieut. Comdr. R. P. Noist has had this duty.

Another busy man is the executive officer, Comdr. H. M. Mullinix, who is directly under Captain McCain. Commander Mullinix also was on convoy duty during the war, looking for submarines, and likes flying considerably better than sitting at a desk.

One of his unusual jobs is handling traffic tickets. The island has rules just like a city and if a civilian gets a ticket for overparking or something, Commander Mullinix can ban his car from the island. It's sometimes more serious when a Navy man is tagged. The man may even find himself brought up before the captain.

The Island has its own stores, barber shops, theater, etc., too, run by the Navy but in many cases employing civilians. The Navy, for example, doesn't train soda jerkers so the two working on the island are hired.

Profits from soda fountain, barber shop, pool room, etc., pay for the nightly films. The projectionist gets extra pay for screening them and usually is an electrician's mate who has been through the school for operators at the Naval Training Station or elsewhere.

Originally a haven for quail and rabbits, North Island made its debut in aviation when Glenn Curtiss established a flying school there in 1911. One of his chief instructors was Maj. T. C. Macauley, now executive secretary of the San Diego Chamber of Commerce.

The precedent for later aerial exploits was set here by a long series of "firsts," including the first seaplane flight in the world by Mr. Curtiss in 1911 and the first night flight by Major Macauley in 1913.

NAVY COMES IN

It wasn't long before the new school was training Army fliers. By 1912, government troops were stationed on the island and military aviation had arrived in San Diego.

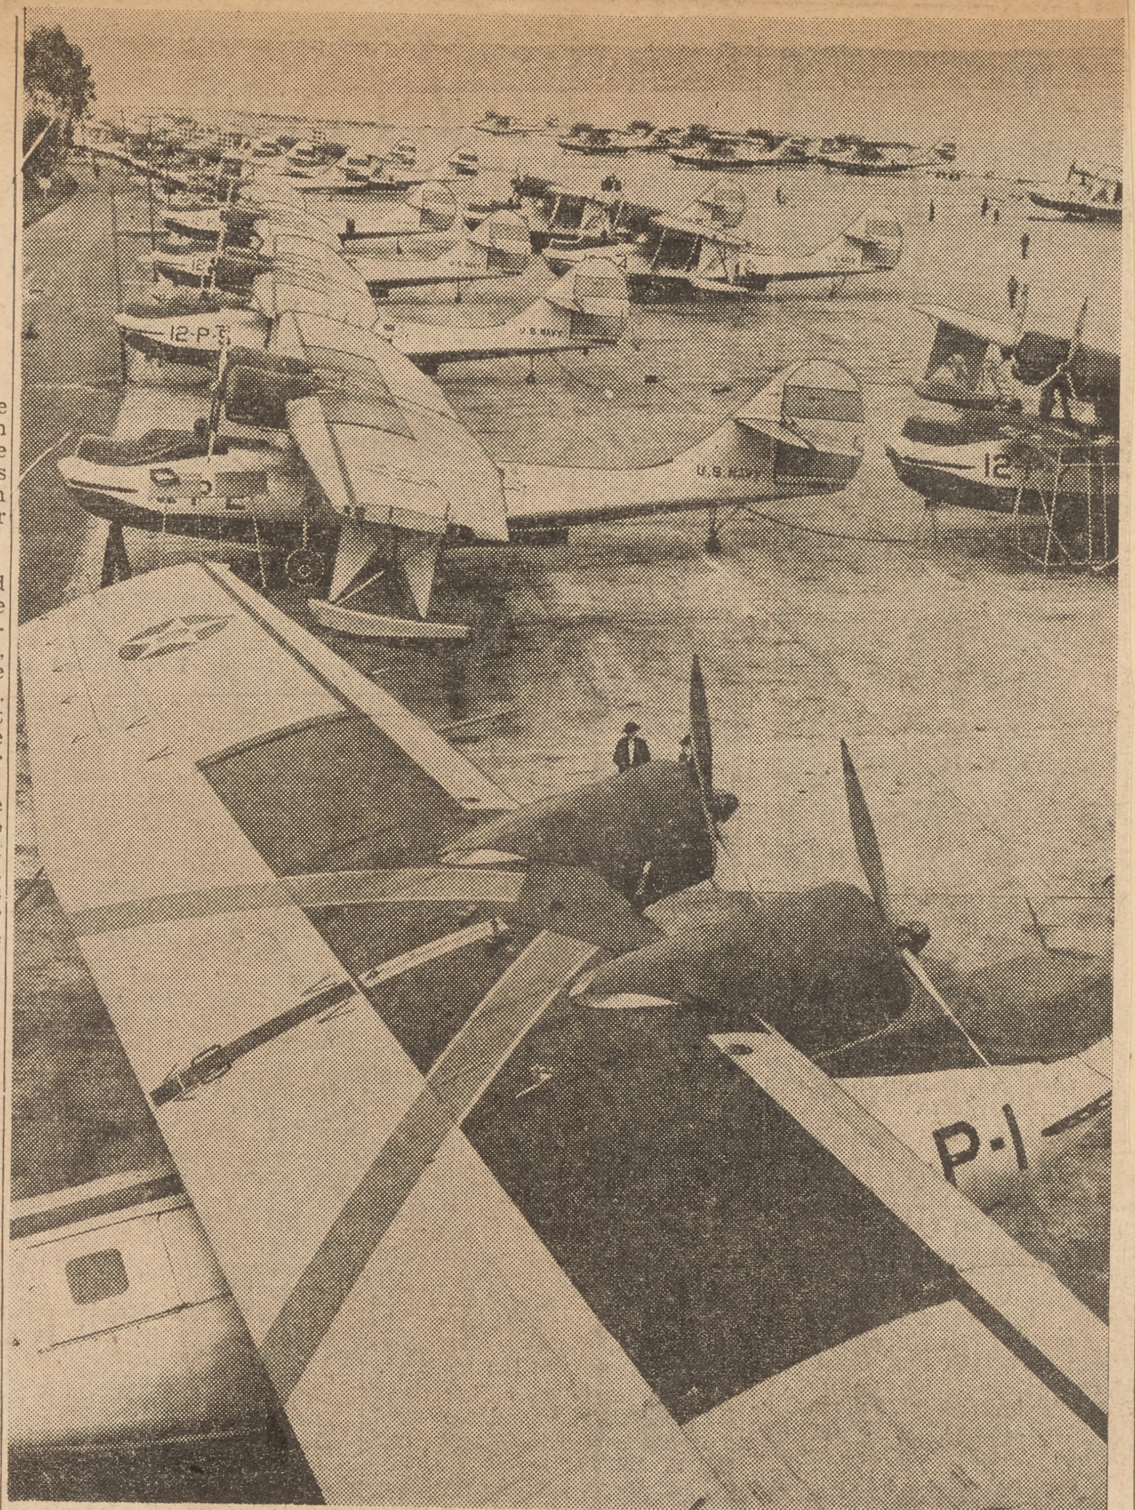
The Navy first gained authority to share the island in 1917, occupying several old buildings. Both the Army and Navy used the island as a training center and after the war the Navy rapidly expanded its facilities on the north end.

After what Major Macauley discreetly terms "difference of opinion on the part of ranking officers of the Army Air Corps," the Navy finally won exclusive use of the island. Since that time it has become the most important air base in the U. S.

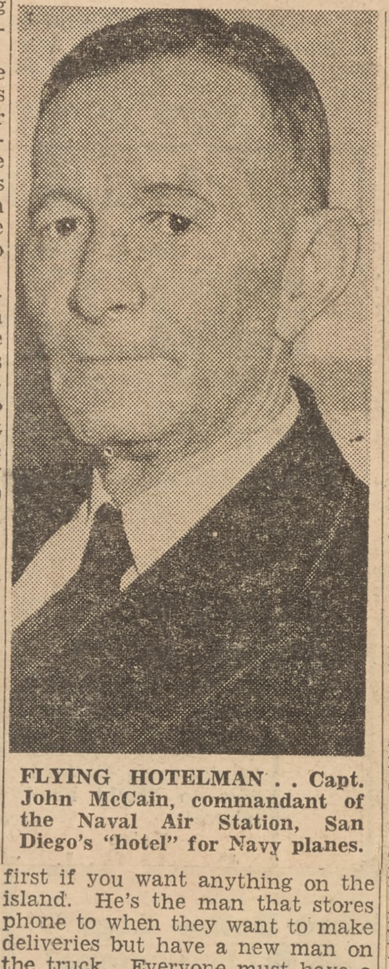
Many civilian employes who first prepared the island for the Navy 20 years ago are still working there. You'll find such old-timers as A. Zitnick, in charge of supply depot shipping; C. L. Downs, head stock man; H. T. Bushart, in charge of the accounting department; S. Pittman in charge of aircraft stores; Maj. W. V. V. Stewart, reserve officer, now chief clerk for the station, and J. N. F. Bishoff, public works foreman, who first went to work for the Navy at Key West in 1930.

Probably best known of the veteran civilians is a San Diego reserve officer, Col. John Sherman. On the island, he is storehouse supervisor for the supply corps; in San Diego he is commander of the National Guard anti-aircraft unit.

As for those 8 or 9 planes which belong to the Air Station, they are used for testing parachutes, taxi service, etc. Every morning one of them spirals 2 or 3 miles into the sky with a recording barograph to take weather observations. It's just part of the day's routine, carried out by whatever pilot is assigned that day.



WINGS AT REST . . . But ready for any emergency. Here are a few of the hundreds of war planes based at North Island. They're groomed for action at a shore tsation, but they come under command of forces afloat.



FLYING HOTELMAN . . Capt. John McCain, commandant of the Naval Air Station, San Diego's "hotel" for Navy planes.

LUNCHEON HONORS CONSAIR OFFICIALS

Sun 10-20-39

R. H. Fleet, president of Consolidated Aircraft Corp., and officials of that plant, was honored at a program celebrating the fourth anniversary of the dedication of Consolidated's factory here, at Hi Hatters' luncheon today in the San Diego Club.

San Diego's civic leaders joined with Hi Hatters in this gesture. Those to speak briefly were:

Emil Klicka, harbor board commissioner, who is credited with doing most to "sell" Consolidated on moving from Buffalo, N. Y., to San Diego; President Don Hanson of Chamber of Commerce; Rear Adm. A. B. Cook, scouting force commander; Leroy Richards, county supervisors chairman; City Councilman Fred Simpson, representing the city in place of Mayor Benbough, whose recent illness prevents him appearing; T. Claude Ryan, president of Ryan Aeronautical Co., and Edmund Price, president of Solar Aircraft.

Other guests of honor were: Rear Adm. Joseph R. Defrees, commandant 11th Nav. dist.; his aide, Capt. E. S. Root; and these officials of Consolidated: C. A. Van Dusen, C. T. Leigh, I. M. Laddon, William Shanahan, and R. A. Stanberry. Horace E. Rhoads will preside, and chairman will be Edgar Gott.

Air Corps In Biggest Spending Splurge

Orders total $85,978,000 in record contract shower.

There was heavy firing along the aviation front Aug. 10, as the War Department reared back and placed the largest single order for war equipment in United States history. Bang! went $85,978,000 of funds made available for new aircraft and equipment by the recently adjourned Congress. Boom! went the country's airplane manufacturing industry as it received in a single day more orders for aircraft than it had ever turned out in any entire year prior to 1937.

The emphasis of the day's procurement was definitely on the heavy "battle-wagon" type of plane. Boeing aircraft got orders for $8,090,000 worth of flying fortresses. Consolidated Aircraft took orders for $8,485,000 worth of similar 4-engine craft. Furthermore "options" for additional planes in this category amounting to $5,400,000 were written into the above contracts. Glenn Martin got the biggest order of all, $15,815,000 for a fleet of its new twin-engined bombers. North American got an order for $11,771,000 worth of its twin-engined bombing planes. Thus a total of $41,076,000 went to strengthen our bombing squadrons. Last April Consolidated got an order for $2,280,000 worth of 4-engined bombers. Douglas contracted to deliver $15,000,000 worth of twin-engined bombers. And Martin and Stearman each undertook orders for a half million for ships of that type. Total current orders for bombers of all classes therefore add up to the very substantial figure of $59,356,000.

Among the Aug. 10 orders, North American also received a $1,326,000 award for advanced training planes and a $2,707,000 contract for basic training planes. The Vultee division of the Aviation Manufacturing Corp. also got an order for $2,489,000 worth of basic training planes.

Lockheed, which on April 26 received a $2,180,728 contract for twin-engined pursuits, last month got a second order for an additional $4,845,000 worth of the same ships.

Stearman received an order for $688,000 worth of basic training planes with provision that the Army might contract at a later date for an additional 2 million dollars worth.

The engine firms likewise came in for big orders. Pratt & Whitney received contracts for $12,320,000. The Wright Company got orders for $7,000,000 worth. Allison received further contracts for $2,375,000 to add to its spectacular 15 million dollar order placed June 29. Lycoming got an order for $270,000.

The War Department announced that its Aug. 10 awards represented "the major portion" of the aircraft purchases it intends to make this fiscal year under the recent air corps Expansion Act. But "additional types are under evaluation at Wright Field, in Dayton and awards will be announced shortly," the Department added. No further details were given but the additional types under consideration were known to be largely single pursuits and the amount involved somewhere between $12,000,000 and $18,000,000.

Wide World

LOUIS JOHNSON

Bang! Went $85,978,000

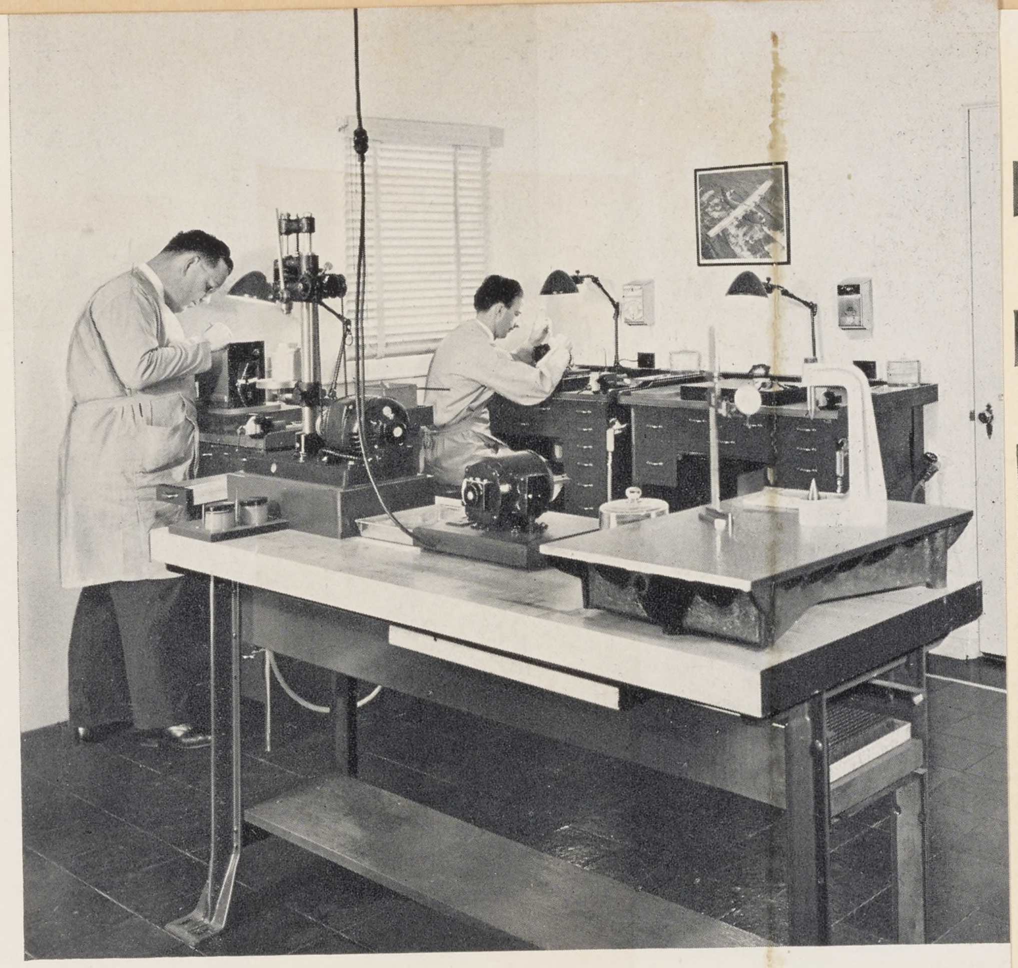
Just for the general interest in the thing, here is a summation of all Air Corps and Navy orders for planes and engines placed since April 3, the date of the act authorizing the Air Corps expansion program. It lists in order of magnitude the total orders placed with each airplane company.

North American $19,809,218; Douglas $15,000,000; Martin

$16,315,000; Curtiss - Wright (Airplane Division) $13,990,209; Consolidated $11,365,000; Boeing $8,778,000; Lockhead $7,025,728; Vultee $3,076,000; Stinson $1,500,000; Beech $1,185,849; Bell $1,073,445; Seversky $974,325; Stearman $500,000; Ryan $152,655; St. Louis $150,002; Waco $100,720; Bellanca $50,000.

Engine contracts awarded during the period by the Army total: Allison $17,355,262; Pratt & Whitney $13,437,872; Wright $7,000,000; Lycoming $270,000.

The Sperryscope Oct. 1939



Aeronautical School, Los Angeles, Instructor Dan L. Garber at left

as China and the Argentine, but by far the majority are from our own Army, Navy and transport lines. Over three hundred students have finished the courses given in our Aeronautical Schools.

The newest and most exclusive of the Sperry Schools exists only for the purpose of training officers, enlisted men and civilians of the U. S. Army, Coast Artillery and Marine Corps in the theory, operation and maintenance of the Sperry apparatus they are required to use. The personnel comes of course principally from the Ordnance Department for whom the Anti-Aircraft Directors and Sound Locators are manufactured.

In the Sperry School the training in anti-aircraft instruments is concentrated upon the maintenance in good condition and effective operation of the Sperry instruments under all conceivable service conditions. The Searchlight and Sound Locator, though less complicated than the Anti-Aircraft Director, also have their problems of effective use and efficient maintenance with which the personnel charged with them must be thoroughly familiar.

From many points of view the functions performed in this School are unusual. There must be few manufacturers in the world whose duties include the instruction of a technical branch of the nation's armed forces in the use of highly specialized military equipment. It need only be said that the position of the Sperry Gyroscope Company in developing anti-aircraft equipment has been so unusual that it has been placed in a position of special service in being so closely connected with this branch of the government service.

EXPLORING NEW GUINEA BY AIR

Rounding out 40,000 miles of flight and a year in the unexplored wilds of New Guinea, the Archbold Aerial Expedition of the American Museum of Natural Science, under the leadership of Richard Archbold, returned to New York on July 1.

A Twin Wasp-powered Consolidated PBY-1 flying boat named "Guba", equipped with a Sperry Gyropilot, flew the Expedition 7,000 miles across the Pacific to a tiny town on the northern coast of Dutch New Guinea which served as an operating base. From there the Guba was used to fly 130 members of the Expedition and 30 tons of supplies to an advance base on Lake Habbema 200 miles inland. From the lake, 11,800 feet above sea level, dozens of takeoffs and landings were made on exploratory and mapping expeditions.

The return journey was made via Australia, the East Indies, Africa and the Virgin Islands.

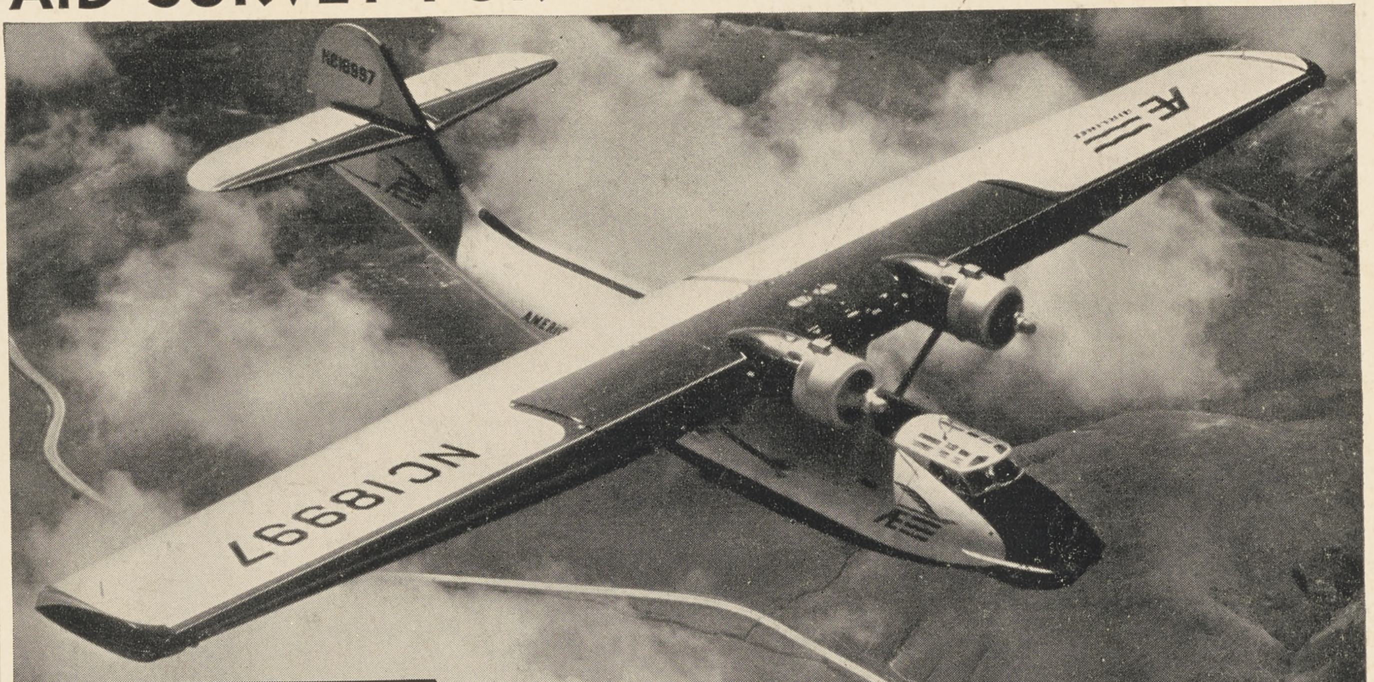
SPERRY INSTRUMENTS

AID SURVEY FOR NEW ATLANTIC SERVICE



Captain P. J. Byrne, commander of American Export Airlines' survey flights

In completing a series of scientific survey flights across the Atlantic, American Export has written a new chapter in aviation history. Long famous for successful steamship operations, the line will soon be ready to accommodate air passengers as well. The routes are ready, the pioneering done.

Referring to the part which Sperry instruments played in this important accomplishment, Captain Byrne reported "During all our flights we relied continually upon the Sperry Gyropilot, Gyro-Horizon, Directional Gyro and Gyro-Magnetic Compass. Their splendid performance was of great assistance to the successful completion of every trip."

SPERRY GYROSCOPE COMPANY, Inc.
BROOKLYN, N.Y.

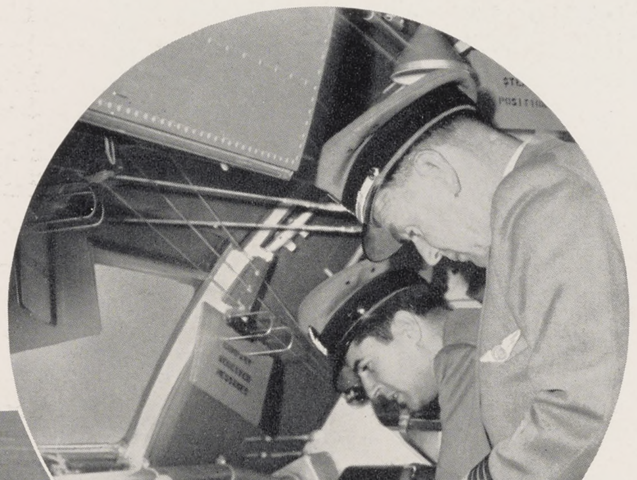
gram would not be simple to carry out. The total number of flights between the United States and Europe would range from ten to twenty per week if foreign flag companies each flew one to two trips weekly and American flag operators flew a corresponding number. On the other hand, if American flag operators were restricted to say four trips a week, then European countries would be restricted to a corresponding number, a total of eight. This would mean that certain countries would be unable to procure permits until the American minimum of four was increased.

If Europe, aviationwise, could organize itself into a United States of Europe, it would be simple for the United States of America to say, "We will run two, four or six schedules a week across the Atlantic, and you can operate an equal number, dividing it any way you see fit between England, France, Germany, Italy, Holland and others." Unfortunately, such is not the case, and an added burden involving decision and procedure is put in the lap of the Authority if America is to hold its position in the air lanes across the Atlantic. It means one country against at least six European countries.

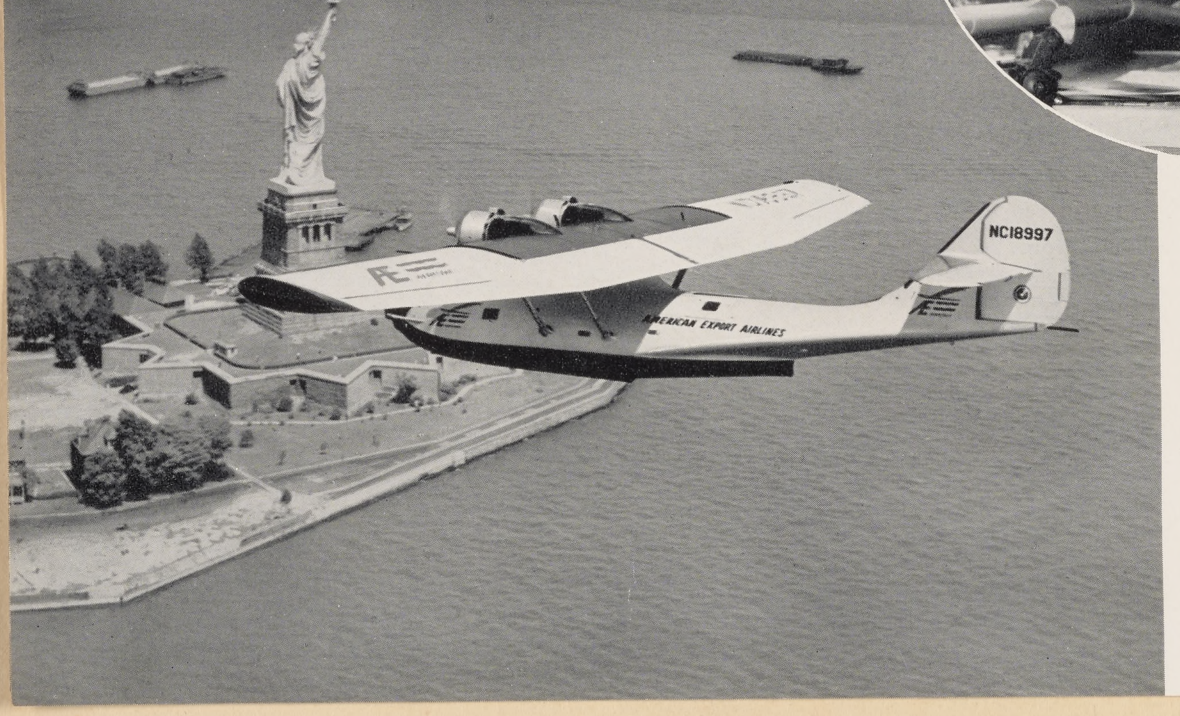
It is perfectly clear that our country should take advantage of the opportunity aviation affords to reclaim its position between here and Europe. It is likewise clear that many interests and groups will be required to supply the organization, engineering talent, adequate equipment, up-to-date ideas and financing, and that all must be, as time goes on, encouraged and fostered by the United States Government.

At the present time aviation appears to be on the threshold of producing more economic equipment than at any other time in its short history, but it has not yet reached the point of self-sufficiency and therefore must be nursed along either by direct subsidy (as in most European countries) or by payment for the carriage of mail (as is the custom in this country). There is a great potential volume of business to be transported across the Atlantic by air, and there is no limit to the amount of mail available if rates are fair and schedules are fast and dependable. On this basis there is adequate mail pay for several companies, and several are required if the United States is to hold its position. They must be strong and alert to recent and future developments.

American Export Airlines has just completed a series of survey flights across the Atlantic, using the various routes—New York, Newfoundland, Ireland, France; New York, Newfoundland, France direct; New York, Azores, Lisbon, France. The flights were laid out and an organization was selected to conduct operations. There was no interruption in the schedule, and the stipulated trips were made on time, leaving New York every other Friday. It is impossible in the limited space allotted to cover the details involved in organization, including personnel, communications and meteorology, but it goes without saying that they received proper attention or results would not have been what they were. Great credit is given the personnel in the organization, including the Captain and his crew, and many pages could be spent on the dependability of the aircraft, engines, radio, instruments and fuel. The flight reports show a perfect score for American equipment.



Capt. Patrick J. Byrne (right) and Co-pilot T. S. Terrill working on navigation charts



American Export Airlines' Consolidated PBY, the *Trans-Atlantic*, piloted by Captain Byrne, as she flew past the Statue of Liberty on a survey flight to Europe

— *Rudy Arnold*

AE AIRLINES

— *Rudy Arnold*

American Export Airlines proposes to run dependable, fast, all-year-round scheduled operation between this country and Europe. It is convinced that if the schedule is to be dependable, it must be conducted on a non-stop basis. The parent company's records, covering years of ocean experience, show that weather conditions throughout the twelve months of the average year cover the full swing of the pendulum from very good to very bad. It is with this information in mind that the importance of long-range equipment, adequate for non-stop, with proper fuel reserves even in the face of high and continuous headwinds, becomes a dominating factor. The aircraft must be able to take off and fly to its destination by whatever route or detour is necessary to avoid bad weather conditions. From all indications at the present time, this means that the winter services must be carried on over a route swinging well south of the bad weather zones and be able at all times to fly a non-stop distance of more than 4,000 miles. Need for dependable engines is recognized, as well as for a sufficient number in case of engine failure; and it is the firm belief of the company that these features, combined into planes able to carry adequate fuel for long non-stop range, will make possible a service that will be popular beyond belief for mail, passengers and express. The size of equipment will be determined by engineering brains as dependability is proven and demand dictates.

American Export is confident that with such a program it can be an important factor in aiding the United States to reclaim its position in the transportation field between this country and Europe.

as China and the Argentine, but by far the majority are from our own Army, Navy and transport lines. Over three hundred students have finished the courses given in our Aeronautical Schools.

The newest and most exclusive of the Sperry Schools exists only for the purpose of training officers, enlisted men and civilians of the U. S. Army, Coast Artillery and Marine Corps in the theory, operation and maintenance of the Sperry apparatus they are required to use. The personnel comes of course principally from the Ordnance Department for whom the Anti-Aircraft Directors and Sound Locators are manufactured.

In the Sperry School the training in anti-aircraft instruments is concentrated upon the maintenance in good condition and effective operation of the Sperry instruments under all conceivable service conditions. The Searchlight and Sound Locator, though less complicated than the Anti-Aircraft Director, also have their problems of effective use and efficient maintenance with which the personnel charged with them must be thoroughly familiar.

From many points of view the functions performed in this School are unusual. There must be few manufacturers in the world whose duties include the instruction of a technical branch of the nation's armed forces in the use of highly specialized military equipment. It need only be said that the position of the Sperry Gyroscope Company in developing anti-aircraft equipment has been so unusual that it has been placed in a position of special service in being so closely connected with this branch of the government service.

EXPLORING NEW GUINEA BY AIR

Rounding out 40,000 miles of flight and a year in the unexplored wilds of New Guinea, the Archbold Aerial Expedition of the American Museum of Natural Science, under the leadership of Richard Archbold, returned to New York on July 1.

A Twin Wasp-powered Consolidated PBY-1 flying boat named "Guba", equipped with a Sperry Gyropilot, flew the Expedition 7,000 miles across the Pacific to a tiny town on the northern coast of Dutch New Guinea which served as an operating base. From there the Guba was used to fly 130 members of the Expedition and 30 tons of supplies to an advance base on Lake Habbema 200 miles inland. From the lake, 11,800 feet above sea level, dozens of takeoffs and landings were made on exploratory and mapping expeditions.

The return journey was made via Australia, the East Indies, Africa and the Virgin Islands.

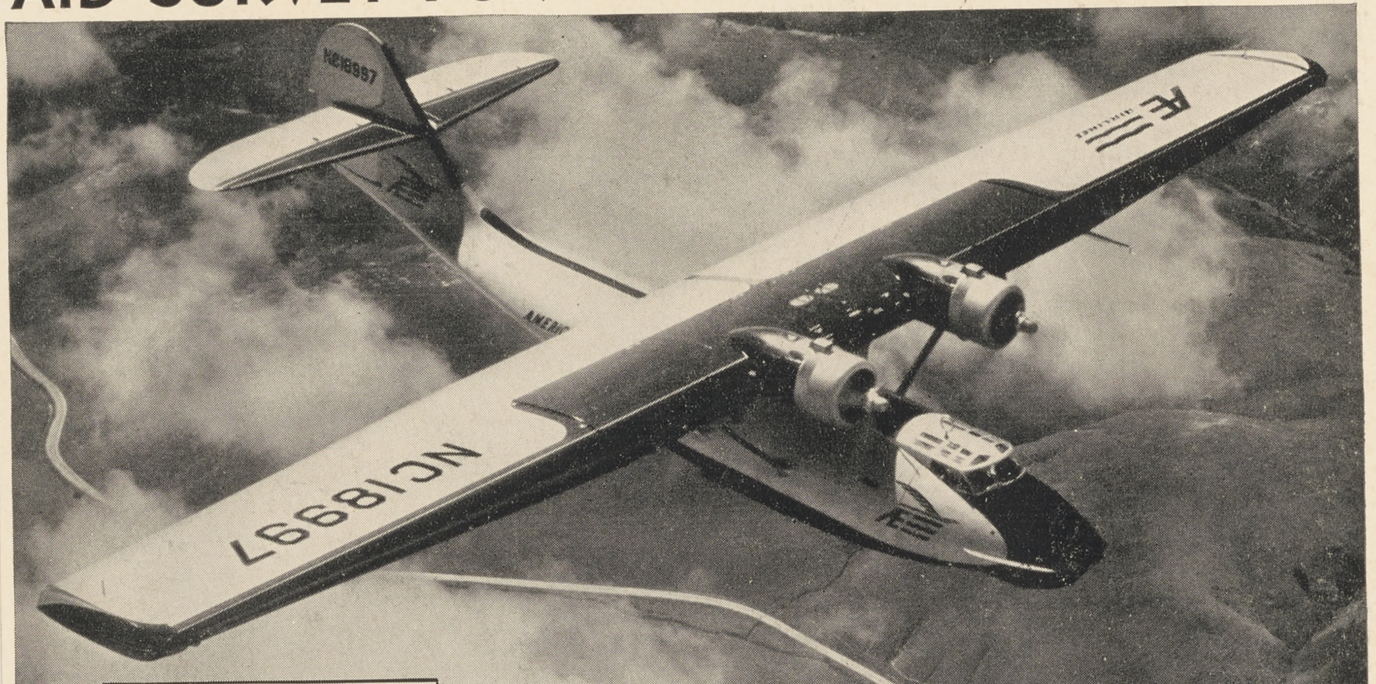
SPERRY INSTRUMENTS

AID SURVEY FOR NEW ATLANTIC SERVICE



Captain P. J. Byrne, commander of American Export Airlines' survey flights

In completing a series of scientific survey flights across the Atlantic, American Export has written a new chapter in aviation history. Long famous for successful steamship operations, the line will soon be ready to accommodate air passengers as well. The routes are ready, the pioneering done.

Referring to the part which Sperry instruments played in this important accomplishment, Captain Byrne reported "During all our flights we relied continually upon the Sperry Gyropilot, Gyro-Horizon, Directional Gyro and Gyro-Magnetic Compass. Their splendid performance was of great assistance to the successful completion of every trip."

AMERICAN EXPORT LINES ACCEPTS A CHALLENGE

J. M. Eaton

WHEN American Export Lines, one of America's outstanding transportation companies in the foreign field, announced its intention to use the air routes over the Atlantic in addition to its existing surface routes, nationwide attention was attracted. The aircraft, a new vehicle, was again proclaimed as an important economic factor of the future in the field of foreign commerce.

More than two years ago W. H. Coverdale, President of American Export Lines, set a pattern for the up-to-date, well rounded transportation service, in which he included the aircraft for transoceanic trade, when he said:

> "The aircraft puts the United States face to face with another important evolution in the maritime system for foreign trade. It will bring about as definite a transition as when our shipping changed from sailing vessels to steamships back in 1840, but primarily will differ in that it will supplement our present surface vessel rather than supplant it as the steamship did the sailing vessel. The result will be the speeding up of the transportation of persons, mail and goods that require faster carriage and will create an even more important position for the surface borne vessel in the movement of freight and persons not requiring great speeds."

The history of American Export Lines is full of romance and adventure. True, its steamships are small compared with ships of foreign nations, but they carry full cargoes in both directions between a few specified American ports and something over seventy ports in Europe, Asia and Africa. The foreign ports, many of them on the Mediterranean, are as colorful, as gay, as tragic, as historic and as specialized as any ports in the world. For example, there are Lisbon, Marseilles, Athens, Naples, Constantinople, Constanza, Alexandria, Algiers, Gibraltar, with different languages, different climates, different costumes and different habits. These countries ship to the United States cargoes ranging from spices, olives, olive oil, cotton, cork and tomato paste to chromium ore, all expressing in some way the habits and temperaments of the countries where these products are produced. In the opposite direction the United States ships automobiles, machinery, packing house products, steel products, lubricating oil, refrigerators and radios, which in turn are the products of a mechanized multiple production development.

The company has a fleet of eighteen steamships — fourteen freighters and four combination passenger and freight. These four ships are known as the "Ace" boats, accommodate 130 first class passengers, and have become decidedly popular since the "Yankee Cruises" were established several years ago.

One hundred years ago America held first place on the Atlantic and maintained that position up to the time the United States, with Yankee ingenuity, turned from the seas toward the development of its own interior. Railroads, factories, cities, mines, communications, schools, towns — all had to be built. While this great American development was going on, Europe was establishing itself on the Atlantic in order to handle the new and ever increasing American business.

The World War put the United States face to face with the realization of its unimportance in transatlantic transportation, and as a result a concentrated attempt was made to improve the situation. Much could be said regarding the creation of the Shipping Board and the establishment of a number of steamship companies, but the fact was that the foreign companies had become too firmly established, and although plans were made for many American flag companies, they did not carry through.

American Export liner unloading at Alexandria. The four "Ace" ships of this Line have Sperry Gyro-Compasses and Gyro-Pilots.

A SERIES of survey flights across the Atlantic Ocean recently was completed by American Export Airlines, a subsidiary of American Export Lines. The activities of this company are of particular interest to shipping and aviation officials in that surface commerce is being organized with flying boat operations under a joint sponsorship. Mr. J. M. Eaton, Vice President of American Export Airlines, has prepared the accompanying article describing the activities and plans of his company as well as some of the problems involved.

American Export Lines was one of the few that survived and grew to a strong, stable unit in the American Merchant Marine. It faced, however, the serious problem of maintaining its competitive position with the big European lines. It could not stand still, and yet it could not afford to go in for the superliners. There was also the possibility that the great modern steamships would be rendered obsolete within a surprisingly short period by new aircraft.

As stated earlier, the officials were not prejudiced against the adoption of a new and faster vehicle and began a study of the possibilities of improving the service between certain European ports along its route, using aircraft in conjunction with steamship operation across the Atlantic, or advancing the entire service by a supplementary service straight across the Atlantic to European ports. The studies included thorough checks throughout Europe with respect to landing facilities, harbor facilities, equipment, potential mail, passenger and express volume, and led to the conclusion that the company should supplement its freight and limited passenger ocean service with faster through air service for passengers, mail and express.

The next steps included consulting with governmental departments in Washington, establishing relations with proper officials in European countries, incorporating the subsidiary company, American Export Airlines, and making the necessary applications for permission to operate aircraft and other necessary equipment.

The importance of the company's steamships, a large percentage of which are at all times between New York and Gibraltar, to the operation of aircraft with respect to communications, weather reporting and emergency bases was not overlooked. Ready made mobile stations existed and simply needed to be coordinated properly under the same general management. Instructions were immediately issued to the officers of the ships to intensify their weather observations to a degree suitable for aviation meteorological requirements and to take these readings four times daily instead of twice. At the same time all radio equipment was modernized and brought up to the standard required for assisting aircraft.

In the meantime the United States Government passed the new Civil Aviation Act in 1938 and established the Civil Aeronautics Authority. One of the important issues which immediately confronted the Authority was how to prevent aviation from "sideslipping" into the same predicament that had been forced upon the steamships. In other words, could a policy controlling aviation outside its continental borders be so set up that the United States would regain its position with respect to transportation across the Atlantic? It would be necessary for American flag companies to fly as many schedules as the combined schedules of the European countries, and such a pro-

Sea weather studied for transatlantic air line operation. On board SS *Excambion*, first of eighteen weather reporting stations across the Atlantic, left to right: W. H. Slater, Executive Vice-President of the steamship and air line company, W. H. Coverdale, President, Captain W. W. Coney, and L. W. Lewis, meteoroligist

deliver $15,000,000 worth of twin-engined bombers. And Martin and Stearman each undertook orders for a half million for ships of that type. Total current orders for bombers of all classes therefore add up to the very substantial figure of $59,356,000.

Among the Aug. 10 orders, North American also received a $1,326,000 award for advanced training planes and a $2,707,000 contract for basic training planes. The Vultee division of the Aviation Manufacturing Corp. also got an order for $2,489,000 worth of basic training planes.

Lockheed, which on April 26 received a $2,180,728 contract for twin-engined pursuits, last month got a second order for an additional $4,845,000 worth of the same ships.

Stearman received an order for $688,000 worth of basic portion" of the aircraft purchases it intends to make this fiscal year under the recent air corps Expansion Act. But "additional types are under evaluation at Wright Field, in Dayton and awards will be announced shortly," the Department added. No further details were given but the additional types under consideration were known to be largely single pursuits and the amount involved somewhere between $12,000,000 and $18,000,000.

Just for the general interest in the thing, here is a summation of all Air Corps and Navy orders for planes and engines placed since April 3, the date of the act authorizing the Air Corps expansion program. It lists in order of magnitude the total orders placed with each airplane company.

North American $19,809,218; Douglas $15,000,000; Martin

Consair Plans Plant Increase Of 75 Percent

Consolidated Aircraft Corp.'s plans to increase production facilities "by approximately 75 percent" were disclosed yesterday when the municipal board of examiners and appeals recommended to the city council that building code provisions be amended to permit construction of a 3-story steel-frame, metal-lathed building.

The concern recently obtained a long-term lease on 17 additional acres of tidelands adjacent to its present holdings, and if the new building is constructed, said Edgar Gott, vice president, it will be put up on part of that site. He declined to reveal what the proposed improvement will cost.

OFFICES PLANNED

Coincidentally, William A. Maloney, plant engineer, disclosed in the company's application that it is the firm's ultimate desire to "erect an administration building of suitable size and area in a central location, on property we now lease on the east side of Pacific highway across the street from our present factory site."

The building contemplated in the present application would be 60 by 180 feet and temporarily would be used for office space "but later to be converted to light manufacturing usage."

PREPAREDNESS AID

Gott said the company "plans to do nothing until we know whether the U. S. government wants us to carry on additional work." He added that Consolidated wants "to be ready if the government gives us more business." The contemplated expansion program, it was explained in the application, is "in anticipation of a national emergency" and in line with the corporation's "desire to aid our country in the forthcoming preparedness campaign."

The building would have an exterior stucco finish, would be plastered within and would have wood floors of slow-burning construction on steel beams and girders. The amendment is necessary, said Oscar Knecht, chief city building inspector, because present code provisions permit construction of such a building only to a height of two stories.

ARMY FLIERS FERRY HEAVY LOAD ON 'RUSH ORDER'

Planning the discharge of 3200 pounds of aerial horses from a sky freighter are (left to right) Lt. Glenn Holland, Maj. E. R. McReynolds, W. G. Chamberlain, Edgar Gott and Lt. Thomas J. Schofield. Boxed engine parts can be seen in the plane.

SKY FREIGHTER BRINGS PLANE ENGINES TO S. D.

★ ★ ★ ★ ★ ★ ★ ★ ★

Power Plant for New Consair Bomber Comes by Fast Air Route

Thirty-two hundred pounds of air power, packed in two engines of the latest type, arrived by air from Hartford, Conn., yesterday to speed one phase of America's armament program by 11 days.

Immediately after they arrived aboard an army aerial freighter they were placed in the nacelles of a new bomber Consolidated Aircraft Corp. is building for the army. Construction of the bomber had reached a point where the engines were necessary to expedite operations, and the army air transport service rushed them through.

Although the new bomber is a four-motored craft, only two engines were immediately necessary. The other two are to be sent out by air within a few days.

Military secrecy surrounds specifications of the new engines, but they are said to develop in the neighborhood of 2000 horsepower each. Similar secrecy clothes the new bomber.

The transport plane which brought the engines left Hartford Wednesday and made overnight stops at Pittsburgh and Oklahoma City. It was piloted by Lt. Thomas J. Schofield, with Lt. Glenn Holland as co-pilot. Both are attached to the 10th transport group and are stationed at Middletown, Pa. It is nothing new to them to haul engines around the country in their specially designed aerial freighter, but it was a novelty to have the engines for a new bomber come into San Diego by the sky route.

On arrival the engines were inspected by Maj. E. R. McReynolds, army air corps inspector in this area; Edgar Gott, Consolidated executive, and W. G. Chamberlain, factory represenative of the engine company.

NEW CONSAIR ORDERS LOOM

Congress Expected To Give Army Huge Sum

Sun Oct 24-39

By HAROLD KEEN
Aviation Editor

For many weeks there has been an atmosphere of expectancy in aviation circles regarding Consolidated Aircraft Corp. Big things—meaning large contracts—were said to be in the offing.

Reports now coming out of Washington seen to justify this feeling. The Administration, according to the United Press, may ask Congress early in its next regular session to appropriate about $100,000,000 for 500 so-called "air dreadnaughts" to supplement the fleet of 5500 planes due for completion July 1, 1941, in a $300,000,000 aviation expansion program.

The description of these "dreadnaughts" could very easily be applied to the phenomenal four-motored Army bombers under construction in the San Diego plant.

SPECIFICATIONS LISTED

According to informed quarters in Washington, this type of lethal dispenser would boast superior performance to the present 12-ton flying fortresses, although they would be little, if any, larger. Improved motor designing would lower fuel consumption, increasing cruising range, it was reported. Special wing design would add to speed and operating range.

The Boeing flying fortress can travel faster than 265 miles per hour at cruising speed and have a range with full "death pay load" of 2000 miles.

The Consolidated bomber has been unofficially reported capable of a speed in excess of 300 miles per hour, and an almost unbelievable range. The wing is believed to be similar to the "Davis perfect wing" on the Consolidated Model 31, the twin-engined seaplane with 2000 horsepower engines that is the fastest airboat in this, and probably any other, country.

CONSOLIDATED MUM

Consolidated will not disclose the exact number of these Army bombers it is building at a total cost of more than $11,000,000. The per unit cost, of course, is much higher on such a relatively limited order. Washington authorities estimate that the bombers in huge quantities would cost about $200,000 apiece, the approximate charge made for the two-motored Navy PBY patrol bombers, of which more than 200 were produced.

Should the $100,000,000 project be approved, in whole or in part, Consolidated is certain to receive a large bulk of the work, and it is safe to say that Maj. Reuben H. Fleet, president of the concern now in the nation's capital, is not sparing any effort to emphasize to the War Department his company's ability to produce in large numbers.

POPULAR AVIATION
Aug 39

THE Man UNDER THE Hood

FRANCE has admittedly purchased some 40 flying boats in this country . . . but **French** officials in this country have, to date, refused to name the company from which they purchased them . . . but a little off-the-cuff mathematics by those in the industry who should know seems to indicate clearly that **Consolidated Aircraft** at San Diego has just come into a most welcome windfall . . . it's no secret, of course, that **Consolidated's** PBY patrol boat so popular with the U. S. Navy has been offered—in an export version—to any person or country interested . . . even **Britain** has purchased one "for tests" . . . other PBY-model owners besides the Navy are **American Export Airlines** and Richard Archbold, the wealthy young explorer. . . .

COASTAL COMMAND CONTROVERSY

Arguments Which Ignore Operational Needs

By the "SUNDAY TIMES" AIR CORRESPONDENT

Controversy has arisen again over a partition of the Royal Air Force. Forceful suggestions have been made that the administrative as well as the operational control of the Coastal Command should be taken from the R.A.F. and handed over to the Royal Navy.

The agitation, presumably resurrected by the present menace to our sea communications by enemy aeroplanes, was evoked not from inside the two Services, which are in perfect accord, but by people not concerned with operational affairs.

The subject is analogous to that of the separation of the Army Co-operation Squadrons from the R.A.F., now happily solved to the complete satisfaction of all parties—except the enemy—by the formation of the Army Co-operation Command of the Royal Air Force, designed to act with but not under the Army.

DIFFERENT PROBLEMS

The Coastal Command is an exact parallel. It is essentially a Naval *Co-operation* Command equipped with shore-based aircraft. Its problems are completely different from those of the Fleet Air Arm operating from warships, and, although 90 per cent. of the flying time of its aircraft is spent over the sea, the Coastal Command remains an essential and integral part of the Royal Air Force as a united and independent Service.

Ever since the war began burdens as great as those endured by any other section of the R.A.F. have been borne by the Coastal Command under Sir Frederick Bowhill. In fact, in the early months of the war the Coastal aircraft put in more flying hours than all the other Commands of the R.A.F. put together. When, with the fall of France, still greater strain was placed on the maintenance of our sea routes because of near-by enemy bases, the Coastal Command excelled its previous efforts.

TWO-ELEMENT CRUISERS

Nevertheless, some reinforcement became an obvious necessity, and the Coastal Command was given squadrons of landplane bombers and fighters to add to its flying-boats and the general reconnaissance and torpedo-carrying landplanes it already possessed. These new squadrons, and essentially units of the R.A.F., add still more strength to the indivisible band between the main Service and its marine branch.

All the C.C. aeroplanes differ greatly from any operated by the Navy. Their work entails as close co-operation with the Navy as does the work of Army Co-operation with the Army. All are types which at any moment might be needed by the Air Staff for independent action to serve the general strategy of the Air Force. When such an occurrence arises, the Coastal Command must not be detached and set apart but must be available as an integral part of an Air Arm which grows daily in power and importance as a decisive instrument in modern warfare.

As new and still bigger flying-boats are evolved they will become light cruisers on their own. Yet they are cruisers which are as likely to have to operate over land as over water.

For instance, the new Consolidated Model 31 flying-boat reported to be ordered from America has a range of some 4,000 miles, carrying a heavy load of bombs, and cruising around 200 m.p.h. That is as formidable as any bomber yet flying. Its high performance is gained partly by a very heavy wing loading, demanding a long take-off, for which big uninterrupted stretches of water make the most convenient and economical aerodromes.

THE SOUNDEST POLICY

The Prime Minister has stated that the operational policy of the Command must be and is determined by the Admiralty in consultation with the Air Officer Commanding-in-Chief. The closest contact exists, and the relations between the two Services are excellent.

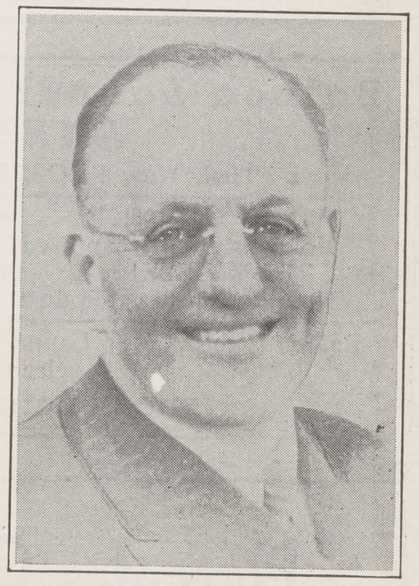
The co-operation is likely to be even closer in the future, when convoys may have dual protection by ship-borne aeroplanes of the Fleet Air Arm and land-based aeroplanes of the Coastal Command. The old ruling by which all aircraft which can be operated from ships belong to the F.A.A. and all other aircraft to the R.A.F. remains the soundest policy for efficient operation.

Big Party Honoring Consair This Friday Noon To Be Broadcast Over Station KGB

For the first time in Hi Hatters' history, the big party honoring Consolidated Aircraft Corp., upon its fourth birthday, this Friday noon in The San Diego Club, will be broadcast over Station KGB of the Don Lee-Mutual network.

The congratulatory messages of at least seven high officials and civic leaders will be put on the air over this radio station which serves an area of the southland containing an estimated 340,000 potential listeners.

CONSAIR LEADER



Maj. R. H. Fleet,

president of Consolidated Aircraft, to be honored at Fourth Anniversary party by fellow Hi Hatters this Friday in The San Diego Club.

Those invited to take part in the program are: Vice-Mayor H. E. Fish, Supr. LeRoy Richards, Don Hanson, president of the Chamber of Commerce; Emil Klicka, harbor commissioner and the man who did most to "sell' Consolidated on moving here; T. Claude Ryan, president of Ryan Aeronautical Co.; Edmund Price, president of Solar Aircraft Co., and Rear Adm. A. B. Cook, commander of the scouting force.

Edgar Gott, vice president of Consolidated and a well-known Hi Hatter, will be chairman. Honored guests will be C. A. Van Dusen, C. T. Leigh, I. M. Laddon and David G. Fleet, executives of Consolidated and Rear Adm. Joseph R. Defrees.

Sidney W. Fuller, manager of Station KGB, will announce and put the program on the air.

It was four years ago on Oct. 20 that Pres. Reuben H. Fleet of Consolidated attended the dedication of the new plant at Lindbergh Field. After years of negotiations and months of herculean efforts in moving the plant here from Buffalo, the thing had become a reality.

Since then—in fact, since Jan. 28, 1937—Consolidated flying boats have set 19 major records, mostly mass nonstop flights across the Pacific, or from the east coast by way of Coco Solo. Richard Archbold, the naturalist of the American Museum, pioneered in his recent exploration to New Guinea and Africa, negotiating country and waters never before spanned.

In those four years Consolidated planes

COMING EVENTS in The SAN DIEGO CLUB

WEDNESDAY, Oct. 18—

Twelve-Ten annual Fall-Winter Style Show and Fashion Parade, 12:10 p. m. Main Banquet Hall. Reservations must be made in advance. Price $1 per person. Supervised bridge follows program.

Joseph E. Dryer, luncheon, Heaven-on-Earth Room.

THURSDAY, Oct. 19—

Executives Association, breakfast meeting.

Lions Club, luncheon, 12 noon. Main Banquet Hall.

Junior Chamber of Commerce, dinner meeting.

Duplicate Contract Tournament, 8 p. m. Lounge.

FRIDAY, Oct. 20—

Naiads Swim Period, 10 a. m. Plunge.

Hi Hatters luncheon, 12:10 p. m. Main Banquet Hall. Gala Fourth Birthday program honoring officials of Consolidated Aircraft Corp.

Monte Carlo Nite, 8 p. m. Lounge.

SATURDAY, Oct. 21—

S. D. Bridge League annual Bridge-Dinner, 7 p. m.

Saturday Nite Club dance, 9:30 p. m. to 2 a. m. Sans Souci Grill. J. Warde Hutton and his music. No cover, no admission. For members and their accompanying guests.

MONDAY, Oct. 23—

Mermaids Swim Period, 11 a. m., Plunge.

Duplicate Contract Tournament, 8 p. m. Lounge.

TUESDAY, Oct. 24—

Kiwanis Club luncheon, 12 noon. Main Banquet Hall.

Phi Chi Fraternity, dinner meeting.

WEDNESDAY, Oct. 25—

Commonwealth Club, dinner meeting.

San Diego City Nurses Association, dinner.

THURSDAY, Oct. 26—

Executives Association, breakfast meeting.

Lions Club luncheon, 12 noon. Imperial Lounge.

Twelve-Ten luncheon, Main Banquet Hall. Ritza Freeman Reardon to discuss serious new books.

Duplicate Contract Tournament, 8 p. m. Lounge.

S. D. City Druggists, luncheon meeting.

FRIDAY, Oct. 27—

Hi Hatters luncheon, 12:10 p. m. Main Banquet Hall. Big Navy Day program featuring first showing of Russell Palmer's Spanish war films in sound and color, "Defenders of The Faith."

HI HATTERS IN BIRTHDAY HONOR TO CONSOLIDATED

A brilliant tribute to Consolidated Aircraft Corp. and its president, Maj. Reuben H. Fleet, was expressed by fellow Hi Hatters at their luncheon meeting in The San Diego Club last Friday noon. Though unable to be present because of government business calling him to Washington, D. C., Maj. Fleet messaged his regrets and thanks to The Club.

Civic leaders joined in congratulating the big aircraft corporation, maker of record-breaking seaplanes and now busy on a big contract for the Army.

The speakers' part of the meeting was broadcast for the first time in Hi Hatters' history, when KGB of the Mutual-Don Lee network picked up the program by remote control.

Those who joined in voicing eloquent praise for, and congratulations to, Consair, were: Donald Hanson, president of the Chamber of Commerce; Earl Prudden, vice president of Ryan Aeronautics Co.; Edmund Price, president of Solar Aircraft Co.; Herbert L. Fish, vice mayor of the city, representing Mayor Benbough, and Emil Klicka, harbor board member and the man credited with doing most to "sell" Consair on making the move to San Diego from Buffalo, N. Y.

Mr. Klicka, also vice president of Bank of America and Life Member of The San Diego Club, recalled the anxious days four years ago when, after many negotiations, the decision to move to San Diego was made by Maj. Fleet.

Able chairman indeed was Edgar N. Gott, vice president of Consair. He introduced the guests of honor who were:

Rear Adm. Joseph R. Defrees, commandant of 11th Naval Dist., who joined in congratulating Consair; his aide, Lt. Comdr. F. W. Benson; Maj. Edwin R. McReynolds, USA, resident inspector at the aircraft plant for the Army Air corps; and these Consair officials: C. A. Van Dusen, vice pres. and manager; C. T. Leigh, vice president; I. M. Laddon, vice president in charge of engineering; William Shanahan, treasurer, and R. A. Stanberry, secretary.

Pres. Horace E. Rhoads presided. Maj. Harry R. Springer, USA (ret) as philosopher, quoted:

"The fly in the air, not in the proverbial ointment, is what has made San Diego famous."

Wednesday Class Is Popular In S. D. Club

Popularity of the exercise and volleyball session on Wednesday and Friday mornings for women members of The San Diego Club is on the increase. The girls also are greatly improving their volleyball games, contributing much to their pleasure of these sessions.

Last Friday these women participated: Mmes. J. H. Lewis, Paul Hornaday, Carl Zaun, Clayton Dible, C. R. Rockwell, H. J. Fulkerson, L. B. Becker, Howard Wessling, C. A. Barnes, Ferdinand T. Fletcher, Myron Insko, Joseph Wagner, James H. Conyne, C. B. Carroll, H. A. Mathias and Miss Elizabeth Kelley.

Squash Tourney Is Under Way In Club

The new squash tournament is under way now in The San Diego Club, but last week found only one recorded match played. That was one in which G. B. Parkinson defeated Herb Sponholz in five straight games.

Dr. Ray Lounsberry, commissioner of the sport, urges all players to play their matches as rapidly as possible.

Consair Plans Plant Increase Of 75 Percent

Consolidated Aircraft Corp.'s plans to increase production facilities "by approximately 75 percent" were disclosed yesterday when the municipal board of examiners and appeals recommended to the city council that building code provisions be amended to permit construction of a 3-story steel-frame, metal-lathed building.

The concern recently obtained a long-term lease on 17 additional acres of tidelands adjacent to its present holdings, and if the new building is constructed, said Edgar Gott, vice president, it will be put up on part of that site. He declined to reveal what the proposed improvement will cost.

OFFICES PLANNED

Coincidentally, William A. Maloney, plant engineer, disclosed in the company's application that it is the firm's ultimate desire to "erect an administration building of suitable size and area in a central location, on property we now lease on the east side of Pacific highway across the street from our present factory site."

The building contemplated in the present application would be 60 by 180 feet and temporarily would be used for office space "but later to be converted to light manufacturing usage."

PREPAREDNESS AID

Gott said the company "plans to do nothing until we know whether the U. S. government wants us to carry on additional work." He added that Consolidated wants "to be ready if the government gives us more business." The contemplated expansion program, it was explained in the application, is "in anticipation of a national emergency" and in line with the corporation's "desire to aid our country in the forthcoming preparedness campaign."

The building would have an exterior stucco finish, would be plastered within and would have wood floors of slow-burning construction on steel beams and girders. The amendment is necessary, said Oscar Knecht, chief city building inspector, because present code provisions permit construction of such a building only to a height of two stories.

ARMY FLIERS FERRY HEAVY LOAD ON 'RUSH ORDER'

Planning the discharge of 3200 pounds of aerial horses from a sky freighter are (left to right) Lt. Glenn Holland, Maj. E. R. McReynolds, W. G. Chamberlain, Edgar Gott and Lt. Thomas J. Schofield. Boxed engine parts can be seen in the plane.

SKY FREIGHTER BRINGS PLANE ENGINES TO S. D.

★ ★ ★ ★ ★ ★ ★ ★ ★

Power Plant for New Consair Bomber Comes by Fast Air Route

Thirty-two hundred pounds of air power, packed in two engines of the latest type, arrived by air from Hartford, Conn., yesterday to speed one phase of America's armament program by 11 days.

Immediately after they arrived aboard an army aerial freighter they were placed in the nacelles of a new bomber Consolidated Aircraft Corp. is building for the army. Construction of the bomber had reached a point where the engines were necessary to expedite operations, and the army air transport service rushed them through.

Although the new bomber is a four-motored craft, only two engines were immediately necessary. The other two are to be sent out by air within a few days.

Military secrecy surrounds specifications of the new engines, but they are said to develop in the neighborhood of 2000 horsepower each. Similar secrecy clothes the new bomber.

The transport plane which brought the engines left Hartford Wednesday and made overnight stops at Pittsburgh and Oklahoma City. It was piloted by Lt. Thomas J. Schofield, with Lt. Glenn Holland as co-pilot. Both are attached to the 10th transport group and are stationed at Middletown, Pa. It is nothing new to them to haul engines around the country in their specially designed aerial freighter, but it was a novelty to have the engines for a new bomber come into San Diego by the sky route.

On arrival the engines were inspected by Maj. E. R. McReynolds, army air corps inspector in this area; Edgar Gott, Consolidated executive, and W. G. Chamberlain, factory represenative of the engine company.

NEW CONSAIR ORDERS LOOM

Congress Expected To Give Army Huge Sum

Sun Oct. 24-39

By HAROLD KEEN
Aviation Editor

For many weeks there has been an atmosphere of expectancy in aviation circles regarding Consolidated Aircraft Corp. Big things—meaning large contracts—were said to be in the offing.

Reports now coming out of Washington seen to justify this feeling. The Administration, according to the United Press, may ask Congress early in its next regular session to appropriate about $100,000,000 for 500 so-called "air dreadnaughts" to supplement the fleet of 5500 planes due for completion July 1, 1941, in a $300,000,000 aviation expansion program.

The description of these "dreadnaughts" could very easily be applied to the phenomenal four-motored Army bombers under construction in the San Diego plant.

SPECIFICATIONS LISTED

According to informed quarters in Washington, this type of lethal dispenser would boast superior performance to the present 12-ton flying fortresses, although they would be little, if any, larger. Improved motor designing would lower fuel consumption, increasing cruising range, it was reported. Special wing design would add to speed and operating range.

The Boeing flying fortress can travel faster than 265 miles per hour at cruising speed and have a range with full "death pay load" of 2000 miles.

The Consolidated bomber has been unofficially reported capable of a speed in excess of 300 miles per hour, and an almost unbelievable range. The wing is believed to be similar to the "Davis perfect wing" on the Consolidated Model 31, the twin-engined seaplane with 2000 horsepower engines that is the fastest airboat in this, and probably any other, country.

CONSOLIDATED MUM

Consolidated will not disclose the exact number of these Army bombers it is building at a total cost of more than $11,000,000. The per unit cost, of course, is much higher on such a relatively limited order. Washington authorities estimate that the bombers in huge quantities would cost about $200,000 apiece, the approximate charge made for the two-motored Navy PBY patrol bombers, of which more than 200 were produced.

Should the $100,000,000 project be approved, in whole or in part, Consolidated is certain to receive a large bulk of the work, and it is safe to say that Maj. Reuben H. Fleet, president of the concern now in the nation's capital, is not sparing any effort to emphasize to the War Department his company's ability to produce in large numbers.

THE Man UNDER THE Hood

Popular Aviation Aug 39

FRANCE has admittedly purchased some 40 flying boats in this country . . . but **French** officials in this country have, to date, refused to name the company from which they purchased them . . . but a little off-the-cuff mathematics by those in the industry who should know seems to indicate clearly that **Consolidated Aircraft** at San Diego has just come into a most welcome windfall . . . it's no secret, of course, that **Consolidated's** PBY patrol boat so popular with the U. S. Navy has been offered—in an export version—to any person or country interested . . . even **Britain** has purchased one "for tests" . . . other PBY-model owners besides the Navy are **American Export Airlines** and Richard Archbold, the wealthy young explorer. . . .

COASTAL COMMAND CONTROVERSY

Arguments Which Ignore Operational Needs

By the "SUNDAY TIMES" AIR CORRESPONDENT

Controversy has arisen again over a partition of the Royal Air Force. Forceful suggestions have been made that the administrative as well as the operational control of the Coastal Command should be taken from the R.A.F. and handed over to the Royal Navy.

The agitation, presumably resurrected by the present menace to our sea communications by enemy aeroplanes, was evoked not from inside the two Services, which are in perfect accord, but by people not concerned with operational affairs.

The subject is analogous to that of the separation of the Army Co-operation Squadrons from the R.A.F., now happily solved to the complete satisfaction of all parties—except the enemy—by the formation of the Army Co-operation Command of the Royal Air Force, designed to act with but not under the Army.

DIFFERENT PROBLEMS

The Coastal Command is an exact parallel. It is essentially a Naval *Co-operation* Command equipped with shore-based aircraft. Its problems are completely different from those of the Fleet Air Arm operating from warships, and, although 90 per cent. of the flying time of its aircraft is spent over the sea, the Coastal Command remains an essential and integral part of the Royal Air Force as a united and independent Service.

Ever since the war began burdens as great as those endured by any other section of the R.A.F. have been borne by the Coastal Command under Sir Frederick Bowhill. In fact, in the early months of the war the Coastal aircraft put in more flying hours than all the other Commands of the R.A.F. put together. When, with the fall of France, still greater strain was placed on the maintenance of our sea routes because of near-by enemy bases, the Coastal Command excelled its previous efforts.

TWO-ELEMENT CRUISERS

Nevertheless, some reinforcement became an obvious necessity, and the Coastal Command was given squadrons of landplane bombers and fighters to add to its flying-boats and the general reconnaissance and torpedo-carrying landplanes it already possessed. These new squadrons, and essentially units of the R.A.F., add still more strength to the indivisible band between the main Service and its marine branch.

All the C.C. aeroplanes differ greatly from any operated by the Navy. Their work entails as close co-operation with the Navy as does the work of Army Co-operation with the Army. All are types which at any moment might be needed by the Air Staff for independent action to serve the general strategy of the Air Force. When such an occurrence arises, the Coastal Command must not be detached and set apart but must be available as an integral part of an Air Arm which grows daily in power and importance as a decisive instrument in modern warfare.

As new and still bigger flying-boats are evolved they will become light cruisers on their own. Yet they are cruisers which are as likely to have to operate over land as over water.

For instance, the new Consolidated Model 31 flying-boat reported to be ordered from America has a range of some 4,000 miles, carrying a heavy load of bombs, and cruising around 200 m.p.h. That is as formidable as any bomber yet flying. Its high performance is gained partly by a very heavy wing loading, demanding a long take-off, for which big uninterrupted stretches of water make the most convenient and economical aerodromes.

THE SOUNDEST POLICY

The Prime Minister has stated that the operational policy of the Command must be and is determined by the Admiralty in consultation with the Air Officer Commanding-in-Chief. The closest contact exists, and the relations between the two Services are excellent.

The co-operation is likely to be even closer in the future, when convoys may have dual protection by ship-borne aeroplanes of the Fleet Air Arm and land-based aeroplanes of the Coastal Command. The old ruling by which all aircraft which can be operated from ships belong to the F.A.A. and all other aircraft to the R.A.F. remains the soundest policy for efficient operation.

Consair Program

(Continued from Page 3)

have made the fastest flying boat time to Hawaii, have spanned the U. S. nonstop—proving the usefulness of seaplanes for transcontinental service—and one PBY flew 19,000 miles in arctic wastes, through all kinds of weather, searching for lost Russian fliers.

Every one of those mass flights, each involving a dozen or more planes—and one consisting of 48 planes—was made without fatality or loss to equipment. Never before has any aircraft builder made such a far-flung record of achievement in so short a space of time.

No other aircraft builder has been contracted to make so many flying boats for the Navy in a space of four years—the total being well over 209. And not content with this gigantic record, Consolidated has forged ahead in the experimental field.

The experimental four-motored "flying battleship," built for the Navy, proved successful, and is now the first permanent flagship plying not the seas, but over them, in the air. It is the flagship now of the commander of the scouting force.

Last and certainly not least, Consolidated, quietly and for its own account, designed a revolutionary new craft which carries the largest payload ever weighted onto a two-motored flying boat. It is the so-called "Model 31," with its slender but 15 percent more efficient wing, and 2,000-HP engines which throw 16-foot three-bladed propellers.

Aztec Alumni Group Is Seeking Names Of Former Students

Getting under way with the opening of fall semester, the San Diego State College Alumni association, under the energetic leadership of its new president, Mrs. Lester Earnest, is launching a campaign to bring in all local former students of the college.

J. K. Stickney, Jr., past president of the association, in assisting Mrs. Earnest and the new board to accomplish its objectives, has asked all fellow members of the San Diego Club who attended State to notify him or the association, or communicate with Dr. George Dodson, professor at State.

The program of the association this year will be very interesting. A homecoming luncheon is set for this month on the campus, a dance in November, a World Affairs conference in January, a reading of a late stage success in February, and the annual Founders' Day Dinner in June.

Billiard Tournament Entries Being Taken Now by Pikelhaupt

All billiard addicts are urged to get their entries in for the big handicap straight-rail tournament to be held in The San Diego Club billiard room, starting Nov. 1. Ben Seymour, commissioner of the sport, asks all players to file their entries with John Pikelhaupt, manager of the billiard department.

Ordinarily closed at that time, the billiard department will remain open for play on rainy Sunday afternoons during the winter, from 12 noon to 5 a. m. This will be done because of popular demand.

San Diego Jottings

By Wm. A. Dennis

Hubert Martin has returned from a three-weeks business trip up to Seattle, Spokane, San Francisco and way points. He is now back to carry on at Lions Club and other activities.

Mrs. Martin, by the way, and Mrs. Fred A. Rhodes have both just been elected by unanimous vote to the board of directors of San Diego Community Theater. Unanimous election to the board is a rarity, and an unusual honor accorded these two prominent ladies.

Mr. and Mrs. John R. Blackett, ardent dog-lovers, were in Hollywood over the week-end to take in the specialty bulldog show there. Two bulldog clubs up there elected her as steward for the show.

Also up in Los Angeles over the week-end, but for other reasons, were such as Ken Flood, W. Foster Jones, and our very own Bert Lembeck. They went up to the U.S.C.-Illinois game to find out who's doing what to who and who's paying for it.

Bill Van Dusen, the smiling genial Chamber of Commerce executive, returned from his vacation last Monday to find himself shouldered with a new honor, that of being on the resolutions committee of the Air Reserves Association. He flew his vacation back to New York, and around.

Mrs. Clayton Dible, after a summer absence, has returned to full activity in the women's athletic department of The San Diego Club.

And new women participating last week were Mrs. Anita Aldrich and Mrs. Howard O. Wessling.

Albert Dryer, having thoroughly baked himself on the sunporch for the past couple of weeks, now feels fit to go in for some gym activity.

Frank G. Forward had to go up to San Francisco last Thursday in a rush on important highway business directly affecting San Diego County. He also was to go to the State Highway offices at Sacramento, before returning here sometime this week.

Lara P. Good, manager of Prudential Life Insur. Co. here, was host to a group of friends at the new office headquarters in the First National Building, last Friday. The occasion was the sixth office expansion in the past 16 years of steady growth of this agency.

A Quick Dip, and You're Feeling In Top Shape, in Club!

Many members like to come down at their noon hour to The San Diego Club plunge and take a quick dip. It restores vitality, calms frayed nerves, and gives you that glowing tingle all over!

Futhermore, it doesn't take more than 20 minutes—and you're dressed, freshened, reinvigorated, and off again inside 30 or 40 minutes.

HI HATTERS IN BIRTHDAY HONOR TO CONSOLIDATED

A brilliant tribute to Consolidated Aircraft Corp. and its president, Maj. Reuben H. Fleet, was expressed by fellow Hi Hatters at their luncheon meeting in The San Diego Club last Friday noon. Though unable to be present because of government business calling him to Washington, D. C., Maj. Fleet messaged his regrets and thanks to The Club.

Civic leaders joined in congratulating the big aircraft corporation, maker of record-breaking seaplanes and now busy on a big contract for the Army.

The speakers' part of the meeting was broadcast for the first time in Hi Hatters' history, when KGB of the Mutual-Don Lee network picked up the program by remote control.

Those who joined in voicing eloquent praise for, and congratulations to, Consair, were: Donald Hanson, president of the Chamber of Commerce; Earl Prudden, vice president of Ryan Aeronautics Co.; Edmund Price, president of Solar Aircraft Co.; Herbert L. Fish, vice mayor of the city, representing Mayor Benbough, and Emil Klicka, harbor board member and the man credited with doing most to "sell" Consair on making the move to San Diego from Buffalo, N. Y.

Mr. Klicka, also vice president of Bank of America and Life Member of The San Diego Club, recalled the anxious days four years ago when, after many negotiations, the decision to move to San Diego was made by Maj. Fleet.

Able chairman indeed was Edgar N. Gott, vice president of Consair. He introduced the guests of honor who were:

Rear Adm. Joseph R. Defrees, commandant of 11th Naval Dist., who joined in congratulating Consair; his aide, Lt. Comdr. F. W. Benson; Maj. Edwin R. McReynolds, USA, resident inspector at the aircraft plant for the Army Air corps; and these Consair officials: C. A. Van Dusen, vice pres. and manager; C. T. Leigh, vice president; I. M. Laddon, vice president in charge of engineering; William Shanahan, treasurer, and R. A. Stanberry, secretary.

Pres. Horace E. Rhoads presided. Maj. Harry R. Springer, USA (ret) as philosopher, quoted:

"The fly in the air, not in the proverbial ointment, is what has made San Diego famous."

Wednesday Class Is Popular In S. D. Club

Popularity of the exercise and volleyball session on Wednesday and Friday mornings for women members of The San Diego Club is on the increase. The girls also are greatly improving their volleyball games, contributing much to their pleasure of these sessions.

Last Friday these women participated: Mmes. J. H. Lewis, Paul Hornaday, Carl Zaun, Clayton Dible, C. R. Rockwell, H. J. Fulkerson, L. B. Becker, Howard Wessling, C. A. Barnes, Ferdinand T. Fletcher, Myron Insko, Joseph Wagner, James H. Conyne, C. B. Carroll, H. A. Mathias and Miss Elizabeth Kelley.

Squash Tourney Is Under Way In Club

The new squash tournament is under way now in The San Diego Club, but last week found only one recorded match played. That was one in which G. B. Parkinson defeated Herb Sponholz in five straight games.

Dr. Ray Lounsberry, commissioner of the sport, urges all players to play their matches as rapidly as possible.

THE SDC

Coast Leads Nation in Aircraft Production; War Spurs Activity

ADVANCES GREAT IN LAST DECADE

Output of Los Angeles Plants in 1939 Near $75,000,000; New Records Set

By Louis F. Holtzman

Aviation in all its phases, from early pioneer and development work, establishment of national and international flying records down to the present large productive facilities, over the past three decades has played an important role in the history of the Pacific Coast, particularly in Southern California. Today, with our country engaged in a huge military expansion program in the air and with foreign countries unable adequately to supply their own needs, the Pacific Coast is the area destined to fill by far the major part of the demand.

Many favorable conditions, climatic and otherwise, coupled with the early start aviation received on the Pacific Coast a few short years after the Wright brothers showed that man could fly, are responsible for the progress attained here. Many names now at the top in aviation are those of youngsters and pioneers who received their early training in western territory. Somehow, the majority of those responsible for progress in aviation drifted to the Pacific Coast at one time or other. Many stayed and established their own plants. Many others are now executives of the large eastern units.

The history of aviation on the Pacific Coast may be said to date back to 1910, a few years after the Wright brothers' successful experiments at Kitty Hawk. Then a group of hardy souls gathered to put on a show and held the first air meet in California at the Dominguez field, a few miles distant from Los Angeles.

First Field a Pasture

The Dominguez "field" was a handy vacant pasture rolled into a semblance of smoothness, its chief attraction freedom from overhead obstructions. Progress in aviation thereafter was consistent. Throughout the following years California was a mecca of aviation. In 1913, Glenn L. Martin at Los Angeles was tinkering with what might be termed motored box kites.

Today the Coast aviation industry centers in the Los Angeles area where are housed the large plants of Douglas Aircraft Co., Lockheed Aircraft Corp., North American Aviation, Inc., the Vultee division of Aviation Manufacturing Corp. and Vega Airplane Co., subsidiary of Lockheed. Scores of smaller plants providing parts, accessories and other materials going into the manufacture of planes are dotted throughout the area and with the exception of a supply of engines, the Coast is self-sufficient.

Los Angeles is flanked on the north by the Boeing Aircraft Co. plant in Seattle and toward the south by Consolidated Aircraft Co. of San Diego where are also several important accessory manufacturers, including Ryan Aeronautical Co. and Solar Aircraft Co.

Today the War Department is dependent upon Pacific Coast manufacturing facilities to supply the greater part of its rearmament program. Of a total of $98,191,484 Army awards for aircraft made last August, Pacific Coast plants received approximately two-thirds. In addition, $4,700,000 of Navy business was allotted to a Pacific Coast unit.

L. A. Firms' Backlog Now $110,000,000

In terms of backlog, the figure is staggering. Close to $110,000,000 of unfinished business is now on the books of those units centering at Los Angeles, augmented by $40,000,000 or more of business held by the plants at Seattle and San Diego.

The Los Angeles area alone this year will turn out $75,000,000 of planes—and probably more—against $53,000,000 last year. And there is apparently plenty of work ahead. In this connection, plant capacity is being expanded and output already can be stepped up. Output in 1937 was valued at $27,000,000, compared with $16,000,000 in 1936, when aviation manufacturing on a large scale first started in a really serious manner.

Glenn L. Martin came to the conclusion more than 25 years ago that there was something to this flying business. Back in 1913 he started tinkering with his box kites. His plant was located at 943 South Angeles Street in the heart of Los Angeles. Deciding that he should enlarge his activity in the field of aerodynamic engineering, he wrote to the Massachusetts Institute of Technology asking that it send along a bright young man. This was in 1915, and the institute promptly sent Donald W. Douglas. Douglas was not entirely new to aviation, as he had been assistant to Commander J. C. Hunsaker, naval constructor back East who built the world's first wind tunnel.

At Seattle, William E. Boeing, having damaged his seaplane on Union Lake one lazy summer afternoon in 1916, decided to build a new one, with the thought that Seattle was as good a place as any for such an undertaking. Captain J. C. Westervelt, Navy construction corps officer at Bremerton, aided him.

Others Prominent

Other men who started on the Coast who later became prominently identified with aviation include Lawrence Bell, of Bell Aircraft of Buffalo; Charles Van Dusen, now vice president of Consolidated Aircraft; T. C. McMahon, official of Douglas Aircraft Co., and Harry Wetzel of Douglas who died a year ago.

James H. Kindelberger, president of North American Aviation, two decades back was a busy young man working with Glenn L. Martin at Los Angeles. He was a draughtsman under Don Douglas, who was then chief of that department.

Twenty-one years ago, on May 18, 1918, the first official air mail service in this country was started at Washington. The plane, headed for Philadelphia, 20 minutes after taking off had grounded. The pilot had lost his course and in landing nosed over, breaking the propeller. R. H. Fleet, then a major in the United States Army Air Corps and now president of Consolidated Aircraft, was the man in charge of the first air mail route projected from Washington, D. C., to New York.

San Diego on the south was voicing its claims about this time, and several pioneers including Major Fleet were attracted to this area. As far back as January, 1911, Glenn Curtiss operated the first seaplane on record and used San Diego Bay as his base. In 1923, Consolidated Aircraft Corp. went into business at San Diego and its first product was a primary training plane.

Along about 1916 a young man was beginning to achieve considerable prominence in the aviation field. He was John K. Northrop, now president of Northrop Aviation, Inc. At that time he was working for Loughhead Brothers (Lockheed), whose pioneer plant was located at Santa Barbara. This was the remote but direct ancestor of the present Lockheed Aircraft Corp. at Burbank. The present Northrop organization formed early this year is erecting a plant for the production of planes at Hawthorne, near Los Angeles. While no orders have been revealed as yet, it is indicated that some business is in sight and that the plant will be producing probably by the first of the coming year.

While from its start some 30 years ago, the record of the aviation industry on the Pacific Coast has been one of achievement in improving its product, the same cannot be said of the industry from the practical businessman's view. The industry at most times in the past was inadequately financed, and it has only been in very recent years that some semblance of earning power was shown. Aviation in a big way, with some measure of profit for Pacific Coast owners, may be said to date only from two or three years ago.

Generally, the airplane industry on the Pacific Coast ten years ago was still in a bad way financially. Douglas Aircraft Co., Inc., by then had already achieved considerable success and was going ahead steadily with military business. The United States Army was and has been one of Douglas' best customers. A number of smaller units were struggling valiantly but with inadequate financing, including such units as Bach Aircraft, Thunderbird, Kreutzer, Moreland and Emsco, none of which achieved any financial success from operations in the field of aviation. Including the Lockheed predecessor, they either quit or sold out.

Lockheed Revamped

Ten years ago Lockheed was finding the struggle for existence a difficult one. As a result of reorganization proceedings, Lockheed became a subsidiary of Detroit Aircraft Co. and this unit, together with Lockheed, finally wound up in receivership proceedings.

A young man, Robert E. Gross, and a small group of associates with a few thousand dollars purchased the Lockheed plant and nursed the company along until this year it will have a gross of some $30,000,000. Its current pay roll includes over 7,000 employes. Actually, Gross and his associates were able to buy the principal assets of Lockheed for $40,000. He is now president of the company and most of his original associates are still with the organization.

The present Lockheed company was organized in June, 1932, but the first of its all-metal ships did not fly until February, 1934. Its planes now fly on 29 commercial air routes scattered all over the world.

Lockheed received the largest military order on record in 1938 totaling upwards of $30,000,000 from the British and Australian governments. While the company got off to a late start and only really got into production on this order last March, it seems certain that the military jobs will all be completed ahead of schedule and before the end of this year. Backlog is now about $30,000,000.

Douglas Aircraft Co., Inc., has shown a consistent record of earnings over the past decade and has an enviable reputation both in construction of military jobs and commercial models. Douglas' backlog now at $50,000,000 is larger than that of any other Pacific Coast unit and is probably exceeded by that of only one other company in this country, that of Glenn L. Martin Co. Douglas' first success was with military models for the United States Army. Today with two plants—those at Santa Monica and El Segundo—the company has facilities with an area of 1,400,000 square feet.

Douglas Transports Widely Used

Douglas' products are now standard equipment on the major airlines in this country and on the Royal Dutch Airlines (KLM) which operates 32 of the company's models. The original DC-1 model of a decade past was later expanded into the DC-2 which carries 14 passengers. Later this model was expanded to make the DC-3 model with 21-passenger carrying capacity and sleeping accommodations in some planes. The DC-3 has become practically standard airline equipment in this country. The 42-passenger DC-4 model constructed at a cost of upwards of $2,000,000 was apparently too far ahead of the needs of airlines and some months ago was sold to Japanese interests. This does not mean that if there was a call for the larger model, that it could not be supplied as Douglas retains its rights.

Donald W. Douglas, president of the company which bears his name, was born in 1892. He left a promising career in the United States Navy to study at the Massachusetts Institute of Technology. In 1915, only a short time after his graduation, he designed his first ship for Glenn L. Martin, the "Martin R." Douglas left the Martin organization in 1920 to start in business in partnership with David Davis, prominent sportsman. The office was in back of a Los Angeles barbershop. The new Davis, Douglas Co. started in auspiciously with an order for one plane and the first model, the "Cloudster," was born.

With its backlog now at $50,000,000, Douglas Aircraft officials have just announced that they will take on 2,500 additional men at the rate of 400 weekly until the total number of employes reaches 12,000. The company aside from military business is concentrating on two commercial models, the DC-3 and the DC-5. The company originally estimated an ultimate demand for perhaps 50 of the DC-3s. Recently the 350th of this series was delivered, and the company before the end of this year will probably turn out close to its 400th of this model.

North American Aviation, Inc., plays an important role in aviation in Southern California. The history of this organization dates back to 1927, the Fokker Aircraft Corp. in Passaic, N. J., being the original predecessor. The planes built at this plant played an important part in the history of aviation. Commander Byrd of the United States Navy flew one of these ships across the North Pole. Later, Sir Charles Kingsford-Smith made his flight from Australia to the United States in one of these planes.

In 1930, Anthony Fokker sold his interest in the American unit to the General Motors Corp. The name of the company was changed to General Aviation Corp., and the addition of new buildings and equipment to its plant began.

In 1931 General Aviation Corp. purchased the assets of the Pittsburgh Metal Airplane Co. which was renamed the Metalair Corp. Engineering and production work then centered at Dundalk, Md. In April, 1933, General Aviation Corp. exchanged a sizable block of its stock for that of North American Aviation, Inc., then a holding unit. The company began to manufacture planes under the North American name, the name it carries today. The Berliner-Joyce Aircraft Corp. was also acquired in 1933 and merged with the parent unit. General Motors Corp. still retains a modest stock interest in the company.

North American Aviation, Inc., now has a backlog of some $27,000,000, chiefly in United States and French military business. From 144,000 square feet of space in 1936, the plant has been more than doubled and work is now under way to double the plant area again and bring the figure to 700,000 square feet.

Boeing's Development

The year 1916 witnessed the genesis of Boeing Aircraft at Seattle. It now employes 5,000 men, works three shifts daily and has a backlog estimated in the neighborhood of $20,000,000.

Boeing's active interest in aviation had started in 1915 when he went to Santa Ana, Calif., to learn flying from Glenn L. Martin. He had purchased one of the stick and wire planes Martin had built and had taken it back to Seattle with him.

The Pacific Aero Products Co. began operating in 1916. During the next year, having meanwhile acquired the old F. W. Heath shipyard at Seattle, the company changed tis name to Boeing Aircraft Co. and operations were started on a growing scale. The end of the World War made it plain that this country would need planes and more planes and Boeing started making aircraft for the Government.

The history of Boeing is replete with the development of better aircraft. As far back as 1935, Boeing produced the original Flying Fortress, a four engine land bomber.

The testing of the new 74-passenger model 314 clipper for Pan American Airways was completed last year. Six of these clippers delivered during the first half of 1939 are now in service on the Atlantic and Pacific oceans. The model 307 stratoliners have for the past several months been undergoing extensive flight tests which are still in progress. The Boeing B17-A Flying Fortress was delivered to the Army last January. The first of a new fleet of Flying Fortresses was delivered last July. An additional order for $8,000,000 was awarded last August in connection with the national rearmament campaign.

Vultee Started in 1932

Vultee Aircraft division of Aviation Manufacturing Corp. began its life in a hangar at Grand Central Air Terminal at Glendale. Gerard F. Vultee, aeronautical designer and engineer, started work on his first transport prototype on January 1, 1932. The corporate charter recorded the name of the organization as Aircraft Development Corp., which name it held until August, 1936, when it became the Vultee Aircraft division of Aviation Manufacturing Corp. R. W. Palmer, now Vultee's chief engineer, was affiliated during the early days. Palmer left the organization thereafter but returned after Mr. Vultee's untimely death in 1938, assuming the position he now holds.

The Vultee management was reorganized in 1938. During March of that year, R. W. Millar became a vice president of Aviation Manufacturing Corp. and general manager of the Vultee division. Mr. Millar had previously served as a director of Douglas Aircraft for ten years, five of which were spent on the executive committee.

Vultee's history in the succeeding years included an imposing list of records established by its planes. In August, 1936, the same month in which the organization became Vultee Aircraft, Sigismund Levenefsky, famed Russian flyer who was recently lost on a transpolar flight, chose a Vultee craft to carry him to Moscow by way of Alaska and the Bering Straits.

By 1935, Vultee was in the military field with an attack bomber. Amtorg Trading Corp., acting for the Russian government, purchased several attack bombers in 1936. Turkey bought 40 in 1937 and Brazil purchased 26. The United States Army Air Corps purchased 7 last June and gave a $3,000,000 order for planes last August as part of the Army rearmament plans, while Turkey has just ordered $300,000 of spare parts.

Vultee's present backlog is $3,600,000, of which above $3,000,000 is for planes for the Army Air Corps. Last March the organization exercised an option to purchase its plant at Downey, Calif., and has purchased ultra-modern high speed equipment. When the production peak is reached on the present United States Army order, between 2,000 and 2,500 men will be employed at the plant. A plant expansion program now under way will double the present capacity.

Vultee will shortly announce a new type attack bomber with an estimated speed of over 300 miles an hour, powered by a 1,600 hp. Wright Cyclone motor recently released for export.

Vega Airplane Co. whose plant is at Burbank is a subsidiary unit of Lockheed Aircraft Corp. The company has its own modern plant and is doing a substantial amount of parts work for the parent organization. In addition, it is preparing very shortly to offer its own plane, a six-place passenger job powered by a Unitwin engine manufactured by Menasco Manufacturing Co. The power unit represents a new departure in aircraft. It comprises two separate engines hitched to one propellor and has obvious advantages in the event of motor failure by one unit.

The new plane, designed for air transportation lines, on recent tests showed a speed of 200 miles an hour utilizing only 75% of its power. It is expected that production of the new Starliner will start within a few months.

TWIN-ENGINED CRAFT FAVORED

Navy Leans Toward Bi-Motored Planes

By MAJOR AL WILLIAMS

That the United States Navy is leaning toward twin-engined patrol planes for scouting and bombing is indicated in the current edition of the Army and Navy Journal. This comes after much flirting with huge, four-engined flying boats which many of us have held impractical and too easy to shoot down.

"The primary requisite of this type of plane (the flying boat)," the Journal reports, "is that they be extremely seaworthy and capable of operating alone for extended periods. In this connection, while the Navy is experimenting extensively with four-engined patrol planes, performance reports on the latest twin-engined planes have been so favorable that the Navy feels that in the event of emergency it could go along with the twin-engined planes and discard four-engined work for the time being."

Left-handed reason though it is, it may steer the Navy away from the big-size complexe toward mass production of planes that are better fitted for their work.

Two small bombers can be built for approximately the cost of one four-engined giant. The eggs are too much in one basket when a $420,000 four-engined bomber sets out on a war mission. One $30 anti-aircraft shell can destroy a plane of any size. By the same reasoning, no single anti-aircraft shell can destroy two airplanes.

The foreign air strategists have already settled this point to the satisfaction of good sense and logic. Their experimental programs are far ahead of ours.

Our naval air service has spent 20-odd years operating with twin-engined flying boats, and it appears to me that this is the time to get on with mass production of types of flying boats which our crews are trained to fly and our maintenance forces are geared to handle.

20 MILLION | Big Navy Job Due For Consolidated | CONTRACT

Ham and Eggs Clouds Consair Bid on Planes

Union 10-31-39

S. D. Figure Lowest On $20,000,000 Order From Navy

Bringing news that his company is low bidder on a huge order for navy bombers and parts which may run to $20,000,000, Maj. Reuben H. Fleet, president Consolidated Aircraft Corp., returned from Washington by air yesterday.

Huge expansion of plant facilities and increase in number of workmen would be necessary to fill the big order if it is awarded to Consolidated, Maj. Fleet said.

HAM-EGGS IS BID THREAT

But the shadow of ham and eggs hovers over the order and the stimulation it would give to local business. A proviso in Consolidated's bid is that the price would be increased $3000 on each $100,000 of the order in the event new state taxes are imposed. An alternative proposal would be for the government to assume any added state tax imposed after the bid was tendered.

No direct mention of the retirement warrants proposal to be voted on next Tuesday was made. but the figures given—$3000 on each $100,000—are the ones which would be paid under the 3 percent gross income tax which would be levied under ham and eggs.

DESIGNS INSPECTED

"Might not the addition of 3 percent to the bid make Consolidated's offer higher than the next lowest bid?" Consolidated officials were asked.

"There are some states that do not have such a tax in sight," was the reply of E. N. Gott, company vice president.

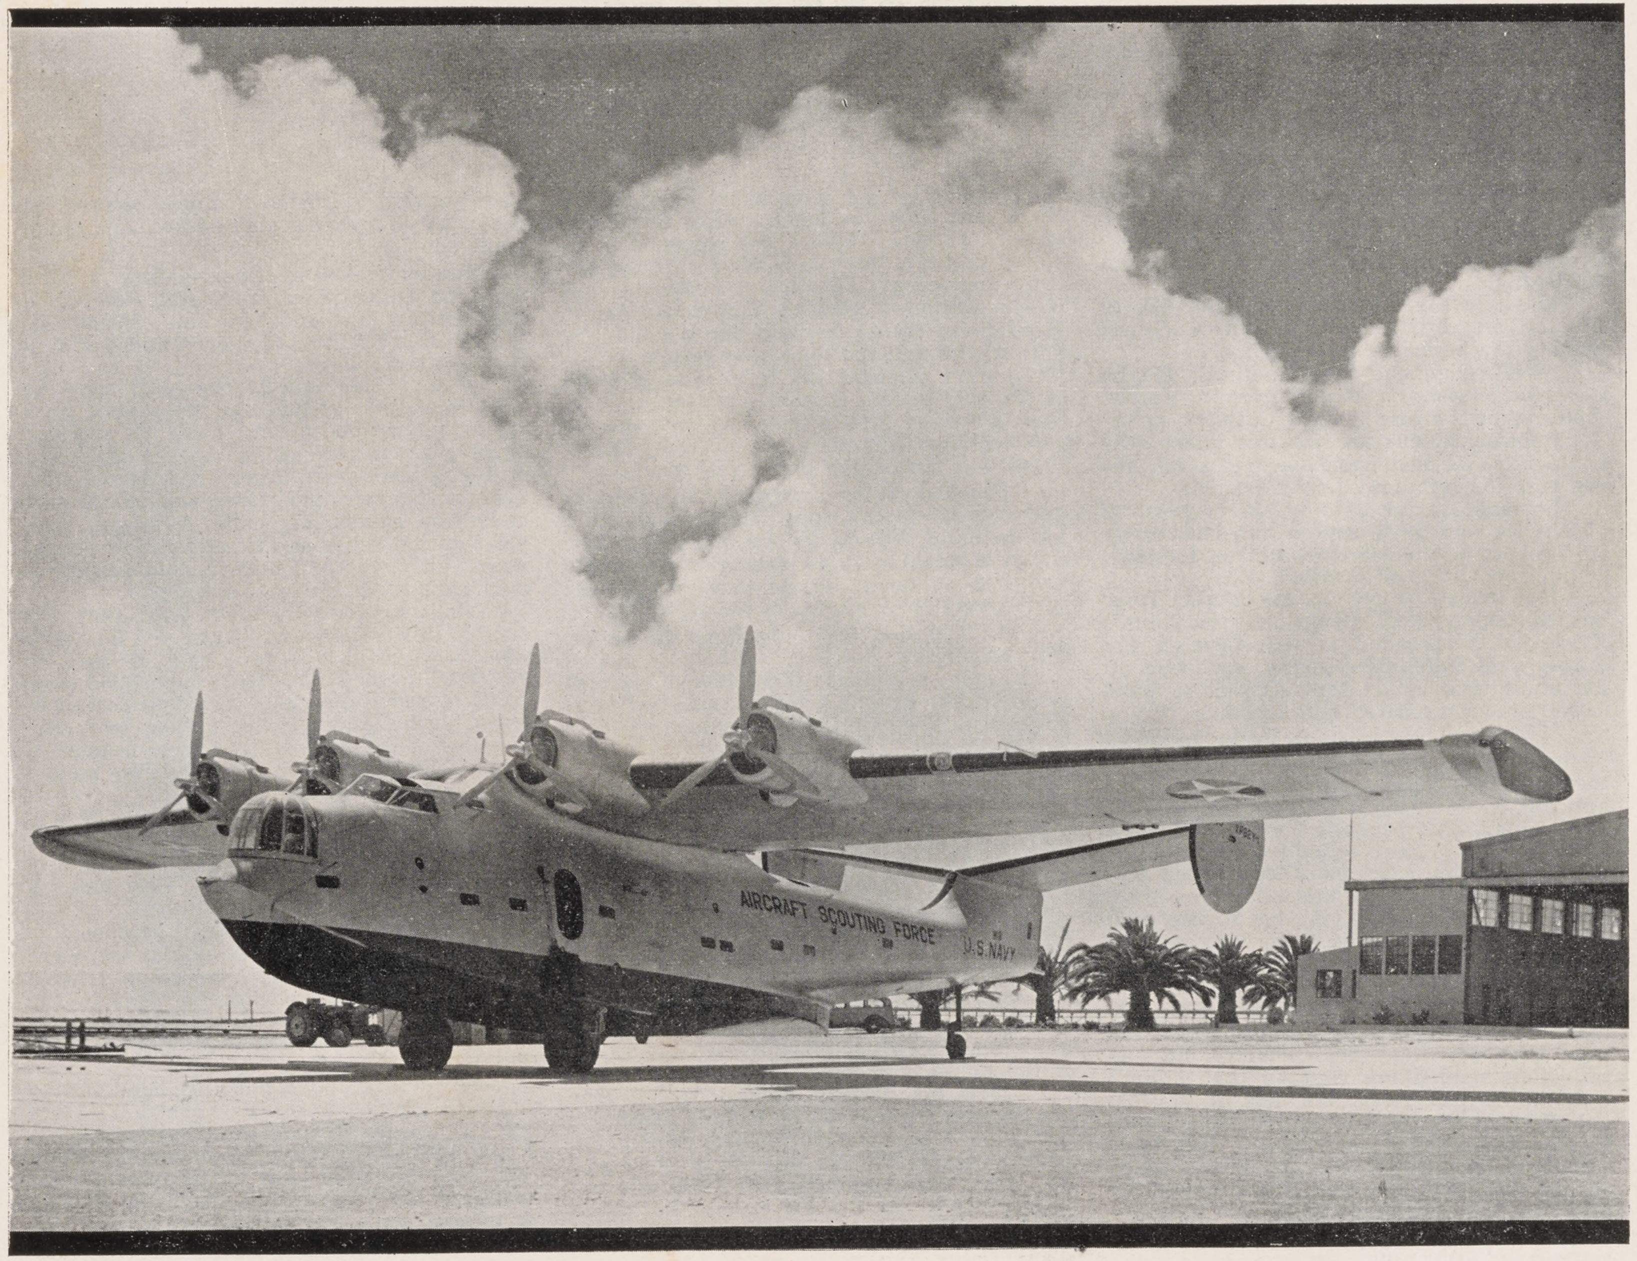
Maj. Fleet said he expected to know within a week or so if the contract would be awarded to Consolidated. Designs submitted with the bid are now being analyzed and navy officials appear favorably impressed, the Consolidated chief added.

EXPANSION PLANNED

Plant expansion needed to carry out the big contract if it is awarded would virtually double the present floor space of the factory. A building 700 by 400 would be required and it would go on land leased recently in anticipation of probable expansion needs. Bids for construction of the new building will not be called for until definite word is received from the navy on the contract.

Consolidated now is working on military orders totaling about $17,000,000 and employs about 2000 men.

"NAVY NEWS" NOVEMBER 1939



FIRST FLAGPLANE OF THE U. S. NAVY... THE XPB2Y-1

—Courtesy Consolidated Magazine

On August 24th, 1939 the Consolidated Aircraft Corporation four engined flying boat XPB2Y-1 became the first airplane to be officially recognized as a Flagplane of the United States Navy. On that date, Admiral A. B. Cook, commanding the Aircraft Squadron of the Aircraft Scouting Force, by dispatch, removed his flag from the USS Memphis at Seattle, and hoisted it aboard the XPB2Y-1. Thereby was established a precedent in Naval history. Never before had such a flag been officially hoisted on an airplane. The huge plane, by formal procedure, thus became the first Flagplane ever to fly for the U. S. Navy—a signal honor. It had been flown to Seattle by Navy personnel commanded by Commander Andrew Crinkley.

Commander Crinkley and his crew, in October of 1938, flew the XPB2Y-1, while still fitted with experimental apparatus and equipment, on a precedent setting flight completely across the United States. The XPB2Y-1 is a flying boat, yet the flight was made entirely over land, expressing confidence in the smooth functioning of the ship. The flight was non-stop from the waters of San Diego Bay, northward over spectacular mountain terrain via Salt Lake City and thence due east to Anacostia (Washington, D. C.). At this destination, the airplane was personally inspected by President Roosevelt. Flight time: 13 hours. Very cold weather, darkness over much of the route ,tailwinds and a closing in fog at Anacosita marked this outstanding transcontinental flight. The return to San Diego, a few days later, was likewise cross-continent, and non-stop. This time by a southern route and against headwinds of considerable magnitude which were met without difficulty.

The casual manner in which these flights were accomplished was expressed by Commander Crinkley soon after the ship's return: 'This flight was made in all respects in a routine operation manner and no special consideration or preparation was necessary in its accomplishment. Upon our return to San Diego the crew felt confident that the ship could have been refueled and departed for Honolulu or any other point immediately."

This double spanning of the continent may, in retrospect, be seen as a striking potentiality, together with the recent honor of becoming the first official Flagplane. Such a performance could easily have been one for transporting the commanding officers and members of their staff, with lightning speed, to positions thousands of miles away, even though the Naval destination might be separated by a whole continent. An official Flagplane thus appears to have in it latent usage of a very wide nature. The recent flight of the XPB2Y-1 to Seattle, for instance, coincided with the arival of Admiral A. B. Cook. The USS Memphis, on which he had arrived, then left immediately for Sitka, Alaska, while the use of the XPB2Y-1 allowed inspection time to be spent in Seattle while the Memphis was under way. The surface ship was passed enroute, and another inspection period was made possible at Sitka while the Memphis was closing up the distance.

As beaching gear had not been shipped in advance, or carried aboard, the Flagplane simply rode at anchor thus becoming a surface vessel, fully equipped as the Admiral's Headquarters. It was the first four engined plane to visit the harbor. Particularly excellent weather prevailed for the official Flagship's flights, and several of these, for observation purposes, were made to take full advantage of the opportunity afforded. One flight took the party over the Juneau, Cross Bay and Inland Passageway which allowed unsurpassed views of some five large glaciers in that region. With the disembarking of Admiral Cook for Kodiak with a patrol formation of Consolidated PBY airplanes, Commander Krinkley headed the huge plane back for San Diego, stopping enroute only at San Francisco. Elapsed time from Alaska to within ten miles of the Mexican Border was just 11 hours.

MAJOR FLEET RETURNS FROM WASHINGTON

Award Job In Week; New Building Planned If S. D. Firm Gets It

By HAROLD KEEN
Aviation Editor

Consolidated Aircraft Corp. was low bidder on an enormous amount of Navy bombers and the San Diego concern will learn possibly within a week whether it is to receive a contract that may run as high as $20,000,000, Maj. Reuben H. Fleet, president, disclosed today on his return from Washington, D. C.

Obviously elated over the results of his 10 days' period of negotiations with the Navy Department, Maj. Fleet, on disembarking from a plane at Lindbergh Field, declared his company would begin immediate construction of a new building to handle the greatly increased production, should the order be awarded.

"The Navy now is analyzing designs," he said, "and officials informed me that they will let us know within a week whether the contract will be let."

FAVORABLY IMPRESSED

It was indicated that the Navy is anxious to expand its force of long-range patrol planes during the existing state of limited national emergency as rapidly as possible.

"The contract may be for equipment valued at between 10 and 20 million dollars," Maj. Fleet said. Navy authorities apparently have been favorably impressed with the Consolidated entry.

It was learned unofficially that as many as 200 twin-engined patrol bombers of the famed PBY type, which has spanned virtually every major water body in the world on spectacular Navy mass flights and those of Richard Archbold's airboat Guba, may be ordered.

NEW DESIGN

Consolidated has manufactured approximately 225 of these ships in four separate contracts since moving to San Diego in 1935. The new design is believed to be an advancement on the most recent bomber, the PBY-4.

The proposed plant expansion will be to the north of the present structures, and will increase floor space by 92 per cent. The building will be 400 by 900 feet and will be situated on 17 acres of city tideland recently leased to the company by the City Council in anticipation of just such a large order.

PLANS COMPLETED

Specifications are said to be completed and only award of the contract is required before bids will be taken for the construction, an important project in itself.

The factory now has about 2000 employes working on a $17,000,000 backlog of orders for Army and Navy four-motored bombers.

Ham and Eggs Defeat Big Factor In Consair's Navy Plane Program

Tribune 10-31-39

Voicing optimism over the outlook for San Diego harbor improvement projects, involving $3,000,000 in WPA work, and for the expansion of plane-building activities at the Consolidated Aircraft Corp. plant as a result of Consolidated's being low bidder on a contract for navy bombing planes that is expected to approach $20,000,000, Port Director Joe Brennan and Maj. R. H. Fleet, Consolidated president, were back in San Diego today. The two returned yesterday from Washington, D. C., by airliner.

Consolidated officials are ready to erect an additional building, 700 by 400 feet, to take care of the work in the new navy order, said Fleet. He reported he expected to know within a week or so whether the contract would be awarded to Consolidated. Navy authorities at Washington now are studying designs submitted with the bid, and appear favorably impressed, Fleet declared.

The new Consolidated building will be erected on land recently leased at Lindbergh field in anticipation of the expected need for expansion. Bids will not be called for to construct the building until definite word is received from the navy on the contract, however, it was reported. The new structure would be situated immediately north of the present Consolidated factory.

Price Increase Provided

The outcome of California's "ham and egg" election next Tuesday will have a profound effect on the aviation business in this state, and a proviso in Consolidated's bid is that the price would be increased $3000 on each $100,000 of the anticipated order in event new state taxes are imposed. An alternative proposal would be for the government to assume any added state tax imposed after the bid was tendered. The $3000 on each $100,000 represents the addition that would be required under a 3 percent gross income tax which would be levied under ham and eggs.

Four major harbor improvement projects and several other smaller projects are involved in the $3,000,000 sought by Brennan for San Diego, of which approximately $1,700,000 would be contributed by the city and the remainder by the WPA. Brennan said he spent 10 days conferring with WPA officials in Washington and received assurances from them that favorable consideration would be given a new application for WPA funds to carry out nine projects here. The major projects are the Tenth ave. pier, $2,000,000; Ocean Beach fishing pier, $425,000; additional improvements at Lindbergh field, $225,000, and completion of the yacht harbor, $270,000.

BIG JOB HINGES ON 'HAM &' VOTE

Sun Oct. 31-'39

Consolidated Hints Possible Transfer

Result of the $30-Thursday pension issue in next Tuesday's special election probably will be awaited before the Navy Department acts on Consolidated Aircraft Corp.'s low bid for a Navy bomber contract which may total $20,000,000, it was indicated today.

The offer carries a proviso calling for a $3000 increase of the price for each $100,000 worth of business if there is a new state tax levy, Consair officials disclosed. This sum would cover the 3 per cent gross income tax which would be levied should the Ham and Eggs plan carry.

'OTHER STATES'

A cryptic statement by E. N. Gott, vice-president, to the effect that there are "plenty of other states where no such tax is contemplated" led to conjectures over whether Consolidated, to obtain the huge contract, would consider transferring its activities elsewhere.

Fate of San Diego county's future highway program and work now being performed—valued at $652,000—also hung in the balance, pending outcome of the Ham and Eggs vote.

JOBS JEOPARDIZED

Among projects which would be jeopardized by passage of the pension plan, according to information from the State Department of Public Works office in Los Angeles, were the following:

Grading and paving of 4.6 miles of road west of La Mesa overhead to El Cajon, $255,000; Lakeside bridge over San Diego river, $135,000; grading and paving 2.9 miles of the Coast highway from the border to one mile north of San Ysidro, $170,000; construction of non-skid surface on 7.2 miles of roadway from Las Flores underpass to San Onofre overhead, $15,000; grading and surfacing, one-half mile on Silver Strand highway, $30,000; and approaches to Lakeside bridge over San Diego river, $47,000.

The Federal government already has warned that the state's share of the cost of such work being performed with U. S. assistance would be unacceptable in ham and egg warrants. Contractors have declared they would be unable to meet material and labor bills under such a plan, and would be forced to abandon work.

ARCHBOLD PILOT IN S. D. TO CHECK GUBA

Sun 11-2-39

Russ Rogers, chief pilot of Richard Archbold's Consolidated airboat Guba, was in San Diego today to conduct flight tests on the recently overhauled globe-girdling craft, preparatory to a transcontinental jaunt to the East coast in the near future.

Mr. Rogers, who arrived yesterday from New York City, said that Mr. Archbold, wealthy scientist-aviator and research associate of the American Museum of Natural History, will come here next month to work on plans for a second expedition to Netherlands New Guinea in 1940. The Guba's owner has been in New York since last July, having remained there when the airboat continued to San Diego to complete its round the world trip.

39

Trib 11-3-39

Archbold Expected In S. D. Next Month

Richard Archbold, research associate of the American Museum of Natural History, is expected back in San Diego next month to complete preparations for another scientific flight to New Guinea. Archbold now is in New York. His plane, the Consolidated-built Guba is to be flown from here to New York by Russell Rogers, chief pilot for Archbold, who arrived here from the east yesterday to make several test flights in the plane. The Guba was flown from San Diego to New Guinea last year.

The liner, supposedly under threat of sinking, is in the right background. On right foreground is a United States Navy destroyer, with a second destroyer on the left. A Navy bomber completed the escort.

Iroquois Safe in Port Despite Threat

By a Staff Correspondent of The Christian Science Monitor

NEW YORK, Oct. 12—Despite warnings by Grand Admiral Erich Raeder, Chief of the German Admiralty, that it would be sunk in a manner similar to the Athenia, the steamship Iroquois, chartered by the United States Lines, was tied at its North River Pier today following its arrival here with 577 passengers last night. The Iroquois was convoyed from mid-Atlantic by two American destroyers—the 395 and the 387—to protect it from any underseas craft attack.

No submarines were sighted during the voyage, passengers and crew reported, and a thorough search of baggage and all parts of the vessel by the crew when reports of the warning were received disclosed no explosives.

Storm Was Heavy

Passengers and crew of the vessel, normally plying American coastal ports, did, however, report they had met with an extremely heavy storm, which shook the craft from bow to stern for hours.

When Capt. Edgar A. Chelton, Master of the Iroquois, received notice from Washington that Germany had warned his vessel would be sunk, he shielded passengers from this knowledge until t

Three S. D. Plane Firms To Benefit From Repeal of Arms Embargo

All southern California aircraft factories, including the three at San Diego, stand to benefit from repeal of the arms embargo, aircraft officials poined out today.

From Los Angeles, The Associated Press reported that new airplane orders totaling $35,000,000 will provide jobs for an estimated 20,000 more men in aircraft factories there. This, it was reported, will represent a 50 percent increase in employment.

The new orders from foreign governments, to be signed as soon as final action is taken on the neutrality bill, include one for $30,000,000 for planes from the Douglas Aircraft factory and one for $5,000,000 from

Firms To Benefit Through Repeal

Trib. 11-3-39

CONTINUED FROM PAGE ONE

Lockheed aircraft. The new orders are additional to a $110,000,000 foreign and domestic backlog already in local plants.

While no foreign orders for planes have been placed with San Diego aircraft factories, the arms embargo repeal "opens up great potential fields" for plants here, an official of one company said. He pointed out that aircraft firms "making planes for Uncle Sam merit immediate recognition for foreign orders because of the high type of workmanship demanded."

Consolidated Aircraft Corp., with a backlog of upwards of $17,000,00, is making planes for the army and navy, with an anticipated additional navy order in the offing. The Ryan Aeronautical Co., in addition to training fliers for the army air corps, is manufacturing primary trainers and observation planes for the army. Solar Aircraft Co. has a large business manufacturing parts and equipment for planes.

Union 11-3-39

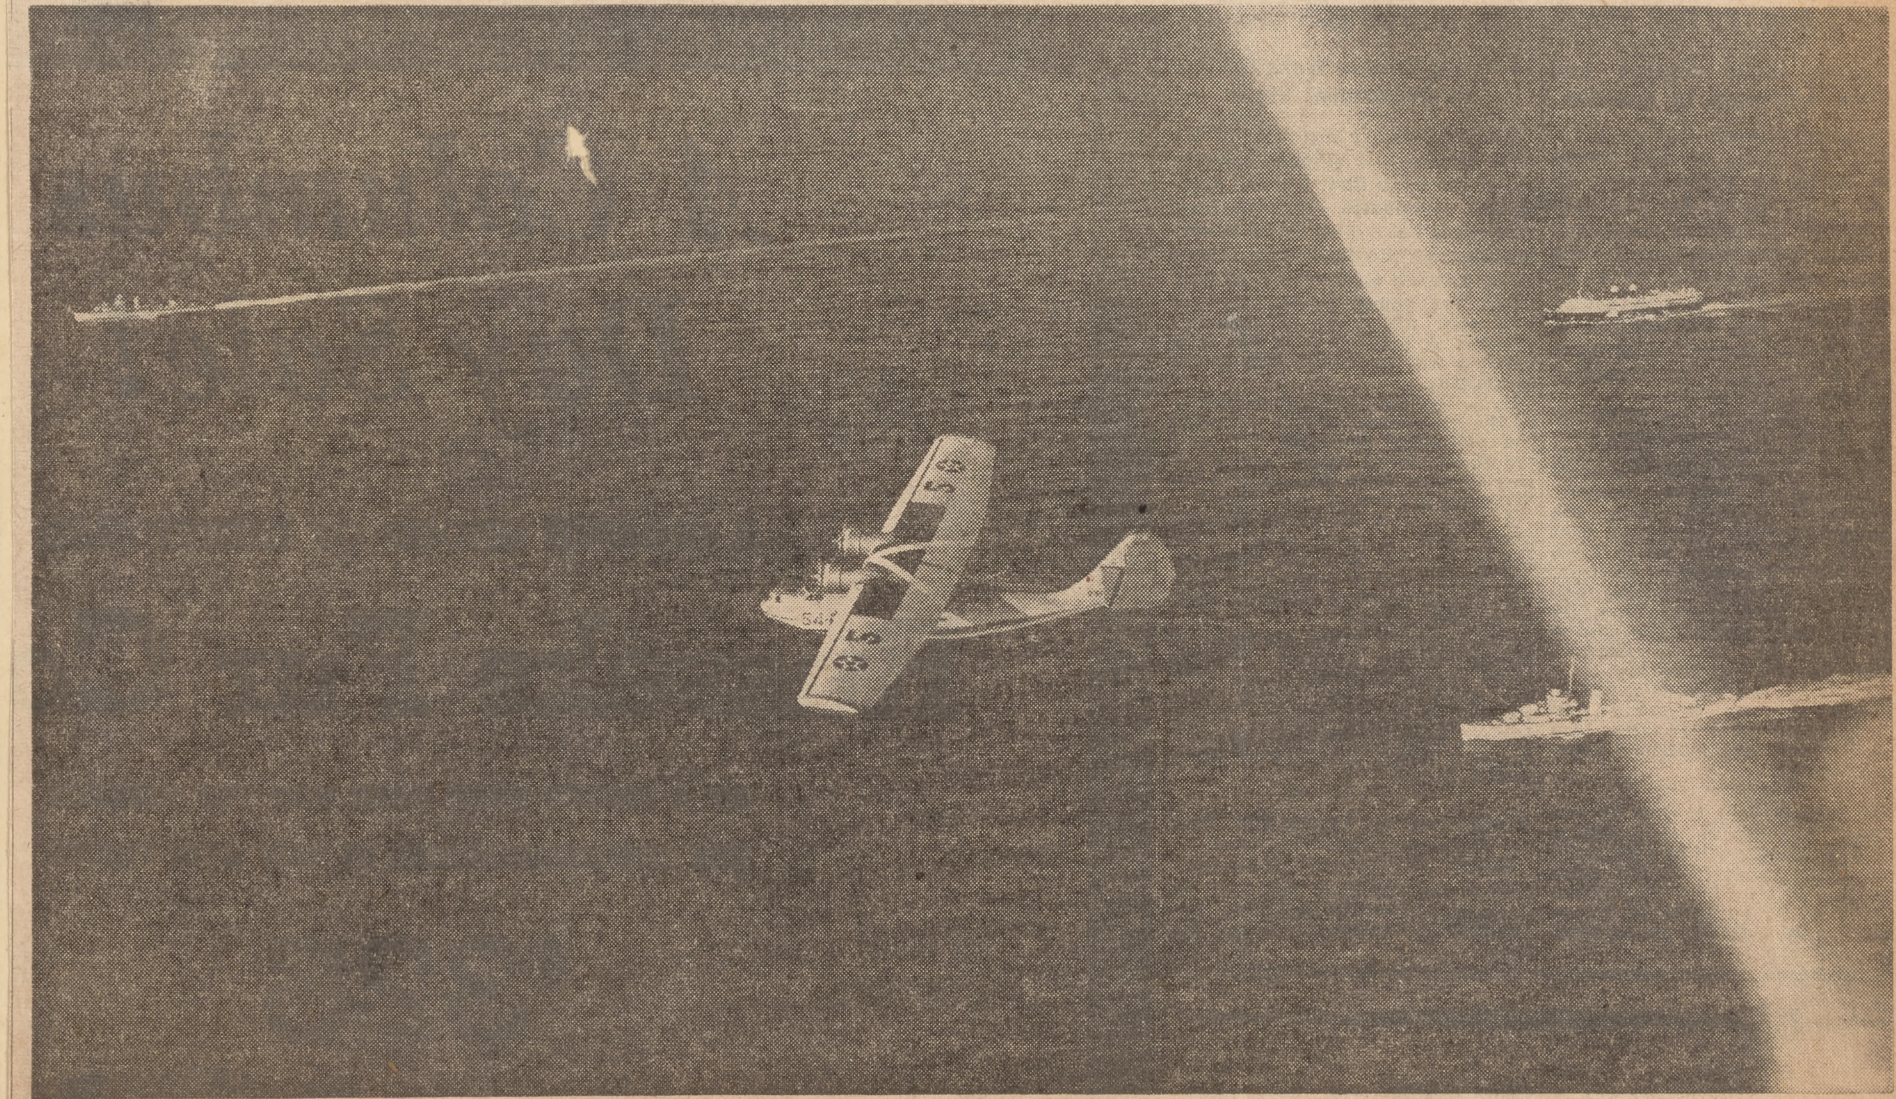
Guba Pilot Here For Plane Tests

Russell Rogers, chief pilot of Richard H. Archbold's Consolidated-built plane Guba, arrived here from New York yesterday to take over command of the big flying boat following extensive overhaul at the Lindbergh field plant.

The Guba, which spent nearly two years in Netherlands New Guinea on a scientific expedition for the American Museum of Natural history of which Archbold is associate director, is to make a number of test flights before beng flown overland to New York. Archbold is expected here next month.

Plans are being made for another expeditionary flight to New Guinea in 1940.

THE NEW YORK TIMES, THURSDAY, OCTOBER 12, 1939.



THE "THREATENED" STEAMSHIP IROQUOIS, DUE YESTERDAY, DOCKED YESTERDAY

The American liner Iroquois, which the German Admiralty intimated would be sunk by an unnamed agency when she neared our coast, is shown (upper right) about 120 miles out of New York yesterday. Ahead of the vessels are two destroyers and above is a navy plane. The light streak is due to the vibrating strut of plane from which picture was taken.

U. S. Aircraft Factories Increase Capacity to 15,000 Planes a Year

Plants Expand; Day-Night Shifts May Boost Total

NEW YORK, Nov. 12 (A.P.)—The Aeronautical Chamber of Commerce of America today made public a survey of aircraft factory expansion which, it said, showed American plants could turn out 15,000 planes a year.

Projects now underway, said John H. Jouett, president of the chamber, would result in even greater production capacity.

"Our survey," he explained, "included 43 airplane and 13 engine manufacturing plants.

"Of the 43 airplane plants, 23 are now working on orders for military equipment. The current capacity of 1250 planes a month, equal to a rate of 15,000 machines a year, is based on several factors.

SPACE INCREASES 17%

"The airplane factory space increased 6,000,000 square feet to 7,025,000 square feet in the first six months of this year an expansion of 17 percent in manufacturing space. At the same time the aircraft engine factory space increased 334,000 square feet, a 20 percent expansion. All that space is now in use."

Jouett said further that while some aircraft plants were working at full capacity, "others have not even approached their limit with single working shifts. When orders are received in sufficient volume to warrant it the plants go into three working shifts a day."

The chamber said that to obtain maximum output, standardization or "freezing" on a single model in one factory would be necessary. Some plants not working at top speed are still producing as many as seven or eight different types of planes.

"Another factor which has increased plant capacity," said Jouett, "is the recent growth of the subcontracting system.

SUB-CONTRACTS AID

"Sub-contracting in the past was a very small part of aircraft production because the manufacturer could not guarantee the sub-contractor continuous business and the sub-contractor could not tool up sufficiently to assure a return on his investment. * * *

"With increased orders and the larger unit volume on each order, all plants in the industry which are not working on their own business and filling original orders of their own are available for sub-contracting. In other words, this opens the entire manufacturing industry to full time production.

"Our survey showed that the industry is capable of rapid expansion of production on all types of military aircraft, including the special types used by the navy air forces."

OVERHAULED GUBA TAKES TEST HOPS

Sun 12-10-39

After more than four months of idleness while receiving a complete overhaul in the Consolidated Aircraft Corp. plant, the widely traveled airboat Guba of Richard Archbold, wealthy scientist-aviator, received its first test hops over the bay yesterday.

Chief Pilot Russ Rogers announced that the craft, which was used to transport personnel and supplies to hitherto inaccessible regions in Netherlands New Guinea during a scientific expedition which ended last summer, may be flown to New York City for the winter unless adequate hangar space can be provided in San Diego.

Mr. Archbold, in a recently purchased Fleetwing four-passenger cabin plane, is expected to arrive here from the East coast next month, according to Mr. Rogers.

AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

Jan 40 Western Flying.

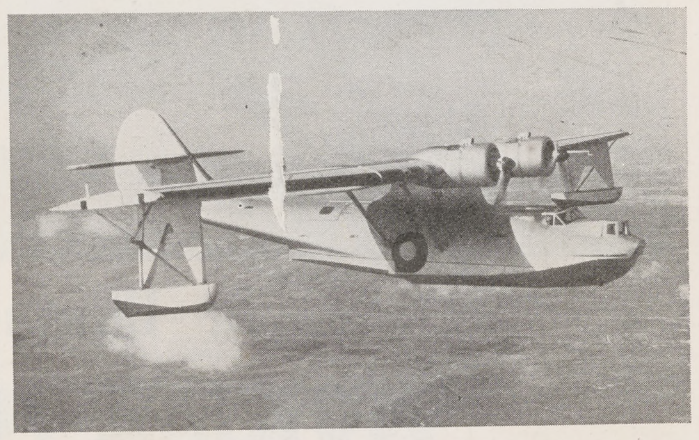
THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

INSPECTS PLANT — Maj. Gen. Emmons visits San Diego aircraft plant to view new Army bomber.

Emmons Sees Great Bomber

Air Corps Commander Watches Third Test Flight at San Diego

SAN DIEGO, Jan. 16.—French and Brazilian military officers today stood on the side lines only a few paces away from Maj. Gen. Delos C. Emmons, commander of the Army Air Corps G.H.Q., as the Army's most powerful completed bomber, the four-motored Consolidated XB-24, was given its third test flight on Lindbergh Field.

The foreign observers were here to confer with Consolidated officials in connection with possible acquisition of flying equipment available for export. The local concern manufactures long-range navy patrol boats, as well as giant army planes.

Maj. Gen. Emmons spent several hours inspecting the Consolidated plant and left late today for March Field to observe the G.H.Q. first wing's participation in this week's joint Army-Navy maneuvers which will test California's vulnerability to invasion.

He arrived this afternoon in a Douglas Army transport from his Langley Field (Va.) headquarters. Accompanying him are Capt. W. Goss, pilot and aide; Maj. H. A. McGinnis of the Inspector General's Department and Lieut. Col. Cedric Lewis, signal officer of the G.H.Q.

Air Force Commander Arrives at March Field

MARCH FIELD, Jan. 16.—Maj. Gen. Delos T. Emmons, commanding general, G.H.Q. Air Force, arrived at March Field at 4:25 p.m. today accompanied by Col. A. S. Pederneiras of the Brazilian Air Force. He was accorded a 13-gun salute. Gen. Emmons tomorrow will visit airplane factories in Los Angeles.

HITLER'S AIR PLANS

Building up his Bomber Forces

From Our Air Correspondent

LONDON, Tuesday Night

TO expect the worst and to prepare to meet it is the only sound defensive maxim and it should be rigorously applied at the present time Things have been going well in the Middle East and in Greece, but that does not mean that we should expect them automatically to begin to go well here.

Rather the expectation should be that there will be further and heavier attacks. For although there have been lulls, there has been nothing to suggest that they are of other than tactical origin. On the contrary, the easiest way to interpret them is as periods of recuperation for the *Luftwaffe* to be followed by more intensive action

It is true that, since Friday last, the Royal Air Force has been making raids on German-occupied aerodromes in France and Holland, but I doubt if such raids could do more than diminish very slightly the scale of the attack. The reason is that the Germans enjoy the use of a huge number of aerodromes, both in Germany and in occupied territory.

MANY AERODROMES

In France alone the number must be about 500, and of these a fairly high proportion would be well suited as bases for the night raiders. In Holland and Belgium there are more aerodromes, and behind them, more difficult to reach for our bombers, there are the German aerodromes, of which there must be more than 600.

It is obvious that the task of attacking so large a number of aerodromes that the enemy would be unable to launch his night raids is so immense that no air force could undertake it. The most that can be hoped for is that some of the aerodromes which are most useful to the enemy shall be knocked about, and this, it seems, was successfully done.

The lulls in night raiding may have been partly caused by these attacks, but that is all. For the rest, they may be due to the desire on the part of the enemy to conserve his bomber forces and to build them up to greater strength for some coming offensive of great ferocity.

The *Luftwaffe* has had heavy losses during the summer and autumn. It has, moreover, measured itself against the R.A.F. and found itself relatively less strong than it had thought. Field-Marshal Goering keeps a wary eye on our production and knows that it is swinging up and being augmented still further by United States production.

Yet the attempt to defeat Great Britain in these islands cannot have been abandoned as a primary German objective. It would be the key to saving Italy, it would fulfil Herr Hitler's dearest ambition, it would sort out all the Axis troubles. But to defeat Britain in these islands the Germans now know that a bigger effort than anything they have so far been able to put out is needed.

So they use this period for weakening us so far as they can by submarine warfare and by intermittent night raids, while not risking great numbers of their aircraft in day raids or in night raids when the weather is such that the number of accidents seems likely to be high.

Night flying under war conditions always entails many accidents, and it is surprising what heavy losses a night bomber force can suffer from this cause alone. The *Luftwaffe* bombers may have been depleted by accidents on a big scale during their attempts to sustain the bombardment of these islands during spells of bad weather.

At any rate, the present method does enable aircraft to be conserved and gives Field-Marshal Goering a chance to build up his forces. And that, I think, is the interpretation of it. There may be moves of some machines to another theatre, but if the aim is to strike in the Balkans or the Middle East the conservation and hoarding tactics are still needed. They would not be forced upon the Germans by a move because the aircraft do not take long to shift; it is the ground equipment that takes the time.

Our object then must be to prepare energetically to meet a new German air offensive. To that end we must increase the strength of the Royal Air Force and push forward with technical improvements. Higher speeds and better climb are the needs, for if we beat them once by technical merit we can beat them again by the same means.

It is clear that we have been able to reinforce our Air Force in the Middle East and also to lend fairly substantial air aid to the Greeks. We have been using not only the Gloster Gladiator fighters in those theatres but also the later Hurricanes. In addition, we have used Blenheims in fairly large numbers and some of the Wellington heavy bombers.

STILL MORE 'PLANES

But what we have done in the past in the way of increasing our air strength must be overtopped in the future if we are to meet with full confidence the coming attack wherever it may be launched. Moreover, there is always our own offensive to be considered, for it comes nearer and nearer to the range of practical possibility. So that not only must our fighter forces be enormously increased but so must our bomber forces.

Especially important will be the coastal reconnaissance types of aircraft and the torpedo-carriers. If, as has been suggested, we are to get some of the Consolidated 31 flying boats from America they should be of the greatest help to the Coastal Command in dealing with the submarine menace and also with the menace of the surface raiders.

NAVAL AVIATION

National Aeronautics, Sept 39

AND NAVAL POLICY

By Rear Adm. John H. Towers, USN

An unusual aerial photograph of a left echelon formation of patrol planes.

Official Photo, U. S. Navy

THE mission of Naval Aviation in our national defense is, primarily, to increase the efficiency of the naval service.

The basic principle of the national policy of the United States is that our armed forces are maintained for defense purposes, and the basic principle of the Navy policy is to maintain our Navy at sufficient strength to support the national policies and commerce, and to guard the continental and overseas possessions of the United States. To do this, the Navy must be properly equipped with ships, aircraft, and trained personnel. The equipment must be modern and in sufficient quantity successfully to carry out the required and assigned missions.

World conditions in recent years have not improved, and the United States, to safeguard its interests, has been forced to continue construction under the Vinson-Trammell Act of 1934 and the Naval Expansion Act of 1938.

While the governing policy is defensive, it is imperative, in the event that war is forced upon us, that our fleet shall be able to bring the enemy to terms at a safe distance from our shores within the shortest possible interval of time. To accomplish this feat, it must be adequately trained and sufficiently strong in every essential element.

The present authorized building program of ships, planes, and naval air stations is a step in the right direction and should be pushed to an early completion. So, too, should the program of construction of other air, destroyer, and submarine bases recommended during the current calendar year by the Hepburn Board.

The Naval policy in regard to heavier-than-air aviation activities is to build and maintain airplanes to the full complement authorized for aircraft carriers, tenders, battleships, cruisers, and the Fleet Marine Force, and to determine and develop the types of airplanes and appliances which are best suited for increased effectiveness of naval vessels, attacks on all classes of Naval objectives, and for scouting and patrolling.

Aircraft For Increased Effectiveness

An adjunct to this general policy is the aircraft policy which aims to build and to maintain aircraft carriers in the maximum

U. S. Aircraft Factories Increase Capacity to 15,000 Planes a Year

Plants Expand; Day-Night Shifts May Boost Total

NEW YORK, Nov. 12 (A.P.)—The Aeronautical Chamber of Commerce of America today made public a survey of aircraft factory expansion which, it said, showed American plants could turn out 15,000 planes a year.

Projects now underway, said John H. Jouett, president of the chamber, would result in even greater production capacity.

"Our survey," he explained, "included 43 airplane and 13 engine manufacturing plants.

"Of the 43 airplane plants, 23 are now working on orders for military equipment. The current capacity of 1250 planes a month, equal to a rate of 15,000 machines a year, is based on several factors.

SPACE INCREASES 17%

"The airplane factory space increased 6,000,000 square feet to 7,025,000 square feet in the first six months of this year an expansion of 17 percent in manufacturing space. At the same time the aircraft engine factory space increased 334,000 square feet, a 20 percent expansion. All that space is now in use."

Jouett said further that while some aircraft plants were working at full capacity, "others have not even approached their limit with single working shifts. When orders are received in sufficient volume to warrant it the plants go into three working shifts a day."

The chamber said that to obtain maximum output, standardization or "freezing" on a single model in one factory would be necessary. Some plants not working at top speed are still producing as many as seven or eight different types of planes.

"Another factor which has increased plant capacity," said Jouett, "is the recent growth of the sub-contracting system.

SUB-CONTRACTS AID

"Sub-contracting in the past was a very small part of aircraft production because the manufacturer could not guarantee the sub-contractor continuous business and the sub-contractor could not tool up sufficiently to assure a return on his investment. * * *

"With increased orders and the larger unit volume on each order, all plants in the industry which are not working on their own business and filling original orders of their own are available for sub-contracting. In other words, this opens the entire manufacturing industry to full time production.

"Our survey showed that the industry is capable of rapid expansion of production on all types of military aircraft, including the special types used by the navy air forces."

OVERHAULED GUBA TAKES TEST HOPS

Dun 12-10-39

After more than four months of idleness while receiving a complete overhaul in the Consolidated Aircraft Corp. plant, the widely traveled airboat Guba of Richard Archbold, wealthy scientist-aviator, received its first test hops over the bay yesterday.

Chief Pilot Russ Rogers announced that the craft, which was used to transport personnel and supplies to hitherto inaccessible regions in Netherlands New Guinea during a scientific expedition which ended last summer, may be flown to New York City for the winter unless adequate hangar space can be provided in San Diego.

Mr. Archbold, in a recently purchased Fleetwing four-passenger cabin plane, is expected to arrive here from the East coast next month, according to Mr. Rogers.

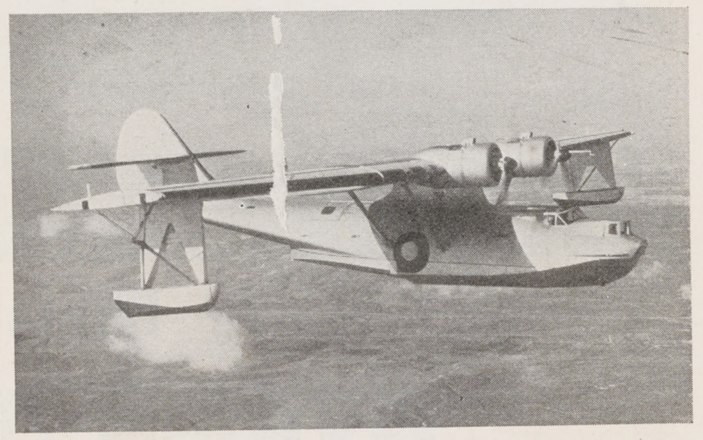
AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

Jan 40 WESTERN FLYING.

THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.

INSPECTS PLANT — Maj. Gen. Emmons visits San Diego aircraft plant to view new Army bomber.

Emmons Sees Great Bomber

Air Corps Commander Watches Third Test Flight at San Diego

SAN DIEGO, Jan. 16.—French and Brazilian military officers today stood on the side lines only a few paces away from Maj. Gen. Delos C. Emmons, commander of the Army Air Corps G.H.Q., as the Army's most powerful completed bomber, the four-motored Consolidated XB-24, was given its third test flight on Lindbergh Field.

The foreign observers were here to confer with Consolidated officials in connection with possible acquisition of flying equipment available for export. The local concern manufactures long-range navy patrol boats, as well as giant army planes.

Maj. Gen. Emmons spent several hours inspecting the Consolidated plant and left late today for March Field to observe the G.H.Q. first wing's participation in this week's joint Army-Navy maneuvers which will test California's vulnerability to invasion.

He arrived this afternoon in a Douglas Army transport from his Langley Field (Va.) headquarters. Accompanying him are Capt. W. Goss, pilot and aide; Maj. H. A. McGinnis of the Inspector General's Department and Lieut. Col. Cedric Lewis, signal officer of the G.H.Q.

Air Force Commander Arrives at March Field

MARCH FIELD, Jan. 16.—Maj. Gen. Delos T. Emmons, commanding general, G.H.Q. Air Force, arrived at March Field at 4:25 p.m. today accompanied by Col. A. S. Pederneiras of the Brazilian Air Force. He was accorded a 13-gun salute. Gen. Emmons tomorrow will visit airplane factories in Los Angeles.

HITLER'S AIR PLANS

Building up his Bomber Forces

From Our Air Correspondent

LONDON, Tuesday Night

TO expect the worst and to prepare to meet it is the only sound defensive maxim and it should be rigorously applied at the present time Things have been going well in the Middle East and in Greece, but that does not mean that we should expect them automatically to begin to go well here.

Rather the expectation should be that there will be further and heavier attacks. For although there have been lulls, there has been nothing to suggest that they are of other than tactical origin. On the contrary, the easiest way to interpret them is as periods of recuperation for the *Luftwaffe* to be followed by more intensive action

It is true that, since Friday last, the Royal Air Force has been making raids on German-occupied aerodromes in France and Holland, but I doubt if such raids could do more than diminish very slightly the scale of the attack. The reason is that the Germans enjoy the use of a huge number of aerodromes, both in Germany and in occupied territory.

MANY AERODROMES

In France alone the number must be about 500, and of these a fairly high proportion would be well suited as bases for the night raiders. In Holland and Belgium there are more aerodromes, and behind them, more difficult to reach for our bombers, there are the German aerodromes, of which there must be more than 600.

It is obvious that the task of attacking so large a number of aerodromes that the enemy would be unable to launch his night raids is so immense that no air force could undertake it. The most that can be hoped for is that some of the aerodromes which are most useful to the enemy shall be knocked about, and this, it seems, was successfully done.

The lulls in night raiding may have been partly caused by these attacks, but that is all. For the rest, they may be due to the desire on the part of the enemy to conserve his bomber forces and to build them up to greater strength for some coming offensive of great ferocity.

The *Luftwaffe* has had heavy losses during the summer and autumn. It has, moreover, measured itself against the R.A.F. and found itself relatively less strong than it had thought. Field-Marshal Goering keeps a wary eye on our production and knows that it is swinging up and being augmented still further by United States production.

Yet the attempt to defeat Great Britain in these islands cannot have been abandoned as a primary German objective. It would be the key to saving Italy, it would fulfil Herr Hitler's dearest ambition, it would sort out all the Axis troubles. But to defeat Britain in these islands the Germans now know that a bigger effort than anything they have so far been able to put out is needed.

So they use this period for weakening us so far as they can by submarine warfare and by intermittent night raids, while not risking great numbers of their aircraft in day raids or in night raids when the weather is such that the number of accidents seems likely to be high.

Night flying under war conditions always entails many accidents, and it is surprising what heavy losses a night bomber force can suffer from this cause alone. The *Luftwaffe* bombers may have been depleted by accidents on a big scale during their attempts to sustain the bombardment of these islands during spells of bad weather.

At any rate, the present method does enable aircraft to be conserved and gives Field-Marshal Goering a chance to build up his forces. And that, I think, is the interpretation of it. There may be moves of some machines to another theatre, but if the aim is to strike in the Balkans or the Middle East the conservation and hoarding tactics are still needed. They would not be forced upon the Germans by a move because the aircraft do not take long to shift; it is the ground equipment that takes the time.

Our object then must be to prepare energetically to meet a new German air offensive. To that end we must increase the strength of the Royal Air Force and push forward with technical improvements. Higher speeds and better climb are the needs, for if we beat them once by technical merit we can beat them again by the same means.

It is clear that we have been able to reinforce our Air Force in the Middle East and also to lend fairly substantial air aid to the Greeks. We have been using not only the Gloster Gladiator fighters in those theatres but also the later Hurricanes. In addition, we have used Blenheims in fairly large numbers and some of the Wellington heavy bombers.

STILL MORE 'PLANES

But what we have done in the past in the way of increasing our air strength must be overtopped in the future if we are to meet with full confidence the coming attack wherever it may be launched. Moreover, there is always our own offensive to be considered, for it comes nearer and nearer to the range of practical possibility. So that not only must our fighter forces be enormously increased but so must our bomber forces.

Especially important will be the coastal reconnaissance types of aircraft and the torpedo-carriers. If, as has been suggested, we are to get some of the Consolidated 31 flying boats from America they should be of the greatest help to the Coastal Command in dealing with the submarine menace and also with the menace of the surface raiders.

of poor visibility in a day when there was no radio communication between plane and ground.

Transcontinental Service Begins

On May 15, 1920, the third leg of the transcontinental route, Chicago to Omaha via Iowa City, Iowa, was established and the final leg of the first transcontinental route was placed in operation on September 8 of the same year between Omaha and San Francisco, with stops listed at North Platte, Nebr.; Cheyenne, Rawlins and Rock Springs, Wy.; Salt Lake City, Utah; and Elko and Reno, Nevada.

With a view to further demonstrating the feasibility of the airplane as a swift means of transporting the mails, the Post Office Department was now ready to undertake a through flight from San Francisco to New York. On February 22, 1921, an air mail plane left San Francisco at 4:30 a.m., and at 4:50 p.m. the next afternoon the same plane encircled Hazelhurst Field on Long Island, made a perfect landing, and the first through transcontinental air mail flight was accomplished. The total elapsed time for the trip, including all stops, was 33 hours and 21 minutes. New routes were now gradually being added to the Post Office Department's expanding air mail system, and night and day flying began to take a regular place in the fixing of the various mail schedules.

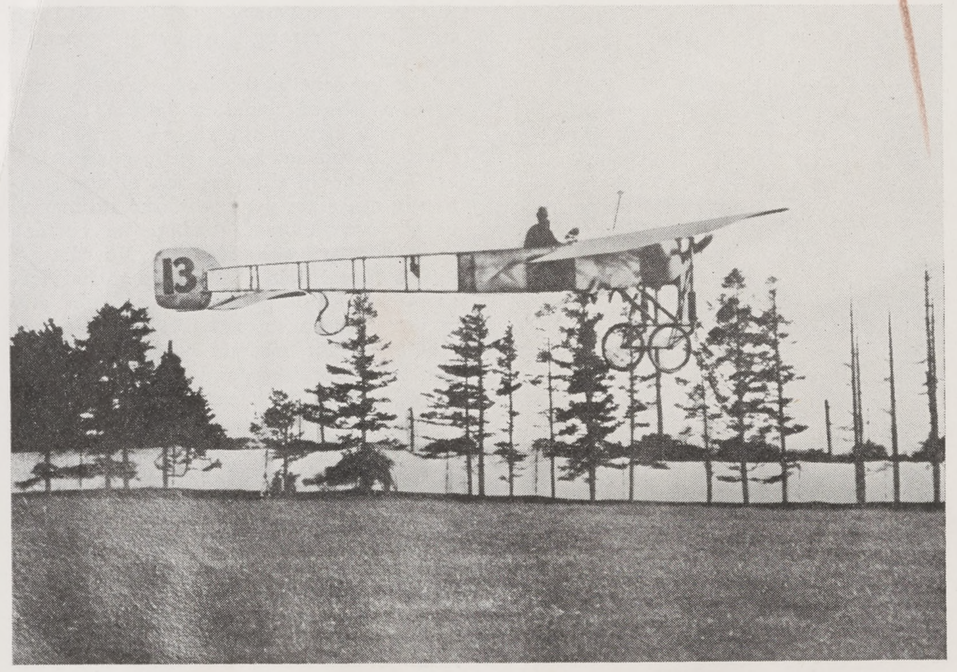
The Post Office Department's Division of Air Mail Service was awarded the Collier Trophy for the most important contribution to the development of aeronautics in 1922 on its outstanding safety record and again the year following for demonstrating the feasibility of night flying. The Harmon Trophy of the United States, offered for the first time in 1926, was awarded by the International League of Aviators to an air mail pilot because of his remarkable record of having flown during that year 718 hours without accident in all kinds of weather, both winter and summer, on regularly scheduled trips, 47 percent of his time having been spent in night flying. It is interesting to note that this feat was considered more meritorious in advancing the cause of aviation during that year than the flight of Admiral Byrd over the North Pole.

Enter the Private Contractors

But it was not the intention of the Post Office Department to operate the air mail service longer than was necessary to clearly demonstrate the practicability of commercial aviation to the general public and thereby induce private enterprise to enter the field and eventually take over the operation of the air mail service. Due to the large measure of success attained in the efficient operation and development of the transcontinental route, the desired interest was rapidly increasing with the result that in 1926 several contract air mail routes were put into operation and contracts on several others awarded. In the spring of 1926, Congress passed a bill, known as the "Air Commerce Act of 1926", which, briefly stated, imposed upon the Secretary of Commerce the duty of fostering the development of commercial aviation in the United States. It authorized the Secretary, among other things, to designate and establish airways and to establish, operate and maintain along such airways all necessary lights and emergency landing fields. But the Postmaster General concluded that the time was at hand when the transcontinental air mail route might be turned over to private contractors and operated successfully and profitably by them.

The first bag of air mail is placed aboard a Queen Monoplane, powered by an Indian Rotary Motor, by Post Office officials at a temporary airport on Nassau Boulevard, Long Island, N. Y. The pilot, Earle L. Ovington, has been sworm in formally as a mail carrier and has accepted orders to deliver the bag of letters at the Mineola Post Office a few miles away. This trip was made on September 23, 1911

Maybe the Post Office officials who sent the first bag of airmail winging its way across the Long Island skies didn't believe in such silly things as hoodos. Maybe there was nothing in the fact that the day was the 23rd and the plane No. 13. The mail was delivered with care and dispatch; but Congress refused for the next 7 years to furnish the Department with funds for other airmail trips



Accordingly, advertisements were issued on November 15, 1926, to expire on January 15, 1927, for proposals for service on the transcontinental route by sections—(1) New York to Chicago, and (2) Chicago to San Francisco. A proposal at a satisfactory rate was received on the Chicago-San Francisco section from the Boeing Airplane Company and accepted. Service began under their contract July 1, 1927, the Post Office Department relinquishing operation at midnight, June 30. As no satisfactory bid was received for the service between New York and Chicago, that section of the route was readvertised under date of March 8, and the bid of the National Air Transport, Inc. of Chicago, was accepted thereunder. This company began service under its contract on September 1, the Post Office Department continuing operation until that date.

Once placed on a contract basis as it was in 1926, the air mail service expanded rapidly as more and more private capital came into the aviation field. New lines were placed in operation in all sections of the country, and a Division of Foreign Air Mail Service was set up under the Department's Division of International Postal Service. Within a comparatively short time air mail routes were in operation on trunk lines from coast to coast, with connecting north-south routes, while air mail contracts had also been let for service to Central and South America, Cuba and the West Indies and also Canada. Air mail service was also placed in operation in Alaska.

Latest Equipment Used

In 1934, the entire air mail system was reorganized and extended. The period from that date to the present day has seen a complete retirement of the old single motor plane. Every plane now in service on both the domestic and foreign air mail routes is of the multimotor type and all are among the finest and most modern in use anywhere in the world. The speed of these great planes, which in many instances is upwards of 200 miles an hour, is more than double that of the earliest air mail planes.

Patronage of the air mail system in the early days of its operation was indeed slight and it is only within the past six years that air mail poundage has mounted to startling figures which are being reported by the Post Office Department each month.

Business and industrial houses, banks, and persons in all walks of life gradually became acquainted with the remarkable service that was now being afforded by the Post Office Department at the very nominal rate of six cents per ounce as

Any contemland attack on this country must be direct or must first enter Canada or o. The only way to do this is via the In any event, therefore, the brunt tial phases of defensive operations be borne by the mobile seagoing It is here that Naval Aviation plays t important role in the preservation country's safety, for it is an acedged fact that the successful operaf a modern fleet depends greatly on ficiency of its aircraft.

Mobile Flying Fields

means for carrying and operating t from the carriers, the battleships, e cruisers has been perfected. The s are in reality armed, floating, moing fields, completely equipped with e shops, hangar space, elevators, pair facilities, in addition to berthd messing space for nearly two nd men.

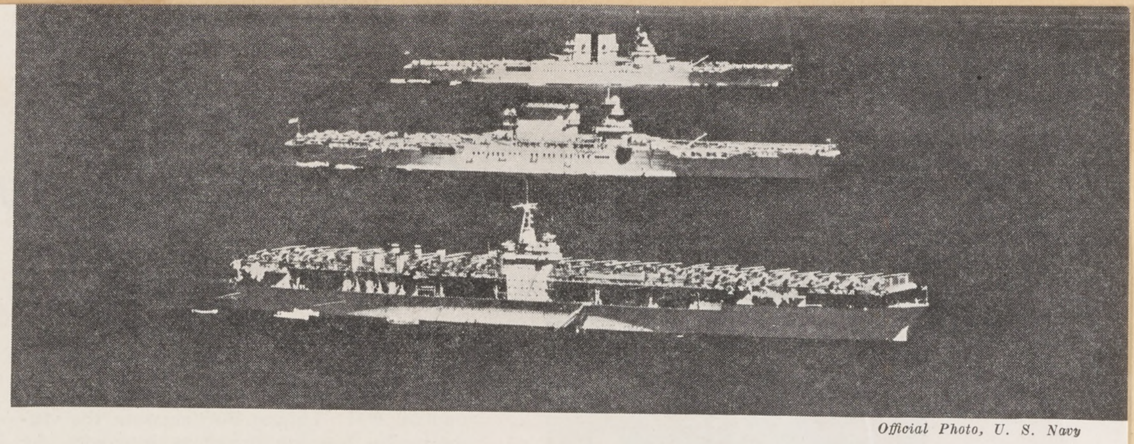
ected and supported by the guns of ttleships and cruisers, they bring complement of fighting, bombing, outing planes to within striking dis- of the enemy, and, from a range many times that of the great guns of the dreadnaughts, launch their squadrons to attack the opposing ships. It should be remembered that these carrier planes are of the landplane type, and their operations from carrier decks and handling on board is a huge engineering problem in itself. Once in the air, the hazards encountered by the pilots in carrying out their missions over open seas in a landplane, where failure of engine or material might result disastrously, have been minimized insofar as possible by the provision of safety devices in the form of flotation gear for both the plane and the personnel. This problem, involving as it does the safety of life, has received continuous study and application.

The planes of the battleships and cruisers differ from those of the carriers in that they are of the seaplane type. Here the method of launching is via the catapult. The Navy has so successfully solved this highly specialized problem that there has never been a fatality in Naval Aviation due to the malfunctioning of the catapult.

The primary mission of battleship aircraft is that of observing and reporting corrections of gunfire while those attached to the cruisers carry out the primary mission of scouting.

Navy Pilots Need Special Training

These missions, and those of the carrier planes, demonstrate clearly the need for specialized knowledge on the part of the naval aviator reaching far beyond the ability to pilot an airplane. Naval strategy and tactics, navigation, radio, gunnery, and other allied activities must be intimately known if the Navy's pilots are to contribute to the efficiency of the Fleet as a whole.



Official Photo, U. S. Navy

Three of Uncle Sam's armed, mobile, flying fields, the airplane carriers, RANGER, (in the foreground) LEXINGTON, (in the middle) and SARATOGA.

With Naval Aviation occupying the position of an integral part of the Navy, a thorough indoctrination in Navy customs and procedures is of paramount importance; for it is through this medium that the officer in the air and the officer on the bridge of a ship may work in complete harmony, each appreciating the limitations and the capabilities of the other craft.

The Patrol or Flying Boat

There is another and very important aircraft type employed by the Navy, and that is the patrol or flying boat. This type is more widely known to the layman than either the carrier or combatant ship-based aircraft because of the many long distance mass flights it has successfully carried out and because of the commercial versions flying on transoceanic schedules.

These planes possess a high degree of mobility in themselves and are the largest type used by the Navy. They are capable of operating over great distances at sea, of being powerful offensively and defensively, of being self-sustaining to a large de-

U. S. Aircraft Factories Increase Capacity to 15,000 Planes a Year

Plants Expand; Day-Night Shifts May Boost Total

NEW YORK, Nov. 12 (A.P.)—The Aeronautical Chamber of Commerce of America today made public a survey of aircraft factory expansion which, it said, showed American plants could turn out 15,000 planes a year.

Projects now underway, said John H. Jouett, president of the chamber, would result in even greater production capacity.

"Our survey," he explained, "included 43 airplane and 13 engine manufacturing plants.

"Of the 43 airplane plants, 23 are now working on orders for military equipment. The current capacity of 1250 planes a month, equal to a rate of 15,000 machines a year, is based on several factors.

SPACE INCREASES 17%

"The airplane factory space increased 6,000,000 square feet to 7,025,000 square feet in the first six months of this year an expansion of 17 percent in manufacturing space. At the same time the aircraft engine factory space increased 334,000 square feet, a 20 percent expansion. All that space is now in use."

Jouett said further that while some aircraft plants were working at full capacity, "others have not even approached their limit with single working shifts. When orders are received in sufficient volume to warrant it the plants go into three working shifts a day."

The chamber said that to obtain maximum output, standardization or "freezing" on a single model in one factory would be necessary. Some plants not working at top speed are still producing as many as seven or eight different types of planes.

"Another factor which has increased plant capacity," said Jouett, "is the recent growth of the sub-contracting system.

SUB-CONTRACTS AID

"Sub-contracting in the past was a very small part of aircraft production because the manufacturer could not guarantee the sub-contractor continuous business and the sub-contractor could not tool up sufficiently to assure a return on his investment. * * *

"With increased orders and the larger unit volume on each order, all plants in the industry which are not working on their own business and filling original orders of their own are available for sub-contracting. In other words, this opens the entire manufacturing industry to full time production.

"Our survey showed that the industry is capable of rapid expansion of production on all types of military aircraft, including the special types used by the navy air forces."

OVERHAULED GUBA TAKES TEST HOPS

Sun 12-10-39

After more than four months of idleness while receiving a complete overhaul in the Consolidated Aircraft Corp. plant, the widely traveled airboat Guba of Richard Archbold, wealthy scientist-aviator, received its first test hops over the bay yesterday.

Chief Pilot Russ Rogers announced that the craft, which was used to transport personnel and supplies to hitherto inaccessible regions in Netherlands New Guinea during a scientific expedition which ended last summer, may be flown to New York City for the winter unless adequate hangar space can be provided in San Diego.

Mr. Archbold, in a recently purchased Fleetwing four-passenger cabin plane, is expected to arrive here from the East coast next month, according to Mr. Rogers.

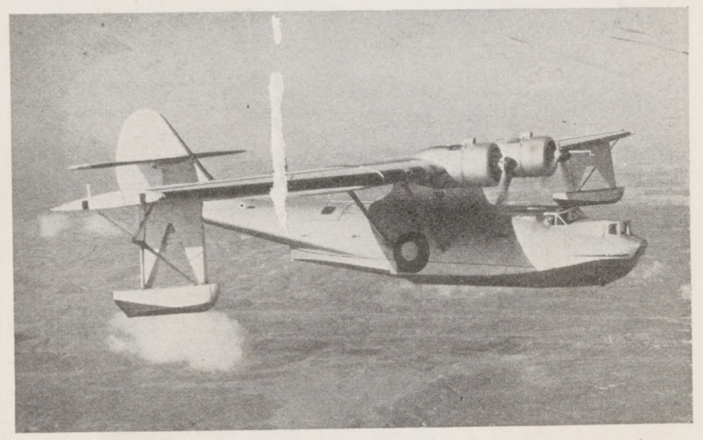
AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

Jan '40 WESTERN FLYING.

THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.

INSPECTS PLANT — Maj. Gen. Emmons visits San Diego aircraft plant to view new Army bomber.

Emmons Sees Great Bomber

Air Corps Commander Watches Third Test Flight at San Diego

SAN DIEGO, Jan. 16.—French and Brazilian military officers today stood on the side lines only a few paces away from Maj. Gen. Delos C. Emmons, commander of the Army Air Corps G.H.Q., as the Army's most powerful completed bomber, the four-motored Consolidated XB-24, was given its third test flight on Lindbergh Field.

The foreign observers were here to confer with Consolidated officials in connection with possible acquisition of flying equipment available for export. The local concern manufactures long-range navy patrol boats, as well as giant army planes.

Maj. Gen. Emmons spent several hours inspecting the Consolidated plant and left late today for March Field to observe the G.H.Q. first wing's participation in this week's joint Army-Navy maneuvers which will test California's vulnerability to invasion.

He arrived this afternoon in a Douglas Army transport from his Langley Field (Va.) headquarters. Accompanying him are Capt. W. Goss, pilot and aide; Maj. H. A. McGinnis of the Inspector General's Department and Lieut. Col. Cedric Lewis, signal officer of the G.H.Q.

Air Force Commander Arrives at March Field

MARCH FIELD, Jan. 16.—Maj. Gen. Delos T. Emmons, commanding general, G.H.Q. Air Force, arrived at March Field at 4:25 p.m. today accompanied by Col. A. S. Pederneiras of the Brazilian Air Force. He was accorded a 13-gun salute. Gen. Emmons tomorrow will visit airplane factories in Los Angeles.

HITLER'S AIR PLANS

Building up his Bomber Forces

From Our Air Correspondent

LONDON, Tuesday Night

TO expect the worst and to prepare to meet it is the only sound defensive maxim and it should be rigorously applied at the present time Things have been going well in the Middle East and in Greece, but that does not mean that we should expect them automatically to begin to go well here.

Rather the expectation should be that there will be further and heavier attacks. For although there have been lulls, there has been nothing to suggest that they are of other than tactical origin. On the contrary, the easiest way to interpret them is as periods of recuperation for the *Luftwaffe* to be followed by more intensive action

It is true that, since Friday last, the Royal Air Force has been making raids on German-occupied aerodromes in France and Holland, but I doubt if such raids could do more than diminish very slightly the scale of the attack. The reason is that the Germans enjoy the use of a huge number of aerodromes, both in Germany and in occupied territory.

MANY AERODROMES

In France alone the number must be about 500, and of these a fairly high proportion would be well suited as bases for the night raiders. In Holland and Belgium there are more aerodromes, and behind them, more difficult to reach for our bombers, there are the German aerodromes, of which there must be more than 600.

It is obvious that the task of attacking so large a number of aerodromes that the enemy would be unable to launch his night raids is so immense that no air force could undertake it. The most that can be hoped for is that some of the aerodromes which are most useful to the enemy shall be knocked about, and this, it seems, was successfully done.

The lulls in night raiding may have been partly caused by these attacks, but that is all. For the rest, they may be due to the desire on the part of the enemy to conserve his bomber forces and to build them up to greater strength for some coming offensive of great ferocity.

The *Luftwaffe* has had heavy losses during the summer and autumn. It has, moreover, measured itself against the R.A.F. and found itself relatively less strong than it had thought. Field-Marshal Goering keeps a wary eye on our production and knows that it is swinging up and being augmented still further by United States production.

Yet the attempt to defeat Great Britain in these islands cannot have been abandoned as a primary German objective. It would be the key to saving Italy, it would fulfil Herr Hitler's dearest ambition, it would sort out all the Axis troubles. But to defeat Britain in these islands the Germans now know that a bigger effort than anything they have so far been able to put out is needed.

So they use this period for weakening us so far as they can by submarine warfare and by intermittent night raids, while not risking great numbers of their aircraft in day raids or in night raids when the weather is such that the number of accidents seems likely to be high.

Night flying under war conditions always entails many accidents, and it is surprising what heavy losses a night bomber force can suffer from this cause alone. The *Luftwaffe* bombers may have been depleted by accidents on a big scale during their attempts to sustain the bombardment of these islands during spells of bad weather.

At any rate, the present method does enable aircraft to be conserved and gives Field-Marshal Goering a chance to build up his forces. And that, I think, is the interpretation of it. There may be moves of some machines to another theatre, but if the aim is to strike in the Balkans or the Middle East the conservation and hoarding tactics are still needed. They would not be forced upon the Germans by a move because the aircraft do not take long to shift; it is the ground equipment that takes the time.

Our object then must be to prepare energetically to meet a new German air offensive. To that end we must increase the strength of the Royal Air Force and push forward with technical improvements. Higher speeds and better climb are the needs, for if we beat them once by technical merit we can beat them again by the same means.

It is clear that we have been able to reinforce our Air Force in the Middle East and also to lend fairly substantial air aid to the Greeks. We have been using not only the Gloster Gladiator fighters in those theatres but also the later Hurricanes. In addition, we have used Blenheims in fairly large numbers and some of the Wellington heavy bombers.

STILL MORE 'PLANES

But what we have done in the past in the way of increasing our air strength must be overtopped in the future if we are to meet with full confidence the coming attack wherever it may be launched. Moreover, there is always our own offensive to be considered, for it comes nearer and nearer to the range of practical possibility. So that not only must our fighter forces be enormously increased but so must our bomber forces.

Especially important will be the coastal reconnaissance types of aircraft and the torpedo-carriers. If, as has been suggested, we are to get some of the Consolidated 31 flying boats from America they should be of the greatest help to the Coastal Command in dealing with the submarine menace and also with the menace of the surface raiders.

Robert N. Hinckley, Chairman. Term of office expires 1943.

Civil Aeronautics Authori
BIRTHDA

By Robert H. Hinckley
Chairman

WHEN the members of the Civil Aeronautics Authority, the Administrator and the Air Safety Board took the oath of office slightly more than a year ago, we found ourselves confronted by a threefold task which in all conscience seemed large to us. We were charged by Congress and the President with the new duty of economic regulation as applied to civil aeronautics; we inherited the duty of providing, maintaining, extending and improving the aids to navigation of the common air; we were charged, and in a very particular way this bore upon our conscience, with the duty of increasing the safety, and therefore the utility, of all flying.

Statistics on Growth

Just to indicate what this growth has been, the scheduled air lines in the month of June carried 164,578 passengers, 64¼ percent more than June a year ago. During the first six months of this year, 1627 airplanes were produced for domestic civil use in the United States, only about 40 of them going to the airlines, the rest being purchased and used by private and non-scheduled flyers. Compared to the first six months of 1938, when 850 civil airplanes were made and sold for domestic use, this is an increase of over 90 percent in production and sales.

Today 26,144 pilots hold certificates, 6,000 more than a year ago, an increase of about 30 percent. There are 11,160 certificated airplanes today, 1,400 more than a year ago or an increase of almost 15 percent, an increase that will be moved startlingly upward by the production figures of the first six months if they are maintained on an annual basis.

The increase in pilots according to every indication of our charts will be even more startling. Even without the Authority's own pilot training program, the curves show that there would be 36,000 certificated pilots by the end of 1940, and 43,000 by the end of 1941. Taking into account the student pilot training program, however, the number of pilot certificates in force by the end of 1941 ought to approximate 70,000 of all classes.

Airways Extended

The federal airways within the United States have been increased by about 10 percent in length to a total now over 25,000 miles. The aids to navigation along these airways have been increased by about the same amount. But that is not as good a measure of their increased usefulness as is the almost complete modernization of existing radio and other aids and the plans now under development for their possible conversion into the new ultra-high frequency category, where they will become even more useful and reliable.

Perhaps no occurrence within this year is of more importance to the United States than the extension of our foreign lines across the North Atlantic, where for the first time, under the American flag, airplanes are flying regularly twice a week between here and Europe. Plans have been proposed for the further extension of our lines in the east to New Zealand. Our flag now flies in the air from Nome, Alaska, to Buenos Aires in the Argentine, and from Hong Kong, China, to Marseilles in France.

Backing up all of these extensions and additions to our civil aviation plant, the Authority is at this moment, thanks to the $4,000,000 appropriation in the Third Deficiency Bill, actually making the arrangements for the training of 10,000 student pilots next year by methods we know through test to be methods that produce safe pilots.

Air Traffic Regulation

Congress, in the Civil Aeronautics Act of 1938, recognized for the first time that air transportation had become a utility whose economic soundness was of sufficient importance to the people as a whole to warrant its regulation in a fashion long familiar with public utilities.

The existing system of scheduled air mail carriers is now legally a public utility. All of the certificates under the so-called "grandfather clause" of the Act have been issued to the air mail carriers after the fullest investigation of the adequacy and efficiency of the services they have rendered. This has not been a merely routine procedure. Under the new decisions affecting the validity of administrative law, it was necessary to make court-proof records in all of these determinations. A good result of that necessary step has been the development of a mass of information on air line operation which will be invaluable in the determination of cognate actions.

The development of this inform
has also proved of great use and will
of further use in determining the eco
and efficiency of management as a
in determining rates for the carria
mail, fair to the government, the c
and the public.

Cases Under Consideration

The determination of these mai
cases and the hearing and determi
of applications for new routes is
actively proceeding. Of the 16 ai
rate cases filed, six have been de
eight have been heard and are aw
decision, one has been assigned for
ing, and the other has been postpo
the request of the carrier concern

Of the 59 applications for new
one has already been decided, te
pending decision after hearing, a
have been assigned for hearing.

It thus may be said that for th
time the relation of the federal g
ment to the common carriers of the
now upon a single, unified, rational
as to safety, utility, fairness of posta
ments, and the fairness of rates c
for the carriage of persons and pr
other than mail.

Air Safety Board

The work of the Air Safety Boa
been of invaluable consequence to
dustry, to the Authority and to
public at large. Its prompt indep
and expert analyses of accidents
ready resulted in changes of const
in important groups of aircraft, bot
lic and private, and in changes of pr
in the air and procedures on the
which have undoubtedly contributed
enormous increase in the safety fac

Airways Extended

The federal airways within the United States have been increased by about 10 percent in length to a total now over 25,000 miles. The aids to navigation along these airways have been increased by about the same amount. But that is not as good a measure of their increased usefulness as is the almost complete modernization of existing radio and other aids and the plans now under development for their possible conversion into the new ultra-high frequency category, where they will become even more useful and reliable.

Perhaps no occurrence within this year is of more importance to the United States than the extension of our foreign lines across the North Atlantic, where for the first time, under the American flag, airplanes are flying regularly twice a week between here and Europe. Plans have been proposed for the further extension of our lines in the east to New Zealand. Our flag now flies in the air from Nome, Alaska, to Buenos Aires in the Argentine, and from Hong Kong, China, to Marseilles in France.

Backing up all of these extensions and additions to our civil aviation plant, the Authority is at this moment, thanks to the $4,000,000 appropriation in the Third Deficiency Bill, actually making the arrangements for the training of 10,000 student pilots next year by methods we know through test to be methods that produce safe pilots.

Air Traffic Regulation

Congress, in the Civil Aeronautics Act of 1938, recognized for the first time that air transportation had become a utility whose economic soundness was of sufficient importance to the people as a whole to warrant its regulation in a fashion long familiar with public utilities.

The existing system of scheduled air mail carriers is now legally a public utility. All of the certificates under the so-called "grandfather clause" of the Act have been issued to the air mail carriers after the fullest investigation of the adequacy and efficiency of the services they have rendered. This has not been a merely routine procedure. Under the new decisions affecting the validity of administrative law, it was necessary to make court-proof records in all of these determinations. A good result of that necessary step has been the development of a mass of information on air line operation which will be invaluable in the determination of cognate actions.

Huge jig for wing section of the world's largest airplane, designated by the War Department as B-19. This ship, now nearing completion at Douglas' Santa Monica plant, has a wing spread of 210 feet, and will weigh 70 tons, or three times as much as the Douglas DC-4s. Its useful load will be 28 tons.

(Photos courtesy Douglas Aircraft Co., Inc.)

"Wings for the World" by California's

Ships and Shops of one of the Nation's Leading Aircraft Manufacturers

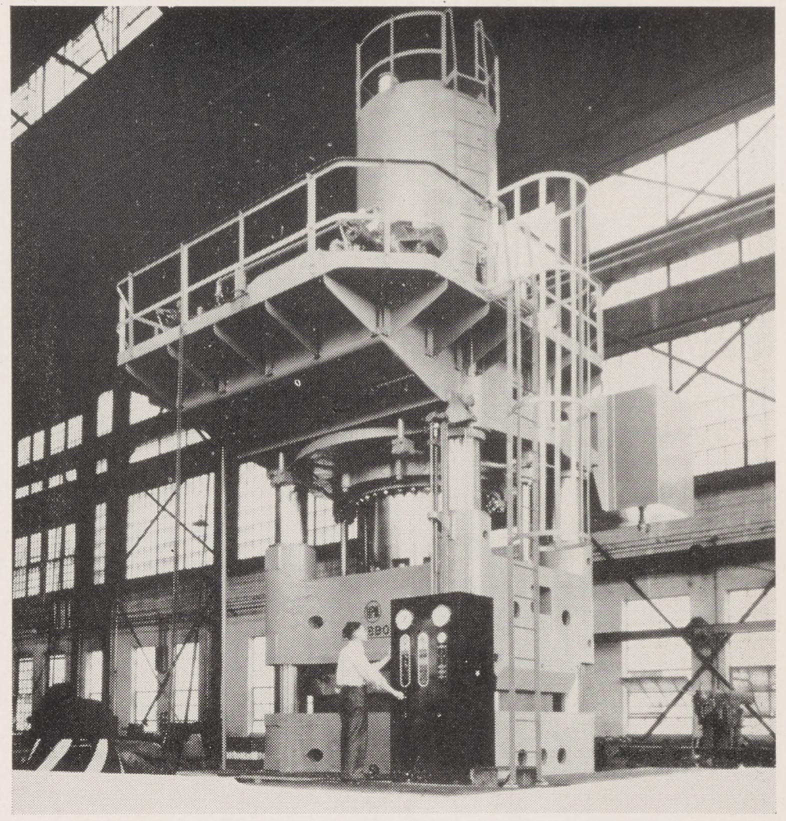
Douglas Aircraft Company, Inc., Santa Monica, California, put 1939 down as the greatest year in its history, and headed into 1940 with further achievements in sight.

Sales, production, pay-rolls and backlog all had reached new peaks. Output was stepped up smoothly as orders of unprecedented proportions poured in from domestic and international airlines, the Army and Navy, and foreign military missions. In early 1940 Douglas was author-

of the plane's inception and its first test flying. Such has been the experience of the past. Yet, illustrative again of the necessity for flexibility and adaptability of aircraft production, Consolidated produced its Model 31 twin-engined flying boat, which can carry 52 passengers, despite its size and inherent large plane complexity, in less than ten months. This was followed with the completion of Consolidated's newest four-engined land bomber, the Model 32, or U.S. Army XB-24, in less than nine months.

This indicates on the surface of things that another change of process of a rather basic nature has been brought about, and a good measure of the credit can be given a new system of lofting which Consolidated has brought into existence. The emphasis in this lofting is a shifting from time-honored engineering scale work to full size, which is almost immediately applicable to shop production. The lofting scheme as worked out sidesteps a tremendous amount of tedious engineering work at a crucial stage in design, and brings the engineering and shop forces into much closer conjunction. Speed, with increased accuracy, is the result.

Change on another front has come about with the installation of very powerful hydraulically-operated presses now being employed by the industry. These utilize rubber in the upper platen to eliminate the female dies in many forming operations. It is often difficult for the layman or uninitiated to realize what can be accomplished with comparative simplicity through the use of this method of forming. Consolidated Aircraft's huge press can exert a pressure of 4,500 tons, which is about the displaced weight of three U.S. destroyers. Under this enormous pressure the sheet dural parts are pressed into shape, and may even be blanked at the same time. Strangely enough, the rubber cannot only form in a downward direction, but press in on the sides and continue to wrap the sheet around the under side of a male die. This is the equivalent of a compound die, with none of its complexity. The action of the rubber is best explained by expressing it as a controlled flow of a liquid. Through the application of this "rubber die" method it can be seen that the emphasis on a lot of the industry's die work has been shifted, and in this case at least, a rather remarkable degree of tool "flexibility" has come into existence.



This 4500-ton press, built by Birdsboro, with H-P-M pump and controls, carries a 10¼-inch thick rubber block on its upper platen for blanking and forming parts from sheet material.

Flexibility in regard to production operations comes into prominence in aircraft production in yet another way. This is brought about by the fact that every ounce of useless metal included in the structure of an airplane is a penalty paid in lost performance, or pay-load capacity. Therefore open structures are quite the rule, and springing or flexing of the work might easily result if such pieces were not adequately supported during machine operations. The machining of aircraft parts calls for supporting the work in perhaps a greater number of cases than in any other field of production. And the tool fixture designer is called upon to exert an extra amount of talent along this line. Aircraft forgings take on greater complexity than elsewhere, due to the battle to save weight, and, of course, clamping and supporting difficulties result. Castings, where used, are light of wall and frequently quite open. Welded structures, such as engine mountings, are even more open, and built-up structures requiring line machining become particularly difficult of solution.

It may easily be seen that the machine tools employed by the industry to handle the constant flux of work must have as wide a degree of adaptability for unusual fixtures as is possible, and be thoroughly capable of handling the gamut of work brought to them. The developments taking place in the aircraft industry can well bear watching, for new methods are bound to arise, particularly since the industry is feeling the necessity for true machine tooling, yet must keep itself agile in the face of each new change.

U. S. Aircraft Factories Increase Capacity to 15,000 Planes a Year

Plants Expand; Day-Night Shifts May Boost Total

NEW YORK, Nov. 12 (A.P.)—The Aeronautical Chamber of Commerce of America today made public a survey of aircraft factory expansion which, it said, showed American plants could turn out 15,000 planes a year.

Projects now underway, said John H. Jouett, president of the chamber, would result in even greater production capacity.

"Our survey," he explained, "included 43 airplane and 13 engine manufacturing plants.

"Of the 43 airplane plants, 23 are now working on orders for military equipment. The current capacity of 1250 planes a month, equal to a rate of 15,000 machines a year, is based on several factors.

SPACE INCREASES 17%

"The airplane factory space increased 6,000,000 square feet to 7,025,000 square feet in the first six months of this year an expansion of 17 percent in manufacturing space. At the same time the aircraft engine factory space increased 334,000 square feet, a 20 percent expansion. All that space is now in use."

Jouett said further that while some aircraft plants were working at full capacity, "others have not even approached their limit with single working shifts. When orders are received in sufficient volume to warrant it the plants go into three working shifts a day."

The chamber said that to obtain maximum output, standardization or "freezing" on a single model in one factory would be necessary. Some plants not working at top speed are still producing as many as seven or eight different types of planes.

"Another factor which has increased plant capacity," said Jouett, "is the recent growth of the sub-contracting system.

SUB-CONTRACTS AID

"Sub-contracting in the past was a very small part of aircraft production because the manufacturer could not guarantee the sub-contractor continuous business and the sub-contractor could not tool up sufficiently to assure a return on his investment. * * *

"With increased orders and the larger unit volume on each order, all plants in the industry which are not working on their own business and filling original orders of their own are available for sub-contracting. In other words, this opens the entire manufacturing industry to full time production.

"Our survey showed that the industry is capable of rapid expansion of production on all types of military aircraft, including the special types used by the navy air forces."

OVERHAULED GUBA TAKES TEST HOPS

Sun 12-10-39

After more than four months of idleness while receiving a complete overhaul in the Consolidated Aircraft Corp. plant, the widely traveled airboat Guba of Richard Archbold, wealthy scientist-aviator, received its first test hops over the bay yesterday.

Chief Pilot Russ Rogers announced that the craft, which was used to transport personnel and supplies to hitherto inaccessible regions in Netherlands New Guinea during a scientific expedition which ended last summer, may be flown to New York City for the winter unless adequate hangar space can be provided in San Diego.

Mr. Archbold, in a recently purchased Fleetwing four-passenger cabin plane, is expected to arrive here from the East coast next month, according to Mr. Rogers.

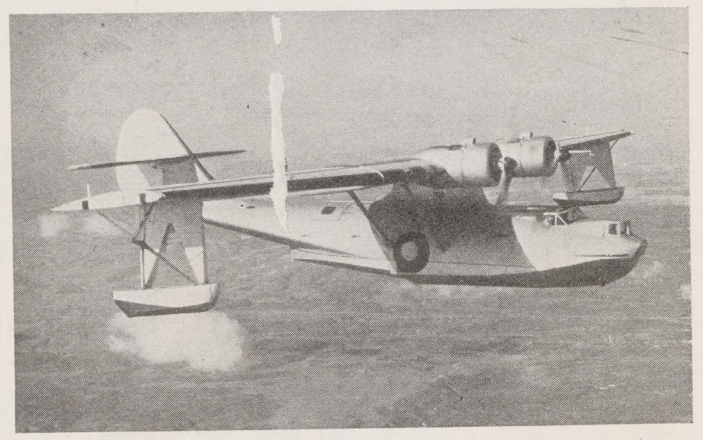
AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

Jan '40 WESTERN FLYING.

THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.

INSPECTS PLANT — Maj. Gen. Emmons visits San Diego aircraft plant to view new Army bomber.

Emmons Sees Great Bomber

Air Corps Commander Watches Third Test Flight at San Diego

SAN DIEGO, Jan. 16.—French and Brazilian military officers today stood on the side lines only a few paces away from Maj. Gen. Delos C. Emmons, commander of the Army Air Corps G.H.Q., as the Army's most powerful completed bomber, the four-motored Consolidated XB-24, was given its third test flight on Lindbergh Field.

The foreign observers were here to confer with Consolidated officials in connection with possible acquisition of flying equipment available for export. The local concern manufactures long-range navy patrol boats, as well as giant army planes.

Maj. Gen. Emmons spent several hours inspecting the Consolidated plant and left late today for March Field to observe the G.H.Q. first wing's participation in this week's joint Army-Navy maneuvers which will test California's vulnerability to invasion.

He arrived this afternoon in a Douglas Army transport from his Langley Field (Va.) headquarters. Accompanying him are Capt. W. Goss, pilot and aide; Maj. H. A. McGinnis of the Inspector General's Department and Lieut. Col. Cedric Lewis, signal officer of the G.H.Q.

Air Force Commander Arrives at March Field

MARCH FIELD, Jan. 16.—Maj. Gen. Delos T. Emmons, commanding general, G.H.Q. Air Force, arrived at March Field at 4:25 p.m. today accompanied by Col. A. S. Pederneiras of the Brazilian Air Force. He was accorded a 13-gun salute. Gen. Emmons tomorrow will visit airplane factories in Los Angeles.

HITLER'S AIR PLANS

Building up his Bomber Forces

From Our Air Correspondent

LONDON, Tuesday Night

TO expect the worst and to prepare to meet it is the only sound defensive maxim and it should be rigorously applied at the present time Things have been going well in the Middle East and in Greece, but that does not mean that we should expect them automatically to begin to go well here.

Rather the expectation should be that there will be further and heavier attacks. For although there have been lulls, there has been nothing to suggest that they are of other than tactical origin. On the contrary, the easiest way to interpret them is as periods of recuperation for the *Luftwaffe* to be followed by more intensive action

It is true that, since Friday last, the Royal Air Force has been making raids on German-occupied aerodromes in France and Holland, but I doubt if such raids could do more than diminish very slightly the scale of the attack. The reason is that the Germans enjoy the use of a huge number of aerodromes, both in Germany and in occupied territory.

MANY AERODROMES

In France alone the number must be about 500, and of these a fairly high proportion would be well suited as bases for the night raiders. In Holland and Belgium there are more aerodromes, and behind them, more difficult to reach for our bombers, there are the German aerodromes, of which there must be more than 600.

It is obvious that the task of attacking so large a number of aerodromes that the enemy would be unable to launch his night raids is so immense that no air force could undertake it. The most that can be hoped for is that some of the aerodromes which are most useful to the enemy shall be knocked about, and this, it seems, was successfully done.

The lulls in night raiding may have been partly caused by these attacks, but that is all. For the rest, they may be due to the desire on the part of the enemy to conserve his bomber forces and to build them up to greater strength for some coming offensive of great ferocity.

The *Luftwaffe* has had heavy losses during the summer and autumn. It has, moreover, measured itself against the R.A.F. and found itself relatively less strong than it had thought. Field-Marshal Goering keeps a wary eye on our production and knows that it is swinging up and being augmented still further by United States production.

Yet the attempt to defeat Great Britain in these islands cannot have been abandoned as a primary German objective. It would be the key to saving Italy, it would fulfil Herr Hitler's dearest ambition, it would sort out all the Axis troubles. But to defeat Britain in these islands the Germans now know that a bigger effort than anything they have so far been able to put out is needed.

So they use this period for weakening us so far as they can by submarine warfare and by intermittent night raids, while not risking great numbers of their aircraft in day raids or in night raids when the weather is such that the number of accidents seems likely to be high.

Night flying under war conditions always entails many accidents, and it is surprising what heavy losses a night bomber force can suffer from this cause alone. The *Luftwaffe* bombers may have been depleted by accidents on a big scale during their attempts to sustain the bombardment of these islands during spells of bad weather.

At any rate, the present method does enable aircraft to be conserved and gives Field-Marshal Goering a chance to build up his forces. And that, I think, is the interpretation of it. There may be moves of some machines to another theatre, but if the aim is to strike in the Balkans or the Middle East the conservation and hoarding tactics are still needed. They would not be forced upon the Germans by a move because the aircraft do not take long to shift; it is the ground equipment that takes the time.

Our object then must be to prepare energetically to meet a new German air offensive. To that end we must increase the strength of the Royal Air Force and push forward with technical improvements. Higher speeds and better climb are the needs, for if we beat them once by technical merit we can beat them again by the same means.

It is clear that we have been able to reinforce our Air Force in the Middle East and also to lend fairly substantial air aid to the Greeks. We have been using not only the Gloster Gladiator fighters in those theatres but also the later Hurricanes. In addition, we have used Blenheims in fairly large numbers and some of the Wellington heavy bombers.

STILL MORE 'PLANES

But what we have done in the past in the way of increasing our air strength must be overtopped in the future if we are to meet with full confidence the coming attack wherever it may be launched. Moreover, there is always our own offensive to be considered, for it comes nearer and nearer to the range of practical possibility. So that not only must our fighter forces be enormously increased but so must our bomber forces.

Especially important will be the coastal reconnaissance types of aircraft and the torpedo-carriers. If, as has been suggested, we are to get some of the Consolidated 31 flying boats from America they should be of the greatest help to the Coastal Command in dealing with the submarine menace and also with the menace of the surface raiders.

Robert N. Hinckley, Chairman. Term of office expires 1943.

Civil Aeronautics Authori
BIRTHDA

By Robert H. Hinckley
Chairman

WHEN the members of the Civil Aeronautics Authority, the Administrator and the Air Safety Board took the oath of office slightly more than a year ago, we found ourselves confronted by a threefold task which in all conscience seemed large to us. We were charged by Congress and the President with the new duty of economic regulation as applied to civil aeronautics; we inherited the duty of providing, maintaining, extending and improving the aids to navigation of the common air; we were charged, and in a very particular way this bore upon our conscience, with the duty of increasing the safety, and therefore the utility, of all flying.

Statistics on Growth

Just to indicate what this growth has been, the scheduled air lines in the month of June carried 164,578 passengers, 64¼ percent more than June a year ago. During the first six months of this year, 1627 airplanes were produced for domestic civil use in the United States, only about 40 of them going to the airlines, the rest being purchased and used by private and nonscheduled flyers. Compared to the first six months of 1938, when 850 civil airplanes were made and sold for domestic use, this is an increase of over 90 percent in production and sales.

Today 26,144 pilots hold certificates, 6,000 more than a year ago, an increase of about 30 percent. There are 11,160 certificated airplanes today, 1,400 more than a year ago or an increase of almost 15 percent, an increase that will be moved startlingly upward by the production figures of the first six months if they are maintained on an annual basis.

The increase in pilots according to every indication of our charts will be even more startling. Even without the Authority's own pilot training program, the curves show that there would be 36,000 certificated pilots by the end of 1940, and 43,000 by the end of 1941. Taking into account the student pilot training program, however, the number of pilot certificates in force by the end of 1941 ought to approximate 70,000 of all classes.

Airways Extended

The federal airways within the United States have been increased by about 10 percent in length to a total now over 25,000 miles. The aids to navigation along these airways have been increased by about the same amount. But that is not as good a measure of their increased usefulness as is the almost complete modernization of existing radio and other aids and the plans now under development for their possible conversion into the new ultra-high frequency category, where they will become even more useful and reliable.

Perhaps no occurrence within this year is of more importance to the United States than the extension of our foreign lines across the North Atlantic, where for the first time, under the American flag, airplanes are flying regularly twice a week between here and Europe. Plans have been proposed for the further extension of our lines in the east to New Zealand. Our flag now flies in the air from Nome, Alaska, to Buenos Aires in the Argentine, and from Hong Kong, China, to Marseilles in France.

Backing up all of these extensions and additions to our civil aviation plant, the Authority is at this moment, thanks to the $4,000,000 appropriation in the Third Deficiency Bill, actually making the arrangements for the training of 10,000 student pilots next year by methods we know through test to be methods that produce safe pilots.

Air Traffic Regulation

Congress, in the Civil Aeronautics Act of 1938, recognized for the first time that air transportation had become a utility whose economic soundness was of sufficient importance to the people as a whole to warrant its regulation in a fashion long familiar with public utilities.

The existing system of scheduled air mail carriers is now legally a public utility. All of the certificates under the so-called "grandfather clause" of the Act have been issued to the air mail carriers after the fullest investigation of the adequacy and efficiency of the services they have rendered. This has not been a merely routine procedure. Under the new decisions affecting the validity of administrative law, it was necessary to make court-proof records in all of these determinations. A good result of that necessary step has been the development of a mass of information on air line operation which will be invaluable in the determination of cognate actions.

speeds between 110 miles per hour and the maximum 2-engine speed, and in this condition it is also possible to make turns with ailerons alone (rudder free). Loaded to its maximum gross weight, the airplane can climb to nearly 8,000 feet with two engines inoperative.

The design of the plane is such that the sudden failure of an engine at any point during takeoff is no cause of concern. In the event of an engine failure at any point beyond 1,750 feet from the start of the takeoff run, it is possible to hold to course and continue the takeoff and climb, or, if a failure should occur within the first 1,750 feet, to bring the airplane to a stop on the airport runway. The plane is also so designed that it is impossible to make a stall takeoff.

● Altitude-Conditioning

The Stratoliner is comfort-conditioned at high altitudes by means of an automatic cabin supercharging, heating and ventilating system. The effect of this is simply to increase the density of rarefied high-altitude air so that it is the equivalent of low-altitude air as it circulates through the cabin.

During high altitude operation, the atmospheric pressure inside the abin exceeds the outside atmospheric pressure by 2½ lbs. per sq. in. This s less than half of the six pounds er square inch differential pressure or which the cabin is designed. With his moderate degree of cabin supercharging, the Stratoliner is able to perate with passenger comfort in he altitude ranges between 14,000 to 0,000 feet.

Advantages of the "altitude-conlitioning" system are: (1) It ineases comfort in the cabin during peration in the upper ranges of conentional flight altitudes, which are ormally limited to the neighborhood f 12,000 feet; (2) It makes it posible to go to higher altitudes at will, n order to override surface weather onditions, gain smoother air, steader winds, and swifter flight because f the decreased air resistance. light research conducted in advance f the Stratoliners by D. W. Tomlinon, T.W.A. chief engineer, has led the conclusion that more than 95 er cent of all "bad weather" is voided at levels of 18,000 to 20,000 eet.

At all altitudes between 8,000 feet and 14,700 feet, the atmospheric conditions in the cabin remain the equivalent of 8,000 feet. At 16,000 feet actual altitude, the "apparent altitude" in the cabin is 9,000 feet. At 18,000 feet, the "cabin altitude" is 10,600 feet, and at 20,000 feet it is 12,300 feet.

The cabin supercharging system is installed completely in duplicate, and can operate on either of the two sets of identical equipment. The automatic cabin-pressure regulation is accomplished in a simple manner by means of a system of control valves that function by natural reaction to the pressures involved. The flight engineer in the control cabin has a compact panel of four instruments to follow the automatic operation of the system, and four simple controls for special regulation if desired.

The routing of ventilation air through either half of the duplicate system may be described briefly as follows:

Fresh air enters an intake in the leading edge of the wing, passes through a water separator and into a mechanical supercharger driven by the inboard engine. Here the air is rotated at high speed and its density is increased. It then passes through a thermostatically-controlled steam heating unit in the engine nacelle.

Before the air enters the cabin, it passes through an automatic flow control valve located in the accessory compartment below deck. It then passes through a distribution valve, to be directed into the cabin either through a series of floor-level grilles or a series of overhead grilles and individual outlets at passenger seats and berths, or both, at the option of the cabin attendant.

After the air has circulated through the cabin it passes through vents in the floor to an automatic outlet control valve in the accessory compartment below deck, where it is discharged to the outside atmosphere. The proper atmospheric pressure in the cabin is automatically maintained by this outlet control valve and the duplicate one in the other half of the system. There is also a relief valve in the rear of the cabin that discharges any excess atmospheric pressures if both main outlet valves should be closed. An auxiliary ventilation system is provided for low-altitude, non-supercharged operation.

● Passenger Accommodations

The Stratoliner's roomy interior is laid out to take full advantage of the size of the plane. A compartment style of interior arrangement is used, with four 6-passenger compartments along the right side of the plane, opposite which are nine individual reclining chairs along the left side of the main aisleway. The compartments have davenport-type seats which are designed for complete relaxation, with large dimensions and an exceptionally soft cushioning substance made of curled and rubberized Australian horsehair. At night these seats are converted into upper and lower berths, which run transversely in the cabin and hence provide exceptional headroom as well as unusual width and length.

Forward of the main passenger cabin, just behind the control cabin, is a large dressing room for men, with two wash basins, wall mirrors, electric razor outlets, and a convenient corner seat. At the left rear of the cabin is the ship's galley, containing complete facilities for rapid service of full-course meals. At the right rear is the women's "Charm Room," a special feature of the plane. It has an expanse of plate-glass mirrors covering the upper wall area, smartly-styled dressing tables and an attractive feminine color scheme.

The passenger cabin is club-like in appearance, with rich carpeting, warm-toned drapes and furniture upholstery, attractive hardwood veneer on compartment walls, and a pleasant color variety, including a different shade of furniture tapestry for each compartment.

Among the interesting features is the hostess call system. Call-buttons at passenger seats and berths are connected with little green signal lights along the main aisleway, which summon one of the two hostesses to the desired location.

The main cabin is indirectly lighted by concealed lights along a central channel at the ceiling, in addition to which there are individual reading lights at seats and berths. The entire airplane is thoroughly soundproofed. Even the individual ventilators—which are neat, adjustable ball-and-socket devices at passenger seats and berths—are made of sound-deadening plastic material, so designed as to be silent in operation.

DAY MORNING, NOV. 13, 1939

S.D. Union

U. S. Aircraft Factories Increase Capacity to 15,000 Planes a Year

Plants Expand; Day-Night Shifts May Boost Total

NEW YORK, Nov. 12 (A.P.)—The Aeronautical Chamber of Commerce of America today made public a survey of aircraft factory expansion which, it said, showed American plants could turn out 15,000 planes a year.

Projects now underway, said John H. Jouett, president of the chamber, would result in even greater production capacity.

"Our survey," he explained, "included 43 airplane and 13 engine manufacturing plants.

"Of the 43 airplane plants, 23 are now working on orders for military equipment. The current capacity of 1250 planes a month, equal to a rate of 15,000 machines a year, is based on several factors.

SPACE INCREASES 17%

"The airplane factory space increased 6,000,000 square feet to 7,025,000 square feet in the first six months of this year an expansion of 17 percent in manufacturing space. At the same time the aircraft engine factory space increased 334,000 square feet, a 20 percent expansion. All that space is now in use."

Jouett said further that while some aircraft plants were working at full capacity, "others have not even approached their limit with single working shifts. When orders are received in sufficient volume to warrant it the plants go into three working shifts a day."

The chamber said that to obtain maximum output, standardization or "freezing" on a single model in one factory would be necessary. Some plants not working at top speed are still producing as many as seven or eight different types of planes.

"Another factor which has increased plant capacity," said Jouett, "is the recent growth of the sub-contracting system.

SUB-CONTRACTS AID

"Sub-contracting in the past was a very small part of aircraft production because the manufacturer could not guarantee the sub-contractor continuous business and the sub-contractor could not tool up sufficiently to assure a return on his investment. * * *

"With increased orders and the larger unit volume on each order, all plants in the industry which are not working on their own business and filling original orders of their own are available for sub-contracting. In other words, this opens the entire manufacturing industry to full time production.

"Our survey showed that the industry is capable of rapid expansion of production on all types of military aircraft, including the special types used by the navy air forces."

OVERHAULED GUBA TAKES TEST HOPS

Sun 12-10-39

After more than four months of idleness while receiving a complete overhaul in the Consolidated Aircraft Corp. plant, the widely traveled airboat Guba of Richard Archbold, wealthy scientist-aviator, received its first test hops over the bay yesterday.

Chief Pilot Russ Rogers announced that the craft, which was used to transport personnel and supplies to hitherto inaccessible regions in Netherlands New Guinea during a scientific expedition which ended last summer, may be flown to New York City for the winter unless adequate hangar space can be provided in San Diego.

Mr. Archbold, in a recently purchased Fleetwing four-passenger cabin plane, is expected to arrive here from the East coast next month, according to Mr. Rogers.

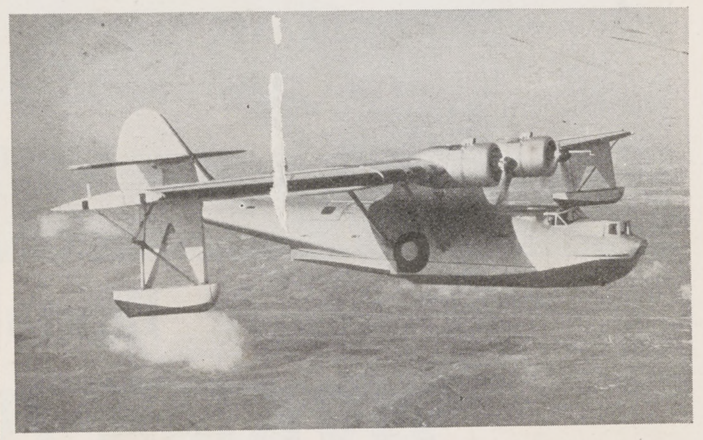
AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

Jan 40 WESTERN FLYING.

THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.

INSPECTS PLANT — Maj. Gen. Emmons visits San Diego aircraft plant to view new Army bomber.

Emmons Sees Great Bomber

Air Corps Commander Watches Third Test Flight at San Diego

SAN DIEGO, Jan. 16.—French and Brazilian military officers today stood on the side lines only a few paces away from Maj. Gen. Delos C. Emmons, commander of the Army Air Corps G.H.Q., as the Army's most powerful completed bomber, the four-motored Consolidated XB-24, was given its third test flight on Lindbergh Field.

The foreign observers were here to confer with Consolidated officials in connection with possible acquisition of flying equipment available for export. The local concern manufactures long-range navy patrol boats, as well as giant army planes.

Maj. Gen. Emmons spent several hours inspecting the Consolidated plant and left late today for March Field to observe the G.H.Q. first wing's participation in this week's joint Army-Navy maneuvers which will test California's vulnerability to invasion.

He arrived this afternoon in a Douglas Army transport from his Langley Field (Va.) headquarters. Accompanying him are Capt. W. Goss, pilot and aide; Maj. H. A. McGinnis of the Inspector General's Department and Lieut. Col. Cedric Lewis, signal officer of the G.H.Q.

Air Force Commander Arrives at March Field

MARCH FIELD, Jan. 16.—Maj. Gen. Delos T. Emmons, commanding general, G.H.Q. Air Force, arrived at March Field at 4:25 p.m. today accompanied by Col. A. S. Pederneiras of the Brazilian Air Force. He was accorded a 13-gun salute. Gen. Emmons tomorrow will visit airplane factories in Los Angeles.

HITLER'S AIR PLANS

Building up his Bomber Forces

From Our Air Correspondent

LONDON, Tuesday Night

TO expect the worst and to prepare to meet it is the only sound defensive maxim and it should be rigorously applied at the present time Things have been going well in the Middle East and in Greece, but that does not mean that we should expect them automatically to begin to go well here.

Rather the expectation should be that there will be further and heavier attacks. For although there have been lulls, there has been nothing to suggest that they are of other than tactical origin. On the contrary, the easiest way to interpret them is as periods of recuperation for the *Luftwaffe* to be followed by more intensive action

It is true that, since Friday last, the Royal Air Force has been making raids on German-occupied aerodromes in France and Holland, but I doubt if such raids could do more than diminish very slightly the scale of the attack. The reason is that the Germans enjoy the use of a huge number of aerodromes, both in Germany and in occupied territory.

MANY AERODROMES

In France alone the number must be about 500, and of these a fairly high proportion would be well suited as bases for the night raiders. In Holland and Belgium there are more aerodromes, and behind them, more difficult to reach for our bombers, there are the German aerodromes, of which there must be more than 600.

It is obvious that the task of attacking so large a number of aerodromes that the enemy would be unable to launch his night raids is so immense that no air force could undertake it. The most that can be hoped for is that some of the aerodromes which are most useful to the enemy shall be knocked about, and this, it seems, was successfully done.

The lulls in night raiding may have been partly caused by these attacks, but that is all. For the rest, they may be due to the desire on the part of the enemy to conserve his bomber forces and to build them up to greater strength for some coming offensive of great ferocity.

The *Luftwaffe* has had heavy losses during the summer and autumn. It has, moreover, measured itself against the R.A.F. and found itself relatively less strong than it had thought. Field-Marshal Goering keeps a wary eye on our production and knows that it is swinging up and being augmented still further by United States production.

Yet the attempt to defeat Great Britain in these islands cannot have been abandoned as a primary German objective. It would be the key to saving Italy, it would fulfil Herr Hitler's dearest ambition, it would sort out all the Axis troubles. But to defeat Britain in these islands the Germans now know that a bigger effort than anything they have so far been able to put out is needed.

So they use this period for weakening us so far as they can by submarine warfare and by intermittent night raids, while not risking great numbers of their aircraft in day raids or in night raids when the weather is such that the number of accidents seems likely to be high.

Night flying under war conditions always entails many accidents, and it is surprising what heavy losses a night bomber force can suffer from this cause alone. The *Luftwaffe* bombers may have been depleted by accidents on a big scale during their attempts to sustain the bombardment of these islands during spells of bad weather.

At any rate, the present method does enable aircraft to be conserved and gives Field-Marshal Goering a chance to build up his forces. And that, I think, is the interpretation of it. There may be moves of some machines to another theatre, but if the aim is to strike in the Balkans or the Middle East the conservation and hoarding tactics are still needed. They would not be forced upon the Germans by a move because the aircraft do not take long to shift; it is the ground equipment that takes the time.

Our object then must be to prepare energetically to meet a new German air offensive. To that end we must increase the strength of the Royal Air Force and push forward with technical improvements. Higher speeds and better climb are the needs, for if we beat them once by technical merit we can beat them again by the same means.

It is clear that we have been able to reinforce our Air Force in the Middle East and also to lend fairly substantial air aid to the Greeks. We have been using not only the Gloster Gladiator fighters in those theatres but also the later Hurricanes. In addition, we have used Blenheims in fairly large numbers and some of the Wellington heavy bombers.

STILL MORE 'PLANES

But what we have done in the past in the way of increasing our air strength must be overtopped in the future if we are to meet with full confidence the coming attack wherever it may be launched. Moreover, there is always our own offensive to be considered, for it comes nearer and nearer to the range of practical possibility. So that not only must our fighter forces be enormously increased but so must our bomber forces.

Especially important will be the coastal reconnaissance types of aircraft and the torpedo-carriers. If, as has been suggested, we are to get some of the Consolidated 31 flying boats from America they should be of the greatest help to the Coastal Command in dealing with the submarine menace and also with the menace of the surface raiders.

Robert N. Hinckley, Chairman. Term of office expires 1943.

Civil Aeronautics Authori

BIRTHDA

By Robert H. Hinckley

Chairman

WHEN the members of the Civil Aeronautics Authority, the Administrator and the Air Safety Board took the oath of office slightly more than a year ago, we found ourselves confronted by a threefold task which in all conscience seemed large to us. We were charged by Congress and the President with the new duty of economic regulation as applied to civil aeronautics; we inherited the duty of providing, maintaining, extending and improving the aids to navigation of the common air; we were charged, and in a very particular way this bore upon our conscience, with the duty of increasing the safety, and therefore the utility, of all flying.

Statistics on Growth

Just to indicate what this growth has been, the scheduled air lines in the month of June carried 164,578 passengers, 64¼ percent more than June a year ago. During the first six months of this year, 1627 airplanes were produced for domestic civil use in the United States, only about 40 of them going to the airlines, the rest being purchased and used by private and nonscheduled flyers. Compared to the first six months of 1938, when 850 civil airplanes were made and sold for domestic use, this is an increase of over 90 percent in production and sales.

Today 26,144 pilots hold certificates, 6,000 more than a year ago, an increase of about 30 percent. There are 11,160 certificated airplanes today, 1,400 more than a year ago or an increase of almost 15 percent, an increase that will be moved startlingly upward by the production figures of the first six months if they are maintained on an annual basis.

The increase in pilots according to every indication of our charts will be even more startling. Even without the Authority's own pilot training program, the curves show that there would be 36,000 certificated pilots by the end of 1940, and 43,000 by the end of 1941. Taking into account the student pilot training program, however, the number of pilot certificates in force by the end of 1941 ought to approximate 70,000 of all classes.

Airways Extended

The federal airways within the United States have been increased by about 10 percent in length to a total now over 25,000 miles. The aids to navigation along these airways have been increased by about the same amount. But that is not as good a measure of their increased usefulness as is the almost complete modernization of existing radio and other aids and the plans now under development for their possible conversion into the new ultra-high frequency category, where they will become even more useful and reliable.

Perhaps no occurrence within this year is of more importance to the United States than the extension of our foreign lines across the North Atlantic, where for the first time, under the American flag, airplanes are flying regularly twice a week between here and Europe. Plans have been proposed for the further extension of our lines in the east to New Zealand. Our flag now flies in the air from Nome, Alaska, to Buenos Aires in the Argentine, and from Hong Kong, China, to Marseilles in France.

Backing up all of these extensions and additions to our civil aviation plant, the Authority is at this moment, thanks to the $4,000,000 appropriation in the Third Deficiency Bill, actually making the arrangements for the training of 10,000 student pilots next year by methods we know through test to be methods that produce safe pilots.

Air Traffic Regulation

Congress, in the Civil Aeronautics Act of 1938, recognized for the first time that air transportation had become a utility whose economic soundness was of sufficient importance to the people as a whole to warrant its regulation in a fashion long familiar with public utilities.

The existing system of scheduled air mail carriers is now legally a public utility. All of the certificates under the so-called "grandfather clause" of the Act have been issued to the air mail carriers after the fullest investigation of the adequacy and efficiency of the services they have rendered. This has not been a merely routine procedure. Under the new decisions affecting the validity of administrative law, it was necessary to make court-proof records in all of these determinations. A good result of that necessary step has been the development of a mass of information on air line operation which will be invaluable in the determination of cognate actions.

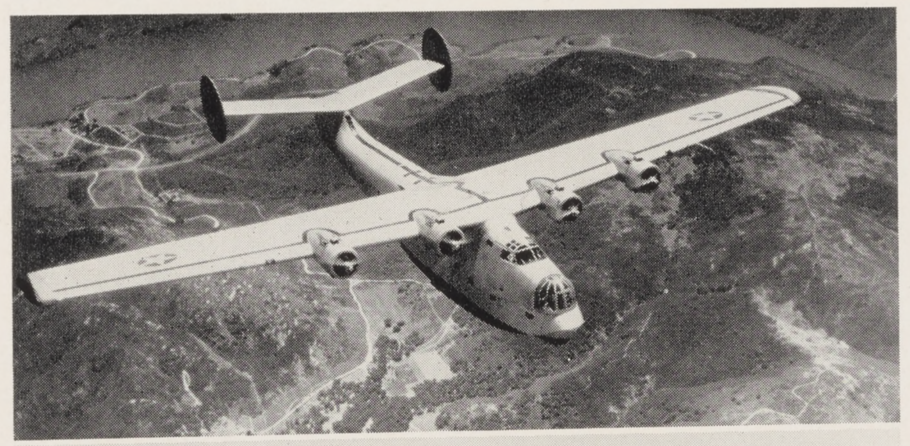
Machine Tool Flexibility— the Keynote At Consolidated Aircraft in San Diego



Consolidated Model 29 four-engined flying boat prototype, the XPB2Y-1, built for the U. S. Navy.

XB-24 Army bomber on Lindbergh Field.

Famous Consolidated Model 28 twin-engined flying boat which has established remarkable series of long-distance, non-stop massed flights.

Model 28-5A twin-engined amphibian, the world's largest amphibian plane, which can fly to or from practically any spot on the surface of the globe.

(Photos Consolidated Aircraft Corporation)

That the aircraft industry is at this moment in a fluxional stage of development, few will deny. Flexibility, adaptability and speed are the keynotes of the whole atmosphere surrounding the industry's challenge to meet the huge series of orders pouring in. Flexibility and adaptability of the machine tools selected for the industry's use naturally follows, for it may be assumed without question that such equipment will be pressed into a wide range of work, and it goes without saying that the production rate will be high.

Aviation's transition from the wood and fabric days through the gamut of materials to the present, which exemplifies an almost universal leaning upon all-metal construction, has been accomplished through complete flexibility of aircraft production methods. The rapidity with which the changes have come, and their more recent magnitude, have placed particular emphasis upon this ability to meet change both quickly and well. Thus the highly-important phases of aircraft tooling and machine work, which continuously demand a high degree of accuracy, must employ equipment with which it is possible to accomplish, upon short notice, rather radical changes in procedure.

Consolidated Aircraft Corporation at San Diego lends itself as an instance of this. Consolidated's trend has been a virtual specialization upon large craft. This is shown in the fact that it recently sold its rights to the smaller airplane designs upon which it gained its start toward its present position as the world's largest builder of flying boats, and, in the years just past, has built and delivered the largest total order for twin-engined flying boats ever placed by the Government. These were the Model 28s, or, as they are known to the U.S. Navy, the PBYs. Such a specialization might indicate a freezing of production methods, but such is not the case. A rather remarkable flexibility was necessary to meet the production requirements.

In 1935 Consolidated moved its entire plant from Buffalo, N.Y., to San Diego, which was an industrial move of some 3,000 miles. Logically, in so doing, Consolidated shed much of its older machine tool equipment, which ordinarily might have been retained for some time, and acquired new. The new plant at San Diego was specially designed and built to specifications calculated to make it one of the most modern aircraft plants in existence. Thus, less than five years ago, in a completely new plant, with a large proportion of new machine equipment, aircraft production got under way on the first of the Model 28s. But the 28s were destined for more than just this, and shortly thereafter a greater volume of business than was anticipated for the future at the time of the building of the plant was received, and expansion became necessary. Further acquisition of new machinery to complement the building additions was made, and the percentage of factory machine equipment less than five years old was still further raised.

The plant's business has outstripped anticipation, and currently a plant expansion amounting to 87 per cent is under way. The new buildings have been scheduled for completion by August 1. More new equipment is being added—jig borers; millers, both horizontal and vertical; boring machines; threaders; lathes; automatic screw machines; drop hammers; radial drills; shears; tool grinders; power rolls; draw benches and other pieces; are being set up and swung into full production almost as rapidly as received.

When Consolidated Aircraft moved to San Diego, it had received its first order for 60 Model 28 twin-engined flying boats. This, while a large order for craft of this size, did not present a difficult problem of tooling, for 60 ships is not a great number of a single type to make. Assembly boards, assembly fixtures, a great percentage of the necessary form blocks, tools and production aids were constructed of wood. These, in hardwood suitably treated, serve admirably for such a contract of small proportions, and their low cost of production is an item in their favor. Not an exceptional number of special machine fixtures were required for this design and number. But Consolidated's Model 28s were destined to become the outstanding flying boats of their type, and repeat orders followed, until over 200, plus spares, were on the production schedule. It became apparent that the original wood tooling was in places impractical because it would not stand up under continued production. Tooling for such an order, with steel replacing wood, is costly, as may easily be realized. This is especially so because of the thousands of such pieces necessary, and the importance

DAY MORNING, NOV. 13, 1939

S.D. Union

U. S. Aircraft Factories Increase Capacity to 15,000 Planes a Year

Plants Expand; Day-Night Shifts May Boost Total

NEW YORK, Nov. 12 (A.P.)—The Aeronautical Chamber of Commerce of America today made public a survey of aircraft factory expansion which, it said, showed American plants could turn out 15,000 planes a year.

Projects now underway, said John H. Jouett, president of the chamber, would result in even greater production capacity.

"Our survey," he explained, "included 43 airplane and 13 engine manufacturing plants.

"Of the 43 airplane plants, 23 are now working on orders for military equipment. The current capacity of 1250 planes a month, equal to a rate of 15,000 machines a year, is based on several factors.

SPACE INCREASES 17%

"The airplane factory space increased 6,000,000 square feet to 7,025,000 square feet in the first six months of this year an expansion of 17 percent in manufacturing space. At the same time the aircraft engine factory space increased 334,000 square feet, a 20 percent expansion. All that space is now in use."

Jouett said further that while some aircraft plants were working at full capacity, "others have not even approached their limit with single working shifts. When orders are received in sufficient volume to warrant it the plants go into three working shifts a day."

The chamber said that to obtain maximum output, standardization or "freezing" on a single model in one factory would be necessary. Some plants not working at top speed are still producing as many as seven or eight different types of planes.

"Another factor which has increased plant capacity," said Jouett, "is the recent growth of the subcontracting system.

SUB-CONTRACTS AID

"Sub-contracting in the past was a very small part of aircraft production because the manufacturer could not guarantee the sub-contractor continuous business and the sub-contractor could not tool up sufficiently to assure a return on his investment. * * *

"With increased orders and the larger unit volume on each order, all plants in the industry which are not working on their own business and filling original orders of their own are available for sub-contracting. In other words, this opens the entire manufacturing industry to full time production.

"Our survey showed that the industry is capable of rapid expansion of production on all types of military aircraft, including the special types used by the navy air forces."

OVERHAULED GUBA TAKES TEST HOPS

Sun 12-10-39

After more than four months of idleness while receiving a complete overhaul in the Consolidated Aircraft Corp. plant, the widely traveled airboat Guba of Richard Archbold, wealthy scientist-aviator, received its first test hops over the bay yesterday.

Chief Pilot Russ Rogers announced that the craft, which was used to transport personnel and supplies to hitherto inaccessible regions in Netherlands New Guinea during a scientific expedition which ended last summer, may be flown to New York City for the winter unless adequate hangar space can be provided in San Diego.

Mr. Archbold, in a recently purchased Fleetwing four-passenger cabin plane, is expected to arrive here from the East coast next month, according to Mr. Rogers.

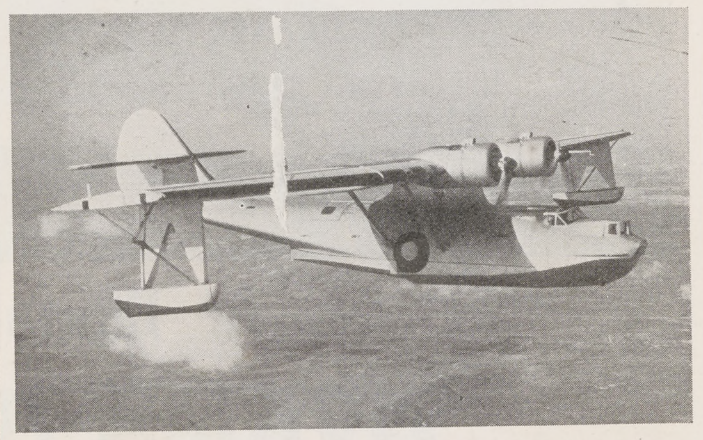
AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

Jan '40 WESTERN FLYING.

THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.

INSPECTS PLANT — Maj. Gen. Emmons visits San Diego aircraft plant to view new Army bomber.

Emmons Sees Great Bomber

Air Corps Commander Watches Third Test Flight at San Diego

SAN DIEGO, Jan. 16.—French and Brazilian military officers today stood on the side lines only a few paces away from Maj. Gen. Delos C. Emmons, commander of the Army Air Corps G.H.Q., as the Army's most powerful completed bomber, the four-motored Consolidated XB-24, was given its third test flight on Lindbergh Field.

The foreign observers were here to confer with Consolidated officials in connection with possible acquisition of flying equipment available for export. The local concern manufactures long-range navy patrol boats, as well as giant army planes.

Maj. Gen. Emmons spent several hours inspecting the Consolidated plant and left late today for March Field to observe the G.H.Q. first wing's participation in this week's joint Army-Navy maneuvers which will test California's vulnerability to invasion.

He arrived this afternoon in a Douglas Army transport from his Langley Field (Va.) headquarters. Accompanying him are Capt. W. Goss, pilot and aide; Maj. H. A. McGinnis of the Inspector General's Department and Lieut. Col. Cedric Lewis, signal officer of the G.H.Q.

Air Force Commander Arrives at March Field

MARCH FIELD, Jan. 16.—Maj. Gen. Delos T. Emmons, commanding general, G.H.Q. Air Force, arrived at March Field at 4:25 p.m. today accompanied by Col. A. S. Pederneiras of the Brazilian Air Force. He was accorded a 13-gun salute. Gen. Emmons tomorrow will visit airplane factories in Los Angeles.

HITLER'S AIR PLANS

Building up his Bomber Forces

From Our Air Correspondent

LONDON, Tuesday Night

TO expect the worst and to prepare to meet it is the only sound defensive maxim and it should be rigorously applied at the present time Things have been going well in the Middle East and in Greece, but that does not mean that we should expect them automatically to begin to go well here.

Rather the expectation should be that there will be further and heavier attacks. For although there have been lulls, there has been nothing to suggest that they are of other than tactical origin. On the contrary, the easiest way to interpret them is as periods of recuperation for the *Luftwaffe* to be followed by more intensive action

It is true that, since Friday last, the Royal Air Force has been making raids on German-occupied aerodromes in France and Holland, but I doubt if such raids could do more than diminish very slightly the scale of the attack. The reason is that the Germans enjoy the use of a huge number of aerodromes, both in Germany and in occupied territory.

MANY AERODROMES

In France alone the number must be about 500, and of these a fairly high proportion would be well suited as bases for the night raiders. In Holland and Belgium there are more aerodromes, and behind them, more difficult to reach for our bombers, there are the German aerodromes, of which there must be more than 600.

It is obvious that the task of attacking so large a number of aerodromes that the enemy would be unable to launch his night raids is so immense that no air force could undertake it. The most that can be hoped for is that some of the aerodromes which are most useful to the enemy shall be knocked about, and this, it seems, was successfully done.

The lulls in night raiding may have been partly caused by these attacks, but that is all. For the rest, they may be due to the desire on the part of the enemy to conserve his bomber forces and to build them up to greater strength for some coming offensive of great ferocity.

The *Luftwaffe* has had heavy losses during the summer and autumn. It has, moreover, measured itself against the R.A.F. and found itself relatively less strong than it had thought. Field-Marshal Goering keeps a wary eye on our production and knows that it is swinging up and being augmented still further by United States production.

Yet the attempt to defeat Great Britain in these islands cannot have been abandoned as a primary German objective. It would be the key to saving Italy, it would fulfil Herr Hitler's dearest ambition, it would sort out all the Axis troubles. But to defeat Britain in these islands the Germans now know that a bigger effort than anything they have so far been able to put out is needed.

So they use this period for weakening us so far as they can by submarine warfare and by intermittent night raids, while not risking great numbers of their aircraft in day raids or in night raids when the weather is such that the number of accidents seems likely to be high.

Night flying under war conditions always entails many accidents, and it is surprising what heavy losses a night bomber force can suffer from this cause alone. The *Luftwaffe* bombers may have been depleted by accidents on a big scale during their attempts to sustain the bombardment of these islands during spells of bad weather.

At any rate, the present method does enable aircraft to be conserved and gives Field-Marshal Goering a chance to build up his forces. And that, I think, is the interpretation of it. There may be moves of some machines to another theatre, but if the aim is to strike in the Balkans or the Middle East the conservation and hoarding tactics are still needed. They would not be forced upon the Germans by a move because the aircraft do not take long to shift; it is the ground equipment that takes the time.

Our object then must be to prepare energetically to meet a new German air offensive. To that end we must increase the strength of the Royal Air Force and push forward with technical improvements. Higher speeds and better climb are the needs, for if we beat them once by technical merit we can beat them again by the same means.

It is clear that we have been able to reinforce our Air Force in the Middle East and also to lend fairly substantial air aid to the Greeks. We have been using not only the Gloster Gladiator fighters in those theatres but also the later Hurricanes. In addition, we have used Blenheims in fairly large numbers and some of the Wellington heavy bombers.

STILL MORE 'PLANES

But what we have done in the past in the way of increasing our air strength must be overtopped in the future if we are to meet with full confidence the coming attack wherever it may be launched. Moreover, there is always our own offensive to be considered, for it comes nearer and nearer to the range of practical possibility. So that not only must our fighter forces be enormously increased but so must our bomber forces.

Especially important will be the coastal reconnaissance types of aircraft and the torpedo-carriers. If, as has been suggested, we are to get some of the Consolidated 31 flying boats from America they should be of the greatest help to the Coastal Command in dealing with the submarine menace and also with the menace of the surface raiders.

Civil Aeronautics Authori

BIRTHDA

Robert N. Hinckley, Chairman. Term of office expires 1943.

By Robert H. Hinckley

Chairman

WHEN the members of the Civil Aeronautics Authority, the Administrator and the Air Safety Board took the oath of office slightly more than a year ago, we found ourselves confronted by a threefold task which in all conscience seemed large to us. We were charged by Congress and the President with the new duty of economic regulation as applied to civil aeronautics; we inherited the duty of providing, maintaining, extending and improving the aids to navigation of the common air; we were charged, and in a very particular way this bore upon our conscience, with the duty of increasing the safety, and therefore the utility, of all flying.

Statistics on Growth

Just to indicate what this growth has been, the scheduled air lines in the month of June carried 164,578 passengers, 64¼ percent more than June a year ago. During the first six months of this year, 1627 airplanes were produced for domestic civil use in the United States, only about 40 of them going to the airlines, the rest being purchased and used by private and non-scheduled flyers. Compared to the first six months of 1938, when 850 civil airplanes were made and sold for domestic use, this is an increase of over 90 percent in production and sales.

Today 26,144 pilots hold certificates, 6,000 more than a year ago, an increase of about 30 percent. There are 11,160 certificated airplanes today, 1,400 more than a year ago or an increase of almost 15 percent, an increase that will be moved startlingly upward by the production figures of the first six months if they are maintained on an annual basis.

The increase in pilots according to every indication of our charts will be even more startling. Even without the Authority's own pilot training program, the curves show that there would be 36,000 certificated pilots by the end of 1940, and 43,000 by the end of 1941. Taking into account the student pilot training program, however, the number of pilot certificates in force by the end of 1941 ought to approximate 70,000 of all classes.

Airways Extended

The federal airways within the United States have been increased by about 10 percent in length to a total now over 25,000 miles. The aids to navigation along these airways have been increased by about the same amount. But that is not as good a measure of their increased usefulness as is the almost complete modernization of existing radio and other aids and the plans now under development for their possible conversion into the new ultra-high frequency category, where they will become even more useful and reliable.

Perhaps no occurrence within this year is of more importance to the United States than the extension of our foreign lines across the North Atlantic, where for the first time, under the American flag, airplanes are flying regularly twice a week between here and Europe. Plans have been proposed for the further extension of our lines in the east to New Zealand. Our flag now flies in the air from Nome, Alaska, to Buenos Aires in the Argentine, and from Hong Kong, China, to Marseilles in France.

Backing up all of these extensions and additions to our civil aviation plant, the Authority is at this moment, thanks to the $4,000,000 appropriation in the Third Deficiency Bill, actually making the arrangements for the training of 10,000 student pilots next year by methods we know through test to be methods that produce safe pilots.

Air Traffic Regulation

Congress, in the Civil Aeronautics Act of 1938, recognized for the first time that air transportation had become a utility whose economic soundness was of sufficient importance to the people as a whole to warrant its regulation in a fashion long familiar with public utilities.

The existing system of scheduled air mail carriers is now legally a public utility. All of the certificates under the so-called "grandfather clause" of the Act have been issued to the air mail carriers after the fullest investigation of the adequacy and efficiency of the services they have rendered. This has not been a merely routine procedure. Under the new decisions affecting the validity of administrative law, it was necessary to make court-proof records in all of these determinations. A good result of that necessary step has been the development of a mass of information on air line operation which will be invaluable in the determination of cognate actions.

U. S. Aircraft Factories Increase Capacity to 15,000 Planes a Year

Plants Expand; Day-Night Shifts May Boost Total

NEW YORK, Nov. 12 (A.P.)—The Aeronautical Chamber of Commerce of America today made public a survey of aircraft factory expansion which, it said, showed American plants could turn out 15,000 planes a year.

Projects now underway, said John H. Jouett, president of the chamber, would result in even greater production capacity.

"Our survey," he explained, "included 43 airplane and 13 engine manufacturing plants.

"Of the 43 airplane plants, 23 are now working on orders for military equipment. The current capacity of 1250 planes a month, equal to a rate of 15,000 machines a year, is based on several factors.

SPACE INCREASES 17%

"The airplane factory space increased 6,000,000 square feet to 7,025,000 square feet in the first six months of this year an expansion of 17 percent in manufacturing space. At the same time the aircraft engine factory space increased 334,000 square feet, a 20 percent expansion. All that space is now in use."

Jouett said further that while some aircraft plants were working at full capacity, "others have not even approached their limit with single working shifts. When orders are received in sufficient volume to warrant it the plants go into three working shifts a day."

The chamber said that to obtain maximum output, standardization or "freezing" on a single model in one factory would be necessary. Some plants not working at top speed are still producing as many as seven or eight different types of planes.

"Another factor which has increased plant capacity," said Jouett, "is the recent growth of the subcontracting system.

SUB-CONTRACTS AID

"Sub-contracting in the past was a very small part of aircraft production because the manufacturer could not guarantee the sub-contractor continuous business and the sub-contractor could not tool up sufficiently to assure a return on his investment. * * *

"With increased orders and the larger unit volume on each order, all plants in the industry which are not working on their own business and filling original orders of their own are available for sub-contracting. In other words, this opens the entire manufacturing industry to full time production.

"Our survey showed that the industry is capable of rapid expansion of production on all types of military aircraft, including the special types used by the navy air forces."

OVERHAULED GUBA TAKES TEST HOPS

Sun 12-10-39

After more than four months of idleness while receiving a complete overhaul in the Consolidated Aircraft Corp. plant, the widely traveled airboat Guba of Richard Archbold, wealthy scientist-aviator, received its first test hops over the bay yesterday.

Chief Pilot Russ Rogers announced that the craft, which was used to transport personnel and supplies to hitherto inaccessible regions in Netherlands New Guinea during a scientific expedition which ended last summer, may be flown to New York City for the winter unless adequate hangar space can be provided in San Diego.

Mr. Archbold, in a recently purchased Fleetwing four-passenger cabin plane, is expected to arrive here from the East coast next month, according to Mr. Rogers.

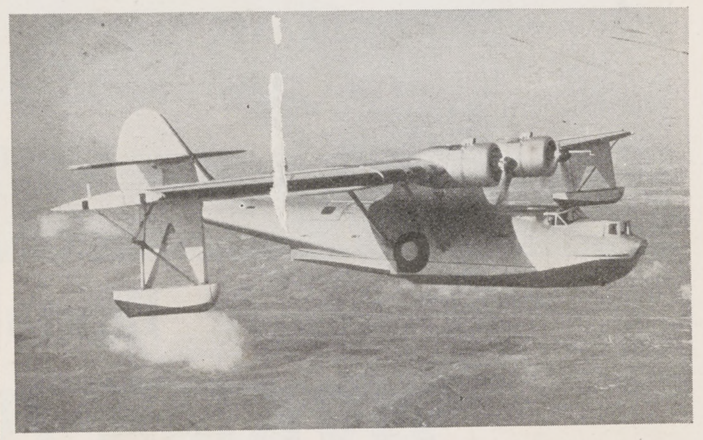
AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

Jan '40 WESTERN FLYING.

THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.
